Don't Tie the Dead Weight of a Cheap Belt to your Plant

¶ When you install a cheap belt in your plant you are led to expect it to last as long as a good belt—if you thought it would not, you would obviously have installed a good belt in the first place.

¶ You know the advantage of reliable and efficient power transmission in your plant—do not hope to effect this by poor equipment—cheap belts will stretch and slip and cause a shut-down, with its consequent loss of time and money, for shortening and repairs. The good belt saves its slightly additional cost in its reliability.

¶ Every Brand of Beardmore Belting receives the same care and attention and goes through the same process.

¶ All brands are uniform in the possession of the highest quality possible in leather belting.

¶ You are in the market for leather belting—let us demonstrate the advantage of buying the best on the market.

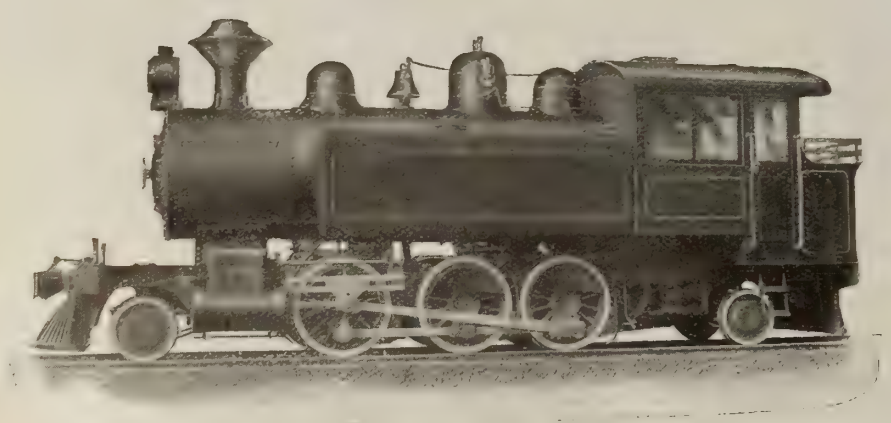
SELECTION OF LOCOMOTIVES

WHAT SHOULD BE KNOWN BEFORE YOU PURCHASE LOCOMOTIVES:—



Nature of the service.
Capacity of the cars and weight of train.
Character of track—is it new or old.
Length of haul.
Is time an important factor.
Do you want a quick locomotive or a big puller.
Distance from base of supplies and quarters for the men.
Water and coal carrying capacity.
All these items and more should be considered.
A careful study of conditions may mean larger profits.
Our experience may be valuable in considering them.
A dollar saved is more than a dollar earned.

Write or wire us, or better still, come to see us.

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

NO FRAYING AT THE EDGES

Dick's Balata Belting possesses perfect uniformity throughout, whereby true and steady running is ensured, fraying at the edges rendered impossible, and perfect success in fork driving guaranteed. The combination of strength and uniformity in Dick's Belts is due to the process of solutionizing to which the textile portion of the Belting is subjected, and which thoroughly solidifies and unites the whole material.

You can get all the facts in our Catatog No. 17.

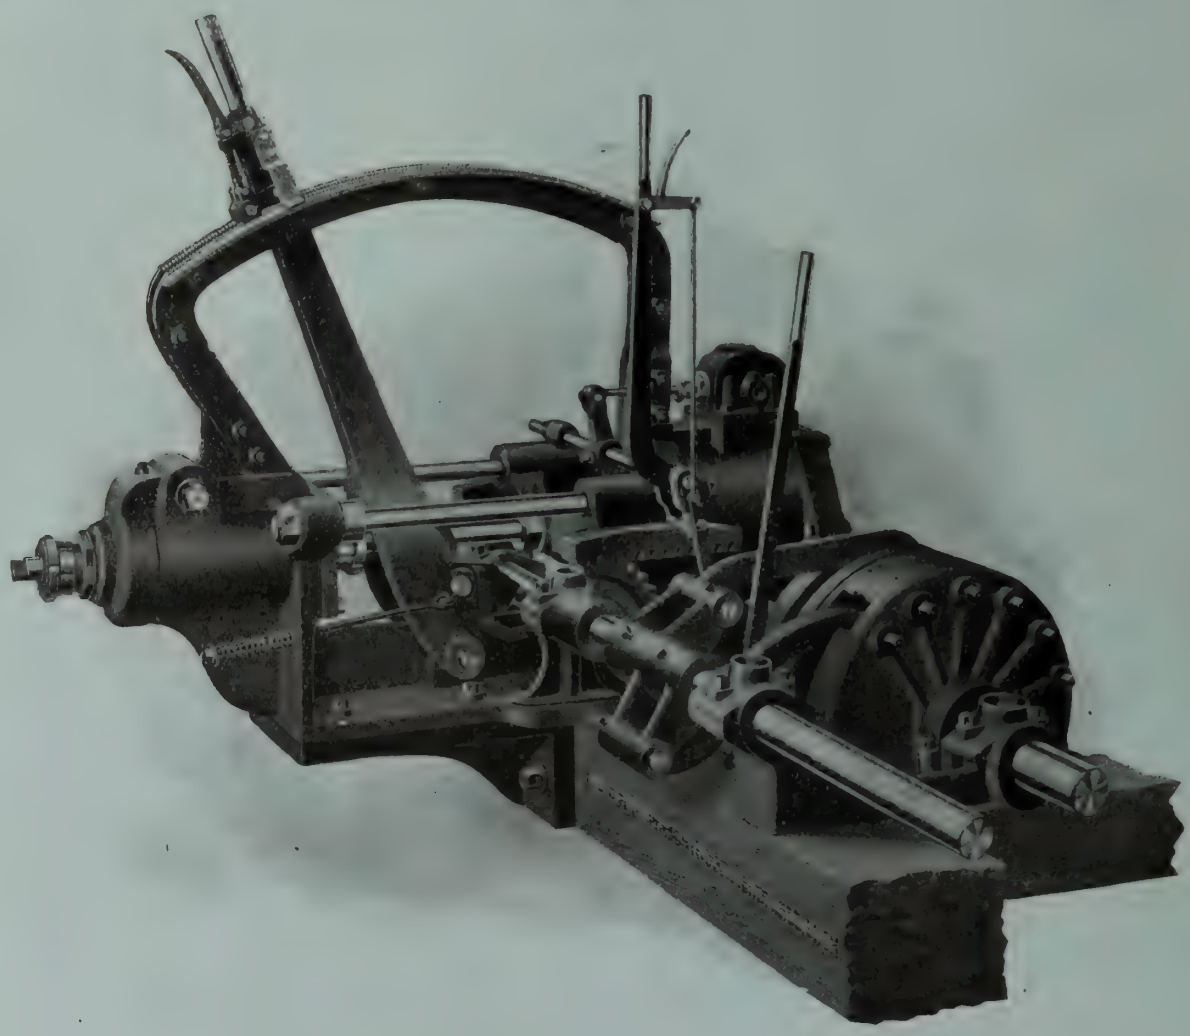
WRITE FOR PARTICULARS

B. J. COGHLIN CO., Limited ∴ ∴ **MONTREAL**

Alphabetical Index to Advertisers, page 60

Did you ever really figure what it means to you to increase your cut 2,000 feet per day?



That is, increase it 2,000 feet per day without adding to your cost of sawing.

Or, in other words, what effect will it have on your profits if you can distribute your overhead charges and wages over an output 2,000 feet per day greater than it is now?

If you haven't figured it out, take your pencil and try it now.

You know how much it costs you to run your mill every day—divide that amount by the number of thousand feet per day in your present output—add 2,000 feet to your present output and divide your daily cost by that amount—and the difference between the two results represents the saving per thousand feet in your operating cost.

Then multiply that figure by your total output per season—and we think the result will surprise you, if you have never looked into this before.

This is just one of the ways in which our FOUR INCH STEAM SET WORKS will make money for you, and it will do just this because the users themselves have written us stating that they have increased their cut *upwards* of 2,000 feet per day.

May we send you further information about this Steam Set works?

There's Satisfaction in Ordering These Quality Grades of Lumber

If you're depending upon a supply of lumber you must get your orders in before the fall or you will be up against car shortage—a serious question.

Last spring it was bad enough, and even now there is a scarcity of cars—what will it be when the West begins to move this year's wheat crop?

For Fall and Winter requirements place your orders now and make sure of getting August and September shipments.

Right now we are ready to supply your every demand—at lowest market prices, in

HEMLOCK 1 x 4 and up, 1 x 6, 1 x 8, 1 x 10, 2 x 6, 2 x 8, 2 x 10

SPRUCE 1 x 4, 1 x 5, 1 x 6, 1 x 7, 1 x 8, 1 x 9 and 1 x 10

We can also fill orders, in any quantity, of **White Pine**—the finest well-watered stock obtainable. Always ready for shipment. We can dress or resaw.

Timber Limits for Sale on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

The Parry Sound Lumber Co., Limited

1315-20 Traders Bank Building, TORONTO, CANADA

THE trend of trade is now towards our **CUTLER** Mills, when customers want anything at **BAY** ports for water or rail delivery, and our **LUMBER** is selling itself by repeat orders from any **COMPANY** to whom we make a shipment. Our stock is **LIMITED** but we still have a goodly quantity to dispose of at prices worth while considering.

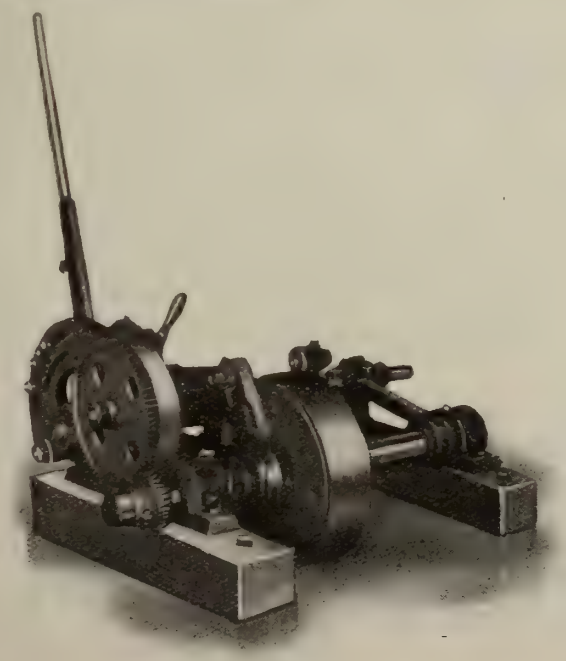
FASSETT, QUEBEC

The Importance of Efficient Mill Machinery

In Millwork, where every portion of the equipment has to undergo the severest treatment with unusually hard conditions only the best machinery will serve. No mill can be run at a profit with inferior equipment. This is an expression of the opinion of men of wide and varied experience in the business.



P. Payette's Improved Mill Machinery, is built to stand all the strain and hard usage of mill work. This machinery is of the special Payette design and embodies many improvements, which add considerably to the efficiency of mill equipment.

The New Patent Saw Mill Dog which operates in soft or hardwood timber of any kind will do good even work in summer or winter with perfect safety.

Payette's Improved Set Works will set even thickness of lumber in all class of timber and will set any size log with perfect ease, Can be changed instantly so as to make either thick or thin lumber and can be put on any make of carriage.

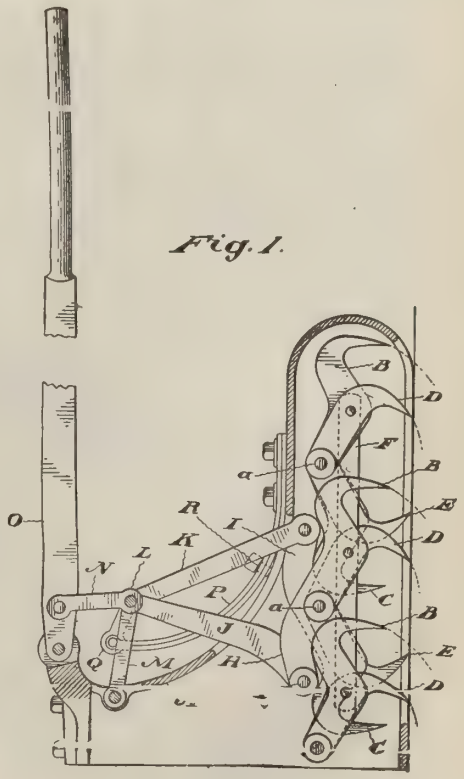


Fig. 1.

We want to prove to you the advantage of this set works in your mill and we are prepared to demonstrate its efficiency and superiority. Full information sent on application. Ask for our booklet on set works.

The Great Pulling Power of a Little "Want Ad"

A "want" advertisement is a small thing both in size and in cost, but through a a small "want ad" great things have often arisen.
A subscriber to the Canada Lumberman and Woodworker recently inserted a small ad in the "WANTED and FOR SALE" Department of this paper and received

47 REPLIES

Have you some odd lots of lumber that you would like to move quickly?
Have you some second hand mill machinery you wish to sell or exchange?
Do you want to buy some special lots of lumber or machinery?
If so **YOU NEED** the assistance of the "Wanted and For Sale" Department.
Let us assist you in filling your next want.

A Belt which Conveys ALL the Power

Practical men know the drainage of power from a slipping belt, ***and because they know,*** they are buying

GOODYEAR RUBBER BELTING

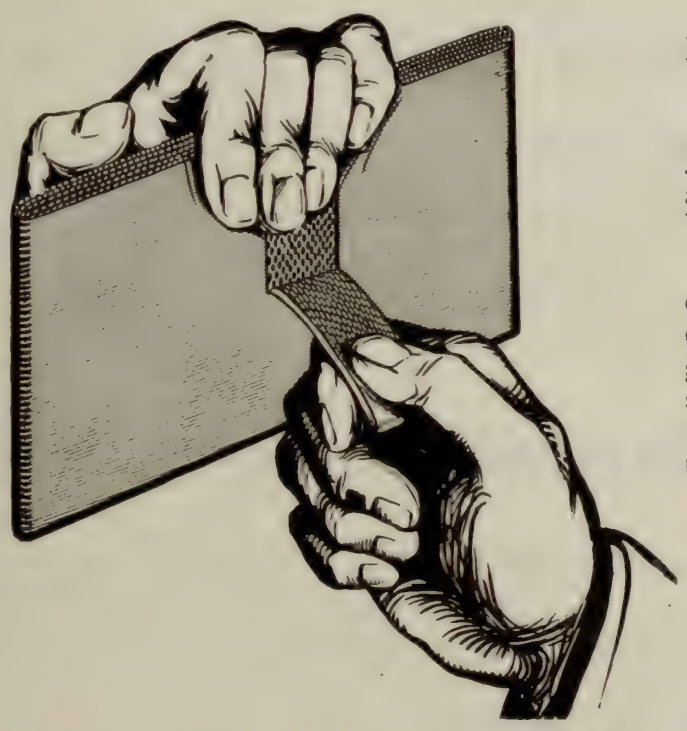
Which Neither Slips Nor Stretches

It is built up, layer upon layer, of close-woven, long-fibre, cotton fabric, rubberized and cured under Goodyear processes. And every Goodyear belt has in it the lowest possible minimum of stretch, because the belt is "cured" whilst stretched to the limit of safety in a special machine.

That is the Goodyear Method of Belt Manufacture

And the result is entirely satisfactory to belt users—a fact to which our enormously increased sales testify. What is the significance of this CONTINUED SALES INCREASE — 50% over last year? Simply that Goodyear Belting more than fulfills the claims made for it by the Goodyear people—who know what a belt should do, and make a belt to do it.

It has cost us less than $200.00 for claims or adjustment of every kind in connection with our total output for the past two years—a remarkable tribute to Goodyear reliability.



Look into the Belt for Yourself—Try to Tear It Apart.

Make a cut in the top layer—and then try to pull it apart. You will get a faint idea of its strength.

That is the result of forcing rubber at tremendous pressure through the fine cotton fabric—separating every strand—thus abolishing all internal friction or grinding. Whilst these layers of fabric are afterwards so compressed as to be almost homogeneous, the finished belt bends easily, the "duck" being so woven as to retain complete pliability in the finished belt.

For Main Drives and High Speed Pulleys GOODYEAR Belting is the Best

It has all the tensile strength necessary to absorb tremendous strain without slip, stretch or rent. The grip of rubber and the prodigious strength of hard-twist cotton fabric are united, and prove equal to every emergency.

Where the power transmitted is high, and great tensile strength is essential, Goodyear Rubber Belting proves its worth.

EVERY GOODYEAR BELT IS SUBJECTED TO A STRINGENT TEST BEFORE LEAVING THE FACTORY, and what is more, the materials used in the manufacture are also tested in the Goodyear laboratory before using.

IF YOU USE A BELT AT ALL IT WILL PAY YOU TO USE A GOODYEAR

Loss of power is loss of profit—and an inferior belt is dropping power all the time. Goodyear belting quickly earns its cost in power saved and trouble avoided.

TWO HUNDRED AND FORTY ROLLS—A TOTAL OF 72,000 FEET

We have just received an order for this quantity of GOODYEAR RUBBER BELTING from one business concern in the west, for the equipment of interior elevators. Such an order shows supreme confidence in the quality of GOODYEAR Belting.
If we have not just the belt you require we will make it for you.
In the choosing of belts our booklet would be of great assistance to you. We supply it free. Write to our nearest Branch for one.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, September 15, 1912 No. 18

May Advance Southern Freights

A great deal of interest has been evoked both in the United States and Canada by the recent increase in the freight rates upon lumber from points in the Southern States to Ontario and Quebec points. Lumbermen in the shipping districts affected were quick to raise objections to the proposed advances which were to have become effective on September 1st. Recent advices are to the effect that these objections have been presented successfully before the Interstate Commerce Commission of the United States and that the date upon which the tariffs are to become effective is postponed until December 30th, pending investigation by the Commission. So far as Canadians are concerned therefore, the matter is not likely to reach a stage at which it will be a subject of any interest to the Dominion Board of Railroad Commissioners until after the end of the present year, when some pronouncement has been made upon the subject by the Interstate Commerce Commission.

An indication of the interest which has been taken in the subject by manufacturers and shippers in the Southern States may be gathered from a forcible editorial article which appeared in a recent issue of the St. Louis Lumberman. "The question which presents itself in this case," says the above journal, "is a rather unusual one for the reason that the jurisdiction of the commission extends only over a part of the through haul, and there is no conceivable way by which it can reconcile, much less adjust, clashing rate-division differences between roads on this and the other side of the boundary. It could not accomplish this result even with perfect co-operation with the Canadian railroad commission, for, if we are correctly informed, the latter body has no control over rates on Canadian lines. Its authority does not extend that far.

"However, despite all the confronting difficulties, the commission is likely to hold up the advances until it can look into the situation carefully, as otherwise great hardship would be worked on lumber shippers to Canada with the higher rates going into effect at the scheduled time, September 1st. Considerable numbers of lumber, stave and cooperage concerns have contracts with Canadian customers, based on the present rates, and would suffer heavy losses thereunder if compelled to pay advanced freight charges from and after September 1st. One concern has stated that it would be caught on more than 100 carloads of its product.

"An idea of what the higher tariffs for Canadian delivery would mean may be had when it is stated that the rate to Montreal on yellow pine would be increased from 37 cents per hundred weight to 44 cents, or by approximately $1.75 per thousand. To Quebec the cottonwood and gum rate would be 41½ cents; the walnut, cherry and cedar rate 45 cents, and that on other kinds of wood (meaning mainly yellow pine), 42 cents. The general range of the advance to Canadian points is from 1 cent to 7 cents per hundred weight.

"Memphis and its immediate district do a considerable amount of hardwood business with Canada, and the advances therefrom are covered by Supplement No. 4 of Memphis Lumber Tariff No. 3. This tariff shows, in the case of Montreal delivery, 36½ cents for cottonwood and gum, as against 33 heretofore; 40 cents for walnut, cedar and cherry, as against 36 cents, and 37 cents for 'other kinds,' as compared with 33 cents.

"In truth, the tariffs the railroads would put in force on September 1st from both sides of lower Mississippi river lumber producing territory would be the sum of the locals, basing on Ohio and Mississippi river crossings. All of the increase, to the last penny, would, of course, go to the American railroads, which claim that their divisions of the through rates are not sufficient for the service rendered, and that the Canadian roads refuse to part with any portion of their excessively large division. The real facts, though, as to the divisions cannot be ascertained until the Interstate Commerce Commission shall have investigated the whole subject.

"It is almost needless to add that the proposed advances have been strongly protected by lumber shippers in the Southeast, the Southwest and at such important centers as St. Louis, Nashville, Memphis, Cairo, Cincinnati, Louisville, Buffalo and other places. Prominent among the organizations that have protested may be mentioned the Georgia-Florida Saw Mill Association, the Cincinnati Lumbermen's Club, the Hardwood Lumber Exchange of Buffalo, the Nashville Traffic Bureau, the rivers and rail committee of the Lumbermen's Club of Memphis and the Memphis Freight Bureau."

The above reference to the inability of the Canadian Board to deal with questions of freight rates, is of course based upon a misapprehension, as that body can and does frequently deal with them. Its jurisdiction however, is like that of the United States Interstate Commerce Commission, strictly limited to business within the boundaries of its own country and the development of difficulties arising out of through rates from a point in one country to a point in the other, will require the creation of something in the nature of an International Board, such as has already been discussed by representatives of the two commissions.

Order in the Retail Yard

One of the indirect results of the extremely wet weather which has prevailed during the past few months is that retail lumber dealers have been forced to give more consideration than formerly to the question of getting their stocks under cover. The wet weather of course, has only been a contributing cause, as this tendency has been growing more and more noticeable of late. There is little or nothing to be said in favor of the old-fashioned method of conducting a retail lumber yard which included the piling of stock in the yard in any old place and in any old manner, so that the appearance from the buyer's point of view was far from inviting. When a man goes into a yard to purchase lumber, nothing makes so favorable an impression upon him as nicely piled stock, kept under cover and well arranged. Not only does it incline him to come back with further orders later on, but it persuades him that the company's stock is good and that he would do well to pay a high price for it rather than look for bargains in some other yard where the stock is not so well cared for. This is simply one of the natural tendencies of human

nature. In the city we all admire the well dressed shop windows and we think of them whenever we are considering our purchases. Similarly a lumber consumer will bear in mind the yard where he can get good stock easily and where the manager seems to believe so much in the quality of his stock that he looks after it as carefully as though it were something far more perishable.

Retailers can scarcely give too much attention to this matter. Properly worked out it will do more to make profits for a business than any other feature of the management. By way of a general suggestion as to what can be done we reprint a paragraph from the Lumberman's Review which recently discussed the subject as follows:—

One large shed comes to mind where special effort is made to keep all of the oldest lumber moving out and the new, bright stock going into bins. The sills of the bays are so constructed, being bricked up, that the driveways are easily kept clean and no waste is allowed to accumulate under the piles in the bays, and when a section is refilled with lumber any waste that may have collected is removed. In stormy weather the employees are brought into the sheds, trucks are placed ready for delivery when the weather permits, every pile is squared off at the top and the ends are gently tapped into position with a short piece of 2 x 4 until every pile in the shed is as regular on the end toward the driveway as this careful work can make it. The result is a very orderly shed with stock perfectly arranged for easy handling, and as it greets the eye of the regular customer or the prospective purchaser, he is favorably impressed, for he assumes at once that the business methods of the concern warrant the expectation that his dealings with it will be along correct lines. First impressions are most important in displaying lumber on the retail yard, as in practically every line of activity.

Sacrificing Pulpwood for Christmas Trees

A Montreal nursery man by the name of S. S. Bain has made complaint to the Forestry Branch of the Department of the Interior that a great deal of valuable pulpwood from the province of Quebec goes over to the United States annually to supply United States families with Christmas trees. The forestry branch will look into the complaint and do what it can to remedy any waste which they may find to exist. This matter has been occupying public attention each year in the daily press to the extent of one or two paragraphs annually and has made quite an interesting little piece of reading for those who have no other concern in the matter than to consider it as an interesting piece of reading. The situation however, is reported, by those who have looked into it, to involve quite a serious loss. There is some element of doubt as to the actual extent of the loss and there are people, who claim to be posted, who state that the loss amounts to practically nothing. It will be well therefore, if the Forestry Branch of the Department of the Interior will set at rest all doubt and try to remove any cause for complaint.

According to the report by Mr. Bain, a large number of men from the United States come to Canada each year and buy up thousands of spruce trees from 6 to 15 feet high, paying for them at the ridiculously low price of ¾ to 1½ cents each in the woods, and the farmer has to haul them to the railway. On its face, such a statement seems to be almost absurd. How a farmer can cut such a tree and transport it to the railway for so low a price is difficult to conceive. If he were trying to clear his land it might be different. It would be on a par with cutting a crop of grain before it was ripe. These trees in a few years will grow into fair sized sticks of pulpwood, with a market value of several dollars a cord. It is to be presumed that the farmers in Quebec know this as well as anyone else. In the past it has been questionable whether the farmer did know this, but to-day every one in the province of Quebec knows the value of pulpwood and probably if there has been wasteful destruction of valuable resources in the past, the future will see a change, inasmuch as no one is ignorant to-day of the value of his spruce trees.

The Canadian Forestry Association has always taken an interest in this matter and has gone so far as to recommend the passing of legislation to prevent the exporting of spruce and balsam trees for Christmas uses. One of the most wasteful features of this matter is the fact that after the use to which these trees are put for a few hours on Christmas day, they are practically useless. They are in fact completely wasted so far as their actual value is concerned. It will be a good thing if the forest branch will make a definite report upon the subject and, if necessary, recommend drastic action by the government.

United States Imports of Pulp and Paper

Official figures covering the foreign trade in pulp and paper of the United States during the fiscal year ended last June 30 have just been made public. They do not disclose a wide divergence in the course of trade, but tend to prove that the paper industry during the twelve months under review has easily held its own, and has even done a little more.

While the progress in some branches may not have proved as substantial as some people would like, yet it has been progress, and the general tone of the market has been healthy, despite some internal dissension and a liberal number of drawbacks.

The quantity of print paper imported during the twelve months ended June 30, 1912, aggregated 59,789 tons, valued at $2,482,968, as compared with 57,206 tons, valued at $2,567,670, during 1911, and 46,455 tons, valued at $1,920,801, in 1910. The increase over last year was only 2,584 tons, and the value decreased $84,702. Compared with 1910, the increase in quantity was 13,334 tons and in value $562,167.

The average price of imported print paper at the point of shipment, during the fiscal year of 1911-12, was $41.53 per ton, a decline of $3.35 as compared with the previous year, when it was $44.88. During 1909-10 the per ton price averaged at point of shipment $41.35.

Canada's share of the imports of print paper during the last fiscal year was 55,563 tons, valued at $2,101,086, as against 53,144 tons, valued at $1,969,102, in 1910-11, and 43,388 tons valued at $1,615,100 during 1909-10. The figures show an increase of 2,449 tons and in value of $131,984 over 1910-11, and of 12,175 tons and in value of $485,986 over 1909-10. The average price of Canadian print paper at the point of shipment during the last three fiscal years was shown from these figures to have been—in 1911-12, $37.81; in 1910-11, $37.07 and in 1909-10, $37.22.

Wood pulp, mechanical and chemical, was imported during 1911-12 to the extent of 534,804 tons, valued at $14,218,922, as compared with 550,897 tons, valued at $13,980,357 the previous year, showing a falling off in imports of 16,093 tons and in value of $238,565. During 1909-10 the imports were 423,720 tons, valued at $11,708,014; there was therefore an increase during the last fiscal year over 1919-10 of 111,084 tons, and an increase in value of $2,310,908. Of mechanical pulp there were imported during 1911-12 215,931 tons, valued at $3,516,537, as against 263,501 tons, valued at $4,198,760, the previous year, and 159,678 tons, valued at $2,542,725, in 1909-10. The figures show a decline from last year of 47,570 tons, and in value $528,812. The average price of the mechanical pulp imported has been 35 cents per ton higher than during 1910-11, and 36 cents per ton higher than during 1909-10, the respective average prices at the point of shipment being 1911-12, $16.28; 1910-11, $15.93, and 1909-10, $15.92.

Chemical pulp, unbleached, was imported to the extent of 238,349 tons, valued at $7,266,271, as compared with 206,840 tons, valued at $6,286,615, during 1910-11, and 187,288 tons, valued at $5,831,616, in 1909-10. The figures show an increase over last year of 31,500 tons, and in value of $979,556, and over 1909-10 of 51,052 tons, and in value of $1,434,655. The average price per ton of imported unbleached pulp at the point of shipment during 1911-12 was $30.48, com-

pared with $30.39 during the previous year, and $31.14 during 1909-10.

The imports of bleached pulp during the twelve months ended June 30, 1912, amounted to 80,537 tons, valued at $3,436,114. During 1910-11 they were 80,656 tons, valued at $3,436,114. During 1910-11 they were 80,656 tons, valued at $3,494,982, and during 1909-10, 76,757 tons, valued at $3,394,273. There was therefore a decrease, as compared with 1910-11, of 119 tons, and in value of $58,868, but compared with 1909-10 there was an increase of 3,780 tons, and in value $41,841. The average price of bleached pulp at the point of shipment has declined during the last three years. During 1911-12 it was $42.66; during 1910-11, $43.33, and during 1910, $44.18.

The pulp wood, rough, peeled and rossed, brought in during 1911-12 aggregated 901,270 cords, valued at $5,834,828, as compared the previous year with 869,955 cords, valued at $5,565,273, and with 1,000,342 cords, valued at $6,392,023, during 1909-10. The figures of the last fiscal year therefore show an increase of 31,315 cords and in value $271,555 over 1910-11, and of 99,072 cords and in value $557,195 over 1909-10. The average value of a cord of pulp wood at the point of shipment was, according to these figures, $6.47; during 1910-11, $6.39, and during 1909-10, $6.38.

Reduction of Mill Waste—An Important Factor

While the forestry association of Canada are doing their best to spread the gospel of conservation of our forest resources and have met with great encouragement, they are not the only ones who are going about the work in a practical manner. Their chief work is to interest the public in the actual preservation of the forests and the proper exploitation of timber, with a due appreciation of the importance of seeing that the growing timber resources of the country are not destroyed. At the other end of the lumbering business, there is an equally important opportunity, namely in the using up of everything which has been cut and preventing the great waste which has been so regrettable a feature of the saw-milling business in the past. One of the most important factors in the modern development of economic methods of wood utilization is the commercial instinct of the manufacturer of machinery. In the wood-working machinery business, perhaps more than in any other lines of manufacturing, the leading firms have anticipated the requirements of the industry to which they cater and have led the way in bringing about important reforms. They have not waited until a new class of machine was required, but have gone ahead, developing new machines which not only perform their work more efficiently than the old machines, but which do a new class of work altogether, namely, use up raw material which was formerly wasted and make it into a first class manufactured article for which there is already an urgent demand.

In the making of box shooks for instance, wood is being used to-day which formerly was wasted and was a source of expense to the firm which had to handle it and then throw it away. One firm of manufacturers of box shooks, describing the raw material which it uses, says: "one half of the lumber we use is mill waste, so poor and trashy that we do not go to the expense of measuring it, but buy it by the thousand pounds. The balance of low grade lumber we use is of not much greater value."

There will be a time in the not far distant future when a story like this will attract no attention and we will look back with wonder upon the days when most of the saw mills wasted during the course of a year, enough raw material in the form of edgings, slabs, trimmings, etc., to keep a large shook-making industry in supplies. The chief difficulty during the past seems to have been the lack of demand for the shooks and the consequent excessive cost of freight when compared with the prices which the shooks would bring. The rapidly increasing activity of manufacturing industries in many parts of the world promise to remedy this situation before long and to make it profitable for all saw mill owners to work up their trimmings and defective stocks into shooks or to sell them to some firm of shook manufacturers. The day is probably near at hand when even the surplus sawdust which cannot be used up in some of the mills will have a sufficient value to give it a regular place on the market. The problem to-day seems to be solely one of freight charges as the demand for all these products now exists in one form or another. There is little doubt that the multiplication of railways and the increasing demand for packages and the bi-products of wood will reduce the waste material in connection with the saw-milling business to a practical minimum. When that day arrives, it will be found that one of the chief factors in bringing about this result has been the wonderful inventive genius of the machinery manufacturers.

Editorial Short Lengths for Busy Readers

It will be but a very short time before the United States will have to look to British Columbia to supply her with lumber, according to Hans Dirks, a prominent lumberman of Kansas City.

The Dry Goods Section of the Retail Merchants' Association decided at their annual meeting in Toronto recently to forward to the Dominion Government a resolution opposing the duty of fifteen per cent. which is charged on British packing and wrapping-cases and twenty per cent. on foreign packing-cases.

The circular sent out recently to members of the Canadian Lumbermen's Association calls attention to the fact that during the fiscal year ended June 30, Canada sent the enormous total of $11,796,333 to United States for boards, planks, deals, joists and scantling. This represents an increase over the previous fiscal year of 363,838,000 feet.

For the purpose of founding an organization through which Germany's trade in Canada may be developed, Dr. H. Hammann, of Berlin, recently visited Toronto enlisting members in the German-Canadian Economical Association. In discussing some of the lines, including manufactured paper goods, in which Germany has not achieved a fair share of Canada's patronage, Dr. Hammann declared that the defeat of the reciprocity pact had saved Germany from a powerful rival in the markets of the Dominion. Although the surtax imposed on German goods coming into Canada had been removed, German exports had not increased in volume to the extent that was predicted. The imposition of the surtax, he said, was a serious blow to Germany's trade, and moreover it permitted other European nations to gain a position in the Canadian markets from which they could not easily be dislodged. German manufacturers in all lines, Dr. Hammann feels, must put forth a special organized effort to capture the trade of the Dominion.

W. J. Laite, managing editor of the South African Commerce and Manufacturers' Record, who is making a tour of the world in the interests of the Union Government of South Africa for the purpose of investigating tariff conditions, said in an interview at Toronto recently that the thing which impressed him with greatest force in Canada was the tremendous waste in timber. "It is absolutely criminal," he said, "and will cause present generations to be remembered by posterity as ruthless wasters of national wealth."

Do you ever take your trade paper home? Try reading it in comfort and at leisure, instead of giving it a mere hurried glance during the pressure of business at the office and then laying it aside for the incidental future reference that may never be made. It will give you a worth-while thought now and then; certainly keep you in more intimate touch with the field where your interests lie; and possibly suggest effective plans for a profitable business campaign. Then again, the women folks, the bright boy or girl, we venture, would find considerable in it to interest them. Try it.

Pulp and Paper Making in Nova Scotia

Progressive Development and Expansion of Macleod Pulp and Paper Company, Milton, N. S. — Owners of Extensive Limits and up-to-date Mills

Written specially for the Canada Lumberman—By W. D. Taunton

Down in Nova Scotia there is a town called Mersey. Like the Liverpool of the old world, it is situated on the river Mersey. But the Nova Scotia Liverpool and River Mersey are not as large nor yet as important as their namesakes across the pond. They are, however, large and important as Nova Scotia towns go. Liverpool is a flourishing town and a beautiful town. It has a magnificent harbor and is an important shipping port. The River Mersey has a reputation for salmon, and other things. The "other things" include the greatest water falls in the province, and the mills of the Macleod Pulp & Paper Company, Limited.

Situated on one of the most picturesque spots in the beautiful country of Queens, about five miles distant from Liverpool town and the shipping piers, the mills are reached either by waggon road or a branch railway, formerly known as the Liverpool and Milton Railway and now a part of the Halifax and Southwestern, a road traversing the south and western shores of Nova Scotia from Halifax to Yarmouth, Liverpool being about half way between the two ports. The scenery in this part of the country is grand and inspiring. Just above the village of Milton are two great falls and here the river, so far as shipping purposes go, practically ends. A series of great lakes are above, extending for miles through an unbroken yet highly delightful country, the haunt of the timber and the fisherman. With a watershed of six hundred and eighty square miles, and a reservoir of some twenty square miles (which will be enlarged to sixty in the near future), the waters come tumbling down the river and over the falls, supplying power to run the two mills night and day, summer and winter.

For the purpose of the manufacture of pulp and paper the mills have a natural situation unequalled in Maritime Canada; a great watershed fed by four counties, unsurpassed shipping facilities, cheap transportation and nearness to the markets. Added to this are an abundant supply of raw material, intelligent labor and a delightful climate.

Unique Shipping Advantages

Liverpool is the point of shipment for the product of the mills. Steamers and sailing vessels take in their cargo here, after it has been brought in by rail to the ship's side. Water rates are low. Liverpool is not much more than a day's sail to the New England ports, and as near to England as any other Atlantic port. Shipments can be made and are made by water to United States and English ports all the year round. This is one of the great advantages enjoyed by the Macleod mills.

The company own 25,000 acres of stumpage and timber land, but on this they do not have to rely. Hundreds of farmers cut and sell to the company and they also buy the timber as it stands and do

Macleod Pulp and Paper Company's Mills, Rapid Falls, Milton, N. S.

the cutting and logging themselves, giving employment in the winter season to as many as four hundred men. Labor is reasonable, intelligent and always available.

In addition to the pulp and paper mills the Macleod Company operate a sawmill at Mitchell's Brook, where white pine, spruce and hemlock lumber and laths are manufactured, the output being about one million feet each year. Logging operations, however, are not extensive, the distance from the stump to the mill not being of any consequence. In this respect the company occupies a unique position, both as regards the lumber and the pulp mills.

Output of the Pulp Mills

At the pulp mills from twelve to fourteen thousand cords of wood a year are used, and the daily output is one hundred tons of pulp and twenty tons of cardboard. Of the output, sixty per cent. this year goes to the Old Country. The home market, however, promises to take care of the whole output in the near future.

It is the aim and intention of the company to use up all their pulp in the manufacture of cardboard. To-day they are turning out a very superior grade of board goods and colored papers and the total output of board is sold months ahead of manufacture. To meet the growing demand the company will put in another board mill having a capacity of 6,000 tons yearly. With the new board machine all the pulp will be converted into paper and thus the export

John R. Macleod, Pres. & Gen. Mgr.

F. B. McCurdy, M. P., Director

Sidney Downer, Manager

of pulp will be stopped, more labor will be employed and the company's earnings greatly increased.

The company have a good market for their product in England. It may surprise many to learn that the tickets used in the London tram car system are made from colored board manufactured by the Macleod pulp mill, the company having a contract with the City of London. Cadbury's cocoa is put up in boxes made from the product of these mills, and Lever Bros. use up many tons for receptacles for Sunlight Soap.

There are two up-to-date pulp and paper mills in this enterprise. One is situated at what is known as Rapid Falls. This is the "upper" mill, with 3,500 horse power developed. Here are situated the offices of the company, the boarding house for the men, etc. The second mill is located half a mile down stream at what is known as Cowie's Falls, where there is 2,500 h.p. developed. Both mills lie alongside the railway track and the logs are fed into the mills by means of a canal.

The water power of the Mersey is the greatest in Nova Scotia and it is proposed to utilize it for commercial purposes. A company has already been organized and incorporated with that end in view, the idea being to send the power into the city of Halifax, a distance of about 130 miles.

The Men Behind the Company

The principal owners, or, in fact, the sole owners to-day of the Macleod Pulp & Paper Company, Limited, are John R. Macleod and F. B. McCurdy, M.P. The mills were established some years ago, but did not reach a paying basis until Mr. Macleod became interested, reorganized the company and introduced new machinery and modern business methods. Financially the enterprise is a great success and the future looks exceedingly bright. Mr. Macleod is one of Canada's bright young business men and has already made a reputation as a successful promoter and financier. He graduated from Dalhousie Law School in 1898 and on his admission to the bar practised law in Halifax, first in the office of Hon. J. Y. Payzant, President of the Bank of Nova Scotia, and subsequently in the firm of Rawlings & Macleod. Turning his attention to company business, he organized and promoted the Nova Scotia Fire Insurance Company, of which he was the capable manager for several years. He also organized Stanfields Limited, Truro, N.S., probably one of the most successful industrial concerns in eastern Canada, and the Macleod Pulp & Paper Company, of which he is the President and Managing Director. All of these concerns have been remarkably successful. Last year he became a member of the firm of F. B. McCurdy & Company, but still remains on the directorate in an advisory capacity. He is also a director of the Maritime Telegraph & Telephone Company, which last year purchased the Nova Scotia Telephone Company.

Mr. F. B. McCurdy is one of the best known financial men in Canada. He established the firm of F. B. McCurdy & Company in Halifax thirteen years ago, and to-day it is the largest investment house in eastern Canada, with offices in Ottawa, Montreal, Sherbrooke, Halifax, Sydney, Charlottetown and St. John's, Newfoundland. The firm are members of the Montreal Stock Exchange. Mr. McCurdy is a banker by training and previous to going into the brokerage business was assistant to Mr. H. N. Wallace, General Manager of the Halifax Banking Company, since merged in the Canadian Bank of Commerce. Mr. McCurdy won special distinction one year ago, when he was elected to represent Queens-Shelburne in the Federal Parliament.

The manager of the Macleod Pulp & Paper Company is Mr. Sidney Downer, a young man of outstanding ability. Previous to taking his present position he was with the Newfoundland Timber Estates Company, the proprietors of five large sawmills and six thousand square miles of timber land, turning out forty million feet of lumber annually.

Newfoundland Needs Canadian Hoops

The Canadian Trade Commissioner at St. John's, Newfoundland, in a recent report, writes as follows:—"Canadian manufacturers of barrel hoops will not, it is hoped, overlook the importance of the recent inquiry forwarded from this office to the Department of Trade and Commerce referring to coiled elm flat hoops. The quantity of 100,000 to 250,000 is merely a trial order, as millions are used every year by manufacturers of barrels in this city.

"That conditions are gradually but surely undergoing a change in Newfoundland is further evidenced by the additional fact that the fishermen who in the past supplied the requirements of this branch of industry, seem to be no longer in a position to do so. The kind of hoop supplied by the fishermen was no longer popular, it being of half-round birch with the bark left on, and the crudeness of the make such as did not add to the appearance of the finished barrel. These hoops were usually made in the slack season when the voyage was over, and were therefore a source of additional income for the fishermen. In recent years, however, by reason of death and old age the old time fishermen are disappearing one by one from the field of action, and the young men who are expected to fill their places thus made vacant are not as a rule disposed to take any too kindly to the vocation of their fathers, but prefer to take up a trade or other employment in the city; consequently the supply of hoops is getting less every year.

"These conditions are well known to those still employed in the business, with the result that they hold back their goods until the market is bare, and the needs so urgent that fancy prices are often realized. The consumers now find themselves compelled to look to outside manufacturers for an article which will not only improve the appearance of the package containing fish for export, but can be got for a more reasonable price. This the local manufacturer is unable to furnish. It behooves the Canadian manufacturer, therefore, to appreciate the importance of this market, and to assist in removing every obstacle in the way of Canada getting full control thereof.

"There is no denying the fact that if the Canadian manufacturer will be satisfied with a modest profit, and give special attention to the requirements of this market, he will be a big factor in bringing Newfoundland into closer commercial relations with the Dominion. Although importing hoops is entirely a new thing for Newfoundland, all the oak staves and heading used in the manufacture of oil barrels are imported.

"During the year 1910, 524,064 dressed oak staves, valued at $24,-112, and 20,924 pairs of heading, valued at $6,420, were imported from the United States, while Canada only supplied 750 pairs of heading, valued at $105.

"The year 1911 shows a falling off in importations of staves, but increase in heading, as is shown by the following figures: Staves, 385,930, value $18,728; and heading, 28,730, value $9,019, all of which came from the United States.

"The duty on staves is $5.50 per 1,200, and on heading, 5c. per pair. The duty on hoops is 40 per cent."

Importations of Mahogany into Canada

Felix S. S. Johnson, U. S. Consul at Kingston, Ont., in a recent report says:—"The enormous increase in building operations throughout Canada has been instrumental in increasing imports into this country in products which some fifteen or twenty years ago could hardly be noticed in commercial statistics. Mahogany, for instance, is an article which Canada half a generation ago had very little use for, one reason being that in the early growth of the country office buildings, houses, and hotels were erected rather on a cheap scale. Mahogany in Canada has always been considered somewhat of a luxury, particularly for office fittings and decoration purposes. Today this feeling has somewhat changed. Mahogany is very generally used; in fact in almost every large banking house or commercial office one generally looks for the finely polished desk and comfortably upholstered mahogany chair.

"That Canada is now commencing to build her own railway cars is another factor in the importation of mahogany. Although this is the greatest timber country in the world, the fact remains that no wood grown here can be used for manufacturing good cars. Hard wood in Canada is short grained and it is difficult to get anything that will equal mahogany for durability and finish. Automobiles also require mahogany to be properly finished, and in the last five years large amounts of this wood have been imported by automobile manufacturers who have opened factories in Canada.

"The wealth of Canada, which has increased tremendously per capita, naturally calls for more luxurious living. In the old days the best of furniture in the house might be made of any hard wood or even pine, with a veneer finish, while now nearly everything must be mahogany. The wood in the rough brings sufficiently high prices, selling in large lots at $110 to $115 per thousand feet. Although this wood has always been looked upon as more or less of a luxury its use now is becoming general, because at last people are beginning more and more to feel the advantages which it has over other woods; but the supply has been decreasing during recent years, causing corresponding increase in the price.

"Tabasco mahogany comes from the southeastern part of Mexico and there is much competition between New York and Boston firms and large dealers in England for the shipments of the few companies operating in the Tabasco wood. One of the largest shipments from the territory received lately into New Orleans approximated 4,000 tons.

"Canada imported during the fiscal year ended March 31, 1912, a total of 2,696,455 feet of mahogany, invoiced at $314,409. Of this 301,316 feet came from England (evidently South African mahogany) and 2,364,309 feet from the United States (evidently Mexican and Central American mahogany). This came in free of duty. There were also considerable imports of mahogany veneering, which is classed in imports with veneers of oak, rosewood, cedar, and walnut, which pay 7½ per cent. ad valorem under the general tariff, and of which imports in the last fiscal year were $251,522, all from the United States."

Quebec's Timber and Pulp Resources

United States Consul Willrich Reports as to Paper and Pulp Matters in that Province

Gebhard Willrich, United States Consul at Quebec, in a report refers to Quebec's resources as follows:

The decline in the exports of pulp wood was not due to a scarcity of this article, but probably to a corresponding increase in the exports of wood pulp. Conditions are highly favorable to the production, at a minimum of cost, of the various classes of pulp, chiefly mechanically ground, by reason of a superabundance in many parts of the province of water power and of vast quantities of raw material.

It is another matter when it comes to the manufacture of paper, requiring coal, which must be imported, to produce power, and highly skilled labor, which can not be obtained for sections of a country as yet without many of the advantages of development. The manufacture of pulp, in other words, has been found most advantageous near the source of power and of raw material, and that of paper near the points of distribution and the supply of skilled labor.

Two large Quebec companies, now making pulp, have decided to build paper mills in the United States. Some of the paper mills already established here have, it is true, increased their capacity during 1911, and a number of new ones have been built, but this was to be expected in view of the increasing demand for paper by the home market.

In the general lumber exports from this port to trans-Atlantic points and to the United States during 1911 the increase in some lines was much more than counterbalanced by a reduction in others, resulting in a considerable diminution in the export trade of wood goods from the St. Lawrence Valley. The decrease amounted to 34,350,253 feet board measure. The unmanufactured wood products from this district to the United States suffered the greatest decrease, while manufactured products showed a decided increase during the past year.

The timber resources of this province are enormous, though greatly diminished in past years by forest fires. The privately owned timber lands comprise about 6,000,000 acres and are able to supply 500,000 to 1,000,000 cords of wood per annum for years to come. The island of Anticosti alone is able to produce 80,000 to 100,000 cords per annum for years, a good portion of which, however, will probably be converted into pulp in the near future, as a large mill is now in process of erection there. Pulp mills are also in process of construction in other parts of this district, so that the pulp industry, especially in this district, is bound to witness a great boom in the near future.

The forests leased to lumbermen by the Provincial Government total about 45,000,000 acres. The first of these were leased in 1825 for nominal sums, such leases being good for one year only. Since 1841 such leases were made renewable from year to year, and they practically became private property, subject only to Government regulations and the payment of certain stumpage dues.

Lumbermen were originally required to pay as a guaranty one-quarter of the estimated stumpage dues annually. Later on a bonus was substituted for this payment in order to obtain such leases. Since 1868, however, leases were put up at auction sale, with the result that bonuses varying from $8 to $1,000 per square mile have been obtained at these sales.

About 69,000 square miles of forest lands of this province have thus passed under lease, and the premiums, or bonuses, as they are termed, between the years 1867 and 1906, represented the sum of $3,250,000, or an average of $63.74 per square mile.

In 1851 an annual or ground rent tax was imposed, payable at each yearly renewal day of such leases. In 1868 such tax or rent amounted to $2 per square mile, which was increased to $3 in 1887 and to $5 in 1910. In addition to this, holders of timber licenses have to pay stumpage dues to the Government for all timber cut by them on their limits, which dues are fixed for a term of ten years.

To assure, as far as possible, the continuance of forest growth, no trees can be cut of less diameter than from 7 to 13 inches, according to the class of timber, and in order to promote home industry it has been provided that no timber cut on these limits, or lands owned by the Crown, can be exported in the raw state, but must be manufactured in Canada.

These regulations had their first full year's trial during 1911, and while the reasons advanced for their enactment can not be questioned, and many persons hold that they have proved beneficial and in the interest of timber conservation and the encouragement of an important home industry, others claim they have resulted in great hardship to those owners of timber limits who were unable to convert their wood into pulp, or could not dispose of it to those who were able to do so.

The declared exports of pulp wood during 1911 declined somewhat, but this was the case likewise with lumber, upon which there were no export restrictions. The first five months of 1912, moreover, show such increase of pulp wood exports over the corresponding period of 1911 that it may be assumed that the decrease in wood exports for 1911 was a temporary one. The vast pulp wood resources of this province will certainly permit of large exportation of wood for years to come, for no other country, it is claimed, possesses such a large and valuable forest area as Quebec, much of which has only lately been made accessible through the construction of new lines of railroad.

During last year forest reserves were created by the Provincial Government in fourteen different districts in order to protect the forests and to insure an adequate future supply of water. A commission was also appointed to investigate the water powers of the province with a view to further developing them for industrial purposes, etc.

Exports from the Rimouski District

United States Consul F. M. Ryder, Rimouski, Que., in a recent report shows that the exports of wood and manufactures of wood from his consular district to the United States during 1911 was valued at $2,279,621, against $2,432,080 during 1910. The principal decreases were as follows: Lumber, 1911, $931,402, against $1,036,460 in 1910; pulpwood, $73,129, against $118,352; shingles, $739,334, against $811,077; ties, $93,477, against $119,948; wood pulp, $171,619, against $186,123.

Referring to these decreases, Mr. Ryder says:—"The decrease in exports of shingles was due to the low price in New England markets, which caused several of the mills to curtail production and some manufacturers to close their mills altogether. Inasmuch as the demand for shingles in the American markets is increasing and prices have improved, the logging of cedar has been increased and there is everp prospect of the market being abundantly supplied this season. One of the largest shingle mills in this district was destroyed by fire in August last, but a new mill has been erected and equipment is being installed that will triple the output of the antiquated machinery in the old mill.

The decline in exports of lumber during the last year was general, shipments to foreign countries showing a greater percentage of loss than those to the United States. Had the shippers in this district been provided with adequate transportation facilities, the exports of lumber to the United States would doubtless have shown an increase over the previous year. Practically all lumber shipments from this district are forwarded by railway and these have been seriously hampered by a shortage of cars. A number of large mill orders were cancelled because shipments could not be made within the contract period, entailing serious loss to the manufacturers.

Pulp-Wood Resources—Trans-Atlantic Mails

The pulp-wood limits at Berimis, on the north shore, almost opposite Rimouski, were successfully worked during the past season. Extensive logging operations were carried on, so that the product will probably be doubled next season. Shipments from this property were formerly made through this consulate, but these now go to Quebec.

A new company, financed with American capital, has purchased the pulp-wood limits at Manicougan River, and extensive preparations are being made to exploit the property. There is a fall not far from the mouth of this river capable of furnishing about 350,000 horse power, and this is to be utilized in connection with manufacturing the product of the forest. A wharf is to be constructed near the entrance of the river so that vessels drawing 10 to 12 feet of water may reach the wharf at high tide.

The price of labor has kept pace with the increased cost of living, The lumber industry is practically the only interest of the district in which the class of labor required was not of a high grade, but some experience is necessary in order to produce successful results. A few years ago there was no difficulty in procuring all the well-seasoned woodchoppers required for the numeruos lumbering camps at wages varying from $12 to $20 a month, with board, but now it is difficult to get the number of men necessary for less than $20 to $35 a month, and these are mostly youths 16 to 19 years of age. A camp cook could be engaged for $20 a month two or three years ago, but a competent man in this line to-day can command $40 to $50. The cost of boarding the men in the lumber camps has doubled in the past few years, but the quality and variety of food has greatly improved.

The Fassett Lumber Company, Limited, Fassett, P.Q., recently made up a record load to be taken down the Ottawa River to Montreal. On August 21st they loaded on the barge "Rowley" for Messrs. Shearer, Brown & Wills, Limited, Montreal, 450,000 feet of 1½-inch basswood, of the finest quality, to be used in making tobacco caddies.

Riordon Paper Co. Extending their Sulphite Plant

Montreal, September 10th.—The Riordon Paper Company, Limited, Montreal, are making large additions to their sulphite mill at Hawkesbury, Ont. At present this mill is the largest in the British Empire, but its capacity is to be still further increased by thirty tons per day. The new equipment will include two twelve-ton digesters, together with drying machines. The expenditure on the additions will run into about half a million dollars. The comapny have extensive holdings of timber licenses along the Rouge River, P.Q., the products of which are utilized in the manufacture of sulphite at Hawkesbury. With the additions to the plant about 100,000 cords of pulp wood will be used annually. The company also manufacture at Merriton, Ont., a considerable quantity of sulphite, using about 25,000 cords of pulp wood per annum for making pulp and paper. The additions at Hawkesbury are under the immediate supervision of Mr. C. B. Thorne, C.E., the company's mill manager, who is a recognized authority on all matters relating to engineering as applied to sulphite. The product of the Hawkesbury mill and their sulphite fibre has a world-wide reputation, particularly among manufacturers of fine papers. Mr. C. E. Deakin, of Montreal, is the contractor for the building. It is expected that the new portion of the mill will be in running order in March of next year.

Another Big Plant for Quebec

The Donnacona Paper Company has acquired a parcel of land and will erect a large plant at the mouth of the Jacques Cartier River, Que. The deeds which have been registered transfer to George M. McKee, of Quebec, all the properties on the Jacques Cartier River owned by Mr. John Foreman, of Montreal.

The property consists of water powers, mill sites, beach lots and other property at the mouth of the Jacques Cartier River and along the St. Lawrence on the line of the Canadian Northern Quebec Railroad; about $20,000 acres of freehold timber land in the united townships of Stoneham and Tewekesbury and 187 square miles of limits on the Jacques Cartier River watershed. The consideration mentioned is $300,000.

Mr. McKee has organized the Donnacona Paper Company, Limited, an Ontario corporation, with a capital of $3,500,000. This corporation will take over the properties just purchased, together with all the property of the Baie St. Paul Lumber Company, Ltd., at Baie St. Paul, consisting of saw mills, pulp wood plant, and 60,000 acres of pulp wood lands.

The Donnacona Paper Company will commence immediately the construction of a large plant at the mouth of the Jacques Cartier River, for the manufacture of news print paper. Mr. McKee has had a corps of engineers on the site for the past two or three months making surveys and preliminary plans for the building of the plants. The development for the immediate present will be a 50-ton paper mill, with water power development, ground wood mills and buildings large enough to increase the plant to 100 tons of paper next year.

The construction of the plant and the operation of the properties will be under the direction of Mr. McKee, who will be the managing director, with offices in the city of Quebec. Mr. McKee was formerly president and general manager of the Hinckley Fibre Company, New York State, and is thoroughly conversant with the pulp and paper business and the operation of timber limits.

New York, Utica and Syracuse capital is largely interested in the enterprise, together with several well known paper manufacturers from the States. Among them is G. H. P. Gould, president of the Gould Paper Company, Lyons Falls, N.Y., and president of St. Regis Paper Company, Watertown, N.Y. The combined output of these two plants is over 200 tons of news print paper per day, and they are two of the most successful plants in the States. All of the stock which was not taken by the officers and directors has been subscribed.

The officers will be: President, G. H. P. Gould; vice-president, Walter N. Kernan, New York, vice-president of the New York State Railways; treasurer, Charles B. Rogers, president First National Bank, Utica, N.Y. Among the directors and others interested are many well known financial men of New York City.

Laurentide Company Had Good Year

For the year ended June 30, the profits of the Laurentide Company, Limited, were $1,009,551, of which $910,846 were derived from mill nets from ground wood, sulphite pulp ,paper and cardboard, and $98,705 from lumber and miscellaneous. Deducting interest and other charges and betterment to plants, $753,572 was left. In addition there was expended during the year on extensions a sum of $118,570, which was charged to capital. From the profits were paid four quarterly dividends on the capital stock, aggregating $540,000, and $20,000 was added to the depreciation reserve, leaving a balance of $193,572.91 to be carried forward. The retiring directors were re-elected with Sir William Van Horne as president, Mr. George Chahoun, Jr., vice-president, and Messrs. R. M. Angus, James Ross, Chas. R. Hosmer, Edwin Hanson and Frederick A. Sabbaton.

To Receive Tenders on River Jean de Terre Limits

Sealed tenders will be received up to December 20 of this year for the purchase of limits 194 and 195, River Jean de Terre, tributary to the Gatineau, each of which comprises 50 acres of valuable pine and pulp wood and land. Notice to this effect has been issued by the Toronto General Trusts Corporation, and Messrs. Aylen and Duclos and Messrs. Belcourt and Ritchie, of Ottawa, and tenders may be sent to any of these firms.

Prosperity Attends Clarke Brothers Plant

After many vicissitudes, success is now attending the pulp making enterprise established at Clarke City, Seven Islands, P.Q., by the Clarke Brothers. This enterprise marks the last industrial outpost on the north shore of the St. Lawrence, east of Quebec. It is run by the North Shore Power, Railway and Navigation Company, of which James Clarke, formerly of Toronto and later a well known United States publisher, is the president. Mr. Clarke made a fortune out of the "Encyclopaedia Britannica," of which he purchased the plates from the English company for printing in America. Twelve years ago he took a sailing and fishing excursion down the St. Lawrence River to Seven Islands, the result being that he took up timber limits and secured the control of a water power at that place.

A fine concrete mill, with concrete dam for the water power, and a large plant of pulp making machinery is now on the site. There are twenty-four grinders with a capacity of 250 tons gross per day; and an average all the year round of 160 tons. There are 980 miles of timber limits. The water power has a head of 54 feet and a development of 10,000 horse power. A second fall, a quarter of a mile up the river, now undeveloped, will give a further 9,000 horse power.

The mills are running at full capacity, with day and night shift. The output is stacked during the winter, and shipped out by boat to Quebec and the Great Lakes during the season of navigation.

Where there was nothing but forest, far from civilization, the company has built a pretty village for the workmen, as well as a hotel. There are sidewalks, electric lights and other appointments of an up-to-date industrial village. The people are prosperous and contented.

Canada's News Print in United States

Canada's share of the United States imports of print paper during the fiscal year ended June 30 last, was 55,563 tons, valued at $2,101,086, as against 53,114 tons, valued at $1,969,102 in 1910-11, and 43,388 tons, valued at $1,615,100, during 1909-10.

The average price of Canadian print paper at the point of shipment during the last three fiscal years was shown from these figures to have been in 1911-12, $37.81; in 1910-11, $37.07, and in 1909-10, $37.22.

The total quantity of print paper imported from all sources into the United States during the fiscal year aggregates 59,789 tons, valued at $2,567,670, compared with 57,206 tons, valued at $2,482,968, during 1911, and 46,455 tons, valued at $1,920,801, in 1910.

Imported print paper, at the point of shipment, brought an average price during the fiscal year 1911-12 of $41.53 per ton, a decline of $3.55 as compared with the previous year, when it was $44.88.

Canada therefore was a very important factor in the print paper importations into the State during the year, as will be seen by the following table:

	1912		1911	
	Tons	Value	Tons	Value
Total imports	59,789	$2,567,670	57,206	$2,482,968
Canada's share	55,563	2,101,086	53,114	1,969,102

The higher average is no doubt due to the importation of a certain quantity of high grade European paper for a special purpose.

Mr. F. D. Monk, Minister of Public Works, recently inspected the channel between Ha Ha Bay and Chicoutimi, P.Q., and also the facilities for shipping pulp and paper at the latter place. The Minister, accompanied by Mr. Sevigny, M.P., and under the guidance of Mr. Dubuc, managing director of the Chicoutimi Pulp Company, visited the mills of the company. It is proposed to construct an additional mill with a production of 500 tons per diem. Price Bros. are building a paper mill at Jonquieres, with a daily output of 120 tons of paper. The minister also visited Ha Ha Bay.

Mr. J. T. Sadler, father of Mr. Walter J. Sadler, of the firm of Sadler & Haworth, Montreal, died recently in Montreal, aged 63.

Lumber and its Interests at C. N. E.

Varied Collection of Exhibits Showing Importance and Prosperity of Lumbering Industry—Some of those who Displayed their Products

The chief point of interest for lumbermen developed by the Canadian National Exhibition at Toronto was the fact, so clearly demonstrated that the past year has been an excellent one for the lumbering industry and its allied lines. The machinery manufacturers report a greater number of sales and promising enquiries than at any former exhibition. In most instances, exhibitors state that orders on hand would keep them busy for some time ahead, and a number of them are unable to keep up with the demand, although their employees are working overtime as much as is reasonable.

In the Government Building an exhibit of much interest was one of British Columbian lumber and timber. This included a magnificent piece of fir 54 in. wide by 1¼ in. The log from which this plank was cut was 10 ft. in diameter. It came from the Vancouver Island limits of the Canadian Western Lumber Company, Limited, Fraser Mills, B.C. The sample was finished by the Crossen Car Company, of Cobourg, Ont. There were also on exhibit logs from the Peace River district of B. C. fir, 72 in. in diameter, spruce 66 in. in diameter, and cedar 55 in.

The Dunlop Tire & Rubber Goods Company, Toronto, were showing their "Sunset" red high pressure steam packing and "Gibraltar" belting, as well as a full line of steam and piston packings. Their stand was in the Manufacturers' Building.

The Gutta Percha & Rubber Manufacturing Company, Toronto, in the Manufacturers' Building, exhibited a large range of shoe packs manufactured specially for the lumber trade. They also showed their makes of packing and fire hose.

The Wm. Hamilton Company, Limited, Peterboro, exhibited the "Samson" turbine in the Machinery Hall. This turbine is adapted to all water power requirements and is specially suited for direct connection to electrical generators.

The Goodyear Tire & Rubber Company, Toronto, located in the Transportation Building, showed their rubber belting. A special feature at their stand was a quantity of "Goodyear" fire hose which forms part of a consignment sold to the Toronto Fire Brigade.

The Schacht Motor Car Company, Toronto, exhibited in the Transportation Building and also in the Transportation Annex. In the former they were showing a 1500 lb. 45/50 h.p. 4-cylinder delivery car, and in the latter a 6-ton truck of 45/50 h.p. dual system, with 5-in. dual tires on rear.

The Brantford Motor Truck Company, Limited, Brantford, exhibited their trucks in the Transportation Building. In addition to some lighter lines, they were showing a 35 h.p. 3000 lb. heavy truck with dual rear wheels and chain drive.

The Commercial Oil Company, Limited, of Hamilton, showed their well-known "Lubriko" brand of oils and greases, in the Transportation Building. They claim that their cup grease has a higher melting point than any other in the world. They were also showing belt dressing and metal polish.

The Crescent Oil Company, Hamilton, exhibited as their chief lines, the "Alligator" steel belt lacing and the "Limestone" wood split pulleys. Their stand was situated in the Machinery Hall.

The Canadian Fairbanks-Morse Company's exhibit in the grounds was of special interest to lumbermen and sawmill owners. They were demonstrating marine engines for towing logs, and stationary and portable engines for saw work.

The Brantford Roofing Company, Brantford, had a building of their own in the grounds in which they were exhibiting their celebrated lines of roofing. Their slate finish roofing in green, red and grey attracted much attention. It is surfaced with crushed slate, has a terra cotta finish and is durable as well as artistic.

Elmira Machinery and Transmission, Limited, Elmira, had their exhibit in the Machinery Hall. Their lines of pulleys, hangers and transmissions made an interesting showing.

The Tallman Brass & Metal Company, Hamilton, had a large and interesting exhibit in the Industrial Building. This company are now making the Tallman carburetor for gasoline engines. The other chief lines which attracted the lumber trade were: Special "Arctic" babbitt for sawmill and lumber machinery, manganese bronze castings, and 3X genuine "Arctic" metal for heavy machinery.

S. F. Bowser & Company, Toronto, had an exhibit in the Industrial Building. They were showing oil tanks for sawmills. These tanks are fireproof and are accepted by the Underwriters' Association of America. They stop the waste of oil, which is found all too frequently in sawmills where no proper tank system is installed.

The Dominion Register Company, Toronto, were demonstrating the McCaskey Account System. Important improvements have been added to this system and they are now equipped with the new interchangeable index and the electric cash recorder. Their exhibit was in the Industrial Building.

The Shurly-Dietrich Company, Galt, Ont., had, as usual, a very large exhibit of their saws and tools in the Industrial Building. Their plan of exhibiting is a very attractive one, the wall space being artistically covered with saws of all descriptions. The Shurly-Dietrich Company claim to be the largest saw manufacturers in the British Empire and their goods are all Canadian made.

The Canada Metal Company, Toronto, exhibited a large line of their products in the Machinery Hall. Their motto is "Everything in Metals." Their exhibit was both comprehensive and attractive.

The Carborundum Company, Niagara Falls, N.Y., exhibited in the Industrial Building. Of special interest are their "Aloxite" goods. These include "Aloxite" saw gummers, and "Aloxite" cloth for machinists. Among the large range they were showing were saw wheels, garnet paper for woodworking, etc.

Cowan & Company, Galt, situated in the Machinery Hall, had an exhibit of great interest to woodworkers. Their specialties were chain saw mortising machines, hollow chisel mortising machines, and power feed rip saws.

D. K. McLaren, Limited, Toronto, showed their lines in the Machinery Hall. One of their new manufactures is the "Diamond" clinching belt hook. Other lines are "Diamond" belt dressing and Philips split steel pulleys, which are specially adapted for high speeds and small pulleys. The firm have just completed a $15,000 contract for belting in the Transcontinental Railway Shops at Transcona, Winnipeg.

Canada Machinery Corporation, Limited, Galt, Ont., had their display in the Machinery Hall. Their mitre saw for furniture factories was specially interesting as was also the "Falls" self-feed attachment for jointer. The "Standard" chain mortiser, the "Standard" glue jointer, and a lathe and shaper were also to be seen at this stand.

The Dodge Manufacturing Company, Toronto, had a specially large showing of pulley castings and transmission machinery in the Machinery Hall.

Beal Bros., Toronto, occupied a large stand in the Manufacturers' Annex, and displayed a full range of lumber and truck harness, oil tanned moccasions, etc.

Molassine Company, Limited, London, Eng., in the Manufacturers' Annex, devoted all their attention to making their Molassine meal known. They have awarded a prize of $25 in gold to the owners of every horse winning a first prize, provided that the horse has been fed on Molassine meal.

The Dominion Belting Company, Limited, Hamilton, whose exhibit was in the Machinery Hall, displayed their Maple Leaf Belting. Some of their special sizes were, 5 ft. 10 ply and 52 inch 20 ply.

Interesting Legal Case Concluded

Judgment was recently given by Hon. Mr. Justice Sutherland in the case of the Hilty Lumber Company vs. the Thessalon Lumber Company and the Traders Bank of Canada. The action was for a declaration that a certain contract for the sale of lumber by defendant company to the plaintiffs, was made on the express representation that certain of the lumber known as the Mississauga cut would run at least 5,000,000 feet of No. 3 and that plaintiffs should be allowed a discount of two per cent. on the purchasing and for damages for breach of the said representation. Hon. Mr. Justice Sutherland found that the agreement contained no reference to either of the above terms and the defendants denied that the terms had been referred to in the making of the contract. Instead of running 5,000,000 feet, the Mississauga cut ran 3,235,000 feet, and for the shortage, plaintiff claimed $7,060 damages. Hon. Mr. Justice Sutherland held that no false representation had been made, nor any prior or contemporaneous oral agreement and that there was no arrangement for the allowance of a discount. Accordingly he dismissed the action with costs.

Extensive Proposition for Ontario Forest Industry

Mr. F. L. Barledt, a British capitalist of German birth, who holds large interests in forestry and wood-manufacturing enterprises in Germany and Russia, was recently in Toronto negotiating with the On-

tario Government to secure a large area of forest land in Northern Ontario. Mr. Barledt has traveled extensively through Ontario and other provinces, familiarizing himself with the timber resources and seeking a location for a system of forest industries. He proposes to manage the area on forestry principles, clearing out the poor timber first and the dead trees, and utilizing every part of the trees from the roots up, in the manufacture of various wood-products. A system of systematic reforestation will be pursued and the standing timber protected from disease and cared for by experts. It is proposed, if a sufficiently large area can be obtained, to bring over trained foresters and experts in the wood-working industries from Europe and give them steady employment all the year with a share in the profits of the enterprise.

Workman's Compensation Law in Ontario

It seems now assured that the Province of Ontario will have a workmen's compensation law submitted at the next session of the Legislature. Sir William Meredith, who has been in Germany and other countries examining the laws and conditions affecting the subject, on behalf of the Ontario Government, made a statement recently to the effect that Ontario was badly in need of a new system, but that different conditions here would make necessary a specially devised arrangement covering employer and employee.

New York Market Situation

Chase, Talbot & Co., New York, report as follows:—Any likely advances for delivered prices of lumber during the balance of the season are not apt to reflect a proportionate benefit to the manufacturer. There is not sufficient vessel tonnage available this Fall to move all of the stock from the east, and consequently a considerable quantity of lumber will be carried through the winter at the various water shipping points.

Owing partially to the splendid crops in the west, there is an excess of demand for rail tonnage, and southern, as well as western lumber shippers already report a car shortage. This is particularly true in the Pennsylvania hemlock section and West Virginia spruce section.

It is reported that there is a general increase in freight movements throughout the country. Buyers are cognizant of this situation and to protect themselves, are purchasing lumber in larger quantities and on an agreement for an extended period of shipment. It can be readily appreciated that this demand for future requirements coupled with that warranted for immediate consumption, places the seller in an enviable position.

As is usually the case at this season, funds in large volume have been transferred to the western section to provide for the movement of the crops and this week Wall Street sent to Western Canada several billion dollars for the same purpose. Interest rates have naturally hardened somewhat, but the lumber trade is in a very sound condition and will not be materially affected.

We quote random spruce 2 x 6, 2 x 8 and 2 x 10, good assortment of widths and lengths $25. 9-in., 10-in. and 12-in. $26 to $27. 2 x 3 and 2 x 4, $21 to $22. Dimension spruce 8 in. and under, admitting of not to exceed 20 per cent. 9-in. and 10-in., $25. Dimension 2 x 4, $23 to $24. Fancy lengths in dimension 10-in. and 12-in., $27.50 to $28.50. Spruce staves 20c. Spruce furring 1 x 2 DIS and B, $22. Eastern white cedar shingles, "Clears" $3.25 to $3.35. "Extras" $3.75 to $3.85. Hemlock 2 x 3 and 2 x 4 random $18 to $19. Dimension 2 x 4, $20 to $21. Other dimension hemlock in larger sizes $20 to $22. Eastern white pine "Box" 7-in. and up, $22 to $23. "Shippers" $25 to $26. Small knotted white pine boards of selected quality $28 to $30.

For spruce laths $3.85 and $3.90 is now being realized, with probabilities of a $4 or better market in the near future.

Good Demand for Canadian Pine

The Timber Trades Journal, of London, Eng., in an editorial article of Aug. 24th said:—"Canadian pine of practically all descriptions is lighter in stock on the other side than ever known at this time of the year, and as everything points to an exceptionally light production, holders should do well. The shortness of stocks applies more particularly to the better qualities, and we hear that it is extremely likely that little, if any, more of the better classes of wood will be available for contracts or for shipment right up to the end of the season. Some agents have been compelled to decline to quote for firsts and seconds owing to the fact that they are closely sold up and that supplies on the other side are short. Although one might judge from the Board of Trade returns that Canadian wood tends to show a falling off in import, we are inclined to think that this applies more to the lower qualities of Canadian pine, for which, no doubt, the cabinet-making and other trades interested are finding substitutes. But for the better qualities there is, in spite of severe competition, an increasing demand, and although pattern-makers and others sometimes try woods which might at first sight appear cheaper, they almost invariably return to Quebec pine, no matter what price they have to pay. Generally, prices are keeping up, the better quality pine and good sidings are increasing in value, and, considering the high freights, the approach of the end of the season, increasing insurance, and the small production, there is little chance of prices falling. Practically all Canadian timber is in the same position, especially rock elm and oak.

"Since our last report the c.i.f. market has for spruce deals stiffened, mainly owing to advanced rates of freight, and we are inclined to think that values will now continue on the upward grade. Parcels per liners have been realizing slightly better values, and, from what we can gather, there will not be a very large quantity of these shipped—at least before the end of the present year. It is stated that the regular liners have practically booked all the space available for spruce during the season, and there was certainly not a large amount of space offered, which rather tends to show that imports will tail off very considerably as soon as the last cargoes have left their ports of loading."

United States Timber Exports

Official statistics of exports of forest products from United States ports during the year ending June 30, 1912, show an increase in value of over $4,000,000. The total value for the year under review amounts to $96,782,186, as compared with $92,225,951 for the preceding year. The increase is due to expansion of trade in boards, deals, planks, joists, and scantling which account for more than half the total export; the figures are 2,340,909,000 ft. for 1912, against 2,060,965,000 ft. for the preceding year. The advantage thus gained not only makes up for the decrease in the export figures for timber but shows a substantial increase on the combined figures. Timber, hewn and sawn, has fallen from 531,634,000 ft. exported in 1910-11 to 438,021,000 ft. for last year. The loss is not attributable to any marked individual reduction, but is spread over all the consuming markets. In lumber the figures for Canada show the large increase of 49,736,000 ft. over the 403,285,000 ft. of the preceding year; South America took the enormous addition of 139,683,000 ft. over 1911; British Oceana 31,937,000 ft.; Netherlands 20,728,000 ft.; United Kingdom 10,104,000 ft. (from 216,433,000 ft. to 226,537,000). On the other hand shipments to China show a falling off of 37,945,000 ft.; Africa a loss of 10,001,000 ft.; Cuba 8,925,000 ft.; Italy 5,818,000 ft.; Belgium 4,466,000 ft.;France 3,758,000 ft.; Germany 2,983,000 ft.

German Importers Find Fault with United States

United States Consul E. P. Secker in a recent report says:—"There is as much dissatisfaction in the Netherlands and Belgium as was found in Germany on the part of firms which are endeavoring to do direct business with United States lumber manufacturers. The latter do not in many instances keep to their contracts as to grades, specifications, or time of delivery. All of this produces not only loss to both sides but is bound to defeat the aims of the American shippers who are endeavoring to build up direct connections in the foreign markets. The trade in Germany, Netherlands, and Belgium places as great stress upon fidelity to contracts as do the American people.

"In this connection one of the many instances which have come to the writer's attention may be cited: A Rotterdam firm placed a direct order for some choice white oak, firsts and seconds, and agreed to and did pay a premium of $5 per thousand over market price. Not only was red oak substituted but the quality, instead of being firsts and seconds, was a poor No. 1 common. The purchaser having taken up the draft covering the shipment has no recourse except to enter suit, since the shipper contends that firsts and seconds white oak of superior quality was shipped. There can be no room for claiming a transposed shipment since the measurement and piece tallied at both ends.

"There are, however, a number of American lumber firms enjoying the confidence of their customers in the markets mentioned and who have no difficulty in holding the trade. They accord the foreign trade the same treatment as they are forced through competion and propinquity to accord their home customers."

While Australia's imports of paper and manufactures of paper from Canada during 1911 showed an increase, some surprise has been occasioned by the fact that there was a considerable decrease in the imports of printing paper. D. H. Ross, trade commissioner at Melbourne, in a recent report states that the consumption of printing paper was never greater in Australia, and hence that the contraction of imports in this line from Canada can only be attributed to two things, viz., accumulated stocks or the competition from Scandinavian and other paper mills.

How to Make Hardwood Business Pay

Proper and Improper Methods of Handling and Equipment Discussed—Reasons for Some of the Frequent Failures and Successes

Written Specially for the Canada Lumberman by H. E. Miles

MANY mill owners have made a failure of the hardwood trade, and others are receiving comparatively small profits, simply because of not employing proper methods in manufacturing, or by reason of inadequate equipment. This is especially true of those handling birch and maple. The writer has noticed this by careful observation when visiting many of the milling plants throughout the provinces. This, together with inferior built machinery, and unqualified operators, is quite enough to produce such results.

It is evident from observation that there is no industry so badly abused as that of lumbering. Just imagine the foreman and manager of our textile and other works having no more technical knowledge than is possessed by the average sawmill owner. I fear that if such were the case, Oriental costumes, and the bark canoe would not seem so untimely.

A lawyer once stated that he could conceive of nothing in connection with a country sawmill which would involve professional help, and such, it is evident is the opinion of many mill owners. While this may be true as relating to the higher branches of education, those who get proper returns for their products, nearly all operating directly on the stock, with machinery, are those who have simply made such work a profession. From the one who handles the setting device on the carriage to the one or more who trim or butt the lumber, technical knowledge, combined with experience, is necessary. Their work becomes a profession and only those who have mastered it should be employed.

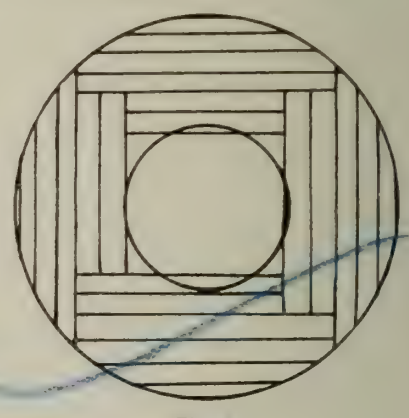

Fig. 4

Enhancing the Value of Stock

The simple fact that what might be a valuable piece of cutting is often rendered worthless, or has to be consigned to a lower grade, bringing an insignificant price in the market, is sufficient to warrant a more careful study of the methods employed in our mills. It has been demonstrated that the value of a stock can often be enhanced thirty per cent. by expert operators, as compared with that produced by the common methods.

It is most important that logs be cut into sizes to which they are best adapted. Hence a knowledge of this work must be possessed by the sawyer. It often happens that a log which is suitable for one market is unfit for another. For instance, some have manufactured birch for both the American and Liverpool trade at the same time, depreciating the product of one in favor of the other, often depreciating both. Others have successfully cut for both markets from the same stock to a great advantage without depreciating either. This may be done by a careful study of the requirements of both, and by cutting the logs into stock to which they are best adapted.

First, however, let us consider the hardwood business from the point of view of the standing timber. It is noticeable that those complaining about the hardwood industry, as a rule, are not careful enough in selecting their logs. Fuel is not lumber, and while great care should be exercised in cutting all that constitutes lumber, some will stock their mills with logs, many of which are only suitable for fuel; logs which contain no lumber whatever. We too often see hardwood logs hauled to the mill, from which the most experienced expert operators would be unable to extract a sufficient quantity of clear cutting to make the product suitable for any market. Or if marketed it would not pay for handling.

The next loss comes from not having logs which are suitable for lumber, properly cut. A slight crook in a log is sufficient to reduce greatly the amount of lumber, which should be sawn from it. Great care should be exercised by those who are preparing the logs. After a tree has been felled it should be surveyed by the marker to determine at what points it should be sawn into logs. While it is a well-known fact that twelve feet is the most desirable length for most eastern hardwoods, it is also a fact that much shorter and longer lengths are suitable for the trade. However, those who have attempted to render the most uniform lengths, by cutting the logs all the same length, have been surprised to find the product of the mill to contain a larger per cent. of shorts than those who have followed an entirely different method. When it is discovered that a tree contains one or more crooks the marker should mark it to be sawn directly in the crook or crooks, as the case may be, after which he should figure to divide the remainder of the tree into the most numbber of uniform lengths possible, By a bit of care it may be marked so economically that no waste of timber need occur. It seldom happens that the most crooked trees will necessitate the taking of more than two odd lengths, and often it involves but one, if a careful survey is made. However, it sometimes happens that odd lengths are involved to utilize all the good lumber contained in a single tree and render the logs straight. Such lengths, however, are not, as we have seen, objectionable to the trade, and where there is one foot or more left to remain on the tops of trees, below the limbs, (as is often seen when passing through forests which have been lumbered) the only conclusion possible is that the cutting has been extravagantly done.

The Question of Lengths

The trade accepts nearly all hardwood cut in lengths ranging from four to sixteen feet. While it is not good economy, as a general rule, to cut hardwood logs over twelve feet as a standard, since a longer length would involve waste by virtue of crook, if proper care is exercised the entire length of that portion of a tree which is free from other defects may be utilized by cutting an occasional short or longer length. It often happens that where all the logs are cut a uniform length, many of them contain crooks within one to three feet of the end, which, when sawn can hardly produce a board their full length. Those few feet might better have been allowed to remain on the other log. In such an event these odd feet would be saved. Such a log would produce no shorter lumber than otherwise, and the other would produce longer lumber which is worth quite as much as the standard lengths. Such manoeuvreing not only produces a larger and better quality of lumber, but increases the cut of the mill. Nothing pleases a sawyer more than straight logs, as they enable him to avoid many extra motions in manufacturing.

It will be readily seen that where uniform lengths of logs are maintained, such logs are bound to be more or less crooked and to produce more short lumber of every conceivable length, below standard, than where the stock is cut as above described. A crook in the middle of a twelve-foot log involves many five and six-foot lengths,

or if placed on the carriage to be sawn the other way, will produce only a few more narrow boards composed mainly of heart stock.

The above are two main causes for failure in the hardwood trade, but they are by no means all.

The heart of every tree contains knots and many other defects which render it, as a rule, wholly unfit for the trade; and unless the stock be manufactured in such a way as to exclude that part of the log, much good timber goes into culls. In viewing the requirements of the trade, we find that the most obvious is that the stock be rendered as wide and clear as possible. Hence a careful study should be made to attain that end. Such facts, although simple in themselves, can only be appreciated by the operators being properly instructed, and adhering to certain methods. This, however, is often not the case. The log is frequently promiscuously loaded and sawn through and through, giving little attention to the results obtained, and if the lumber produced contains defects it is alleged that the stock was poor.

A most forcible illustration of good manoeuvreing was recently shown by an expert operation in the Province of New Brunswick. Despite the existing prejudice in the markets agains hardwood lumber from that province, some of the finest stock was produced from what was regarded, by some of those who had failed in the business, as being very ordinary logs.

The following cuts show some of both the proper and improper methods of plain sawing for inch lumber. It will be observed that the first cut shows the most common way of siding down, and then slashing the logs into boards by cutting right through the heart, rendering most of the lumber culls.

The second is where it has been discovered that the heart is of no value, hence the sawyer has continued to saw closer to the heart before turning the log. Thus, while avoiding the heart, he has been cutting stock which should have been rendered in two or more different grades all in one. This point he has failed to observe and has also failed to reckon the loss incurred by the taper of the log. However, his lumber looks better than before and he most frequently settles down to such a method and soon becomes unteachable.

The third cut illustrates a case in which the sawyer has considered a few more details. This is a practical method for the ordinary run of logs, but in the case of logs of sufficient size to produce several grades, the fourth cut will illustrate better the proper method of handling. The two last methods should be used according to the size, the per cent. of heart which appears at the end, and the general appearance of the log. A sawyer can soon school himself to that extent that his eyes, to a great measure, will acquire the character of an X-ray machine.

After the slab is removed, side boards should be taken according to the taper of the log. Here is where much value is often sacrificed. If more sideboards are taken than is co-ordinate to the amount of taper of the log, this infringes on timber rightfully belonging to the sideboards of the adjacent sides yet untouched, and it is wasted in edgings if edged full length of the piece of cutting. Or, if it is allowed to escape the edger it involves a waste at the trimmers by such boards having to be cut short to render them free from wane. While if too few are taken, according to the taper of the log, the same results will be experienced as soon as those on the adjacent sides are sawn. Hence much care should be exercised in this matter.

As soon as the two opposite sides are dealt with, the log should be turned down and as many boards taken as may be comparitively free from defects and no more. If the log is such as will evidently produce a good percent of good lumber no boards should be taken on the first three sides after a defect is discovered. Then a second but high grade of lumber may be secured by cutting closer to the heart from each side successively, according to figure four. If, however, the log is not of sufficient size to warrant making the three extra turns necessary, it should be sawn according to the method illustrated in figure three. Let the inner circles in the cuts represent the heart which is usually worthless except for fuel, and never of much value for lumber. It will also be remembered that adjacent to the heart are to be found minor defects which must also be avoided in the higher grades. Hence the force of each of the illustrations will be easily comprehended.

How Often Should a Log be Turned?

To secure proper results no log should be turned less than five times in plain sawing, and should it be of large dimensions, having a comparatively small heart, it should be sawn according to the illustration in figure four, being turned eight times.

It sometimes happens that large logs contain small hearts and are very free from other defects. These are ideal for the American deal trade, and the only ones which should ever be selected for it. It is impossible to cut thick stock free from heart and other defects where it does not exist, but this has too often been attempted. The apparent high prices offered have induced many inexperienced operators to attempt to saw such from ordinary logs, which, of course, ended in utter failure. Such product when placed under inspection is entirely rejected or only a small part accepted.

While we have considered the proper methods in connection with one-inch boards only, the foregoing principles are applicable to every specification. The general principles are the same. It only requires a slight change in tactics to enable one to produce any other specification which may be required and which the logs will make. Much of the fancy woods should be quarter sawn, but since most of them are being handled by men who are better versed in the work it will not be necessary to present that matter here.

Although the price may be sufficient to warrant one in sawing thick lumber, it is always well to cut a portion of the logs into one-inch boards. There are many logs which would produce high grade one-inch lumber, if properly sawn, but would be wholly unfit for deal or planks. While this is true of oak and other woods, it is especially true of birch. Take for instance a log which shows signs of shake. It is utterly unfit for thick lumber for it is sure to season crack; but when sawn into one-inch boards, by turning the logs as above described, such logs will often produce as good inch lumber as any.

This may suggest an inferior quality of that specification. Not necessarily. The thinner the lumber the more defects can be avoided. Hence many logs which produce little or no lumber but culls when cut into thick dimensions, would, if properly handled, produce a large amount of high grade one-inch lumber, Such boards may be associated with the inch sidings produced when sawing thicker dimensions, and be placed on the market as regular goods, which will be in every way equal in quality to that offered by any competitor, unless he is offering a large per cent. of red birch.

By such methods ordinarily timbered lands will produce much valuable lumber, and the per cent. of the lower grades will be greatly reduced.

Transportation charges are as high for poor lumber as for good, hence it follows that a great saving is made by shipping perhaps a smaller quantity, but better quality, which also gains a reputation in the markets and assures a ready sale for everything offered.

If the foregoing methods are studied, and carefully followed, but few stocks taken from lands lying in any of the provinces will produce less than thirty per cent. of the grade known as firsts and seconds, according to the "National" rules of inspection. In fact, what have been regarded as very ordinary cuts of timber have produced from 40 to 47 per cent. of this grade in one-inch lumber. The writer, although having the logs cut as above described, has never had an output which contained nearly as many shorts as the rules of inspection would admit.

In sawing thin dimension lumber there should never be more than twenty per cent. of No. 2 common grade. If there is, it is proof that the stock, if composed of purely lumber logs, has been improperly handled. A good cut should not produce more than twelve or fifteen per cent. of that grade. In view of such facts and the prevailing prices, why should not birch be a profitable timber to handle?

Quality of Machinery

It is of the utmost importance that only high grade machinery should be used in a sawmill for cutting hardwood. It has been alleged that the cost of manufacturing eastern hardwoods was too great, owing to its being too hard for rapid sawing. This is a mistake. If the saws are made to special order for the purpose by those skilled in the art, and the other machinery is of good quality, and properly installed, rock maple and birch may be perfectly sawn on faster feed than is usually employed in many mills cutting pine. One of the most detrimental features of hardwood milling is that the first cost of the plant is often too little. Because good machinery is expensive cheap houses too often get the order. But machinery thus obtained is bound to cost very high in the end. The coarse, imperfect work turned out by some manufacturers of sawmill machinery, and accepted by the majority of mill owners, is alone a sufficient reason for many failures. One man who had thus failed informed the writer that had he at the time known what he had since learned, while being connected with those who only bought the best, he might still have been in business. Light, inferior machinery cannot produce good lumber. Neither can good machinery, poorly installed, produce good lumber. It must be good machinery, well installed, and well operated. Such only is in keeping with the progress of the age, being able to meet the requirements of the scientific operator.

This is an age when every attempt at manufacturing must be according to scientific principles, but technical knowledge is much lacking on the part of many of our mill owners, millwrights, sawyers, filers, etc. This is shown by a comparison again with our textile and other works. The ordinary factory girl is able to earn a living and often saves money on sums paid for piece work, which would seem to the inexperienced person insufficient to pay for a fraction of her daily food. However, she is able to turn out perfectly manufactured goods in quantities which are appalling. These are the results of

scientific research on the part of not only the owner of the plant, but of the foreman who instructs such help to make just certain motions in just such a way, and at just the right time. Why should we not insist on those operating our sawmills applying themselves to secure the knowledge and experience necessary to do efficient work? The only reason I know of is that too often we lack that knowledge and experience ourselves. Many of us cannot impart it.

Better Inspection Needed

Some years ago the writer believed that hardwood was the oncoming trade. It has now arrived, and while we note much improvement each year, are we fully prepared for it? How many of our inspectors are qualified to make shipments? How many of them can correctly quote from any of the accepted written rules and make a practical application of the same? How many of them are prepared to defend their grading by being able to tell why, according to the rules on which it is sold, or should have been sold? Not many, I fear. And here is another cause for failure. Much of the lumber shipped from the smaller mills is sold without any specific rule for its inspection being mentioned. Hence all kinds of trouble arise in the market. Some sharp dealers often take advantage of the shipper who is as helpless as an infant, although as a rule the market is imposed upon by the shipper who lacks that technical knowledge and good judgment which he ought to possess. This lack is not confined to the small shipper. It is also present with those doing extensive business, even members of boards of trade. The writer has met such who have complained that they have had many shipments turned down and are constantly compromising to effect settlements. Someone is in wrong, and when one begins to compromise, compromise he must.

A far better way is to secure copies of printed rules, where such are in use, for the several markets to which one intends to ship, and always specify the rules of inspection when quoting prices. Then you have a guide to go by. Insist that your culler make a careful study of such rules, being able to repeat them fluently, and if he is worthy of his position, he can make a practical application of them. This is not exacting. He charges you a salary, or wage, which warrants just that. A little catechising will do him good. He should be able to do this, but I fear many cullers would be embarrassed if placed under examination for their profession. Too many of them have simply aped others learning a few general ideas and think they are competent.

When making re-inspections, we frequently find that the argument of too many inspectors employed in some of the largest Canadian as well as the American cities is, that they have inspected lumber for many years, usually in some particular yard, hence; "I guess I know my business." They can easily maintain such a bluff against some shippers, but to those who can tell why, it cuts but little figure. A well qualified shipper soon gets such a reputation in the market that his product is accepted without question or comment. His honest customers soon tire of inspecting and measuring after him, and the dishonest ones soon find it is of no avail.

I invite my fellow lumbermen to join in trying to know more about this hardwood industry which I believe can be made profitable.

A Treatise on Moulding Knife Design

Written specially for the Canada Lumberman by N. J. Millette

We find to-day that science is making great developments in all branches of the industrial world. Every motion is depicted, timed and figured under special classification and carried out through the various processes in simple units, so that they can be understood and mastered by mechanics who have a moderate knowledge of mathematics.

Most intricate combinations are rendered simple and practical by means of a tool, a chart, an instrument or a test gauge, so that clear and simple readings can be made by the working man, thus reducing the worry and increasing the efficiency of the industrial world.

Calculations are simplified by the use of a "slide rule." The difficult problems of making suitable allowance for shrinkage on a pattern for different metals, are solved to a nicety by the use of a "shrink rule," &c. An indefinite number of other mathematical problems are solved without the least effort of brains and become simple labor.

In many operations of the wood working line, we rest on the oars and stick to the old methods of "guess work." We know it is not right, but we believe that it is not worth while to change for a better way, as if the wood working business was going to stop in the early future.

It is never too late to get busy and attempt to master difficult problems, especially those where "guess work" has been used, and eliminate from our ways of doing things, all methods that are not practical and known to be mechanically correct.

My intention in writing this treatise is to give those interested a method of constructing a special scale which may be used to measure dimensions of mouldings on the cutter line, or, in other words, to furnish a scale that will read on the knife measures, what a rule will read on the finished mouldings, and to explain the way to make use of this scale in setting moulders with combination cutters or in designing cutters for special shape mouldings.

We find that heads not carrying cutters at the same angle require a different shape cutter to produce a duplicate moulding. Although a slight variation in the angle may not make enough difference to be very perceptible, the difference exists, and it is advisable to have a scale made to use with each machine, unless the shapes of heads are found identical.

Fig. 1

Fig. 1 shows the lay-out of a sticker head, and the method of designing the scale. To construct this figure, make the outlines of the head, by tracing around the end, or designing from dimensions, laying it out in such a way that one corner of the head will be perpendicular to the center of the shaft. From these points draw a

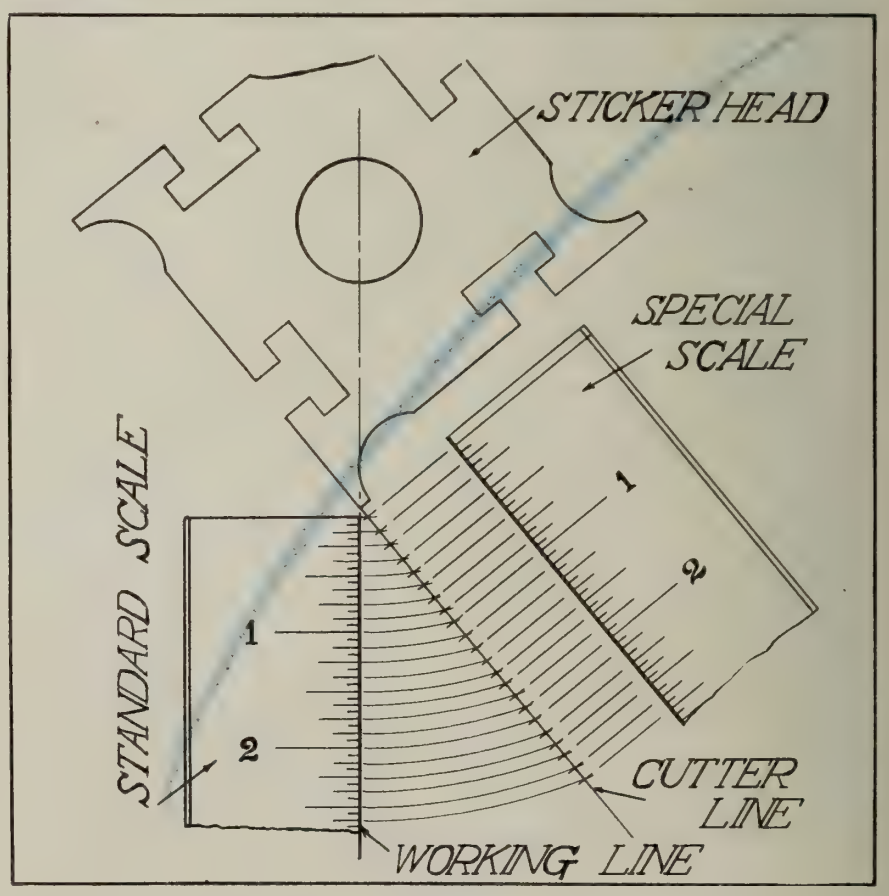

Fig. 1

vertical line which will represent the working line of the moulding feeding horizontally.

Along the working line, at the left side, is designed the standard scale or graduations of the rule. (English measure). At the distance allowed as clearance over the corner of the head, as represented in the figure. This clearance may be altered to suit the projection adapted by the operator.

Then following the surface of the head, where the cutters are bolted, draw a straight line long enough to clear the length of the scale desired. This line is termed "cutter line." Now, all the graduations of the "standard scale" are transferred to the cutter line by using the center point of the shaft for a center, using a compass.

We find that these divisions as they increase in distance from the

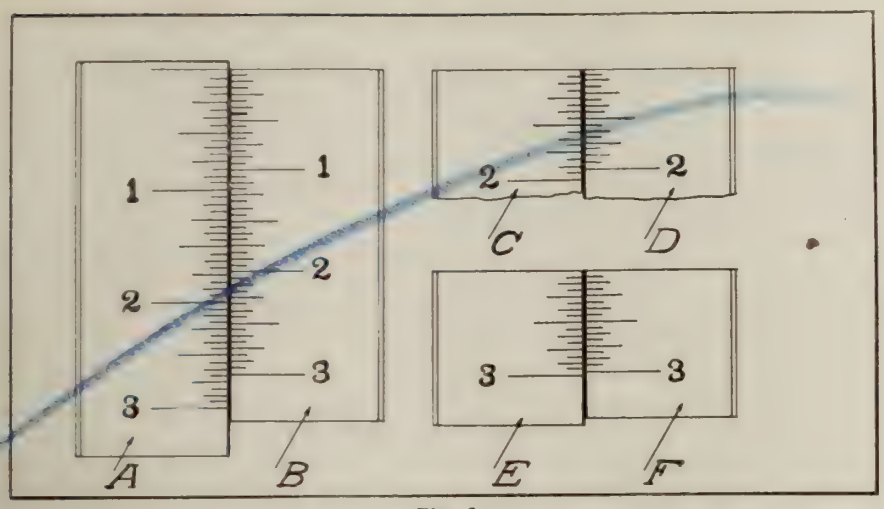

Fig. 2

center, gradually decrease in length on the cutter line. From this point, we have an illustration of the extended shape of the cutters over the shape of the moulding.

The "special scale is designed parallel to the cutter line using the intersection points as stated. Using this same principal with different shaped heads we find that the graduations on the special scale will vary in size, showing that a scale made for a certain shaped head could not be used to advantage for another.

Fig. 2

Fig. 2 illustrates a comparison of the scale made as above stated.

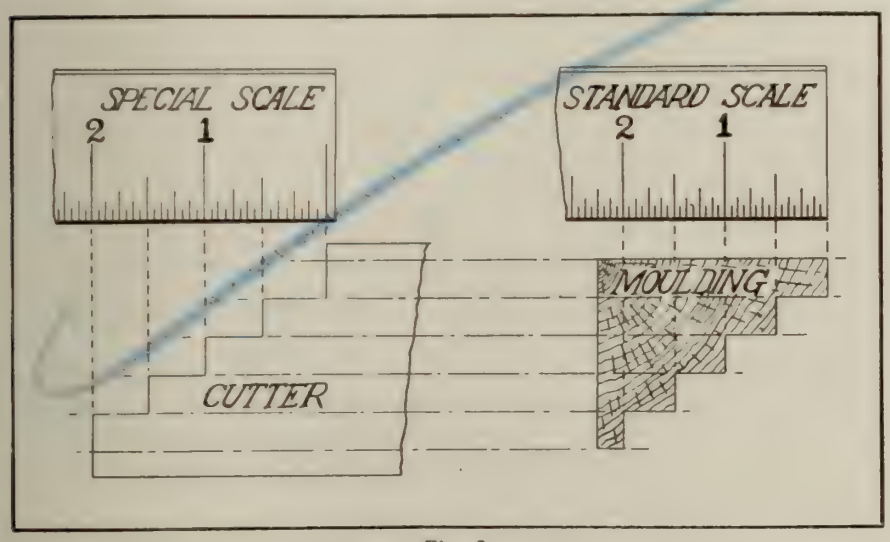

Fig. 3

"A" represents the special scale; "B" the standard. Note the difference between the two scales and particularly in the first inch of the length. "C," in the second inch of the scale "A," placed opposite the second inch of standard scale, shows less variation and difference. We find by referring to "E" and "F" that very small difference exists between the two scales at that projection, and it decreases as they extend from the centre.

Fig. 3

Fig. 3 shows how straight work can be laid out, using the scale,

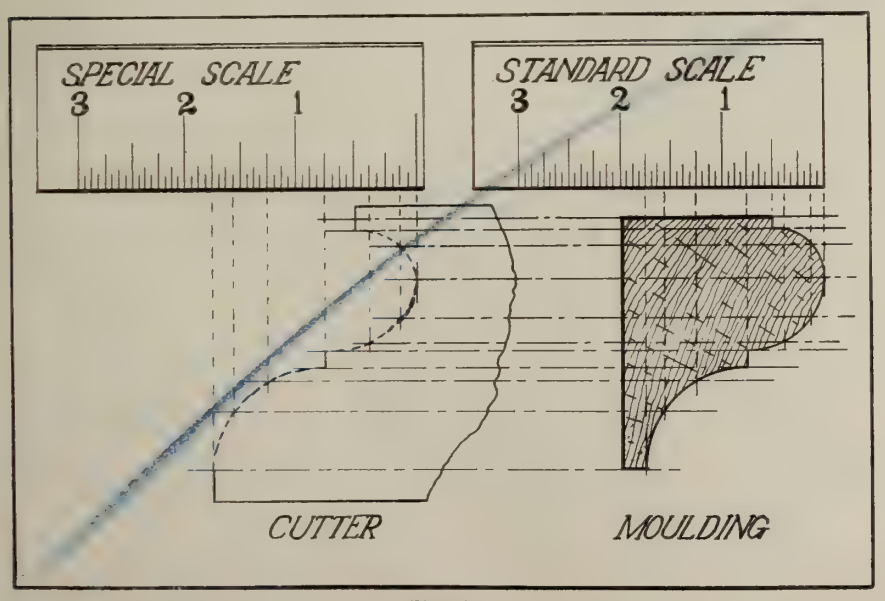

Fig. 4

if we desire to make a piece of straight work, in steps of one half inch in succession divided as represented by "moulding." Lines drawn from the standard scale at desired size and squared-off on both ways will determine the shape of the stock.

To get the shape of the cutter, we proceed as follows: As the proportions across the cutter are equal to the reverse shape of the moulding, parallel straight lines are extended to the cutter shape, allowing extra width on sides for clearing edges. To determine the length of cutter, the special scale is used in the same way as the standard scale is for the moulding. The same construction can be made direct on the head by using sectional cutters measured in place with the special scale.

Fig. 4

In making a moulded form, we proceed in the same way as for straight work, carrying every straight point and making as many intersections along the curves to get the proper shape, as illustrated in Fig. 4. Moulded combinations are measured direct on the head the same way as if straight work and with a little practice, a person in short time will be able to set any shape of moulding by placing his cutters to the size required, setting accurately at the first shot, saving considerable time and material.

A Shot at the Draughtsman

During an experience of nearly forty years in many woodworking shops the writer necessarily has come in contact with lots of drawings for woodwork construction and, naturally, I find the methods of expressing various needs upon such drawings are as many as the draughtsmen who made the pictures in question. Some things the draughtsman might do which would greatly assist the shop man in executing the work, and some things the draughtsman might do to the sure pleasing of many more shop workers!

To begin with: Don't try to make a pretty picture—try to show the work the plainest way for the worker. The shop man doesn't care a continental if the section lines are all spaced like lines on a banknote, or whether they are put in with the stub of a match dipped in the ink bottle. In fact, the latter way does give section lines which are easier for the worker to read, than the best section lines laid off by a mechanical spacer. The irregular hand-sectioning appeals more to the worker, in showing broken off interior sections, than does the exact machine ruled lines.

Do not imagine that I want slouchy, carelessly made drawings; for the neater, more carefully the draughtsman executes his work, the better it goes through the shop. But I do wish to protest against the making of shop drawings as though they were to be hung in the Paris Salon instead of worked to by a mechanic in a busy machine-room.

In fact, the draughtsman when making drawings from which work is to be done should be able to put himself in the place of the actual worker for the time being. Then, and only then, will the draughtsman be able to appreciate the kind of drawing which enables the worker to obtain best work most quickly. But, in order to be able to do this, the draughtsman must have had actual experience in the shop, at the several machines and at the bench.

Here is where the young technical man falls down and makes the drawings which cause shop men to wish they had never been born—until after that draughtsman died! The technical man, who has no idea of work in the shop, can not make as good drawings to work from as he could with a year's actual experience in the shop. And I earnestly advise each and every man who is taking or intends taking a technical course to take a year in the shop first.

If you don't know what line you intend to take up, and are just going to "Tech" for a general education, then, just as soon as you decide what line you will follow, right then and there, break away from school, go to work in overalls and jacket for one year, and your technical work will be ten times of as much value to you as though you had crammed first and then spent three years at sifting out the little acquired knowledge that is of use to you, and unlearning the rest!

Just a few hints of some of the things this leads to: The technical student with shop experience "knows what he doesn't know!" That is, he knows what things will be of value to him in his chosen work and he can specialize in these, passing over the other things as lightly as possible. But when a young man knows nothing of shop work or requirements he "must believe everything they tell him"—to quote a certain person, and cannot select the useful and reject the useless things placed before him.

In making details, the man with shop experience places dimension figures where they will prove the handiest—where they are at hand just when the worker gets to need those dimensions. But the man who is not "shop-broken" will place dimensions in such out of the way places that a map and card seems necessary to find the figures. When one is wanted it may be necessary to hunt the whole drawing over and finally drag the required dimension out of some

corner into which it had been hidden by some mental acrobatics known only to the tech-bred draughtsman.

Some young draughtsmen—and some old ones, too, I am sorry to say—work by the rule that no dimension, under any consideration whatever, shall appear across the face of any drawing. Dimensions, their lines and witness marks, must all be located at the sides or ends of the several views, no matter whether it is convenient to find a certain dimension in a special part of the detail or otherwise.

The writer, in his work, places dimensions, in all cases, where they will be found most convenient, no matter whether they fall across the face of a drawing, or at the tail end of 6-inch work lines.

Another point is the "projection" of a drawing. Some men become so imbued with "third angle" or "first angle" that they will use no other projection angle, no matter how inconvenient that angle may prove in certain situations.,

The generally accepted form of projection is the third angle. The shop workers frequently call them " pick" (third angle) projection, and "roll" (first angle). The "roll" is where an object is simply laid upon the board, marked around, then rolled over upon another side or end, and marked around in that position. This straight "first angle" projection and the side which was on top, before the roll, is the farthest from its plan view after the "roll" has been made.

In the "pick" form, after a side has been "marked around" so to speak, it is picked up—hence the name "pick," carried to one side, turned over and laid down again with what before was the top side. So much for the often discussed difference between first angle (roll) and third angle (pick) projection. But the point I wish to drive home, even if, Mr. Woodworker, it has to be placed in your chair, is that either or both forms of projection should be used when the most convenient or when either will show the work the best.

The writer often uses both forms of projection in the drawing of a single piece. I use third angle projection whenever it is convenient to do so, but, with one elevation of an object made at third angle, I may make the other elevation first angle. Whenever this is done I always tag such projection with a line reading: "First angle (roll) projection." This enables anybody to determine, without studying the matter out, whether or not the several views are first or third angle projections. This simple method is found to help things a whole lot, in actual practice, where hundreds of drawings are being continually made and used. As a last word. I wish to advise that in all cases, where dimensions depart from scale, the figures be underscored so a man will know whether he can trust the drawing as well as the figures. This is a very fine habit to get into.

—Peter Hanscom, in Wood-Craft.

Notes on Using a Band Saw

While the use of hammers is indispensable in the proper levelling and tensioning of band saws, the use of the stretcher for the work for which it is adapted is very superior to hammer work, says the Timber Trades Journal. With a good stretcher and rolls properly shaped every particle of steel affected is stretched uniformly. The roll leaves no marks upon the blade as does the hammer, which may ultimately result in crystallised spots that crack and break, require a braze, and rapidly destroy the life of the saw. Saws tensioned with the hammer are often spotted with places that have never been stretched, even after the saw has run for months; hence a portion of the steel must be stretched more than necessary, because of the portions not stretched at all. This condition is unlikely to exist if a stretcher is used. The stetcher is a great time saver, as an expert filer can put up a saw in from one-fourth to one-half the time required in hammer work. You can roll any section in a saw from one inch to the entire length. Commonly the filer takes a short place as a section —two or three feet long—and rolls that where required. By using the stretcher the final work of levelling is reduced to a minimum. There is little use for the hammer unless the saw is kinked or twisted.

But a twist cannot be taken out with the rolls or put in with the rolls if they are in proper shape. The argument in favor of a stretcher instead of hammer for tensioning is all on the side of a good machine, but all on the side of the hammer if a poor machine.

Millmen should not buy a poor, cheap stretcher, when for a slightly added cost they can obtain a machine warranted of the highest superiority.

The time that some filers spend in hammering their saws might be better spent in working up the points of the teeth into a better condition for cutting.

Before using the hammer you must know where and how to use it. Then every blow struck counts and serves a purpose. It is not necessarily a mark of industry in a filer that he is continually hammering or fussing with his saws, as too much hammering takes the life out of them. Never make indentations with the hammer which bruise or crush the steel. It causes crystallisation and destroys tensibility. Also avoid unnecessary blows. Have a reason for every stroke of the hammer, and try to place it in the right spot every time.

The roller is far superior to hammer work for the uses to which the roll is properly suited, and there are many filers who through careful watching of their saws and proper use of roll rarely have occasion to use a hammer. Some filers say they have no use for a roll, preferring hammer work. This may be so in some individual cases, but the cause of such condition can be traced either to the fact that the filer is not familiar with a roll or has used one sometime that was not properly made and ground, and consequently gave results the reverse of beneficial. However, this is no disparagement of the principle, but simply of the individual defective machine. After having completed the rolling you should carefully examine saw on levelling board, and give a finishing touch with hammer to any spots that do not show uniformity of tension.

The use of the rolls in tensioning is less likely to dish the saw than the use of the doghead hammer, if the rolls are of even diameter, track, and travel together, and the saw runs straight through the rolls. If one roll is sharper than the other, or if the saw is bent as it passes through the rolls, the saw will be apt to dish away from the flattest or broadest faced roll, and a very little dishing becomes objectionable. Too much tension in the saw will also cause the roll to dish the saw. In machines with the upper roll an idler, or if the saw is gummed or greasy, the upper roll may stop or slip, which will dish the saw. Hence, for large heavy gauge saws that require immense power to tension them properly a machine with geared rolls is unquestionably the best.

Using all the Oilstone

For many years, the woodworker has rubbed along with an oilstone an inch or an inch and a half wide—often narrower than the tools to be sharpened—while the length of the stone was much more than ever was used, says a writer in Wood-Craft.

As a consequence, the corners were worn off the middle of the narrow stone, the middle of which was also worn hollow, while the ends, never being used at all, remained their full height, untouched and unused. As a consequence, the oilstone was nearly always in bad condition and made the sharpening of fine tools a hard task and often a real hardship.

Truing the oilstone was an operation so frequently necessary, and such a hard and tedious job, that it was nearly always neglected, and the workman got along somehow with an oilstone in outrageous condition. When the stone was trued up, about the only way of doing it was to rub the stone back and forth over a board on which sand had been sprinkled!

But all this drudgery is changed nowadays. To true up a large oilstone it is only necessary to hold it against the side of a big emery-wheel for a few minutes and the job is done. If the emery-wheel is too small, the disk sander will do the trick. At the expense of a sand disk, to be sure, for the sandpaper will be worthless after a stone has been trued and the paper must be replaced.

So great an improvement—no, so many improvements—have been made in oilstones that the old-time wood craftsman would feel bewildered were he given modern oilstones to work with. It is no longer necessary to pick over a bushel of stones to find one the right degree of hardness, and "Berea, Ohio" stones, while as good as can be found, are not the only oilstones by a good deal—as they used to be.

The woodcrafter can now make a selection from a dozen qualities of stones, each of a different degree of hardness, with the "grit" in each quality so exactly known that each stone of that brand is exactly like all the others of that quality. Furthermore, the two sides of the stone are made with a different "grit," so the workman can use either a fast-cutting or a finishing surface at will by turning the stone upside down!

But the greatest advance in oilstones has been in the abandonment of the long, narrow shape and the making of circular, flat shapes. A rotary movement is sometimes given by the skilled workman to a tool while bringing the edges to the condition of greatest keenness. This can be given best by the rotary motion on a long narrow stone but which can be practised to perfection upon a circular stone.

Once the woodcrafter has used the circular oilstone, he will never desire to go back to the old-fashioned shape again, not unless he is hopelessly in a rut and will consider no tools that his grandfather didn't teach him the use of!

There is another kink in the oilstone matter which is worth a good deal to every shop, and that is, the power or revolving oilstones which are allowed to run continually, turning in a bath of oil, and ready at all times for instant use, the same as the emery-wheels, beside which the oilstones are usually mounted. A touch of the tool against the revolving oilstone does in a half-second what it would require at least a minute's use of much "elbowgrease" at the bench and does it better as well as quicker.

There is one point, regarding the use of rotary oilstones, which might be improved in some shops, and the same is true of emery grinders, viz.: Put in more of them and instead of placing them in some out-of-the-way position, put them right in front, in the best

light the shop affords, and right among the men who have to use them most. Put in two or three grinders and oilstones where now you have one of the former, and perhaps none of the latter, and the outlay will prove one of the best investments ever made.

As for the truing of the revolving oilstone, that job is quickly and easily done in the same manner that emery-wheels are trued, and with the same tool. Do not let the stones run while the least untrue. Make it the business of some particular workman to keep all the emery grinders and revolving oilstones trued up, the baths and water tanks filled with clean oil or water, and the quality and quantity of the work done by the well-kept stones will pay big interest on the small amount of time necessary to keep these tools in perfect condition.

The Patching of Belts

I have often seen a heavy belt patched with a piece of lighter belt. When the belt is running at a low speed there is little or no trouble, but when the belt is a fast one there is trouble aplenty, says M. Smith, in Wood-Craft.

One of our machines has a finishing head that runs fast on the main cylinder and is driven from the end of that. The belt has a travel of over 6,000 feet a minute, consequently is a hard belt to keep up, needing frequent renewals.

On the occasion of a recent break my helper put a short piece of single 3-inch belt in the double belt for a patch. It did not take long for the belt to enter an emphatic protest against being made to work with unsuitable company.

It was a good object lesson, and I feel safe to say it will not be tried again with that belt.

Mechanics and Wrong Machine Methods

Poor little circular saw! It is not enough that ordinary farm-hand ignorance subjects it to all sorts of abuse and neglect in the fitting but now comes a correspondent suggesting the fitting to be done in a manner contrary to all best-known methods.

He advises square gullets in which to start cracks, cross-cut teeth for a rip-saw, then lays all the blame on the saw arbor. Verily, the ways of mechanics are many and some of them past understanding.

Next to him on this roll of false prophets is a man who seriously advises some inquiring fellow man to put powdered resin on his belts to take out the grease. This is a machine-shop man advising this method. Unfortunate shop owner for whom this man is working! Ordinary machine-shop ignorance of belting is not wearing out the belts fast enough, so it is advised to eat them up with resin.

He says if you use resin there will be no more trouble. That is true. He should add, there will be no more belt after not many days.

—J. Wallace, in Wood-Craft.

Placing the Piping of Blower

If any find it more convenient or economical to put their blower piping under the floor than it would be to put it overhead, don't let the idea run away with you that everything around the shop will drop down in the floor sweeps and that wrenches and other heavy articles will go through the fan, with a possible wreck, says M. Wright, in Wood-Craft. That is so easily prevented that it is surprising that the argument has any weight.

To prevent any possible danger from that source, invert the opening in the suction pipe next to the fan, making it about a foot deep, and leave a small opening in the bottom, just enough to cause a current of air upward. Knots, sticks, nuts, bolts and the possible wrench will drop in this recess from their own gravity and nothing can go through the fan that would injure it.

It will not do to condemn a good system for an imaginary danger.

The Tool Room

In these days all up-to-date mills recognize the value of a fully equipped tool room placed in the hands of a really competent man, who is made answerable for the proper equipment and perfect working condition of all cutting tools; and there is no doubt when this plan is properly carried out, the result is a larger output of better quality with a considerable saving in power and time. It cannot be too frequently urged that the tool room is really the most important department in a mill, and any reasonable outlay in this connection is soon amply repaid. In addition to a full equipment of tools for repairs, it will be found to effect a considerable saving in time and pay well in the end to provide each machine with a duplicate set of saws, cutters or chisels, as the case may be. In this case each machine should be numbered and have a peg rack or small cupboard to itself in the tool room, and as the saw becomes dull all the operator has to do is to take it to the tool room for resharpening, and obtain a fresh saw from his peg, thus practically saving a large amount of stoppages of the machines.—Timber Trades Journal, London, Eng.

Rolling Boards for Cloth

United States Consul A. L. Ingram, Bradford, Eng., in a recent report says:—"Cloth rolling boards are extensively used in the Bradford district, probably more so than heretofore, owing to the greater variety of fabrics and to the fact that shorter lengths or half-pieces are more in demand. They are made from thoroughly dried and selected Norwegian pine in over a thousand different sizes, most of them having the ends trimmed, and are either planed or papered. The sizes range from 11½ to 36 inches long, 6 to 19 inches in width, and ⅛ to 1 inch in thickness, the sizes in greatest demand being 17 to 32 inches long, 7 and 8 inches wide, and ⅜ and ½ inch thick. A board 18 inches long, 7 inches wide, and ⅜ inch thick, either planed or papered, costs about $2.80 per gross."

Lumbering Conditions in Russia

United States Consul W. F. Doty, of Riga, Russia, in a recent report, gives some interesting information regarding the lumbering business in that part of Russia, from which a large quantity of lumber is exported into Great Britain to compete with shipments from Canada.

"Lumber is one of the principal industries of the Riga Consular district," he says, "and provides employment in the forests throughout the winter months for a large proportion of the agricultural population of these provinces."

The region from which the lumber is obtained comprises a forest area of 53,473,732 acres, situated in fourteen provinces and yielding timber for the most part of medium-sized red and white pine. Other varieties available, but of less importance to the trade, are birch, alder, and aspen. Of these forests 9,374,310 acres are State owned, 36,891,245 acres are manorial woods, 2,730,113 acres are Crown lands, and the remaining 4,478,064 acres are peasant and other tracts.

The value of forest lands in this district depends upon several conditions, the two main being locality and the amount of timber obtainable for export purposes. An average price per acre can not be given, as in addition to the timber suitable for the export trade, which mainly influences the price, there is often a considerable quantity of inferior stuff available for local consumption in the shape of firewood, shingles, etc. For a forest lying near the River Dvina the value per dessiatine may range from 100 rubles for ordinary growth to 300 rubles for special growth ($19.07 to $57.22 per acre).

Cost of Getting Out Logs—Sawing and Other Charges

Timber is usually sold in this district either in tracts for a stated sum, or at prices varying with the dimensions of the logs. The logs coming to Riga range from 7 to 9 inches at top; the bulk are 8 and 7 inches, the quantity over 9 inches thick being very small.

Felling the trees and hauling the logs to the railroad or nearest stream is for the most part possible only during the season of snow roads in winter, and is either undertaken by the purchaser, usually a lumber dealer, or the seller agrees to deliver the logs to the contracted spot, whereby it often happens that a mild winter or the absence of snow roads makes it impossible to haul out the logs from the forest and penalties for breach of contract are incurred.

The prices paid for felling and hauling vary according to the price of labor current in the district and the distance to be hauled. An estimate of the cost of bringing to Riga an average log of 28 feet length, diameter at butt end 11 inches, at top 8 inches, from a forest in the Province of Vitepsk lying ten miles from the river Dvina, gives, per fathom of 7 feet: Felling and hauling, 15 kopecks; making roads in forest, 3 kopeks; tying into rafts, 3 kopecks; rafting to Riga, 15 kopecks; making a total of 36 kopecks, or 18½ cents.

The cost of sawing at the railroad is stated to be $5.15 per standard of 165 cubic feet; cartage at station, $1.03 per standard; average railroad freight to Riga, $5.15 per standard. The total expenses—sawing, lighterage, etc.—incurred at Riga to convert logs which have been rafted down the river into lumber for export would amount to $9.27 per standard. Sawmill charges at Riga are $6.70 per standard.

Terms of Sale

Purchasers of forest lands seldom export in person, but sell to exporters and millowners at the different ports on terms usually for two-thirds cash and one-third bills, running three, four, and six months, which they afterwards discount at the local banks. By producing a properly executed contract, which is deposited as security for the loan, firms of good reputation are able to obtain from the banks advances on their purchases of forest lands up to two-thirds of the estimated value of the tract, at rates varying from 6½ to 8 per cent. On sawn goods and rafts lying at Riga, loans up to 70 per cent. of the market value can be obtained if the goods have not been previously pledged. There is always sufficient capital available to finance the lumber trade at Riga.

Forestry Convention at Victoria, B. C.

Successful Gathering of Prominent Men to Promote Wise Use of Our Forest Resources — Important Resolutions Adopted

The fourteenth annual convention of the Canadian Forestry Association was held at Victoria, B.C., on September 4, 5 and 6 and was one of the most successful and largely attended that the association has ever held. Representatives were present from every province of Canada and from many important lumbering points in the United States. Among the prominent members present were the following:

Hon. Jules Allard, minister of lands and forests, Quebec, P.Q.; E. T. Allen, forester, Western Forestry and Conservation Association, Portland, Oregon; W. A. Anstie, secretary, Mountain Lumbermen's Association, Calgary, Alta.; Thorpe Babcock, secretary, West Coast Lumber Manufacturers' Association, Tacoma, Wash.; F. S. Becker, secretary, Pacific Coast Shippers' Association, Seattle; Hon. C. H. Campbell, attorney-general of Manitoba; R. H. Campbell, Dominion director of forestry, Ottawa; C. S. Chapman, secretary and manager, Oregon Forest Fire Association, Portland, Ore.; Dr. Judson F. Clark, Vancouver; Hon. W. A. Charlton, M.P., vice-president Canadian Forestry Association, Toronto; Roland D. Craig, Vancouver; F. H. Davis, secretary and treasurer, Couur d'Alene Timber Protective Association, Spokane, Wash.; Dr. Bernard E. Fernow, dean of Toronto Forest School, late chief forester of the United States; Geo. Harcourt, deputy minister of agriculture for Alberta, Edmonton; G. W. King, Clyde F. E. Leavitt, forester, commission of conservation; P. L. Lyford, forest engineer, Montreal and Vancouver; A. F. Mantle, deputy minister of agriculture for Saskatchewan, Regina; Paul G. Owen, secretary, Quebec Limit Holders' Association, Quebec; G. C. Piche, M. F., chief of forest service for Quebec; W. Gerard Power, lumberman, Quebec; Arthur J. Price, member of Price Bros., Ltd., Quebec; R. D. Prettie, superintendent of forestry, C. P. R., Calgary; A. H. D. Ross, M.F., lecturer in forestry, University of Toronto, consulting forester to C. P. R.; H. S. Stone, president Pacific Coast Shippers' Association, Seattle; E. W. Tobin, M.P., Bromptonville, Que.; Aubrey White, deputy minister of lands and forests for Ontario; James White, F. R. G. S., secretary, commission of conservation, Ottawa; E. J. Zavitz, forester, Ontario department of agriculture, Toronto.

On Wednesday evening, Sept. 4th, a reception was tendered to the delegates in the Parliament Buildings by the Premier of B. C., Sir Richard McBride, and the members of the Executive Committee.

The Premier's Welcome

The official opening of the convention took place on Thursday morning, September 5th, when an address of welcome was delivered by Sir Richard McBride who remarked that they were convening in a province which contained the largest amount of merchantable timber in the Dominion and where the most up-to-date forest legislation was in force.

Hon. J. R. Flemming, the premier of New Brunswick, spoke of what is being done there and paid his tribute to the forward movement shown by British Columbia.

Hon. Jules Allard, minister of lands of Quebec, also spoke briefly.

Hon. Colin Campbell, attorney general of Manitoba, came to the convention for the first time as the representative of a member of the confederation whose bounds have lately been quadrupled by the inclusion of a large part of the unorganized districts which lie to the north.

All of these speakers dwelt upon the Dominion as binding all in one grand purpose of preserving the common heritage of all in the forests of the land. The speakers in addition, included Dr. Fernow, dean of the faculty of forestry in the University of Toronto and Aubrey White, deputy minister of lands, forests and mines of Ontario.

The business sessions were commenced on Thursday morning, September 5th, by Hon. W. R. Ross, Minister of Lands for British Columbia, who delivered a much appreciated address upon "The Guardianship of the Public Forests of British Columbia."

The speech of Sir Richard McBride showed how impressed the head of the Government of British Columbia is with the importance of acting quickly and on an adequate scale to secure the best methods of handling the great forest asset of the province. The same idea was carried further by Hon. W. R. Ross, Minister of Lands for British Columbia. R. H. Campbell, the Dominion Director of Forestry, sketched the present forest situation throughout Canada, pointing out the mistakes of the past and showing the great opportunity which lay before British Columbia to do in time what other parts of the country had not been able to do until too late.

The subject of "Fire Protection" was discussed by R. E. Benedict, Assistant Forester of British Columbia, who outlined what the newly organized service was aiming at. This was followed by a paper by Clyde Leavitt on the relation of the Railway Commission to fire protection on the railways, and by R. D. Prettie, who showed what the C.P.R. was doing, both in regard to protection and looking ahead for supplies.

A number of practical addresses upon various branches of forestry were delivered during the sessions of the convention and the discussion served to bring out many comments of value, regarding prevailing conditions.

Removing Forestry Out of Politics

One of the most important subjects of discussion was the problem of removing the management of the forest resources of the country out of politics. Mr. H. R. MacMillan, Chief Forester for B. C., is one of the chief among those who are seeking to bring about this result. The proposal is to put all forest administration under civil service, based on the British principle and regulations, and to appoint, tive co-operation of the Dominion and the provinces. A proposal has also been made to enquire into the actual state of forest resources in all the Provinces.

At the concluding session resolutions were adopted without discussion congratulating the government of British Columbia upon the excellent showing it had made in forest conservation; endorsing a recommendation by the British Columbia Lumber and Shingle Manufacturers' Association that a course in logging engineering should be established at the University of British Columbia; reiterating the former pronouncement that all appointments in the forest service of the Dominion and provinces should be based on ability and experience; that squatting and settlement should not be allowed on lands that are chiefly valuable for timber; that the fire acts of the three prairie provinces be revised so as to provide more efficiently for the prevention of fire; urging upon the Dominion and Provincial governments the advisability of adopting measures as soon as practicable for disposing of logging debris; recognizing the work of United States foresters and hoping for co-operation between the two countries.

An announcement was made by the Hon. W. R. Ross that a school of forestry will be established at the University of British Columbia.

T. H. Linlayson, of the Dominion Forestry service, whose territory covers Alberta, Saskatchewan and Manitoba, told of the harmonious results obtained since the first establishment of fire patrols on the prairies.

Various speakers alluded to the fact that practically all of the young men now engaged as trained foresters in Canada have been pupils of Dr. Fernow, Dean of the School of Forestry in the University of Toronto.

A Chair in Logging Engineering

Among the interesting visitors who attended the convention was Mr. George M. Cornwall of Portland, Ore. Mr. Cornwall is the publisher of the "Timberman," but his chief business in Victoria was to have the convention endorse a project for the teaching of scientific logging. He proposed that a chair for the teaching of this subject should be established in the new university. A movement is also on foot for the establishing of similar chairs in the universities of the Pacific coast states.

"There are over three hundred logging railroads in the coast states and British Columbia," said Mr. Cornwall in an interview, "and their total mileage is over four thousand. You can easily see, therefore, that there is an opening for a large number of young men who would understand both the technical and practical aspects of this work. Our idea is that they should spend seven or eight months in the bush and the rest of the year in college. Young men would have no trouble at all in being self-supporting while learning the business. The lumbermen would be glad to get them and to pay them well. There is much more to be learned than an outsider would think. We would have boys start at about 18 years of age and continue their course in the bush and in college, under competent instructors in both places, until they were twenty-six, making a total course of instruction spreading over eight years. Their earning capacity would increase steadily from year to year and at the end of that period they would be competent in age and knowledge to take charge of gangs, survey and lay out roads, and in fact do everything connected with

the getting of the timber from the forest to the mill, in the most economical and profitable way."

Officers for the coming year will not be elected till the annual business meeting in Ottawa next February. It was taken for granted that Hon. W. A. Charlton will be the next president. The selection of a place for the next convention was also left over to the Ottawa meeting. Winnipeg, Saskatoon, Regina, Moose Jaw and Halifax all asked for the choice.

West Coast Lumbermen at Vancouver

Monthly Meeting Held for the First Time in Canada—B.C. Members Tell How They Won Out on Odd Lengths

The monthly meeting of the West Coast Lumber Manufacturers' Association was held in the banquet room of the Vancouver Hotel, Vancouver, B.C., on Aug. 30th. This was the first meeting of the association held in Canada. The Pacific Lumber Inspection Bureau held its regular meeting on the day previous. The members of the inspection bureau are all members of the association.

The secretary's report called attention to the campaign for members being carried on by his office and pointed out the advantages of securing the memberships of all of the representative lumber manufacturing concerns on the North Coast.

The finances of the association were reported to be in excellent shape.

The work of the association in extending foreign markets was reported on and it was shown that the association had received a list of the United States consuls in all foreign countries, and data will be gathered from them regarding the use of fir and cedar in those countries. The department of Commerce and Labor, in furnishing the list of consuls, called attention to the fact that it now has a commercial agent who is gathering information on this subject, and that his report when made will be published for use of those interested in the foreign trade.

Manager Miles made a short report, part of which was a history of the market for the last 15 months. According to his statements the downward tendency of prices during 1911 and the early months of 1912 was due largely to a surplus of stock left over from 1910, as the shipments of 1911 both in rail and cargo business far exceeded those of 1910, but prices were lower because of the 1910 surplus cut.

A letter from the Bolcom Mills (Inc.), of Seattle, called attention to the old question of cash discounts and the unfairness to the manufacturers in the method usually employed. H. J. Mackin, of Fraser Mills, B.C., said British Columbia lumbermen were about as badly off in this respect in their eastern Canada territory as the manufacturers of Washington and Oregon, and felt that the matter was largely controlled by competition with lumber manufacturers and that they were almost compelled to meet the terms of others selling in the same territory. This subject was held over to be considered at the next meeting of the association.

One of the features of the meeting was a discusstion upon odd lengths. Mr. A. D. McRae, of the Canadian Western Lumber Company, being requested to speak upon the subject said in part:

The history of this case you are all familitr with, as your former secretary came up here and talked us into the notion of manufacturing odd lengths. To begin with we had the advantage of you in introducing this plan because we had a must more restricted district to market our product in. The opposition from the retailers at first was very strong and the question came to be: "Should the retailer dictate just what he was to get or should the manufacturer say what he would sell?" While we were at it we bundled up the short lengths with the long. Our own company operates about 185 retail yards and we found that it had no trouble selling the odd lengths or the short either when they were bundled with the long. A farmer seeing some short pieces bundled in with long ones would hardly have nerve enough to ask the dealer to cut the bundle open and take out the short ones. They go every place in our markets now without any trouble at all. It took about six months to work off the even lengths in stock, but in the meantime we were all manufacturing odd lengths. We won out because the mills all worked together. And they worked together largely because we had an inspector checking them up all the time and furnishing the mills with the information as to just who was making odd lengths. I estimate that it means a saving of more than $25,000 a year to my company.

Mr. H. J. Mackin, also speaking on this subject, said he figured that his company saved $60 a day in the planing mill by not trimming off the odd feet. In his opinion the most important thing was bundling the short lengths with the long. His company saves the short lengths from four feet up, but makes its bundles mostly 12 feet and up. He had been informed by many of the retailers that they preferred to have the short bundled with the long and that they formerly sold short lengths, amounting to about 20 per cent., at from $3 to $5 less than long lengths and threw away the 4-foot lengths. "We now bundle a 5 and 6-foot piece in a 11-foot bundle," etc.

Mr. E. G. Griggs said that if the meeting had done nothing more than convince the members from the South that British Columbia mills had made a success of this plan it was well worth the long trip. He expressed it as his opinion that this policy would be adopted by the manufacturers in Oregon and Washington at the next meeting of the association.

E. J. Palmer, E. H. Heaps and F. L. Beecher, all prominent British Columbia lumbermen, gave short talks, telling their brother manufacturers from the States what they were doing to extend their markets and get better prices for their lumber by selling short and odd lengths, encouraging wood block paving, etc.

In the discussion of wood block paving it was brought out that the principal trouble in the West had been that the blocks were not properly treated and laid. Mr. R. H. Alexander said wood block paving had long passed the experimental stage, and its high qualities were recognized in other parts of the world. Anybody who had ever stood at Trafalgar Square, London, and seen the endless chain of traffic passing over the wood block paving there could testify to its qualities.

The question of standard sizes of car siding and lining was brought up by the British Columbia millmen, who recommended to the mills of Washington and Oregon that they make fir car siding and lining ¾-in. thick instead of 13/16-inch. The British Columbia mills have been doing this for a long time and it is satisfactory to the Canadian railroads. President Griggs said he thought the association ought to go farther than car siding and make standard all of the sizes now being manufactured by the British Columbia mills.

Large New B. C. Mill Opened

George F. Johnston, of the financial house of Johnston, McConnell & Allison, of Montreal, has just returned from British Columbia, where he opened a new mill belonging to the British Canadian Lumber Corporation, at New Westminster. Mr. Johnston, who was president of this company, performed the opening ceremonies. The mill is one of the largest electrically equipped mills on the American continent and starts off with a minimum daily cut of 250,000 feet of lumber. By doubling the shift, which will be done in a short time, the output will be increased to 550,000 feet a day. Mr. Johnston reports that the lumber industry in British Columbia is very active and wholesale prices have recently advanced $1 a thousand.

Conditions are fairly safe now for the forests of British Columbia in the matter of fire this year. The week-end reports sent in to the chief forester, Mr. H. R. Macmillan, by the divisional wardens are all most hopeful in tone. There has been a good deal of rain and the vegetation has not dried up except in the very dry districts. The constant patrol kept up by the fire rangers, seconded by what the railway companies have done along their lines, has materially reduced the danger, and it is not unlikely that the rest of the season will be got through without any serious fires. Testimony is borne by the divisionai wardens to the value of the patrol system.

The extensive work being done in protecting the forests of British Columbia by the greatly increased service of wardens under the new forest branch of the lands department, continues to be manifested in the weekly reports sent to Chief Forester MacMillan from the divisional fire wardens. As the summer advances the forests usually become drier, but so far the efforts of the wardens and the men on patrol have been aided by the rains falling in mountain sections and the conditions of the ground and vegetation.

If timber rates in British Columbia were better, a market could be found in Australia, says Mr. F. C. Howard, managing director of the Broken Hill Silver Mining Co. and the Broken Hill Globe Timber Co. The mines import much timber from the Pacific coast, mostly from the United States, but Mr. Howard says that because of sentiment they would sooner buy in British Columbia if the rates were as good.

Important Deal in Progress in Alberta

Negotiations for the purchase of the fifteen thousand acres of timber land belonging to Dr. Alexander Forin and others in the Province of Alberta, which was referred to in the Canada Lumberman of August 15th, are reported to be progressing favorably. The berth is reported to contain approximately 100,000,000 feet of timber, including tie material for about 700,000 ties. The price at which it is held is in the neighborhood of $200,000, not $100,000, as was at first reported. A railroad is being built to the limits and recent information is to the effect that it will be completed during the coming winter.

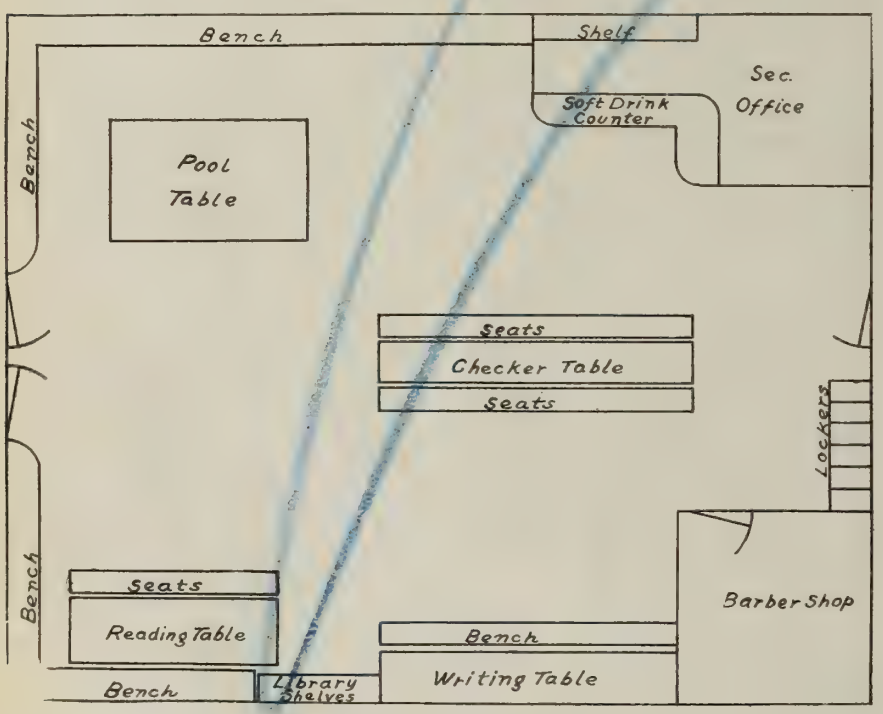
Y.M.C.A. Work in the Lumber Camps

Growth of a Movement Which Divides Between Employer and Employee the Profit of Increased Efficiency — Address Before Logging Congress

By J. A. Goodall

THE particular need of the lumber industry to which I wish to draw your attention is the vanishing personal relationship between the employer and the employee. A need, by the way, that is not confined to the lumber line alone, but is felt by the employers in all branches of industry. I cannot improve on the statement of this need made by President Griggs of the National Lumber Manufacturers Association at their recent annual meeting, when he said: "Where personality no longer appeals and industry becomes so large that men furnishing capital do not recognize the hardship of labor, it is important that greater need be given to the welfare of the employee. I believe employers are realizing more and more the obligation they owe to society and if the employee can be brought to assume his own responsibility the condition of labor will continue to improve."

I think this need is recognized by all thoughtful employers. Recently the manager of a large concern said to me: "Ten years ago, when we had but 75 or 80 employees, I knew each one by name, and frequently the members of their families, but to-day we have a crew of 700, I am overloaded in the office and about the only ones I know are the few that are left from the original crowd." Another gentleman, the manager of several cement plants, who is only able to visit each plant occasionally, said: "I am willing to give or do anything I can if our men would only be loyal to the company." Lack



A Portable Y. M. C. A. Building 40 x 32 feet

of personal contact between employer and employee begets indifference, and this in return results in inefficiency. You are giving much attention to conservation. You are having regard to the material waste by fire, by neglect and by unskillful handling, and then, after you have done your best in felling the trees and sawing the timber, you must consider reforestration for the sake of the future.

Industry is guarding the time element more carefully than ever. Every time-consuming feature that can be dispensed with is quickly cut off. There must be no lost motion.

Conserving the Human Element

Great genius has been shown in conserving material resources, but how about the human element in the lumber industry? Efficiency in production that secures the maximum output to the minimum waste of life, limb or capacities, is pressing for consideration. Conservation congresses have become the order of the day, but attention has principally been directed toward the conservation of commodities, and yet the human conservation is by far the most important aspect of the theme, whether considered from the standpoint of the worker, the industry or society. Mr. Griggs emphasized this same thought at the national manufacturers meeting when he said: "If dividends are sought at the expense of our citizenship, it will not profit us." It is here that the Young Men's Christian Association offers service. The modern Young Men's Christian Association in an industrial community represents the employer, the employee and society, and its results include the two great factors that go to make human efficiency—avoidance of waste and the development of creative power.

Because of this I feel justified in referring to the Young Men's Christian Association as an efficiency producing agency.

By what plan or method does the association prevent waste and develop creative power? How does it increase efficiency? The answer is this: The association is a character-making force. Right standards of character are the best guarantee against waste of human energy and the basis of the highest creative power. It is not necessary to argue this here, for to those who handle men it is a self-evident proposition. Sober, steady,intelligent workers must be found among men who have the right character basis, who follow right standards promote, and discipline on merit. This project will require legislaof conduct, because they have the right character back of their conduct. This is true alike of individuals and companies and of nations. It is not an accident that the nations that are governed by the highest character standards hold the industrial supremacy of the world.

I have tried to suggest three points: 1. That the modern objective in industry should be efficiency in production. 2. That the human factor in industry is of chief importance. 3. That permanent efficiency is dependent upon character. May I add to these a fourth proposition, namely, that there is no higher standard of character than that which we call "Christian," using "Christian" in its broadest sense. I believe that because the Young Men's Christian Association is a Christian character-making force it is having an increasing place in industry.

The Movement's Strong Claims

The association is especially adapted to serve in industrial fields because: 1. It is co-operative; employer and employee unite for mutual help. It is non-paternalistic. 2. It ministers to the allround man—physical, intellectual and spiritual—and not only to the individuals, but the whole community. 3. It has trained leadership—the secretary, who is the representative of the interests of the employer, the employee and the commuity—is an essential to success. 4. It is related to a world-wide movement and has supervision by representatives of both state and international committees.

The modern association in an industrial community has been successful regardless of the section of the country or the type of workers. Employers welcome it regardless of creed or condition. Religious differences are not a bar to either membership or the use of its privileges. Men of all creeds and no creeds are enrolled among the half-million members in the 2,100 associations in North America. There are more Roman Catholics in the railroad department, for example, than from any other denomination, and in some places more than from all other denominations combined. Even with the non-English -speaking the association is working successfully.

During the past five years association branches in the lumber industry have increased rapidly in the lumber fields. At present it is serving the employees of between twenty-five and thirty lumber firms extending from the eastern fields of Newfoundland and New England, Ontario, Minnesota, Mississippi, Louisiana and in Washington.

The Eastman Gardner Company, of Mississippi, were the pioneers in encouraging the establishment of associations in their sawmills and camps in the United States. After two years' experience, Mr. Geo. S. Gardner writes: "Sober, saving permanent labor is one of the best assets the lumber manufacturing concern can have. Our experience thus far has been that the Y. M. C. A. is of the greatest assistance toward this end, in that it helps all to help themselves morally, mentally and physically." Superintendent Mahoney, of the same company, said: "The Y. M. C. A. has far exceeded expectations; we cannot do without it, and when we move to the new camp, I shall have a building up in advance so as to avoid a break in the work."

The results of the Y. M. C. A. work among the loggers of the southern field have been so successful that the members of the Yellow Pine Manufacturers' Association, at their annual meeting at New Orleans last January, voluntarily inaugurated a movement and provided funds for the purpose of maintaining a traveling secretary to devote his entire time to promoting Y. M. C. A. work to the various camps and sawmill towns of their territory.

Results That Really Pay

The four lumber companies which maintain the club house at Cloquet, Minn., have expressed their appreciation in the following

statement: "We are very glad of an opportunity to express our sincere appreciation of the work done by the Y. M. C. A. here during the past year. Until last May there had been no public place in Cloquet where men and boys could go for clean and profitable entertainment during their leisure hours. It is hardly necessary to add that the splendid work being done by the Y. M. C. A. has exceeded the expectations of its most loyal friends, and that it is destined to have a marked influence on the community, and thus become a distinct benefit to the companies is undoubted."

The first industrial Y. M. C. A. to be established in the northwest lumber territory was at Doty, Washington, where it has been in operation about one year. The manner in which it was secured illustrates the plan of co-operation by the association that brings the employer and employee together for the mutual best interest of both. The proprietors of the Doty Lumber & Shingle Company, realizing the need of such an agency in their mill-town, invited a traveling representative of the Y. M. C. A. to visit and investigate their community. As a result of his visit, considerable interest was awakened and a desire expressed on the part of the men to have such an institution established at Doty. This resulted in a conference of representative employees with the officials of the company and the association, at which time the company agreed to provide a major portion of the expense of the building and to contribute annually the heat, light and water and a proportion of the maintenance, provided the employees would raise approximately $1,500 and a part of the maintenance. The men were pleased with the offer and went about the task with enthusiasm, making a systematic canvass in which they solicited every man in camp, with a result that instead of securing $1,500 they secured $3,500.

This organization is managed by a committee of employees, of which the general manager is a member, and the activities are directed by a trained secretary of the Y. M. C. A. The building contains, on the first floor, a large social lobby, kitchen, night school room, and game room equipped with two billiard tables. An attractive fireplace, a piano, a victrola, chess and checker games, easy chairs and a well-stocked reading table makes the lobby the most attractive place in town in the evening. A carefully-planned schedule of the activities enables the building to serve all classes of the citizens. The building is reserved for the women two afternoons each week, and the secretary has helped them in organizing a basket-ball league. The boys and girls of the town have the building at their disposal from 4 until 8 p.m. each evening, and are given athletic instruction and are directed in their games by the secretary. After 8 o'clock the building is used exclusively by the men. The gymnasium is equipped with a large spectators' gallery and is a popular place of entertainment for the families of the town.

Two Classes of Activity

The industrial work of the Y. M. C. A. is of two classes—the camp work adapted to bring the threefold activities of the association to the working men in the logging and construction camps, the other being the club house work suited to the permanent mining and sawmill town. In the northwest are four permanent club houses erected by the employers and maintained jointly by them and the employees, each one of these club houses being in charge of a trained secretary of the association. The finest and most expensive of the four is located at Kellogg, Idaho, and was built by the Bunker Hill & Sullivan Mining Company for its employees at a cost of $37,000. It has been in operation a little more than a year. In that time it has done much to transform the moral and social life of the community. The general manager, Stanley A. Easton, in a recent letter, said: "The Y. M. C. A. building, which was thrown open to our employees and to the public February, 1911, has received continued and active patronage both from the general public and from our employees, and the interest and good work it has been doing is productive of very much good. It holds the interest of the men in spite of the many other attractions in this community, and we feel that our support of it has been amply justified by the results secured." There are also in the northwest five construction camps where Y. M. C. A. secretaries are located. The equipment for temporary camps usually consists of a tent or rough board structure to match the other camp outfit. These buildings are usually supplied with small games, phonographs, a big list of daily papers and magazines, and the men are furnished free stationery and are encouraged to keep in correspondence with their homes. Where it is possible the secretary arranges to cash the men's cheques and thereby is enabled to encourage the men to start a saving account. One secretary in eight months handled $40,000 for the men, putting $3,000 in the savings bank. Practical talks on health, hygiene and first aid to the injured are given by doctors secured by the secretary, and religious meetings are held on Sunday nights.

The Camp Secretary's Work

The preaching of the camp secretary is more by example than by precept. Instead of lecturing the men about getting drunk on holidays the secretary usually promotes a patriotic celebration lasting from eight o'clock in the morning until ten o'clock at night, the programme being made up of wholesome amusements that appeal to the men, including baseball games, wrestling contests, tugs-of-war, a greased pole, pie-eating contest, etc. A patriotic address is always included and a big display of fireworks at night. In one camp of 400 men two and a half miles from a railroad town with four saloons, on a holiday such a programme was conducted and the timekeeper reported that less men left camp that day than on ordinary working days. The camp superintendent, who had had several years' experience with the Y. M. C. A., has this to say: "Our camp is located within two and a half miles of a town served by two railroads, which has considerable attraction for the men, but we have found that by providing a club room for their amusement and instruction, the tendency to seek diversion elsewhere is greatly lessened, and there is no question in my mind but that the influence of the club tends not only to keep a large proportion of the men contented, but also enables us to secure and retain a better class of men than would be the case if we did not have the association influence."

The first Y. M. C. A. work in the lumber camps in the northwest was started last year in the camps of the Anaconda Copper Company, near Bonner, Montana, the secretary visiting the several camps carrying with him a folding organ and reading matter for the men. Some work was done in the direction of getting the men to save their wages and to make profitable use of them. The service was appreciated fully by the men, and is most heartily endorsed by the officers of the company.

The most recent development in this type of work has been the opening of the Y. M. C. A. in the camps of the Sunset Timber Company, near Raymond, Wash., and the plan followed illustrates the method used in industrial plan of work. Following a visit to the camps by one of the secretaries, the men started a petition asking the company to co-operate with them in the establishment of a Y. M. C. A. in their camp. The company officials replied that they would erect a club house and provide an appropriation to cover the annual salary of the secretary if the men would provide the funds for the furnishings of the building and incidental expenses for the first year. The building will be 32 x 40 feet, and is so framed that it can be made into two separate buildings, 16 x 40 feet each, affording a club room for each camp when the camp is divided. The building will contain a social lobby with easy seats around three sides, part of the seats being arranged so that the men can recline and rest while reading. It will be equipped with billiard tables, reading and correspondence table, large chess and checker table to accommodate fourteen men, also a barber chair and a soft-drink counter where soft drinks and confectionery will be sold to the men. The key to every successful work of this kind is the trained secretary, and a study of the young man in charge of the work at the Sunset Timber camps will be interesting. He is a jovial little Dutchman, who has worked for years as a machinist, but later decided to give his life to Y.M.C.A. work. He is an expert cornet player, having been a bugler in one of the regiments of the Spanish-American war; has a keen mind, takes a healthy interest in athletics, but above all is a lover of his fellow men and delights in this sort of work. He is banker, lawyer, nurse, missionary, umpire, athletic instructor, orchestra leader and school teacher to the 250 men in that camp. He inaugurates all sorts of games and contests. He is a friend to every one. He shows them the folly of the periodical trip to the city and the squandering of their earnings, a thing that is a curse to the logging business probably more than any other.

The Economic Side of the Problem

We are willing to predicate this work upon its economic value to the industry. It always pays dividends on the investment. The cost includes two items—equipment and maintenance. The equipment may range from a $1,000 to a $30,000 building, the equipment includes heat, light and water and the secretary's salary. With these guaranteed by the employer we can leave the remainder of the operating expenses to be borne by the employee. Our plan is to visit the field and submit a report which will get the employer interested first; then the employees are consulted, and if they do not want us we go no further, no matter how interested the company may be. (I say this is the plan, but as a matter of fact, we have never had a group of employees turn down the proposition for a Young Men's Christian Association). Success depends upon getting the interest of the men. When this has been done and the equipment and the secretary have been secured, the organization is effected and the work begins. You then have in relation to your industry a force for individual and community betterment that is a part of a world-wide movement, and which, by this fact, takes on a larger strength and permanency than if it were strictly local. The association work is unselfish; it divides between the employer and employee the profit arising from increased efficiency; it gives to society the benefits of improved standards of life; it transmits to the men themselves the blessing of transformed character for time and eternity, glory to God, in whose name the Young Men's Christian Association serves.

Forest Protection in British Columbia

Detailed Explanation of Provincial Policy and its History—Address Prepared for the Recent Pacific Coast Logging Congress

By the Honorable W. R. Ross, Minister of Lands, Victoria, B. C.

I HAVE but recently returned from a trip of inspection to the Northern interior of the Province of British Columbia—a trip made by me for the purpose of examining at first hand the problem of land settlement and forest administration in the new regions about to be opened to the world by the approaching completion of the new transcontinental railway, the Grand Trunk Pacific. My absence from headquarters has naturally caused an accumulation of work, the pressure of which, I much regret to say, prevents my carrying out my original intention of being present in person at this convention of the Pacific Logging Association. The best I can do under the circumstances is to write a brief summary of the present situation concerning the forest administration committed to my care as Minister of Lands in the huge western province of Canada that shares with Washington, Oregon and California the present trade and future development of the Pacific Coast.

The forest policy pursued for many years already by the Government of which I am a member creates a special reason for my interest in the proceedings of your association. No other government has drawn so large a portion of its revenues from forest sources; in few other countries does general commercial prosperity depend more upon the success of the lumbering industry than it does in British Columbia; and I venture to say that no government is more alive to the fact that the conservation of forest resources is a business proposition that needs vigorous practical work on a large scale and hearty co-operation between Government, lumbermen and the public.

I will not weary this meeting with statistics, but in order to make clear the present situation in our province to those of you whose attention is at times more or less absorbed by matters of more domestic concern, including Presidential elections, I will describe briefly the history of our forest legislation. In early days, of course, the single idea was to encourage settlement, and timber lands were sold to anyone with courage enough to buy them. Counting in the timber which went with the land granted in aid of railway construction there are consequently about one and a half million acres of valuable forest Crown granted and in private ownership to-day. These are subject to annual tax of 2 per cent. levied on a very conservative valuation.

When the Canadian Pacific Railway had joined the Province to the rest of Canada the first faint stimulus was given to the lumbering industry, and in 1888 the system of leasing timberlands for 20 or 30 years was adopted. The rental for these leases was at first ten cents an acre, fifty cents a thousand feet being charged as stumpage on any timber cut by the lessees. Some few years later, in 1896, the sale of any lands on the Coast carrying 8000 feet or more per acre and of those in the eastern portion of the Province carrying 5000 feet or more was prohibited by law. The leasing of timberlands continued to be the standard method of providing the lumbermen with material for their operation up to the year 1905, though, of course, the conditions of the leases were varied from time to time. Thus we find that about one million acres are held under lease today at rentals varying from ten to 25 cents per acre except in the case of certain leases granted at lower figures in 1901 to encourage the establishment of the pulp industry in the Province. Most of these leases possess the privilege of renewal every twenty-one years, the rental being naturally subject to readjustment when the period of renewal arrives.

History of the Forest Policy

It was in 1905 that the present Government adopted the remarkably successful system of special timber licenses, and for over two years the staking of these licenses created a tremendous movement and revealed to the whole American continent the greatness of British Columbia's forest resources. A special license, as most of you are aware, conveys to the holder the cutting rights over a square mile of forest for a year, and, provided the conditions of the license are fulfilled, these rights are rewable from year to year as long as merchantable timber in commercial quantities remains standing on the ground. The Government had several definite purposes in view in granting these licenses. In the first place, the immense forests of the Province had, previous to 1905, been contributing no appreciable revenue for the development of the Province. They represented so much unproductive capital, and the progress of the Province was being seriously retarded for lack of money with which to open up new regions for settlement by means of roads, bridges, surveys and other public works. The leasing of timberlands for long periods at fixed rates was a clumsy, unscientific method of raising revenue that was clearly out of date. Then again, the lumbering industry had reached a point of development at which its further progress depended upon securing definite sources of supply for future operations that would justify the large investments that are necessary nowadays for profitable working. The third main object of the licensing system was to interest outside capital in the Province.

Every policy is open to objection, but taking a birdseye view of the whole situation in the light of subsequent experience it is quite clear that the Government achieved the three ends it had in view in a very successful manner. Licenses covering some nine million acres were issued; a steady revenue of about two and a half million dollars was secured (and this has been devoted wholly to the public works that have enabled the Province to forge ahead so rapidly), and the lumbering industry obtained the supply of timber it needed for the important operations already conducted in this year, 1912, and for the immensely greater annual cut that the near future will see.

Stumpage Charges Not Taxation

The fact that under the licensing system investors were required to pay for their cutting rights by annual installments has led some critics to the mistaken idea that the Government of British Columbia was levying heavy annual "taxation" on the lumbermen. It should be pointed out emphatically that the installments of the purchase price of the stumpage thus sold by the Government have no connection with taxation, and that the payment of annual rental of 22 or 18 cents an acre—which works out at a very small amount per thousand feet—is a far more advantageous arrangement for the lumbering industry than the locking up of capital in the heavy investments that would have been necessary between the years 1905 and 1908 had the Government required cash payment down for the value of the stumpage. Besides this, the levying of the extremely moderate charge of 50 cents a thousand feet only at the time when the timber has been cut and is yielding its profit to the operator shows that the Government has done its best to facilitate the financing of an industry whose importance to the country is so great.

I have dwelt at some length upon the financial side of our forest policy because the partnership between the Government and the lumbering industry in the utilization of our forests that this has brought about has led to such happy results in the way of co-operation against the fire hazard. For some years past my department has been maintaining a constantly increasing force of fire wardens during the summer months, but, at the last session of the legislature the creation of a Forest Protection Fund for the protection of the resources in which both the lumbermen and the Government are equally interested enabled the Government to undertake this great work in a far more effective way. Every licensee or lessee of public timberlands and every owner of private timberlands now contribute one cent an acre to this fund, and the Government puts up dollar for dollar. We have thus about $220,000 earmarked for forest protection alone this present season, and, should this amount prove insufficient the law provides for its increase to whatever may be necessary. Through this fund we have already established some one hundred and forty-two fire districts in charge of district wardens controlled by the inspectors of the fifteen divisions into which the Province has been divided, who, in their turn are under supervisors and the headquarter officials of the forest branch of my department. The staff of regular wardens is automatically increased in spells of hot weather by the hiring of temporary patrolmen on the principle that it is far better to pay a certain number of men to watch dangerous places than to hire perhaps fifty times that number to fight the fires that might be started there. When fires occur the numerous Government road gangs at work in most sections of the Province are immediately available in each district as the nucleus of a fire-fighting force, and such men are hired as are needed. The expense of fighting fires on timberlands where operations are being carried on—whether fought by the operator's crew or by the combined forces of the operator and the district warden—is shared between the operator and the Gov-

Editor's Note.—The above paper was read by Mr. H. R. MacMillan, in the absence of Hon. W. R. Ross. A signal mark of honor and appreciation was shown in regard to this paper when the association ordered that it be printed as a separate pamphlet and distrbuted to all state and federal legislators, lumbermen, loggers, boards of trade and other interested bodies in the five Pacific states of Washington, Oregon, California, Idaho and Montana.

ernment, for instance, in the former case refund or half the expense is made to the operator from the Forest Protection Fund, provided the fire has not been caused by neglect to obey the law regarding the use of screens on donkey engines, the cutting down of snags near donkeys at work, and similar matters. The idea in this half sharing of expenses is that as the Government and the operator pay equally to the Fund they should share equally in the expense of a fire occurring round the operator's holdings. It has been contended that the whole expense of such fires should be borne by the fund, but so many objections to this were foreseen that we preferred to adopt the half-sharing system until we could see our way more clearly.

The Handling of Sash

Before the Forest Act had been brought down to the Legislature last winter many lumbermen expressed the fear that drastic provisions would be included in it to compel operators to burn their slash, and they were doubtless relieved to learn that no such impracticable law had been under consideration. The handling of slash, as I see it, is a matter far too important in its effect on the young growth that will reforest cutover lands, to be dealt with under compulsion by private parties. The question of what slash should be burnt and when it should be burnt must be studied in each different section of the Province by men who are making a business of seeing that the right kind of assistance is being given to Nature in her work of producing new forest crops to replace the crop we are cutting now. For that reason I secured the services of practical men with forestry training who should take charge of work of this nature; and in these sections of the Province where local conditions make it desirable in the best interests of the forest the burning of logging slash will be undertaken by the Forest Service itself at the expense of the Forest Protection Fund. Work such as this and the construction of trails, field telephone lines, look-outs, cabins and fire lines will be undertaken each year following the close of the fire season, and besides its great importance in diminishing the fire hazard the work will serve to keep together throughout the year the picked men of the Forest Protective Service. Temporary men in considerable numbers will always have to be hired for the fire season each year, but unless a permanent staff of officials is kept in existence from one year to another it is impossible to create a really efficient force.

It may not be known to all of you that while some railways in British Columbia are subject to the control of the Provincial Government the majority are under the Federal Railway Commission. Railway construction, as someone has said, used to mean forest destruction all along the line, but under the new Forest Act the Province has been most successful in protecting from fire, timberlands near the lines now being built. We have done this by putting on enough wardens to exercise a firm control over right-of-way burnings, the expense of this work being charged to the railways concerned. But, as I have just said, most of our railways are under the Federal authorities, and until the present year the Province was unable to secure systematic patrol along their rights of way. The representations that we made to the Railway Commission have now had a most satisfactory result, the Chief Fire Inspector of the Commission having established definite patrols after trains that the railways are now required to maintain. Specially appointed Government inspectors supervise this patrol work and see that locomotive screens and other preventative appliances are kept in good condition. I must express my great appreciation of the way in which the railway companies themselves have met us in this matter. We have found that, whatever may have been the case in the past, the up-to-date railway man is nowadays wide awake to the necessity of preventing forest fires.

Necessity for Taking Stock of Timber

Forest protection is only one side—though a very important one—of the forestry work that I am directing. My recent trip through the still undeveloped northern country that the two new transcontinental lines of the Grand Trunk Pacific and the Canadian Northern Railways will soon open up to the lumbermen revealed to me still further the magnitude of our forest resources and the necessity of taking stock of them in order to base our forest policy solidly on facts. A complete timber survey of the Province will be made, the main work being completed, I hope, within three years. Ten parties, each in charge of a technically trained man, are now being sent into the field, most of them being concentrated in that great forest area north of the Canadian Pacific Railway that extends to the line of the Grand Cache; the idea in this connection being to obtain definite information and accurate timber maps of the great undeveloped region that will soon be the scene of extensive lumbering operations. With the data thus obtained the Government will know best how to deal with such matters as timber sales and land settlement. My recent journey through the North considerably altered my former opinion as to the amount of merchantable timber still held in reserve by the Government in the heavily wooded districts mentioned above. When the results of the forest survey are published it will be found that the reserved areas contain a larger and much more valuable stand of timber than is commonly supposed, and it is evident that the sales of stumpage that we shall be making there some day when the new railways are in operation will attract considerable attention from Western lumbermen, perhaps from some of the gentlemen present at this congress to-day. With the abundant waterpower available in certain sections and the magnificent supply of pulpwood, the pulp and paper industry may also be expected to establish itself on a large scale in the Northern interior before many years are past.

Forest protection and timber surveys are matters in which the members of this convention are directly interested. Our Forest Act deals with fire prevention in a very comprehensive and thorough manner. It summarizes and adds something of its own to the most up-to-date legislation that has resulted through the conservation work of the voluntary Forest Fire Associations of the Western States; but I will not inflict a long discussion of its many provisions upon this audience. Again, much of forestry work on which my department is now engaged consists in the working out of administrative plans that are extremely important to us but of very little interest to anyone outside the department. As soon as the preliminary work of laying sound foundations for our forestry service has been accomplished you will find, however, that several lines of work designed to assist the lumbering industry will be taken up vigorously. For instance, studies and tests of the different varieties of British Columbia timber will be made in order to produce standard literature advertising their special uses and value in foreign markets, a form of publicity that will directly benefit the lumbering industry. Again, it is most important that expert studies should be carried on persistently to discover how the abundance of low-grade material that is at present unmarketable can be made use of, and that experiments should be made with by-products. It is seldom worth while for private firms to spend money on such investigations; and the splendid example set us by the experimental plant of the United States Forest Service at Madison, Wisconsin, shows how great the commercial value of such practical Government work may prove.

In conclusion, gentlemen, let me say that one of the most satisfactory features of my work as Minister of Lands in British Columbia is that it brings me in contact with one of the finest and most manly industries in the world—the logging industry. Long may it prosper! And in our present work of laying the foundations of what we hope to make as vigorous and efficient a forest service as the American continent can show, I feel, gentlemen, that the safety and the perpetuation of the forests on which the logging business depends are being secured and the future operations of a great industry safeguarded.

The Use of Electricity in the Woods

By E. J. Barry*

The recent developments in the use of electricity for logging purposes are characteristic of the energy and foresight of the lumbermen of the West. Owing to the vast resources of water power on the Pacific Coast and Inland Empire, no better field could be found anywhere than its application to the logging industry.

The many advantages of electric drive are well known and its success assured in sawmill work. Its extension to logging is a natural result. The outcome of the experiments made by the Potlatch Lumber Co. at Elk River, Idaho, has justified all expectations, and the two especially designed electrically-operated logging engines will be in use this coming season in the woods, having been tried out breaking rollways this spring. Power for these machines is developed from saw and planing mill refuse and the voltage is stepped up for transmission to the logging camps.

The elimination of the fire risk, the fact that no water is required, the much smaller labor cost and the increased output are all factors to be considered in advancing the claims of electric drive as against the steam donkey.

Where a sawmill is operated in conjunction with logging camps or within reasonable distance, the most economical method, naturally, is to develop power from lumber refuse.

Where this is not feasible and power transmission lines are in the neighborhood, power can be purchased at a very cheap rate, as logging engines would form a very desirable load from the power company's point of view. Power lines on the Pacific Coast are carried over large areas of timber and thus would tend to solve the problem of obtaining electrical energy when lumber companies could not generate themselves economically.

It has been suggested that a portable generating plant mounted on flat cars would prove a desirable method of obtaining power for logging, but to the writer this scheme does not appear desirable.

In the first place the size of the generating unit is limited, owing to the question of transportation, and a flat car is not the best of

*Address delivered before the recent Pacific Coast Logging Congress.

locations for high power boilers. The problem of stepping up for long distance transmission could hardly be considered, so that necessarily the area for supplying power would be somewhat limited, say to three or four miles for economical transmission. Water would have to be obtained and fuel, though crude oil would naturally be the best for this purpose. The expense of upkeep for a movable steam plant would be considerable, in view of the lack of suitable foundation, with the incidental troubles of vibration and steam leakage.

The economy of keeping up steam on this machine could not be compared, horsepower for horsepower, with the power derived from refuse lumber or a waterfall, and the question of economy is, after all, the point to consider.

The use of high tension transmission appears to be the practical solution of conveying power through the woods, with portable substations for stepping down to 440-550 volts at each logging engine. The transmission voltage could be 11,000 or 22,000, according to requirements of distance and the amount of power needed.

Unfortunately there are very few figures to present at this time on electric logging, but this coming season will witness several electric logging engines in operation in different parts of the country, which obviously will add to the information on this subject.

The Value of Topographical Surveys

Advantages Secured from Scientific Reports on Operating Conditions — Address before Recent Logging Congress

The modern trend in all well organized branches of industry is to seek for some method or some system which will aid in carrying on work at a minimum cost per unit of product, and by which this cost can be estimated in advance of the necessary expenditure to inaugurate the work.

To find this system, or one step towards accomplishing this result, it is necessary to have in tangible form the results of previous experience and work which must be put in shape so that plans of development and operations may be determined by those whose experience and whose interest qualifies them to direct operations, for the responsible head of the work must be provided with knowledge of conditions and details that he cannot have time to personally obtain.

In this connection the advantage of topographical surveys and maps which are indispensable in many undertakings might fairly be considered indispensable in well planned and conducted timber operations.

By having properly recorded the topographical features of any area the best system of development can be determined, boundaries of logging areas from each point of operation can be fixed, lines of transportation can be laid to obtain the best results, items of cost can be approximated and having it properly presented on the maps the judgment of experienced men, who cannot personally inspect the ground, can be obtained as to the best methods of operation, of its availability to market conditions and relative value as stumpage and possible profits, as to transportation plans and costs, and in fact, most of the questions of policy and plans can be better determined than would be possible without such a survey and map, for the combined experience of all departments of operation can be consulted, as they could not be if all had to make separate investigations.

The product of the logging operations is logs, and the cost at the mill is the standard from which we must work. This cost is made up of the sums of all net expenditures, beginning with the purchase of the timber and including roads, camps, tools and equipment, all labor and overhead charges, transportation, interest, taxes, accidents and waste, and it is evident that there is a broad field, broad enough and exacting enough to require the talent of several specialized lines of training such as we find in other lines of work.

Other leading lines of development and industries such as railroads, electricity, mining, hydraulics, irrigation, mechanics, municipal works and general construction have developed men whom those interests and the world honor with the title of engineer, so the logging industry should seek and develop men who can render a like service to it.

There is a somewhat common idea that a man must have a diploma in mathematics to be an engineer, but while a moderate knowledge of this kind is important, yet a good definition of engineering has been aptly given as "the art of doing that well with one dollar, which any bungler can do with two after a fashion," and the man who can measure and direct to the best advantage the operations of the logging industry is entitled to high standing in the ranks of engineers, but if he would live up to this definition in his work, any means by which the cost of logs may be reduced or the investment of capital be on a better basis, would be worthy of his careful consideration.

One essential of good engineering is that the records of the conditions surrounding any contemplated work or development and all facts and conditions be gathered and preserved in such form as to convey to others a clear knowledge of all matters connected therewith. I mean by this that topographical surveys and cruising should be combined and maps made that will convey to an experienced man a better knowledge and understanding of his work than could be obtained by depending upon his memory and judgments, formed in going through the woods without such aid.

In regard to methods and cost of making topographical surveys and the use of various instruments, much data can be found in various treatises on surveying and in papers and discussions that are available to those interested in and connected with such work, that would be helpful to the engineer who was called upon to make topographical surveys for logging operations.

But the successful engineer in this line must have a broad knowledge of the essentials in methods and costs of the modern system of logging and transportation that he may be able to recognize controlling features and requirements. These features he will develop with care while on other portions he will vary his methods to conform to their relative importance. It remains for the judgment of the engineer to adopt the best method to the case in hand and his ability to do this will depend largely upon his understanding and study of the methods and needs of logging operations in different character of country.

Cost can not help but vary with the character of the country surveyed, the care of developing lines of transportation will be governed by what is beyond that will be tributary, and whether the cost be 15 cents or 50 cents per acre, provided it be judiciously spent, it is probable that the greater the cost the greater the worth of the work.

The writer would say that if errors are to be made let them be made in the way of taking greater pains, for we can more easily become reconciled to a good map that cost 10 cents an acre more, than we can to one where the curtailing of cost by 5 cents an acre has resulted in deficient and unsatisfactory results.

I have said that the engineer when called upon for professional service, should study the methods of, and consult with, the logger.

I would say with equal emphasis, that the logger should consult with the engineer.

No one appreciates more fully than one connected with railroad work the strong and prevalent prejudice of the non-technical or "rule of thumb" man for technical men and methods, and the mutual suspicion that is often entertained between them regarding their methods and work.

While this may act as a spur to each, I would say that the most successful logger will be either a technically trained man or he will find it as much to his advantage to consult the engineer as it will be to the engineer to consult the logger. It is by a proper combination of the work of each that the best results will be obtained.

In summing up, the writer believes that a good topographical map is as desirable and valuable an accompaniment to investment and operation in connection with logging enterprise as a good cruise, and would again emphasize the point that the engineer making a topographical survey and map should first study the needs of the logging operations and should consult freely with the man in the woods, and that the man in the woods should consult as freely with the engineer, that the result may have the value to the business that it should have.

Timber of Lesser Slave Lake Region

D. Roy Cameron, B.A., B.Sc.F., has presented to the forestry branch a report on the timber of the Lesser Slave Lake region. The report, which covers the work of a survey conducted by Mr. Cameron for the branch last year, shows that large tracts of country around Greater Slave Lake are covered with valuable pulp wood.

The poplar type covers an area of about 923,000 acres. The average yield in pulp wood to 4 inches diameter over this area is ap-

proximately 20 cords per acre of aspen and balsam poplar. Of perfectly sound wood, figured on Mr. Cameron's estimate of 7.2 cords to the acre, there are 6,750,000 cords of pulp wood available. Adding defective, but not destroyed wood, at 12.8 cords per acre, which amounts to 11,810,000 cords, the total is 18,560,000 cords.

The report states that the poplar type is in general a temporary type, and the result of fires. At one time or another most of the area was covered with spruce, and is capable of being reforested with that species under capable management.

Turning to the lodge pole pine type, the report states that this covers about 1,900 square miles. On 95 per cent. of the area, comprising some 1,196,000 acres, there can be found at present 5 cords of pulp per acre of pine and spruce. Inasmuch as a great deal of this lumber is a young, growing stand, it may be considered certain that in twenty years' time the yield will increase 100 per cent. Thus by the time this timber is needed for pulp there should be a supply of at least 11,000,000 cords if fire is kept out.

Mr. Cameron submits a scheme of fire protection for the Lesser Slave Lake country, which appears to have been repeatedly swept by fires of great severity.

Two Good Reasons for Burning Slash

For Prevention of Forest Fires and Encouragement of Reproduction—Address before Recent Logging Congress

By F. E. Ames

The favorable attitude of the Forest Service toward slash burning in the coast type of forest can hardly be said to be the result of wide experience. Our cuttings in this type have not been extensive. There seem to me, however, to be two almost unanswerable arguments in favor of slash burning. The first is its desirability as a fire protective measure. Scarcely anyone will deny that old slashings are dangerous and that a successful burn nearly eliminates that danger. The time has really passed when there is much room for argument as to whether slashings shall be burned. In Oregon the law says they shall be, and 90 per cent. of the loggers in the Puget Sound country realize the advisability and advantage of burning slashings. Forest Service timber sale contracts contain provisions requiring the burning of the slash.

The real questions then are as to the methods. Of course getting the trash burned is not the hardest thing about burning slash, it is keeping from setting fire to the surrounding timber. Our contract clauses require the clearing of a fire line from 25 to 35 feet in width about the boundaries of the sale area as logging progresses, and the use of proper precautions in regard to the time and manner of burning. Both the Oregon and Washington fire laws require all snags, stubs, and dead trees over 25 feet in height to be felled if an area is burned over during the closed season. The Forest Service also requires the cutting of all dangerous snags. This is not so expensive as might be supposed, since enough good logs are often obtained to pay for the cutting. Our contract clauses do not specify the season when burning shall be done. This is a less important problem than it used to be because proper safeguards eliminate the dangers of spring burning. Our idea is so far as possible to dispose of summer slashings by fall burning, and of winter slashings by spring burning, thereby reducing to a minimum the accumulation of slash.

The second reason the Forest Service favors burning slash in the coast country is that this clearing of the ground makes conditions more favorable for the reproduction of the most valuable timber tree of this region, the Douglas fir. You all know how thick this species comes in on old burns. This characteristic of the tree is most fortunate since it fits in well with methods of brush disposal required from a protective standpoint.

In the yellow pine country the Service nearly always requires the brush resulting from logging to be piled and burned. The difference in method is due to the smaller amount of slash resulting from logging in pine and to the necessity of using a method which will do as little damage as possible to seed trees and reproduction left on the ground. The danger of fire escaping from burning of brush piles is relatively small if carefully done, and consequently the season at which it is done is less important. Burning can generally follow logging closely. There being no broadcast burn the snags are not so immediately dangerous, but since in any forest fire in that region they are the most difficult factor to control, all dangerous snags are cut.

The cost has been found to be close to 20 cents per thousand for piling and 5 cents per thousand for burning.

In burning brush piles it is a good thing not to set fire to the piles consecutively. Firing perhaps one-third of the piles and waiting until they are burned down before starting another third, decreases the danger of the fire getting too hot or escaping.

It is not necessary to wait until the piles are so dry that they will burn to a bed of ashes. The most inflammable parts of the brush are the needles and fine twigs, and if these are consumed and the coarser parts chunked up enough so that they burn fairly well the burning is satisfactory.

Advantage of the day and time of day should be taken in burning. If the brush is very dry it should be fired on damp days or early in the morning. Each pile should be watched when it is burning most hotly to see that it does not spread.

To sum up: The Forest Service makes a general practice, to which there are, of course, some exceptions, of disposing of its slash by burning, believing that any system by which litter can be removed from the forest without damage to the remaining timber is desirable from a protective standpoint.

The Proposed Freight Advances from Southern States

The advances in freight rates upon lumber from points in the Southern States to points in Ontario and Quebec, which were to become effective on September 1st, have been held over by the railroads upon an order of the Interstate Commerce Commission, resulting from protests filed by St. Louis shippers who would be affected by the change. The situation from the shippers' point of view was very definitely and forcibly presented in the protest referred to, which was in part as follows:

That said defendants are common carriers engaged in the transportation of passengers and property from points in the States of Arkansas, Louisiana, Mississippi, Texas, Georgia, Florida, Ohio, Indiana, Illinois and Missouri, to points in the Dominion of Canada, and as such common carriers are subject to the act to regulate commerce, approved February 4, 1887, and acts since enacted which are amendatory thereof or supplimentary thereto.

That the complainant maintains and operates a general selling office in St. Louis in the State of Missouri, and is interested in mills located in the various Southern States mentioned, and is the shipper of lumber and other forest products from these States to various points in the Dominion of Canada over the lines of the defendants.

That the defendants in their supplements and other tariffs have served notice to the complainants that on and after September 1, 1912, the rates on lumber and other forest products from all Ohio and Mississippi river crossings to points in the Dominion of Canada will be changed—most instances increased 1 cent per hundred, and in some instances increased 7 cents per hundred.

That the defendants, by issuing the supplements mentioned, have exceeded in some cases the rates on lumber and other forest products from Ohio and Mississippi river crossings that are now published in their various issues covering the sixth class rates, and which have always been held and maintained as the maximum rates on lumber; that heretofore the rate from Cairo to Toronto has been 19 cents, and which is the sixth-class rate in the class tariffs. The new supplements, effective September 1st, have exceeded the class rate and are published at 20 cents.

That the defendants, in committee tariff, issued by Eugene Morris, 131B, Supplement 11, I. C. C. No. 281, have printed rates to Canadian points and have indicated them by a character sign as a reduction, while in reality the rates as are published by them are an advance.

That the advanced rates complained of are published in Ill. Central Tar-No. 131-B. Sup., 11 I. C. C. No. 281; M. & O. tariff 7325, I. C .C. No. A-926; Mo. Pac., tariff 616-B, Supplement 5, I C. C. No. 9424; St. Louis Southwestern tariff 5885, Supplement 14, I. C. C. No. 3077; Vicksburg, Shrevport & Pac. 610-B. Supplement 16, I. C. C. No. 2679; Vicksburg, Shreveport & Pac. 610-B, Supplement 12, I. C. C. No. 2630; C. & E. I. tariff 2800-C, Supplement 14, I. C. C. No. 2596.

That the complainants maintain the rates as are shown in the tariffs above referred to are unreasonable, discriminatory and unjust; by reason of the fact that they exceed the present rates now in effect, and that further, the railroad companies in the United States are not complaining as to the revenue, nor neither have they registered a complaint that the rates as carried are not remunerative, but that in view of the attitude assumed by the Canadian lines in regard to the divisions of revenue, the roads in the United States are forced to make this advance in the rates in order to comply with the demands of the Canadian lines, and that tne entire advance is not based with a view of advancing rates, but with a view of adjusting an arbitrary division demanded by the Canadian roads.

New Issue of National Hardwood Inspection Rule Book

Mr. Frank F. Fish, Secretary-Treasurer of the National Hardwood Lumber Association reports that an order for 25,000 copies of the new rules, showing the additions made at the Convention in June, are now in the hands of the printer and will be ready for distribution not later than the 15th of this month. The work of getting these new rules into the hands of the trade has been unavoidably delayed, but all orders now on file will be filled about the 15th and every member will receive ten copies, to which they are entitled.

How to Retain the Buyer's Confidence

By L. H. Murray*

The majority of lumber salesmen have no capital invested in the business. No direct monetary loss is incurred by them should they fail to make a sale, yet few of them receive a salary equal to less than a five per cent. return on a $30,000 investment. This income is their share of the profits from their sales, which depend absolutely upon the good will or confidence reposed in them by their customers. This is the all-valuable asset or investment of the salesman.

Recently a lumber salesman resigned from employer A and entered the employ of B in the same capacity. At present over ninety per cent. of A's former customers in that territory are buying lumber of B through A's former employee. The buyers personally know neither A or B, but they are acquainted with the salesman and have confidence not only in his integrity, but also in his knowledge of grades and conditions at the producing end. Consequently they did not hesitate to give B a trial order. But here is where the salesman's success depends upon the co-operation of his employer. While I have known many instances where a salesman has received a complimentary order, his efforts are futile if the customer learns that his employer has but limited confidence in his ability. One of the most successful lumber salesmen whom I have ever known has made it a rule never to sell lumber for a firm which does not permit him to make adjustments on off-grade or damaged stock whenever an association inspection is not demanded. While this increases his responsibility, it strengthens his prestige with his customers.

One overt act on the part of a salesman may ruin forever his prospects of selling a customer. Conversely he may as quickly win the dealer's unbounded confidence. Only yesterday a big buyer told me that he will never place another order with S—, for while that salesman was in his office, he was called away for a few minutes, and upon his return he discovered S— perusing his order record. S—'s lumber is as good as it ever was, but he has lost the dealer's confidence. A young salesman once entered a dealer's office and was very anxious to sell No. 3 yellow pine boards. His firm was overstocked on the grade and this particular buyer was in the market for cheap sheathing, but was undecided whether to buy No. 2 merchantable hemlock or No. 3 yellow pine. The dealer finally asked, "Have you seen these boards?" The salesman replied that he had. The retailer then showed him the No. 2 merchantable he was using and asked, "Are your boards as good as these?" The new salesman told him they were not. The sale was lost, but the dealer now places the majority of his yellow pine orders with that salesman.

Evolution

It has been said that the evolution of a traveling man has been "bummer, drummer, and traveling salesman." A certain lumber dealer in my territory is addicted to the use of liquor, and frequently invites salesmen to accompany him to a nearby saloon to have a drink. Several months ago I was at a hotel with four other lumber salesmen when one of those present asked another if he sold this particular dealer. The latter replied that he did. The former and older man asked, "Has he ever asked you to take a drink?" The reply was, "No." The old salesman said, "Well, believe me, if you ever refuse to drink with him you will never sell him again," It so happened that the very next time the young salesman called on that dealer he was asked to accompany him and his yard foreman to the saloon, He did so and paid for the drinks, but ordered a cigar for himself. Replying to the customer's inquiry he explained that he did not drink. They returned to the lumberyard, where the salesman received orders for two cars of "uppers." The dealer said, "I have asked many other salesmen who do not drink to go over there with me, and they have always ordered a drink and thrown it in the cuspidor when they thought I did not see them, and by —— you are the first one who has had sand enough to tell me that you are on the water wagon." It was not the fact that this particular salesman did not drink that won the dealer's confidence, but simply because the principles were not for sale.

Many salesmen have made the mistake of changing employers too frequently. A $25 a month advance is very tempting to the majority of us, yet a few changes even at an advance in salary may place us beyond our earning capacity in the dull season, and shake the confidence of the dealer. The customer, in addition to changing the source of his lumber, which must be done if he sticks with the salesman, will soon question whether the salesman's present employer is as reliable as some one of the former; or he is prone to think the changes were not made voluntarily. While talking with me concerning another salesman, a dealer once said, "When he enters my office I always ask him, 'For whom are you now selling?'" There was an implied meaning in the statement which showed the salesman was losing his hold on that customer.

Our greatest asset, which is the retention of the buyer's confidence, is as unstable as the capital invested by our employers. We must guard it as carefully as he does his money, for money once lost may be regained, but confidence never. A friend of mine who worked his way through college by breaking colts told me if a horse kicked at him, no matter how gentle he afterwards became, he never went near that horse without thinking of the time he kicked.

It is a mistaken idea for the salesman to assume that he can gain the confidence of the dealer by giving him an advantage in an adjustment of grade or on a settlement of a complaint. While he may show some appreciation for such an act, he has more respect for the man who has the backbone to stand up for his employer. A young man who had been a grader in a mill started on the road as a salesman in my territory. He was advised by many older salesmen not to call on the S— Lumber Company for S— was a kicker and a scrapper. Contrary to their advice he called on S— and sold him. Upon his third call he sold the company a car of B and better finish. In a few weeks he received a wire from his house advising that S— had complained of their finish. He went to S—'s yard and found that 4,500 feet of the stock was a select grade. The difference in price between the two grades was $6 a thousand or $27 in all. S— demanded a reduction of $40 on the car. "If you were my own father," said the salesman, "and my firm was my bitterest enemy, I would recommend a reduction of $30 in settlement, for you use a select grade as well as a B and better, and I do not think the extra handling would cost over $3." S— was so thoroughly convinced of the salesman's sincerity he accepted the proposed settlement and became one of the salesman's best customers.

All of these illustrations are unembellished facts which I have observed in a few years on the road, and which I know to be absolutely true. We may have codes of ethics, instructions for salesmen and books on salesmanship, but the fundamental requisites necessary to secure and retain the confidence of the dealer are ability, hard work and the qualifications of a perfect gentleman.

* The above article was one of the prize winners in the recent competition conducted by the American Lumberman.

Profitable Use of the "Off" Season

Among retailers of lumber quite generally there is a tendency during the "off season" to restrict purchasing of stocks to the lowest possible limit, and the "hand-to-mouth" policy becomes the rule, says a writer in the Lumber World Review. At such times the manufacturers' salesmen are not so omnipresent as in the busy season, for they are reluctant to "get out and hustle" when the yard men are not in a receptive mood. The midsummer dullness has for many years been a great drawback to the business, and the dealers in the rural communities have fallen into the habit of relaxing effort and vigilance and accepting as a matter of course the stagnation of the mid-year period.

While the retailer can not expect people to come to him for lumber when they do not need it, or are too busy with crops or other work to do any repairing or building, he can employ the spare time advantageously by dropping in on his neighbors and sizing up the prospect for fall business.

If the dealer is not fully posted on the market situation it will pay him to watch closely the columns of his lumber paper—without which, of course, he can not expect to get along in business—and he should not fail to keep in close touch with the secretary of his association—without which also a retail tradesman certainly is at a disadvantage—and through every means available keep informed on current conditions. By so doing he will prepare himself for the fall season and possibly he may see an opportunity to avail himself of price recessions that will induce him to buy in advance of the coming demand. In this way he can profit by the spare time of the dull season and forestall any disadvantage which might occur later, such as car shortage or dearth of supplies at the sawmills.

Salesmen in the Summer

As it is with the retail lumber dealers, so it is with the manufacturers' salesmen in the summer season. The time drags very slowly where commissions are at stake and, with the retailers, they have to play the "waiting game" until the fall revival of trade. But they also have means of putting in the time profitably during the dull days. While many of them prefer the shade and the siesta, there are those who are "Jack-at-the-wheel" all the time. They keep track of trade, blow hot or blow cold. They paddle in sweat or revel in shivers. While the fellows who are luxuriously inclined are dallying with mint juleps on the front stoops of country club houses, these Jackies are poring over stock sheets or happening in on some new find in the yard business. This allusion is not intended to cast any reflection on the taste or intelligence of the fellows who prefer the juleps—not in a thousand—but it is intended to illustrate a fact, which is, that to the retail lumberman and the lumber salesmen the "off season" for trade may not be altogether a period of business stagnation.

The Best Time to Buy

To the lay mind it would appear that the quiet period in the lumber trade is the best time to lay in stocks, and not without rea-

son, as all conditions then usually are more advantageous for the purchase and shipment of lumber. The present season so far has been corroborative of this assertion, yet the yards of nearly all sections of the country have, according to general report, adhered to their habit of holding off for the beginning of fall demand. From many points come the reports that stocks are low and badly broken; and many of them are liable to remain so if the current prediction of car shortage are fulfilled.

A Fastidious Yard Owner

Order being nature's first law, it is most commendable in all walks of life, and particularly in those where there are many things to keep in order. A lumber yard? Yes, that's one of them. A good sized retail lumber yard presents as many opportunities for the exercise of a sense of order, almost, as a library or a 10-cent store. Where there are two or three hustlers to look after, a yard man has plenty to do on his hands to keep things picked up, and laid straight, especially when business is brisk and there is a large variety of stocks in the sheds.

One of the most finnicky men ever heard of, about order in his yard, was a dealer in an eastern city who handled about everything that ever entered into the make-up of a lumber yard, and a number of things besides. He employed five or six men—selected for their abnormally large bumps of order—who were constantly on dress parade, and it was "Careful, Jeremiah, watch your sticks; keep them straight. There, James, brush off the sawdust from that board. You are very careless to load lumber in that condition," and so on. He was as careful of his boards as he was of his clothes, and they were always "spick and span." As the aforementioned Jeremiah once remarked, "Be gorry! It's a great pain in me face I have from blowin' the' dust off av th' lumber. Next thing we know that jood boss av ours will be after makin' us use feather dusters on it, bad scran to him!"

The office of this man's yard was as neat and tidy as a lady's boudoir, and it was with fear and trembling that any one of the yard hands approached its outer portal. Once a careless or forgetful employee expectorated tobacco juice on the walk just outside the office door, and the lecture on the evil of uncleanliness that he was compelled to listen to, gave him such a jolt that he bolted his "cud" and, like Bill Nye's dog, "Entomology," went outside and regretted it.

This dealer stood high in the community, however, and was widely known for his clean business dealings as well as for his clean stocks. He was as careful of his business reputation as he was of the appearance of his office and sheds, and although his men called him finnicky, they freely accorded him the respect to which he was entitled.

When Trucking Lumber In

If, when stock is brought in from the yards to planing machines, it is piled on the trucks with regard to being fed into the planer the right way, it saves time at the machine and insures smoother stock, with fewer boards run against the grain, says the Wood-Worker. This sounds like going to some trouble in the yard to save the planer man having to watch the run of the grain and having to turn some boards. It is trouble, though, that is being demanded by the fast-feed machines, because the operator has no time to look or turn boards—they must be turned the right way on the truck when brought to the machine. And it is really the right thing to do, anyway. The place to begin using brains is right when you start to get lumber out of the piles and bring it in for work, and the man with sense enough to select the lumber that is needed also has the sense to turn it the right way for feeding through the planer while he is at it. It is merely a matter of paying attention. We have reached the point in efficiency where attention is one of the essentials at every step in the work, from the time a board starts from the pile till it is shipped out as part of the finished article.

English Demand for Hickory

United States Consul H. L. Washington, Liverpool, Eng., in a recent report says:—"It appears that there is a constant and fair demand for good quality hickory, and three Liverpool firms that were interviewed have expressed a willingness to communicate with American exporters. Their names and addresses are on file in the Bureau of Manufactures. The two firms first mentioned in the list use both hickory lumber and hickory dimension stock. The third firm up to the present time has used hickory lumber only, but states that if it can be assured that the sizes of the dimension stock when ordered will be sawn exact to a small degree, and not varying, say, one-sixteenth to one-eighth of an inch either way, it will consider taking up that part of the business. All three concerns supply wheelwrights and other trades with required pieces after bending into the shape desired.

"It is very difficult to arrive at an average price owing to the varying quality of the wood. Some idea, however, may be obtained from quoting the following: 'Hickory lumber 42 to 60 cents, dimension stock about 73 cents per cubic foot.'"

Personal Brevities

Mr. A. D. McRae, of the Canadian Western Lumber Company, has been gazetted honorary colonel of the Sixth regiment of the Duke of Connaught's Own Rifles, in Vancouver.

Mr. G. Skiff Grimmer, of the U. of N. B. class of 1908, is engineer and forester for the American Canning Company, near St. Andrews, N.B. The company has a considerable tract of timber and will grow timber for box shooks.

R. G. Lewis, B.Sc.F., who has been for some time engaged in the compilation of the forest product bulletins for 1911 at the head office of the Forestry Branch at Ottawa, is leaving shortly for the Maritime Provinces in connection with a study of the wood-using industries there, on which the branch is entering.

Mr. John A. Potts who for a number of years occupied the position of Superintendent of the Dalhousie Lumber Co., at Dalhousie, N.B., has accepted a position as Manager of the Maritime Lumber Company's mill at Sherbrooke, N.S. Mr. Potts has been for 9 years in Canada, having come originally from Newcastle-on-Tyne. Since his arrival in Canada he has been employed continually by the Dalhousie Lumber Co. In the old country Mr. Potts was in the service of John Herring & Co., a well known lumber importing firm.

Mill Waste for Pulp

The United States Government Forest Service in a recent canvass of some of the large sawmills of the country established the interesting fact that mills with an aggregate cut of 5,440,000,000 board feet had a final waste of 1,870,000 cords of slabs after the best had been used for lath in the many mills. A little less than half was used for fuel at an average price of $1.40 a cord. A little more than one-fourth was burned in the waste burner or slab pile, and about one-fourth used for fuel under the boilers. Assuming these mills to be representative, the slab residue from the entire lumber cut of the country would amount to about 14,000,000 cords, of which 6,000,000 are sold for fuel, 3,500,000 used by the mills for fuel, and 4,500,000 burned in waste burners. When we recall that we use about 4,000,000 cords of pulp wood, says the Bangor News (and one-quarter of this is imported), and that the exhaustion of our pulp wood forests is a live question, it is seen that this cheap slabwood refuse, with the large item of sawdust refuse added, makes an inviting field for the inventor. The iron furnace slab heaps are being seized upon by the brick maker, the screening dump of the coal mines is being worked over by the briquette maker; will it not soon be the custom for the pulp maker to draw his wood supply from the slab and sawdust pile?

American Lumber in the Prairie Provinces

American competition in the export fields, even with its pronounced effect upon the business of British Columbia, has been given less publicity than the heavy exports made from the United States to the prairie provinces, says the Lumber World Review. American lumber has apparently found a profitable market there, the exports from the State of Washington to Canada during 1911 increasing about 7,000,000 feet.

The explanation of the American advantage, according to the American consul, appears to be that the Washington mills sell cheaper than local concerns. The writer is reliably informed that a number of British Columbia mills could have sold a great deal of lumber on the prairies at a lower price than the American mills, shutting the latter out, and made larger profits, if they had been willing to do so. The Canadian mills have the advantage of both a lower freight rate and no customs duty. On finished lumber, for instance, quoted at $35 on the prairie, the American manufacturer receives net about $21, having to pay $8 freight and $6 duty. The Canadian mill would receive $28 selling at the same price, its freight rate being $1 less.

The Schimmel Line of Belt Sanders

Schimmel, Reid & Company, Faribault, Minnesota, have issued an attractive catalogue of their Spiral Belt Sanders, Simplex Belt Sanders, Utility Belt Sanders and Spiral Contact Device. The Schimmel line of belt sanders includes four styles of machines—the Standard and Suspended models of the Spiral Sander, both capable of producing the highest quality of uniform surfacing, the Simplex Hand Block machine, and the Utility small surface sander. The spiral contact device is an attachment for fitting on any other make of belt sanding machine to obtain greater efficiency. The Spiral Sander is a great saver of time, labor, material and power. The catalogue is attractively prepared and would be of benefit to all wood-workers. Readers interested in this line will be promoting their own interests by writing to the above company for a copy of this interesting publication, and mentioning the Canadian Lumberman & Woodworker.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Lumber Wanted

Several cars of good 1-inch No. 3 Common Hardwood, Birch preferred. State quantity, average width, and best price. Box 578, Canada Lumberman, Toronto, Ont. 18-21-5

Slabs and Cord Wood Wanted

Am open to buy any quantity up to 10,000 cords hard and soft wood slabs and cordwood. Write me. Horace Hartley, 19 ayor Street, Montreal. 15-19

Lumber Wanted

White Pine and Basswood Slabs wanted; from this season's cut; must be bright and of good thickness. Write stating how many cords you have, what you want for it on cars your station, and how much is ready to ship now. The Wm. Cane & Sons Co., Ltd., Newmarket, Ont., Canada. 17-19

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

FOR SALE—LUMBER, ETC.

For Sale

100 M. ft. 2-in. Cull Spruce. 300 M. ft. 1-in. Cull Spruce. 15 M. ft. 1¼-in. M. C. White Pine. 50 M. ft. 2-in. M. C. White Pine. Fred T. Smith, 310 Board of Trade Bldg., Montreal, Que. 1.t.f.

For Sale

25,000 ft. 2-inch Rock Elm.
40,000 ft. 1½-inch Rock Elm.
All No. 2 Common and Better.
Can ship promptly.

J. H. DIRSTEIN,
17-18 Elmwood, Ont.

Lumber For Sale

4 cars 1-in. good cedar for boat building.
100,000 ft. 2 x 6 mill run hemlock.
100,000 ft. 2 x 8 mill run hemlock.
4 cars 2-in. white oak, sound and square edge. Apply to Geo. C. Goodfellow.
C Montreal, Que.

For Sale

For quick shipment, 800,000 ft. Birch. All grades and thicknesses.
200,000 ft. Soft Elm M. R. All thicknesses.
100,000 ft. Basswood M. R. inch.
100,000 ft. Maple. All grades and thicknesses.
Send us enquiries. The Meaford Lumber Company. 7-20

For Sale

For quick shipment, 100 M. ft. 2-in. Birch, December, 1911, cut. No. 2 C. & B. at $20 per M. on cars. Farm Point, Que. Hall Bros., 174 Mutual Street, Toronto, Ont. 16t.f.

FOR SALE—MACHINERY, ETC.

For Sale

Large three band sawmill complete, blacksmith shop, docks and trams, located at Ford River, Mich. Will sell at a bargain. Address I. Stephenson Co., Trustees, Wells, Mich. 17-19

Machinery For Sale

A Waterous No. 4 Band Saw Mill, with Carriage Saws, Live Rolls, and complete Filing Room equipment, also several Good Woodworking Machines, in splendid condition.

J. S. FINDLAY,
2-TF Owen Sound, Ont.

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 70 H. P. boiler, 60 H.P. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

Machinery For Sale

Carver, 4 spindle, Rohlman.
Cut-off saw, railway.
Dovetailer, Boults.
Engines and boilers.
Jointer, chair seat, Jenkins.
Moulder, two side, 6-in. Smith.
Moulder, three side, 6-in. Smith.
Moulder, four side, 6-in. Houston.
Moulder, four side, 9-in. Fay.
Moulder, four side, 12-in. Woods, inside.
Mortiser, Smith.
Mortiser, Bit.
Planer, 2-in. Gem.
Planer and matcher, 9 in. x 6 in. Berlin.
Resaw, band, American, 48-in. wheel.
Resaw, 42-in. circular.
Ripsaw, band, 42-in. wheel.
Sander, 24-in. Perry, power, two drums.
Saw gummer, Rogers.
Sawmill, band, 63-in. wheel, carriage, 18 ft.
Shaper, home made, wood frame, two spindle.
Shaper, iron frame, wood table, two spindle, light.
Shaper, iron frame, wood table, two spindle, heavy.
Swing saws, 6 ft.

O. L. Packard Machinery Co.,
Milwaukee, Wis.

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Situation wanted, as office or general man. Sixteen years' experience in lumber. Good references. Box 561, Canada Lumberman, Toronto, Ont. 17-18

WANTED—Position by young man as sawmill office manager or shipper. Ten years' experience with largest hemlock concern in East. References A.1. Address Box 560, Canada Lumberman & Woodworker, Toronto, Ont. 17-20

Advertiser, who knows his business, wants position as Superintendent or Manager with a live lumber concern operating in Ontario or Quebec, where he can obtain an interest. Have best of references. Box 572, Canada Lumberman, Toronto, Ont. 18-3

Manager and Salesman

Would like to correspond with large first class Hardwood Manufacturers unrepresented in New York territory, who would open office here. Years of experience in all lines of hardwood trade. Well known and draw large business. Employed now and could hold open for 1913. Married; good salary wanted. Box 571, Canada Lumberman, Toronto, Ont. 18-8

Thoroughly experienced office man, Canadian, age thirty-four, married. Expert bookkeeper and cost accountant, sawmill, wholesale and box factory. Experienced selling yellow pine; also seven years experience white pine, United States and Canada. Desire change to healthy location with good schools. Prefer position as assistant manager or office manager. Haven't lost a day in thirteen years. Reply, Box 584, Canada Lumberman, Toronto, Ont. 18-10

WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

A Band Resaw Filer to take care of a 5-in. Resaw machine. Reply, Edouard Ruel, Lauzon, Levis, Que. 18-9

WANTED—Salesman with some knowledge of measuring and inspecting lumber, age from twenty-five to thirty-five years. Apply Box 568, Canada Lumberman, Toronto, Ont. 18-21-2

Wanted

A first-class man to take charge of a well equipped Planing Mill, and Sash and Door Factory. Only a man capable of estimating and drafting need apply. References will be required. First-class salary to right man. Reply to Box 497, Renfrew, Ont. 17-19

WANTED—Good man with experience in bush work to take position as supervisor over a number of camps. Must be perfectly sober, active and have a general knowledge of timber and bush work. Apply with references, Box 567, Canada Lumberman, Toronto, Ont. 18-1

WANTED — Well experienced foreman, thoroughly posted in manufacturing of Hardwood Flooring can get immediate position at mill running whole year. Apply to Hardwood Planing Mills, Head of Tide, N. B., giving particulars of former employment and references. 18-6

Reporter

We want an energetic representative in each town in Canada to report on building and engineering work—to tell us where machinery, equipment, supplies or materials may be sold. Reports are paid for on the per item basis. It depends upon your own efforts how much you make. This is a profitable side line and there is good money in it for a hustler. Write to MacLean Daily Reports Limited, 220 King Street West, Toronto.

BUSINESS OPPORTUNITIES

For Sale

Timber limit, comprising 18 sq. miles, containing 25,000,000 feet mixed timber. Apply Geo. S. Nesbitt, Rupert, Que. 16-19

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 115 h.p. boiler, 100 h.p. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

WANTED—To hear from Box Mills in position to furnish boxes in car loads. Apply to Geo. B. Breon, Williamsport, Pa. 17-20

Advertiser wants to purchase small timber limit having at least ten million, sawmill, etc., or will consider half interest. Answer Box 573, Canada Lumberman, Toronto, Ont. 18-4

For Sale — Sawmill with Capacity

Of one hundred thousand feet per day. Located in Everett, Wash. Good rail and water shipping facilities. Ten and one-half acres of land with excellent mill pond. Price less than one-third of appraised valuation. 15-18

Address, P. GARDINER, Everett, Wash.

FOR SALE—A farm, sawmill and timbered lands, also a quantity of choice clear soft pine plank sidings. Apply to Hugh Cameron, Canonto P. O., Ont. 17-18

Timber For Sale

Tenders will be received up to and including the first day of October, 1912, for the right to cut white and red pine and spruce, on two timber berths on the upper waters of the Jocko River east of the townships of Garrow and Lockhart, in the District of Nipissing, Province of Ontario, the berths being designated "Jocko No. 1" and "Jocko No. 2," each containing twenty-five square miles more or less.

For maps and conditions of sale apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, July 17th, 1912. 15-18

Important Sale of Valuable Timber Limits

Sealed tenders will be received by the undersigned up to and including the **20th day of December, 1912**, for the purchase of:

Limit No. 194 of 1873-74—River Jean de Terre—tributary to the Gatineau, containing an area of fifty (50) square miles, more or less.

Limit No. 195 of 1873-74—River Jean de Terre—tributary to the Gatineau—Island Lake, containing an area of fifty (50) square miles, more or less.

These limits comprise some of the best pine and pulpwood areas in the Province of Quebec.

Map showing location of these timber limits and report thereon may be inspected at the offices of the undersigned and from whom further information may be obtained.

The highest or any tender not necessarily accepted, and the acceptance of any tender will be subject to the approval of the Court.

Dated Ottawa, August 5th, 1912. 16-20

Adjustment of Band Saw Guides

The construction and adjustment of saw guides as the blade enters and leaves the cut are very important factors in the successful working of all kinds of band saws. In referring to vertical log band saws, Baldwin remarks in this connection that the guides for supporting the saw blade must

be properly fitted and adjusted, and the column carrying the upper guides must stand exactly parallel with the saw blades. While the guides are a necessary adjunct to the mill, yet the saw should run practically independent of the guides. The back guide should never be used except as a measure of safety. If the column carrying the upper guide be not nicely aligned the saw will come in contact with the upper guide either on wide or narrow timber, as the case may be.

The saw must not vibrate against the guides. Keep the wheels perfectly aligned; the crosshead carefully adjusted to see that it is free to move up and down, and thus retain an even strain on the blade, the feed rolls aligned with the saw blade, and the whole machine examined to see that all parts are nicely in balance to avoid all tremble or vibration. Having the above points attended to, if the saw fails to do good work it will be found that it is not perfectly tensioned or perfectly fitted, and the fault of this is chargeable either to a lack of a good filing room equipment or to a lack of skill in its use on the part of the filer.

Set the guides so that you can see a fair light between them and the saw. The closeness of the guides to saw must depend somewhat on the fineness of the tension. If the saw is perfectly levelled it will run on a narrower opening of guides than if it contains lumps, twists, etc. Guides are variously made of steel, hardened babbitt, wood, etc. Steel or babbitt guides are most commonly used. Wood guides are open to several objections—that if water is used on saw they are not reliable, and they are more liable to heat the saw. If the guides are set too close the laps in the band saw may strike against them and cause a crack to start at this point. It is well to dress lap a trifle thinner than the regular gauge of saw.

In adjusting guides, slack off all four guides from the saw. Next set the lower log side guide up to the saw, put in a sheet of writing paper between the guide and saw, and screw up guide until the paper will not fall out, but not so hard as to move the saw out of line. Fasten the guide firmly, and then put in another piece of paper between saw and the board side guide and push the guide hard up and fasten firmly, and if right the paper will pull out tight and will leave a perfectly guided saw without too much or too little clearance. Set the top guide the same way, but be careful not to move the saw out of line when setting the guides. If a band saw is hammered and fitted right and the mill and guides are properly lined, the saw will stand a good feed and cut straight timber.

Piano Case Woods

Piano manufacturers in the United States are using chestnut in increasing volume, specifically for the ends of piano cases. Two-inch chestnut is used and then veneered. They have come to chestnut for two reasons; because it is fairly readily obtainable while hard maple has become scarce, and because it has been found that chestnut takes glue very well.

Furniture manufacturers are using higher class veneers than ever before. They have found that it is best to spend a little more money to get good figure. While pianos are supposed to be bought for their tone nevertheless the appearance of the case has much to do with the sale. The piano usually is the most conspicuous object in any room in which it is placed, and its appearance, therefore, is also a prime consideration. People inexperienced in piano quality are often good judges of looks and the appearance of the case becomes the argument that clinches the sale.

Circassian walnut has become a new factor in piano case manufacture. It may not have replaced anything, but it has become extremely popular, and in consequence a large number of Circassian walnut cases are being made and sold.

Using Water on Machine Saws

There is something materially wrong with the saw that needs water while at work. Water is a very objectionable liquid or substitute to use about saws and machinery; besides its tendency to damage the timber being cut, it also rusts up the benches and the saws, therefore it should be strictly avoided or abandoned. To free the teeth of gum or resin three drops of turpentine or paraffin are of more use than three gallons of water. Some operators use water to prevent the heating of saws while at work; also that they may regain their nomal. Where such makeshift methods are prectised it simply indicates the defective condition of the tools, and a deplorable lack of efficiency on the part of the saw trimmer."

Ties Scarce in Australia

The state of New South Wales, Australia, through its Department of Works recently issued a requisition for a large supply of railway ties to be used in connection with an extension of the railroad line between Wagga and Tumbarumba. Over seventy thousand ties wil be required, and in spite of the fact that this has been given wide publicity, no offer has as yet been received to supply them.

This would seemingly indicate that the local supply of hardwood is getting low. Hardwood ties running into the hundreds of thousands have annually been exported from New South Wales to other states, and the question of where to secure a sufficient quantity to meet local demand is puzzling the officials. This condition prevails in spite of the fact that reforestation and conservative cutting are thoroughly carried on in the state. The lack of bids on the tie order seems more surprising in view of the fact that the line is owned and operated by the state government.

Ripping with Band or Circular Saws

At the present moment all over the world there seems to be a keen rivalry between the band saw and the circular for both log conversion and re-sawing, and probably this keen competition for supremacy will ultimately terminate in a complete transition of change in current methods of sawing, inasmuch that the band saw will "come out on top" and displace the circular, says the Timber Trades Journal. Of course, it must be admitted that circular saws as a rule give a smoother surface to the wood, but the many other disadvantages embodied in this tool compared with the band makes it the inferior tool. Band saw enthusiasts claim that it is immensely superior economically and in many other respects to the circular saw. The remark that band saws can be fed faster than the circular saw (up to 300 ft. per minute) is not correct. For ordinary re-sawing from 1 in. up to 8 in. the circular saw can be fed as fast as any band saw can, but that either could be fed at the enormous or absurd rate of 300 ft. per minute is preposterous. No saw should be subjected to the half of this feed speed, even when the stuff does not exceed 2 in. deep.

A Sash and Blind Wrinkle

Probably some of you millmen have noticed long ago that the manufacture of blinds is not what it used to be. Especially is this true of the smaller cities and towns where nowadays you hardly ever see a house erected that is equipped with outside blinds.

Recently while in a neighboring city, I had occasion to visit an old carpenter, who, having had blinds on his windows, had removed the slats and cut a rabbet 5-8 inch wide and 3-8 inch deep in the frame of the blind. In winter time he puts glass in these blind frames, they making a good outside window, protecting the house from cold and keeping the windows from freezing.

In the warm weather season he removes the glass and buts back his slats, which he has fitted in a frame to fit the rabbet he cut in the blind frames.

Thus in an instant he can change from blinds to outside windows or windows to blinds.

Wouldn't this be a good idea for some sash and blind manufacturer to adopt? Given a good trial, it would surely prove to become popular.

Job Tracing

There are several different practical and workable plans for keeping track of the cost of jobs in a planing mill, even down to every detail, says The Wood-Worker, of Indianapolis. But there is another bit of information that none of them cover in a satisfactory manner. That is, information about where and in what shape any given job is in. Here is the proprietor of a big, busy mill, who puts in much of his time on the outside getting business. He likes to know what shape his work is in, when this job will be through, and how that one is getting along. His business is too big for him to walk out and get an idea by looking through the mill. What he wuld like to have is some comprehensive system of job-tracing and record-keeping, so that when he comes in at night he can glance at a certain record and tell just where his work is at and how each job is coming along. That is much more difficult than cost-keeping. If you are skeptical, just try your hand at it.

The Planer Set-Dial

Practically every planing machine is provided with a set-dial and a pointer, supposed to show in more or less detail just what thickness of stock the machine is set to cut at any time, says the Wood-Worker, of Indianapolis. But practically all that many of these are used to show is the difference between the inches. In other words, they do not enter into serious consideration when it comes to getting down to the exact thickness of stock going through the machine; a rule or gauge is used for this, and applied directly to the material after it gets through the machine. It is a sort of cut-and-try process that really should not belong in the present order of machine work. It is easy enough to make dials and pointers as a part of machines that will show measurements as accurately as on a hand rule. There are some on sanders that show much finer graduations than the average pocket rule. Making them is not the trouble, though. The weak spot about them comes in the fact that the knives may not be set to cut the same depth each time. But isn't it time for us to get after that very matter with the new order of knife-setting, and get a positiveness that will make the dial on the front of a planer just as reliable as a gauge, in the matter of thickness? It would certainly save time, and it would make the planer dial a really useful part of the machine and not a mere joke —as many of them are to-day.

Review of Current Trade Conditions

Ontario

The delivery of B. C. shingles is becoming more difficult every day not only owing to the scarcity of labor, but also more particularly on account of the shortage of cars for transportation, and the situation is rapidly becoming acute. Owing to these conditions many firms are refusing contracts, and dealers who anticipate using shingles will be wise to place their orders at an early date so as to ensure their being filled.

Hemlock stocks in shorter lengths, such as 12 ft. and 14 ft. are scarce and will probably continue so until the production of another season's cut. There is still a fair supply of lath although a shortage may no doubt be looked for a little later on. The quantity of pine continues good except in mill culls and dead culls.

Boxmakers are complaining bitterly of the price of box lumber (mill culls), and they are looking out for substitutes. It is not impossible that the conditions of 1907 may repeat themselves. The hardwood trade is fair and quite steady and the American trade is now making enquiries for stock. Viewed generally, trade in Ontario is, and has been, remarkably good during the summer months, which is quite an unusual state of affairs. Prices generally are unchanged.

Manufacturers, wholesalers and jobbers continue to report that conditions governing the paper trade at Ottawa, were never more favorable. Owing to continued rainfall, the extent of which was unprecedented for the month of August, there is ample power available. The river is higher than it has been for years at this season. The demand in all lines continues heavy, news print finding a particularly ready market. There has been no movement in prices.

Reports from Western Ontario tell of considerable sharp advances in piece stuff both in Norway and hemlock. There is a very sharp demand for both of these classes of lumber and a shortage in the market, and scarcely any dry stock to be offered at the present time.

Eastern Canada

The lumber business at Montreal continues on an active basis. Trade, in fact, was never better, according to reports from the wholesalers. This applies to every branch of the business. There is a scarcity of dry stocks and the new cut is slow in appearing. All descriptions of spruce are firm at the recent advances. Lath are scarce and stocks of dry lath at the mills have practically disappeared. Shingles are somewhat higher. The car shortage is commencing to make itself more noticeable, although there is not as yet any serious shortage compared with what is feared in the near future. Shipments to Great Britain continue in satisfactory quantities and prices are firm. There are plenty of canal boats for the New York trade. The pulp and paper trade is also on a satisfactory basis, news print mills having a little more business than they can handle. The demand for sulphite fibre is strong and likely to continue so. The Canadian consumption of ground wood is heavy, although the shipments to United States show an extensive decrease. It is expected that a shortage of ground-wood will develop when the Fall demand appears.

Boston reports show that the demand for shingles and for some of the coarser varieties of lumber have advanced quite noticeably of late. The market in general shows a rather stiffer tendency, and the outlook for Fall trade is most promising. The demand for Canadian lumber is strong and stocks are pretty well sold ahead.

A fair volume of business is reported in Eastern spruce at Boston. Some wholesalers report that they expect better prices during September than they have been receiving. Frames are selling at $24.50 and some retailers claim to be purchasing them at $24.25. On the other hand some manufacturers are holding out for $25.00. Random is rather more quiet than formerly. The price of 2 x 4 is from $22 to $22.50. Spruce covering boards are about steady, selling at $21.50 for 5-in. and up, wide, 8 ft. and up, long. Most holders however, will accept $21. The hardwood market at Boston is rather quiet. Plain oak is in good demand and firmly held. Stocks are rather light. There has been a better demand for quartered oak although offerings are rather smaller than formerly. Shingles are firm at Boston and some manufacturers are edging the prices up a little bit. One brand of the best cedar extras is held at $4.25 and another good brand is quoted at $4.10. Extras are quoted at $3.90 to $4 and clears at $3.60 to $3.75. An upward tendency is reported in the market for lath. The asking price for 1⅝ is $4.15 to $4.25 and for 1½-in. the price runs from $3.75 to $3.85. At New York the demand for eastern spruce continues active and prices are unchanged. The price situation is strong and very little surplus stock is offered at mill points. The demand for all kinds of hardwoods at New York continues active. Plain and quartered oak are strong. Thin maple and birch are in good demand and wide and thick stock are also selling well, although offerings are scarce.

Great Britain

The improvement in the trade in wood goods at London which has been noticeable of late is still well maintained and even shows signs of increasing. Many buyers who were holding off, have commenced to realize that the higher level of prices resulting from increased freight rates will not be reduced during the present season. Accordingly they are now coming on the market for supplies for future requirements. Deliveries at London docks for the week ending September 24th amounted to 7732 standards as compared with 6348 standards during the corresponding week of last year. At Churchill and Sim's recent auction sale, 3 x 7, 2nd Quebec spruce was sold at £10 5s. per standard for a lot of 13 foot stock. A lot of dry clear face red pine from Montreal, in 12 to 16 foot lengths was sold at £12 10s. per standard for 1 x 8 and £14 for 1 x 7. Third quality red pine from Montreal brought £10 15s. for 2 x 9, 18 foot. Some prime dry Quebec birch, 4 x 4/9, 7/17 ft. was sold at 1s. 4d. per cubic foot. Another lot of 3 x 7/13, 6/16 was sold for 1s. 10d., and 3 x 7/15, 7/16 ft. brought 1s. 3d.

The soft wood trade at Liverpool continues on a steady basis without any alterations worth of note. There are indications however, that consumers in country districts are commencing to understand that they must pay higher prices to cover the increased cost of importation. The spruce deal market shows no change and it is still an extremely difficult matter to secure freight from St. John and other ports in the New Brunswick and Nova Scotia districts. Stocks in the Maritime Provinces are reported to be low and holders are not eager sellers. These facts and the approaching close of the season which will affect the cost of marine insurance all point to an advance in the price of spruce deals. Canadian pine deals at Liverpool are quiet. Consumers continue reluctant when it somes to paying the prices required by importers. Consumers in fact seem to be paying no attention whatever to the fact that the cost of getting out pine deals is continually increasing.

At Manchester the volume of trade in the lumber business is steady and shows signs of continuing so without decrease for some months. Prices in general have an upward tendency. Spruce has apparently reached its lowest value for the year and prices of yarded stocks are reported to have been advanced. Further advances are expected in the near future.

A slight improvement in the trade situation is reported from Bristol and it is hoped that during the last few months of the year some amends will be made for the poorer results of the previous months.

No change of any importance is noted at Glasgow. The volume of trade is well maintained and prices are steady. The ship-building industry continues its good demand and shows signs of doing so for some time to come. There has been a little more request for Quebec pine and several large lines have been moving. Stocks of sidings are increasing and the demand is not quite so strong. Arrivals of spruce are light and values are firm. Birch logs, in spite of large arrivals are selling quickly at good prices.

United States

In the United States the lumber trade at present is characterized in general by the same shortage of dry lumber as the trade in Canada is experiencing. Compared with the actual demand, the quantity of dry lumber ready for shipping is exceptionally small. Dealers and consumers for several years have been buying in a hand-to-mouth manner and the result is that throughout the whole country retail stocks are short. Accordingly there is both a good demand in general and a small supply. Prices therefore, are quite strong. In the northern pine trade a steady season has been experienced. Now that a good crop seems to be assured, the demand for northern pine is vigorous. The trade in hemlock is enjoying a period of prosperity such as it has not had for years. Dry lumber in the Great Lakes region has practically disappeared and the demand is so strong that green stuff is being shipped from the saw. Eastern spruce in New York continues its strength and the same applies to New England.

Chicago:—The movement of lumber has increased noticeably since the first of September. Apparently the dealers are anticipating a good Fall trade and there is quite a tendency to buy for future needs. A steady business is reported in northern pine, all grades moving actively. The box trade is still buying large quantities of the low grades. Stocks of low grades are short. The hardwood business is quite satisfactory, with numerous and large shipments. Northern hardwoods are active, birch and maple more than holding their own. There is a strong demand for low grade basswood also for

Raft containing 6,000,000 feet towed from the Georgian Bay to our Mills Arrived in Sarnia on August 5th

BUY THE BEST

Retailers and woodworking establishments who like to get AI NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

How about PINE LATH? We have a fine dry stock of No. 1—4 ft. on hand for immediate delivery.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"RUSH ORDERS RUSHED"

SARNIA, ONTARIO

A. F. Holden, Pres. J. M. Diver, Vice Pres. and Gen'l. Mgr. E. C. Barre, Ass't. Mgr.

rock elm and soft elm. Plain red oak is the leader in southern woods and quartered white oak has been gaining strength. Demand for hemlock continues active at firmer prices. Good trade is reported in southern pine and prices are better than they have been for several years. Red cedar shingles are very strong, clears selling at $3.77 and stars at $3.34, Chicago basis. The demand at these prices is active. White cedars are firm and steady. Lath are in good demand and prices are strong.

Buffalo:—An increased volume of trade is reported in white pine. The demand for pattern lumber is heavier as the steel and iron companies are experiencing excellent business. Building grades are selling satisfactorily although the demand is only fair. The hardwood trade has shown a few signs of improvement and has been getting along at about an average pace. Better business is expected during September than formerly. Prices in general are steady although plain oak shows a tendency to advance. Hemlock continues active and strong in spite of the fact that prices are now $1 higher than they were two months ago. There is a good trade in progress and stocks are not heavy. Red cedar shingles are exceptionally strong and dealers report that prices are steadily advancing.

Bay City and Saginaw:—The northern pine market continues firm and the volume of business is in excess of that of last year. Low grade stocks are particularly active and scarce. Receipts have been fair, most of them coming from Georgian Bay, where it is reported that lumber is being well sold up. Saginaw Valley firms are taking large quantities of this stock. The low grade prices are $2 higher than they were at the commencement of the present year.

Market Correspondence

Important Transaction in Quebec Limits

Quebec, Sept. 9th. (Special correspondence of the Canada Lumberman): Since last report the has been an important transaction in pulpwood in this district. The Gould Pulp and Lumber Company, of Utica, N. Y., has purchased extensive limits on the Jacques Cartier River, about thirty miles north of this city. The Jacques Cartier River runs into the St. Lawrence and shipments of the produce of the limits can be made either by water or rail. It is said that the purchasers intend to erect two mills on the premises, one for the production of paper and the other for pulp. The supply of wood is very large and will last for many years.

During the past week a large quantity of white pine was shipped from Quebec to the United Kingdom. The shipment included both square and waney. Lumbermen of fifty years' experience said that for quality, length and girth they may have seen its equal, but certainly never its superior. They had thought that no such timber could be found in Canada at the present time. The timber was in a newly operated virgin forest in Ontario.

Shipments of pulpwood both by rail and water continue to be very large, as shippers are rushing it forward as quickly as possible. As a matter of fact shippers have been requested by railway companies to send the wood along without delay, as they are afraid of a shortage of cars when the grain crop begins to move.

There is now a brisk demand locally for lumber for building purposes, and several large orders have been just contracted for at what are considered good paying figures.

Prices for pulpwood remain steady at from $7.50 to $9.25 per cord. At the above figures contracts have been made for next season's delivery.

Montreal Trade Brisk all Round

Montreal, Sept. 10th (Special correspondence of the Canada Lumberman),—Again one has to report excellent business all round, or to use the expression of a prominent wholesaler, "Trade was never better." This may be the view of a confirmed optimist, but it is evident that in almost every branch brisk trade is the rule. Dry stock is very scarce, and but very little of the new cut has yet come on to the market. The continuous rainfall has had a retarding influence on the new cut, and the shortage in some lines has helped to keep prices very stiff. The feature has been the great strength of spruce, prices in nearly all descriptions having advanced. Lath is difficult to get, and there is practically no dry lath at the mills, in fact some green lath is now being shipped to supply the demand. Shingles are again a little higher.

Although there is no acute shortage of cars, such as is expected a little later, lumbermen could do with a bigger supply than is to be secured. The C. P. R. has put an embargo on cars with lumber coming from certain of the G. T. and C. N. R. terminals.

Shipments to Great Britain are still very satisfactory, with prices firm. Canal boats for New York are more plentiful.

The building permits for August show a total of $1,364,833—a decrease of $433,853 as compared with the corresponding period last year, but this is accounted for by certain projected buildings being held up owing to shortness of staff in the civic building department. The total for the eight months of the current year is $11,181,376, or a gain of $1,106,764.

Conditions in the pulp and paper sections continue to be satisfactory, the news print mills having just a little more business than they can comfortably handle. Sulphite fibre is at a premium, all reports indicating that this position will be maintained for a long time to come.

The heavy rainfalls have made a larger production in ground wood possible; and although the movement to the United States has shown a decrease of 35 to 40 per cent. as compared with last year, the consumption in Canada has been very heavy. One large mill, for example, has entered into a contract for 50 tons per day for a year. The Spanish River and Lake Superior Paper Companies are converting their ground wood into news paper, and this has left very little surplus, with the result that good authorities are of opinion that there will not be sufficient ground wood in stock to take care of the heavy Fall demand.

Buoyant Trade in the Tonawandas

The Tonawandas, N.Y., Sept. 9. (Special correspondence of the Canada Lumberman). September promises to eclipse all previous monthly records for volume of business in 1912. Orders began to pick up with almost the first day of the month and market activity promises to continue throughout the month. All lines are affected. White pine shows the greatest strength but the hard woods are a close second and hemlock is holding its own as a leader. The midsummer lull has been shaken off and dealers look for what many of them predict will be the best months of the year between now and the close of navigation on lakes and canal. The presidential election campaign has apparently had no deterrent effect whatever on business. For not only is lumber particularly brisk at the Tonawandas but all lines of local wholesale production are experiencing especially favorable conditions. The big plant of the Tonawanda Iron & Steel Company that employs nearly 1,000 men and has been idle for more than a year will re-open next month with orders booked to keep it busy for some time to come.

September is always a big month for receipts of lumber by water, but it promises to show a larger total this year than for several years. Dealers are rushing large blocks of stock from upper lake ports partly to help meet the increase in orders and partly to help stock up for the winter. One fleet of boats arriving within a 24 hour period last week brought upward of 80,000,000 feet. Local lumber receipts for August 1912 were less than for the same month last year. The exact figures for August 1912 were 52,902,875 feet of lumber. In August 1911, 55,775,493 feet of lumber was received at the Tonawandas. Receipts of lath, posts, ties and wood pulp have been fair.

While the break in the Erie canal at Bushnell's Basin is fully as serious as first reported, a temporary channel will be completed by October 1. Many of the lumber cargoes from the Tonawandas and Buffalo are waiting at the Tonawandas for the break to be repaired. Local shippers while inconvenienced by the break are confident of geting all their orders forward in time. Small shipments are being made by rail to tide over customers until canal navigation is resumed.

Labor was never so scarce in local lumber yards, box factories and wood-working factories. The reason is partly increased business in all these lines and greater activity in other local manufacturing. Wages are higher than ever before. Pilers in the lumber yards are earning as high as $2.25 a day and want more. It isn't so long ago that all the labor needed could be had for not more than $1.50 a day. Some of the yards have run advertisements constantly all summer in local papers for help.

A scarcity of carpenters delayed building operations in the Tonawandas during the past week.

H. Briese's sawmill at Ullswater, Ont., which was destroyed by fire recently, is being rapidly rebuilt, the new mill will have a capacity of about 2,000 feet per day and will be completed in time to renew operations during the present year.

The new plant of the British Canadian London Corporation at Queensborough, B.C., was put in operation on August 19th. Active operations were not commenced for another week, so that the machinery might be put in use for a short time each day, and thereby properly adjusted. The plant gives employment to two hundred and fifty men, the manager being Mr. J. H. McDonald.

What J. D. Shier says about the Barkey Lumber Register

Barkey Bros., Stouffville, Ont.

Dear Sirs,

Yours to hand and noted. We have been using one of the George Lumber Registers for some years past and find it still working well. It gives very accurate measurements and have never known it to make a mistake. When in need of another we will certainly get one of the same kind.

We remain respectfully yours,

Feb. 5, 1908. J. D. SHIER, Orillia, Ont.

Can be used on any moulding or matching machine.
Ensures absolute accuracy and saves one man measuring.
Sent on 30 days' trial, return at our expense if not satisfactory

EDGINGS

Ontario

The lumber and sawmill of James Elliott, Scotland, Ont., was recently destroyed by fire.

The Construction Lumber Company, 1916 Davenport Road, Toronto, suffered a slight loss by fire recently.

The Riordon Pulp & Paper Company have awarded a contract to C. E. Deakin, 11 St. Sacrament street, Montreal, for additions and alterations to their mill at Hawkesbury, Ont.

The planing mill of James Staples at Runnymede, near Toronto, was recently destroyed by fire, the loss being about $2,500. The fire is believed to have been of incendiary origin.

S. Anglin & Company, Kingston, Ont., are considering the erection of a woodworking factory. They are planning for a building of two storeys, of frame construction with concrete foundation. They will require woodworking machinery.

Messrs. T. A. Cairns, Geo. L. Kaempf and Jos. E. Foster, Guelph, Ont., have opened a new planing mill business in that city. They will manufacture and deal in general planing mill work and make a specialty of office, stair and interior fittings.

Incorporation papers have been secured by the Elliot Woodworker, Ltd., Toronto, with a capital stock of $40,000, to manufacture woodworking and other machinery. A plant will be established for the purpose. William A. and Glen W. Elliot and Armour A. Miller are the provisional directors.

The Donnaconna Paper Company, Limited, has been incorporated with a capital of $3,500,000 to carry on business as manufacturers and dealers in wood pulp and paper of all kinds with head office at Toronto. The provisional directors are J. S. Lovell, accountant, E. J. McEwen, law student, and Glyn Osler, barrister, all of Toronto.

Thomas M. Uptegraff, of Niagara Falls, N.Y.; Walter D. Uptegraff, of Pittsburgh, Pa., and James M. Uptegraff, of New Brighton, Pa., are the incorporators of a new $25,000 concern to be known as the Canadian-American Wood and Pulp Company. The company intend to do a general timber and lumber business, and will buy wood pulp lands in Canada.

The New Ontario Colonization Company, Limited, has been incorporated with a capital of $1,250,000, to carry on business as lumbermen, timber merchants, sawmillers, pulp and paper manufacturers and dealers in all kinds of wood products, with head office at Toronto. The provisional directors are J. F. MacGregor, accountant, H. E. McKitrick and Alfred Bicknell, solicitors, all of Toronto.

A despatch from Beaudette, Minn., states that the large mill of the Rainy River Lumber Company, at Rainy River, Ontario, has shut down for the season and it is likely that it will be dismantled and moved to Banning, Ont. It is also rumored that the Rat Portage Lumber Company is negotiating for its purchase. The people of that place hope that the latter is true for it would be a great loss for Rainy River to lose the mill.

The St. Marys Wood Specialty Company, St. Marys, Ont., are preparing plans for the erection of a sawmill. They will install an outfit of up-to-date machinery, and subsequently will build a handle factory. The company will erect the sawmill this fall, on the Weir property and subsequently the flax mill will be converted into a handle factory. The handle factory will be equipped with special machinery, designed by a member of the company and built in their own factory.

An Ontario charter has been issued to a company which will control the timber limits bought from the Ontario Government recently in Northern Ontario. The capital of the company will be $1,250,000, to be divided into 12,500 shares of $100 each. It will trade under the name of The New Ontario Colonization Company, Limited. Wood pulp and paper will be the principal manufacture in which the company will centre its attention, but it has also obtained permission to carry on the business of lumbermen and sawmillers. The company also propose to build and operate a line of lake and river boats for both passenger and freight business.

Eastern Canada

The Roberval Paper Company, Roberval, P.Q., intend to make additions to their plant and will require hydraulic power machinery.

Grand & Mounce, Cumberland, B.C., whose sawmill was recently destroyed by fire, intend to rebuild at once and are in the market for new machinery.

The International Paper Company, of New York, are contemplating the erection of an up-to-date pulp and paper mill at Grand Falls, N.B., to cost $3,000,000.

The Richards Manufacturing Company, Campbellton, N.B., are contemplating the erection of a mill at St. Leonards, N.B., for the manufacture of lumber, ties, shingles, etc.

Odilon Boily's sawmill at Baie St. Paul, P.Q., was recently destroyed by fire. The loss amounted to about $16,000. The mill will be rebuilt and the owner will require new machinery.

Mr. P. L. Spicer, of the Newville Lumber Company, Parrsboro, N. S., reports that the company have not yet decided upon their plans in regard to rebuilding their mill at Newville, which has been recently destroyed by fire.

Sir William Van Horne has been elected president of the Grand Falls Power Company, which will establish at Grand Falls, N.B., a paper and pulp mill. The plans are understood to provide for the erection of a modern paper and pulp plant at a cost of $7,500,000.

New tenders are to be called for the construction of the Quebec dry dock and harbor improvements, works which will cost considerably over $5,-

600,000 to complete. The wharves and sheds for which tenders were recently submitted but not awarded will be done as straight contract for the government.

Harrison & Hicks, whose shingle mill at Dalhousie Junction, N.B., was recently destroyed by fire, will erect a new mill at a cost of $6,000. They will be in the market for from six to ten shingle machines, steam boilers, engine, circular shingle saws, steel smoke stacks, etc. Full information can be secured from Allan W. Hicks, Dalhousie Junction, N.B.

The Sydney Lumber Company, Limited, Dalhousie, N.B., whose mill was recently destroyed by fire, will rebuild the mill at a cost of $50,000. They will be in the market for shingle machines, heading and stave machines, band and gang sawmills, conveying and transmission machinery, dynamo, electric wiring, etc., and from four to six boilers. N. J. Gorman is the manager of the mill.

The Provincial Lumber Company, Limited, manufacturers and wholesalers of New Brunswick and Nova Scotia pine, spruce and hemlock lumber, have opened a sales office at 71 Beaver street, New York, to be under the management of Mr. George E. Deming, secretary. Mr. Deming has been for many years connected with the wholesale lumber trade of the Metropolitan District and vicinity. The other officers in the company are George McKean, president, of St. John's, N.B., and William E. Golding, treasurer, of St. John's, N.B. Mr. McKean has for years been prominent in the lumber manufacturing trade of St John's, N.B., and vicinity. The company will handle the lumber products of the interests represented by Mr. McKean and his associates, who have been manufacturing large quantities of lumber for the European and South American markets for years, approximating an annual output of 80,000,000 feet. Some portion of this product has previously been sold in the United States, but hereafter this will be handled entirely by the Provincial Lumber Company, Limited. The Kent Lumber Company, of Gold River, N.S., and the River Valley Lumber Company, of Oromocto, N.B., are two of the concerns whose product will be distributed through this office, the companies combined having a daily production of 125,000 feet. In addition to the product of these two mills the company will also have the exclusive sale of the cut of two mills under contract amounting to 25,000,000 feet of lumber and large supplies of lath. A specialty will be made of car shipments of hemlock of all sizes up to 20 feet long.

A report from Fredericton, N.B., states that an expert forester and six assistants are at present cruising the Scott Lumber Company's lands, an option having been given on the property to a well-known lumber company. At present the cruising is going on on the Magaguadavic lands and afterwards will be carried on on the Pokiok property and then on the Morrow lands in Sunbury County. It is understood that the option which has been secured includes the Victoria Mills, which the prospective buyers plan to operate.

Western Canada

R. Grant & Company's sawmill at Cumberland, B.C., is reported to have been destroyed by fire.

Black & Logan, Yorkton, Sask., are erecting a planing mill at a cost of $5,000. The building is to be two storeys, 36 ft. by 60 ft

Hatch Bros., sash and door factory at Vancouver, B.C., valued at $30,000, was recently destroyed by fire. The factory will be rebuilt.

The Royal City Mills site in New Westminster has been bought by the Canadian Northern for between six and seven hundred thousand dollars.

J. H. Lyons, who has been engaged in the lumber business in Saskatoon, Sask., has been succeeded by the Morehart Broderick Lumber Company.

Limits in British Columbia, estimated to contain 300,000,000 feet of timber, have been purchased by the Grain Growers' Grain Company, of Winnipeg.

Sawmills in Vancouver must install sawdust burners before January 1st next, according to the order issued by the city council, following complaints from residents.

Cushing Bros., Regina, Sask., sash and door manufacturers, have commenced the erection of an office and warehouse to cost $20,000. The building will be three storeys, 103 ft. by 53 ft.

Following the re-organization of the Dominion Sawmills & Lumber, Limited, a new name has been chosen, that of the United Sawmills & Timber Company, Limited. A board of management resident in Canada will be appointed.

The Acme Sash and Door Company, Limited, Winnipeg, Man., have awarded a contract for the erection of a factory at St. Boniface to cost $10,000. The building will be two storeys, 104 ft. x 72 ft., concrete foundation, mill construction, with patent roofing, electric lighting and hot air heating. The machinery has already been purchased.

The Canadian Puget Sound Company, whose mill was recently destroyed by fire, have let a contract for the construction of extensive additions to their plant on Rock Bay near Victoria, B.C. The work will be commenced at once and will include a sash and door factory, a planing mill, a large warehouse for keeping dry lumber, etc. Parfitt Bros., Victoria, B.C., have the contract.

Peter Lund, of the Crow's Nest Pass Lumber Company, has organized the Lund Development Company, which will secure logged-over lands and after clearing away the stumps and irrigating the areas, will dispose of them as small holdings. Mr. Lund has about 300 acres of land already in crop at Wardner and Marysville, and this will be increased, so that all the supplies of the company's logging camps may be grown.

The Alberta Lumber Company, Edmonton, Alta., who recently secured a large property on First street east and Fourth avenue north, are now ready to take care of trade. Sheds are being erected for the protection of their stock from the weather. One of the sheds is 104 ft. by 128 feet, and will be used for storing the higher quality of stock and seasoned material. Another large shed will be used for storing sash and doors, plaster, cement, etc. Concrete footings have been laid for the piling of all the lumber in the yard.

SILVER'S NEW JOINTERS

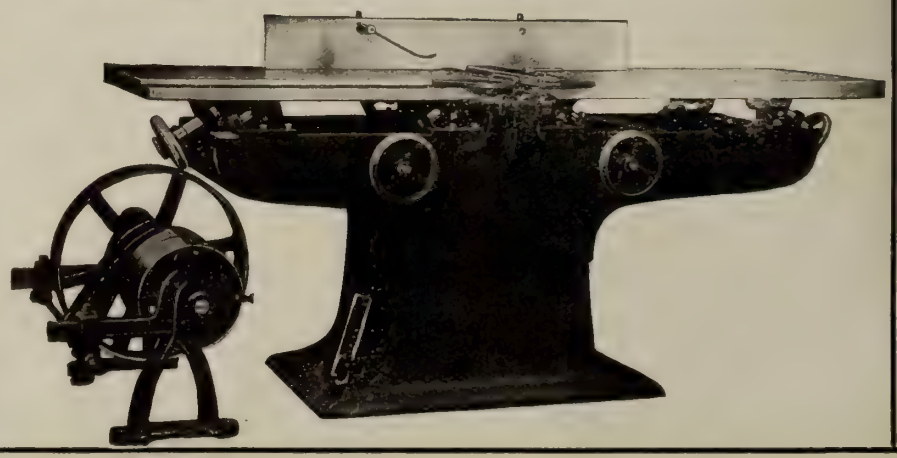
Band Saws, Saw Tables, Swing Saws

Thousands of Silver's Machines are earning big money in all parts of the world. Australia, New Zealand, South Africa and India are heavy buyers.

Silver's machines are designed for convenience and ease of operation and for rapid efficient service. Their moderate price recommends them to all wood workers.

Strong, durable, high pressure machines that will save you time and labor. Made in sizes to suit any need or any purse.

Ask for 1911 Machinery Catalog and special Canadian prices.



THE SILVER MFG. CO.

375 BROADWAY SALEM, OHIO

Gentlemen:-

this ad. presents to you

"AMPHIBIA"

The **Leather Belting** which costs less per day of service than any other and rivals the frog in it's waterproof qualities. Consider this "Cost-per-day-of-service" basis when you buy belting and don't be led into buying a belt simply because it's purchase price is low. It is the length of service per dollar invested that really determines the the value of your belting.

Prove "AMPHIBIA" yourself by keeping tab on a trial order.

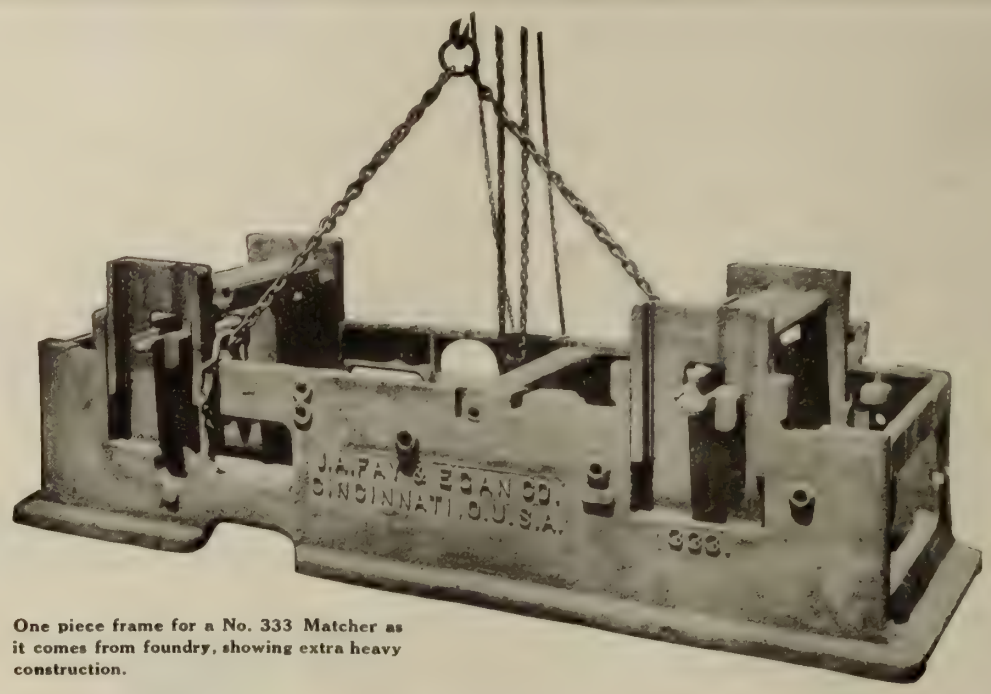
Sadler & Haworth

Tanners and Manufacturers

For Over 35 Years Makers of the Best Leather Belts

MONTREAL TORONTO ST. JOHN, N.B. WINNIPEG VANCOUVER

To insure satisfaction—State where belt is to run



One piece frame for a No. 333 Matcher as it comes from foundry, showing extra heavy construction.

FAY-EGAN "LIGHTNING" "333" Matchers are built with a reserve power sufficient to take care of any increased service required by improved manufacturing methods—

—the extra heavy one piece frame gives the strength, the big gears cut from the solid and running in grease give the power, and construction throughout gives that reserve factor which makes the "333" a good investment not only for today but for many years to come—

—as a straight matcher the "333" has been an unqualified success, in spite of the fierce efforts of competition to keep it out of the field—

—the additional equipment made necessary by improved manufacturing methods—Profilers—Automatic Feeders—Twin Spindle Resaws—Horizontal Band Resaws—all of these we have added to the original "333" and its limit is not yet in sight.

"Can you say as much for the Matcher you are using?"—if not, write us for information on the "333."

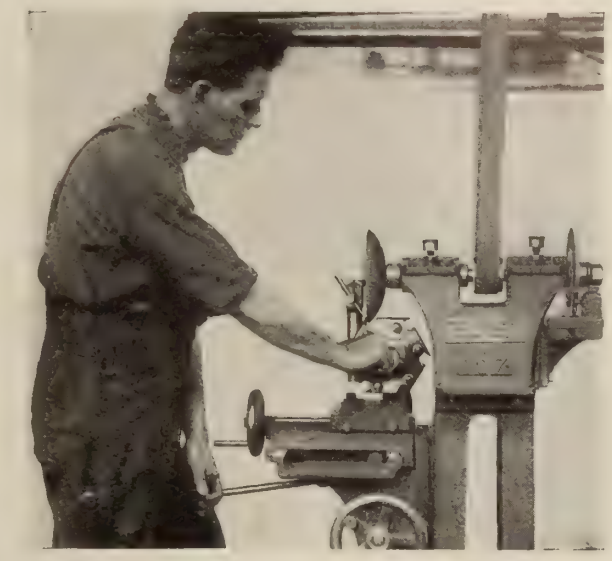
The Old Way

Berlin Profilers Are Insurance Against Mismanufactured Stock. Patterns Are Always True to Standard.



The New Way

Berlin Milled Bits Retain Their Shape

Had any trouble with your profile work? Most mills do—until they install Berlin High-Efficiency Matchers.

With old methods bits are filed to shape. It's a hard job, and patterns don't match.

Berlin Profilers overcome that difficulty.

Our bits are the best high speed steel and milled to shape.

They retain their original shape because they are ground on the bevel side only. It takes but a very few minutes to grind them and it makes no difference how often you grind they never lose their form.

New bits cut the exact pattern that the old ones did, because they are made with the same milling cutter.

Compare our method of grinding with the old way. Filing the bit to shape as shown above is a tedious and difficult job.

It is absolutely impossible to file bits the same every time. Consequently, patterns differ when you use the old style bits.

With our milled bits and method of grinding, profile patterns made today match with those made a year ago or a year hence.

Stock that formerly graded No. 2 on account of mismanufacture grades No. 1.

What's the result? You get more money for your product.

No. 117 Drop Siding

Our designers have built a 6-bitted profile head that manufactures No. 117 drop siding at 250 feet a minute on our High-Efficiency Matchers.

We will send samples of work done at this speed if you desire to see the quality of work Berlin Profilers do at fast feeds.

These new heads don't tear out the knots or raise the grain. The quality of finish is unequalled.

Berlin Profilers are mounted on the heavy one-piece frame just as the cutter head yokes, and run without vibration.

The High-Efficiency Matcher

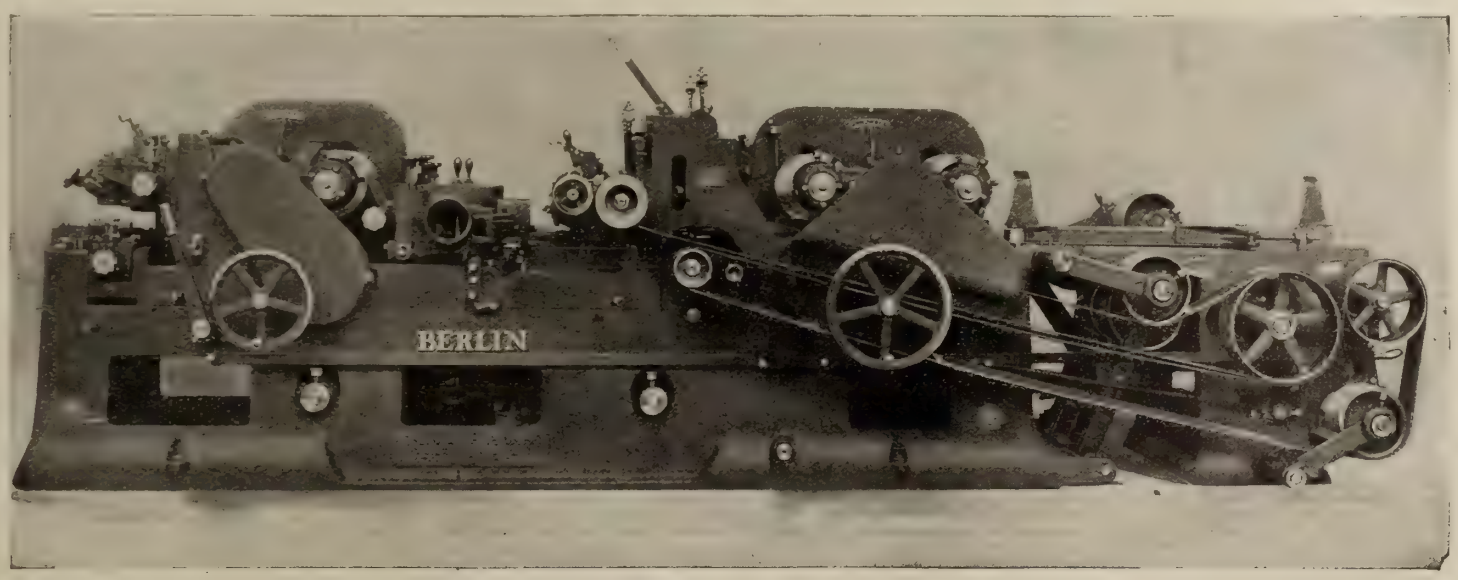
Regarding the machine—not only the profiling devices, but the machine as a whole is the most efficient ever built.

It does the work of three 100-foot a minute machines and does it better. It raises grades 10 to 30 per cent. and cuts producing costs 40 to 60 per cent.

Go and see one running in your own territory. Investigate and be convinced that you can cut producing costs, upkeep and labor expenses, and increase your mill capacity at the same time.

We can put you in touch with mills where Berlin High-Efficiency Matchers are doing all we claim.

Write today for detailed description of this new series of matchers.



Send for ten-page circular of this new machine

DISSTON
Quality Tells

There is something in the appearance of a well-made, high-grade tool which carries to the mind an undefinable feeling of real value—a sense of efficiency and creates a desire for possession.

The demand for the DISSTON BRAND Saws, Tools and Files has been steadily increasing since 1840.

Shimer Cutter Heads and Cutters!

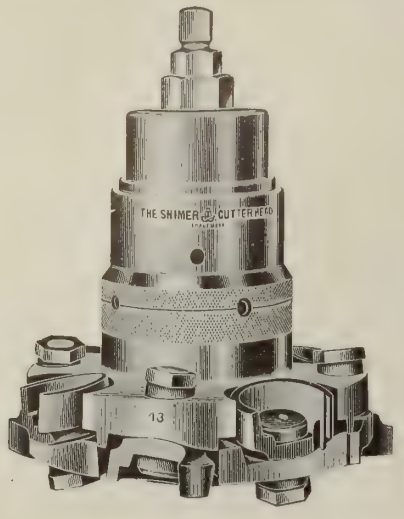

Fig 627

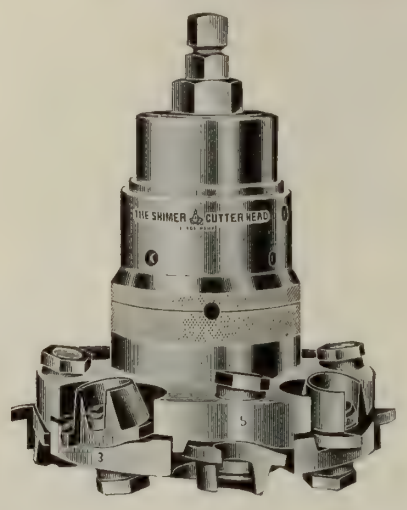

Fig. 628

The "Shimer Limited" with Expansion, price $72.46 per set, complete.

The Tools You Need.

You will eventually realize that the Shimer Limited Cutter Heads are the tools you need to increase your output without sacrificing quality or increasing expense. You will find that the mills that are using them are perfectly satisfied and will give testimony to this fact.

We don't see how it could be otherwise. We have studied planing mill conditions for forty years and have kept pace with the changing conditions by designing tools that were safe, that were efficient, that were profitable to use because time and labor saving, that were lasting and that sold at low prices.

The Shimer Limited Cutter Heads sustain and enhance the reputation built up by our other tools. In addition to the special features which have made the Shimer Cutter Head famous, these new Fast Feed Heads have a self-centering device which clings to the spindle when drawn up, securing it firmly thereto. The bit seats also carry a larger surface and the bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to all parts coming into contact with the lumber. The Spindle gripping device is not only positive and effective in its purpose of holding fast to the spindle, but it also centralizes the Head on the spindle for a more uniform action of the Cutters.

The results of all cutters cutting is a smoother finish, notwithstanding the faster feed, and an output far in excess of former methods.

If you have a machine that will swing Heads of 6¾ inches diameter and feed over 150 lineal feet per minute, we would like to send you a set on 30 days' trial.

Take the measurements now and let us have your order at once.

Popular Cutter Heads

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set $40.95
Price with 6 bits to each head, the set 49.27
Price with 8 bits to each head, the set 57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—⅜ at $1.30 each and Bits for 2-in. thick plank at $1.63 each.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1¼-in. $31.20
Price, with 4 bits to each head, the set, 2-in. 33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and in interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1½-in. thick, $34.84
Price, with 4 bits to each head, the set, 2½-in. thick 35.88

Double Ceiling Heads

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling Heads complete with Bits, net, $40.94

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One Way Cutters

The Shimer Reversible Cutters for Single Spindle Shapers, Variety Moulders or Friezers, are carefully moulded opposite to the shape of the mould to be produced, in such a way as to have only the cutting edge touch the lumber. They are complete—inexpensive—time saving. We also make One-Way Cutters for the Double Spindle Shaper.

Thin Steel Knives

Advanced ideas referring to the planing and surfacing of lumber have developed into the use of the thin blades, made from high speed steel, which when properly tempered and treated, serve for one or two days of work on hard maple, oak or hickory.

These blades are known as our Bedee Knives and are recommended by users as the best that can be procured. For the benefit of those desiring to use this style of a knife we have facilities to furnish them in any length or thickness.

Write us about your requirements.

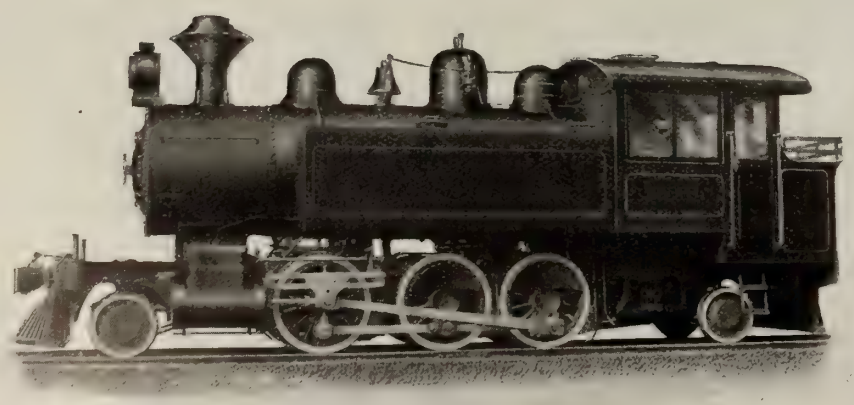
SELECTION OF LOCOMOTIVES

WHAT SHOULD BE KNOWN BEFORE YOU PURCHASE LOCOMOTIVES:—



Nature of the service.
Capacity of the cars and weight of train.
Character of track—is it new or old.
Length of haul.
Is time an important factor.
Do you want a quick locomotive or a big puller.
Distance from base of supplies and quarters for the men.
Water and coal carrying capacity.
All these items and more should be considered.
A careful study of conditions may mean larger profits.
Our experience may be valuable in considering them.
A dollar saved is more than a dollar earned.

Write or wire us, or better still, come to see us.

MONTREAL LOCOMOTIVE WORKS, LTD.

Dominion Express Building, MONTREAL, CANADA

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

Burroughs Bulletin for the Lumber Business

Our Systems Bulletin for Lumber Men tells how the Cartier Lumber Company, Ludington, Michigan, saves time and labor on their general and special office work.

They use a special style Burroughs adding machine to do much routine work that some lumber offices still do by hand.

For instance, they use a Burroughs machine to make out their Log Scale Reports. The machine prints the length and diameter of the logs, number of feet in each log and the total number of feet all at one operation. Shortens the work.

The Bulletin shows how other Lumber Dealers use the Burroughs to figure their Lumber Tally, Tally of Flooring, take Trial Balances, figure Pay Rolls, write Monthly Statements, figure Estimates, etc., in half the time it usually takes.

The Bulletin will be sent ***free*** to any Lumber Man who will ask for it on his letterhead. Just ask for Systems Bulletin No. 480.

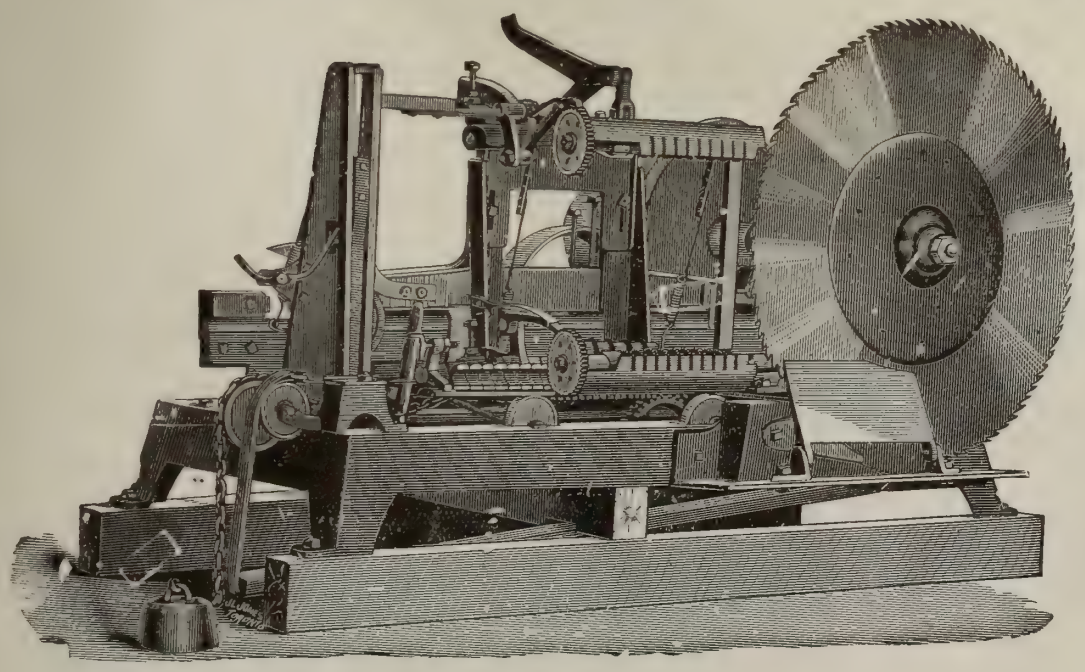
Mowry's Boss Shingle Machine



THIS MACHINE IS ONE OF THE BEST SINGLE BLOCK SHINGLE MACHINES MADE IN CANADA. Wherever introduced it has taken the place of all other shingle block machines. It is perfectly automatic in its action. The stroke is never longer than the cut, thus saving an immense amount of time, and by the touch of a lever the operator can make the machine butt all at one end, so as to bring the knots all at the thin edge. A patent brake relieves the machine of all jar when the carriage is stopped to change blocks. It has a powerful friction feed. It is altogether the simplest in construction of any machine built and combines so many advantages that it is far superior to any machine on the market. We build shingle machines both horizontal and vertical. SIMPLE. CHEAP. DURABLE. If you want a good shingle machine try the "Boss" and you will be more than pleased. One 40 inch saw and one 24 inch collar with each machine.

We also Manufacture all kinds of High Grade Machinery for Saw and Shingle Mills. Write for Prices

McEWEN ENGINES
STEEL PLATE WORK

Mark with a cross the bulletins in this list you would like sent, or if you would like the complete set in the special binder cross out the lot and attach this sheet to your letterhead and send it to us. Do it to-day.

In this way you receive a bulletin that is easily handled or filed for reference. It describes only the machine you are interested in and this in a detailed way impossible in a general catalogue.

As our machines have changed in design to keep pace with changing sawmill conditions our bulletins have been printed to describe them. They illustrate our latest improvement in every line and are absolutely up to the minute.

In them we have endeavored to avoid exaggeration of any kind. The information they contain is accurate and trustworthy. Much of it is invaluable to the up-to-date mill man.

If you have any of our old catalogues on file destroy them now and ask us to send you our *latest* Sawmill Bulletins. A list of these is attached. We will send you individual copies or the complete set assembled in a handsome binder, just as you prefer.

Tear out this sheet and attach it to your letter head. We will do the rest.

$5,000,000.00

worth of mixed metals is what we market every year

PEERLESS metal is compounded specially for sawmills and is the best on the market for that purpose.

FAULTLESS metal is a high grade copper hardened alloy made for heavy duty work, sawmills and engines. Our policy is large tonnage, perfect alloys, and absolutely fair and honest treatment of the trade.

The Steam Tension Band Mill

The steam tension band mill as we make it is entirely different from any other band mill made. Owing to the great success of this mill, many other manufacturers have added steam cylinders to their **standard** mills for operating the top guide and for raising and lowering the top wheel. Of course, these devices at their best are not all they ought to be, but the fact of their being there serves to emphasize the worth of the steam operated mill. Ours is the only band mill which has been **specially** designed from the beginning as a steam tension mill, and consequently the steam cylinders are placed where they should be, and work properly at all times, no matter what your boiler pressure or your sawing conditions.

The advantages of this mill are obvious—the time saved by having **both** the top guide and the upper wheel operated by steam is very considerable, while with our very sensitive steam tension, the saws are easily kept at exactly the right tension to cut perfect lumber, to say nothing of the longer life of the saws.

It costs you a little more to buy this mill because it costs us more to make it, but it saves you far more than the difference in cost in a very short time, and so it is worth more.

Built with 8 foot, 9 foot and 10 foot wheels.

May we send you our catalogue?

William Hamilton Co., Limited

PETERBOROUGH, ONTARIO

VIEW OF OUR MILL AT CACHE BAY, ONT.

CHOICE PINE

Lumber buyers who come face to face with the consuming public are to-day experiencing a demand for quality products that we anticipated a good many years ago.

Our first move in the production of Pine Lumber was the acquisition of a good supply of timber—not only a good quantity, but particularly a good quality, and the best proof we can offer you of our success in the selection of this kind of timber is found to-day in our

Norway or White Pine Lumber, Railroad and Structural Timbers, Flooring, Ceiling, Moulding, Siding, Cross-arms, etc.

Daily Capacity of Mill 190,000 feet of lumber, 65,000 pieces of lath, exclusive box boards and pickets.

George Gordon & Company

Timber Limits for Sale
on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

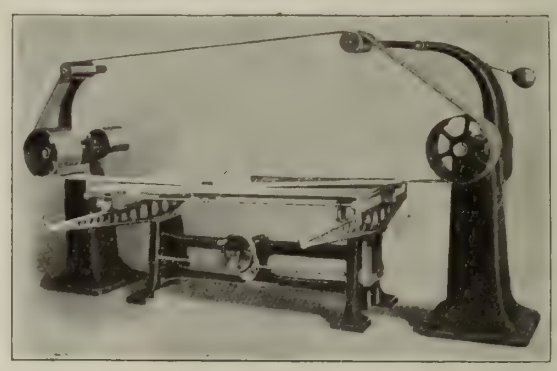
INTERIOR FINISH AND MILL WORK SHOPS

Here is a Sander built for YOU



NO. 131 BELT SANDER

It produces a better and more uniform finish on all kinds of interior trim **at a cost that is down to a manufacturing basis.**

It is made to handle the endless variety of work that comes up in your line—irregular shapes, frames, doors, etc., as well as flat work, and can be expanded to finish any length of stock up to 20 feet or more.

Of a generous capacity and convenient in operation, it is very easily and quickly adjusted to economically care for frequent changes in sizes and shapes of work—a necessity in your business.

Without a skilled operator, it puts on the "finishing touches" usually given by hand, and it never gets out of order.

Write for our special No. 131 Circular and liberal terms

Butterworth Foundry, Limited Ottawa, Canada.

A Belt which Conveys ALL the Power

Practical men know the drainage of power from a slipping belt, ***and because they know,*** they are buying

GOODYEAR RUBBER BELTING

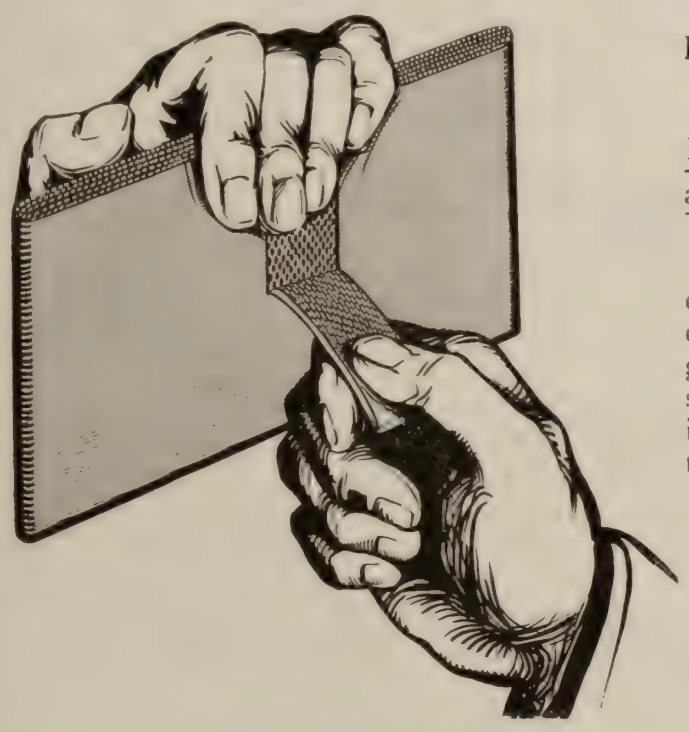
Which Neither Slips Nor Stretches

It is built up, layer upon layer, of close-woven, long-fibre, cotton fabric, rubberized and cured under Goodyear processes. And every Goodyear belt has in it the lowest possible minimum of stretch, because the belt is "cured" whilst stretched to the limit of safety in a special machine.

That is the Goodyear Method of Belt Manufacture

And the result is entirely satisfactory to belt users—a fact to which our enormously increased sales testify. What is the significance of this CONTINUED SALES INCREASE — 50% over last year? Simply that Goodyear Belting more than fulfills the claims made for it by the Goodyear people—who know what a belt should do, and make a belt to do it.

It has cost us less than $200.00 for claims or adjustment of every kind in connection with our total output for the past two years—a remarkable tribute to Goodyear reliability.



Look into the Belt for Yourself—Try to Tear It Apart.

Make a cut in the top layer—and then try to pull it apart. You will get a faint idea of its strength.

That is the result of forcing rubber at tremendous pressure through the fine cotton fabric—separating every strand—thus abolishing all internal friction or grinding. Whilst these layers of fabric are afterwards so compressed as to be almost homogeneous, the finished belt bends easily, the "duck" being so woven as to retain complete pliability in the finished belt.

For Main Drives and High Speed Pulleys GOODYEAR Belting is the Best

It has all the tensile strength necessary to absorb tremendous strain without slip, stretch or rent. The grip of rubber and the prodigious strength of hard-twist cotton fabric are united, and prove equal to every emergency.

Where the power transmitted is high, and great tensile strength is essential, Goodyear Rubber Belting proves its worth.

EVERY GOODYEAR BELT IS SUBJECTED TO A STRINGENT TEST BEFORE LEAVING THE FACTORY, and what is more, the materials used in the manufacture are also tested in the Goodyear laboratory before using.

IF YOU USE A BELT AT ALL IT WILL PAY YOU TO USE A GOODYEAR

Loss of power is loss of profit—and an inferior belt is dropping power all the time. Goodyear belting quickly earns its cost in power saved and trouble avoided.

TWO HUNDRED AND FORTY ROLLS—A TOTAL OF 72,000 FEET

We have just received an order for this quantity of GOODYEAR RUBBER BELTING from one business concern in the west, for the equipment of interior elevators. Such an order shows supreme confidence in the quality of GOODYEAR Belting.
If we have not just the belt you require we will make it for you.
In the choosing of belts our booklet would be of great assistance to you. We supply it free. Write to our nearest Branch for one.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, October 1, 1912 No. 19

The Canadian Forestry Convention

The annual convention of the Canadian Forestry Association, which was held recently at Ottawa, was the 14th that has taken place since the formation of the association and it might have been imagined that it would prove in some respects a repetition of former meetings. One has grown to expect that forestry conventions will result in the discussion of many important theories and the expression of views pro. and con. upon the different points at issue, but very little in the way of definite practical results. Of late years this has, however, been less noticeable, and the forestry movement has apparently developed until it has commenced to result in really practical reforms.

The meeting held at Victoria early in September was particularly notable in this regard. In the first place, it was characterized, more than anything else, by frequent discussions of actual measures which have been brought into effect by the government of British Columbia for the preservation of its forest resources and the proper exploitation of its lumber products. The meeting was notable also on account of the large number of practical foresters and lumbermen who were in attendance and who took an active interest in its proceedings. Men from all parts of Canada who are responsible for the administration of the Crown lands in the various provinces were there and explained the results of their efforts. Prominent lumbermen and foresters from the United States were also present. Every one was greatly impressed with the progress which has been made in British Columbia, in the direction of working out and putting into practice, a forestry policy which is evidently expected to result in the preservation of British Columbia's timber wealth for all time to come and secure from it a revenue much in excess of what was expected under a policy which would have brought about the exhaustion of the timber resources within a generation or two. The new forestry policy of the government of British Columbia was freely commended and spoken of as one of the most enlightened policies for the preservation of forest resources that is to be found anywhere in the world to-day.

One of the most interesting and important announcements made at the convention was the statement by Hon. W. R. Ross that the government of British Columbia intended to establish a school of forestry in connection with the new university of British Columbia. The idea of preparing trained foresters for the practice of the profession of forest or logging engineering is of comparatively recent development in the United States and Canada. The movement has made much progress of late years and the fact that British Columbia with its wonderful forest resources intends to establish a school for the education of men of this class, shows that the government has decided upon a far-reaching policy, the goal of which is the complete exploitation of the forest resources of the province, together with their preservation for all future generations.

It would be impossible to consider in detail the numerous interesting and commendable features of this important convention. Practical subjects of interest to lumbermen were discussed at much length and the question of the organization of the forest service for British Columbia was given much attention. Such problems as the prevention of forest fires, the avoidance of waste in lumbering operations, burning of slash during logging, the prevention of the use for agricultural purposes of land only fit for timber growing, the extermination of the fake settler and other questions which are uppermost in the minds of lumbermen, were exhaustively discussed. The result of the discussion of the problem of fire prevention was a general agreement that much progress had been made during the past few years and that, in British Columbia particularly, an excellent public opinion was being developed which would go far towards preventing future serious forest fires.

There once were a good many people who scoffed at the very idea of conservation and forestry. To-day the tables have been turned, and the Canadian Forestry Association has been one of the most important factors in bringing about the change. By the holding of such conventions and by the co-operation of the press in spreading the views expressed, the chief work in connection with the forestry idea has been successfully driven home into the minds of the public.

Practical Methods of Selling Lumber

An unusually interesting sale of timber is now in progress in the United States, which indicates more clearly than anything else, the benefits which are being reaped by the public and also by the lumbering industry, as a result of the work of the United States forest service. The situation is one which indicates in a most satisfactory manner that the forestry movement is securing definite and practical results.

The chief forester of the United States is at present in San Francisco making final arrangements under which a Californio lumbering company will purchase 800 million feet of timber in Sierra national forest. The timber has already been awarded, after public advertisement, to the highest bidder, but under the terms of the advertisement the final signing of the contract will not take place until the company has been shown on the ground what timber the Government will reserve from cutting in order to preserve good forest conditions and provide for reproduction.

The company will be allowed its full 800 million feet, but naturally it will not be allowed to cut clean . As a rule the Forest Service reserves something like one-third of the forest stand in applying forestry on Government holdings. A marking board made up of one man sent from Washington, one from the District office in San Francisco, and the local Forest Supervisor will carefully mark a sample area, to show how the restrictions on cutting will be applied. Representatives of the company will then go over this area, after which Chief Forester Graves and his assistants will, it is expected, make final arrangements with the company in San Francisco, and the contract of sale will be signed.

"The Forest Service," said Mr. Graves in speaking of this sale,

"has received a number of inquiries whether in selling so much timber to a single purchaser the Government may not be opening the way to a monopolistic control of local lumber markets. Other correspondents are disturbed lest the sale prove a bad bargain for the Government through the rise in value of the timber in the twenty-two years during which the company will cut.

"Such large and long-time sales of National Forest timber as that to the California company are a new development in the Forest Service. Great bodies of mature but inaccessible timber can be put on the market only if sale contracts are let on terms which will justify a very heavy initial investment in transportation facilities. In entering into such contracts, however, special safeguards to protect the public against monopoly and to prevent an undue speculative profit to the purchaser are employed.

"The National Forests contain, in all, the equivalent of nearly 600 billion feet of timber now of merchantable size, besides young growth for future harvest. Because of its remoteness from market and the wild, mountainous country, without transportation facilities, in which most of it lies, only a small percentage can now be sold on any terms. Most of it would cost more to get it out than it would bring. The sale of less than one-fifth of one per cent. of the total supply to one company leaves plenty of room for competition by other companies.

"The timber which has been sold to the California company lies well back in the Sierre Nevada Mountains and will require the construction of 70 miles of standard-guage railroad to open up the area. Since this road will also open up other National Forest timber and will be a common carrier, it creates another safeguard against monopoly. The company is given a cutting period of twenty-two years to remove the timber, besides an additional two years for the construction of logging and manufacturing facilities. The sale was publicly advertised for six months in order to give an opportunity for all who wished to compete for the contract to make bids, as is done in all large National Forest sales.

"No business organization would undertake the heavy investment necessary in such cases unless the handling of a large body of timber and a sufficient period in which to remove it under practicable logging conditions are assured. The great difficulty in making such long-term sales is to establish a price which will be fair to both sides. No one can foresee future conditions well enough to know what stumpage will be worth ten, fifteen, or twenty years hence.

"Consequently the terms of sale provide for the readjustment of stumpage prices every five years. The basis for fixing the prices will be, in each case, the prices of manufactured lumber in the markets where the timber is sold during the preceding two years.

"For several years the Forest Service has been selling in the neighborhood of a million dollars worth of National Forest stumpage per year, but this combined with what is cut for free use is only about one-eighth of what might be cut without reducing the permanent stock of the forests. The supply will be kept up through growth. By making long-term sales it will be possible greatly to increase the amount available for present needs of the timber consuming public, without endangering future supplies through overcutting. It will always remain true, however, that vastly the greater part of the timber sales will be to small purchasers, who are favored whenever possible. Monopoly is impossible as long as the door is kept open for such purchasers. Out of over 5,600 sales made in the fiscal year 1911, about forty were for over $5,000 worth of timber to a single purchaser."

The Pulpwood Export Situation

Owners of pulpwood limits upon private lands in the various provinces of Canada have been greatly interested during the past few weeks in a report appearing in the daily press and which originated in an Ottawa despatch to the Toronto Globe. The report, which stated that the Canadian Manufacturers' Association intended to press the government for an act prohibiting export of pulpwood from any province of Canada, was as follows:

Ottawa, Sept. 19.—Legislation which will absolutely put a stop to the exportation of pulpwood from Canada to the United States is being urged on the government by the Canadian Manufacturers' Association.

It is learned from an absolutely reliable source that a big delegation, composed of leading members of the association, will wait upon Premier Borden shortly, and place the matter fully before him. It will be pointed out that, with the rapidly increasing consumption and demand from the United States, and the corresponding growth of the export of raw pulp from Canada across the line, Canada's forests will soon become depleted, while the profits which should accrue to Canadians by paper manufacture in Canada, are going into the pockets of Americans.

Should the government introduce legislation which would prohibit the export to the United States from any province in the Dominion, of raw pulpwood, the United States would be compelled to buy the manufactured paper here, and the result would be the opening up of a large number of big paper manufacturing industries throughout the Dominion, which would employ many thousands of workmen, pay millions annually in wages, and give Canada prominence as a paper manufacturing country.

Notwithstanding that Ontario, New Brunswick and Quebec have taken steps through the medium of provincial legislation to practically put a stop to, or place a restriction upon the export of pulpwood cut on Crown lands to the States, millions of cords of excellent pulp timber are annually being shipped to American centres from private owned lands, chiefly from Quebec. The wood is manufactured in American mills and the benefit which Canada should derive goes to the pockets of the workingman and manufacturers of the United States.

The Canadian Manufacturers' Association hopes to prevent the export from private-owned property through a federal enactment, which would be universal. The question is an important one, and it is thought likely that it will be found among the number of big matters which Parliament will take up during the coming session.

The above report seems to have been the product of the imagination of some newspaper correspondent or some representative of the paper trade in Canada who is interested in securing cheap paper and encouraging the manufacture of paper in Canada. There has been a great deal of discussion of this particular subject during the last year or two and there are many who would like to see an act of this nature put into effect. Nevertheless, the question is one which cannot be settled off-hand by any government. The interests involved are much too important and those whose interests would be sacrificed are far too numerous, for the question to be settled without the most exhaustive enquiry into the necessity for the legislation and its probable results.

All the owners of private lands in Quebec, for instance, upon which pulpwood is growing, would lose heavily by any such law. They are to-day able to export to the United States large quantities of pulpwood. They find in this way a very ready market for their products and their main source of revenue would be immediately destroyed if such an act were passed.

The grounds upon which the request for a prohibitive duty are based are very generally understood. Briefly, they are, that if no pulpwood were exported from Canada, many large mills would be established to manufacture paper and export it to the United States. In theory this argument seems fairly reasonable and in practice it might work out very nearly as indicated. There are many considerations, however, which might interfere with this result. The chief objection to such a prohibition is that most of the benefits to be expected from it are practically certain to come about in the very near future without any interference. The paper manufacturing industry in Canada is growing very rapidly. The prohibition of the export of pulpwood from Crown lands is preserving an enormous supply of pulpwood for future generations. At the same time the export of pulpwood from private lands permits Canadians to profit from the excellent markets of the United States.

Enquiries which have been made since the appearance of the above report indicate that it is not founded very definitely upon fact. The Canadian Manufacturers' Association, for instance, through their general secretary, Mr. Murray, have stated that they know absolutely nothing about the proposed deputation to Ottawa. Mr. Murray's words, as reported in the press are as follows: "I know absolutely

nothing of it, and if it is so, the paper interests are doing it off their own bat and entirely independent of this organization. In fact I am very much surprised if they are. I doubt if it is true."

Many curious arguments have been based upon the alleged fact that the prohibition of the export of pulpwood from Crown lands has resulted in a decrease in the exports of pulpwood from Canada. The facts of the case, however, do not seem to warrant these arguments. Take the province of Quebec, for instance. During the first six months of 1912, the exports of pulpwood from that province amounted in value to $456,089, whereas during the corresponding period of 1911, the value was $318,067. In 1910 during the corresponding period, the total was very large, namely, $580,596, as a result of the expectation that the new prohibitive law would prevent exports after that year. Operators, accordingly, took out all they could, in a hurry. During the first six months of 1909, the exports of pulpwood from Quebec were valued at only $230,757. Unquestionably, therefore, there has been a great increase in the exports of pulpwood from the province of Quebec in spite of the act confining exports to pulpwood produced from private lands. The problem is one of great intricacy and those who are closely interested will do well to discount any occasional reports to the effect that the government intends to enact a general prohibitive law. The government would be certain to give the question lengthy and minute study before taking any such radical step.

Editorial Short Lengths for Busy Readers

Exports from St. John, N.B., to U. S. points for fiscal year ending 30th June, 1912, were valued as follows: staves $3,117.28; telegraph poles $117.50; laths $200,082.22; fire wood $502.50; lumber $652,022.10; pulp wood $127,030.46; wood pulp $388,559.92; spruce piling $11,804.90; pine boards $24,143.28; ships' knees $804.45; tree roots $158.00; shingles $46,307.23; kindling wood $202.50.

United States Consul General J. H. Snodgrass, of Moscow, Russia, in a recent report, says that American manufacturers of sawmill and woodworking machinery will be interested in the intense activity that prevails in the region directly adjoining the Ural Mountains, where promoters have turned their attention toward the unexploited riches of the place, and recently a number of companies have decided to work the immense timber areas on a share-holding basis. Many of the old firms have become shareholding companies, and others are forming every day. It is intended to develop the timber trade by the employment of up-to-date machinery. There is also a proposition to construct a rail line to convey to the coast the timber from the lands belonging to the Government in the Province of Turinsk.

The Hon. Arthur C. Hastings, president of the American Paper and Pulp Association, recently made a comparison of American and Canadian competition, as a result of a visit he has paid to Canada. On the question of paper, he says that the answer to the argument as to whether Canada can manufacture cheaper than the United States is the fact that there have been built, and are in course of construction in Canada, mills to produce in the coming year one grade of paper alone at the rate of something like 1,000 tons a day. It is not a question, he adds, of whether that amount of paper could be manufactured cheaper in Canada than in the United States, but it is going to be manufactured and it is going to go into the United States market to the detriment of the American manufacturers, as well as the citizens and taxpayers. Pursuing the same policy in other lines, it would soon drive United States manufacturing industries to some other country. Mr. Hastings has come to the conclusion that the competition which the United States is about to experience with Canadian paper manufacturers "is real" and "not imaginary."

The report of the Provincial Waterways Commission of the Province of Quebec, which has recently been submitted to the Department of Lands and Forests, contains an interesting reference to the question of controlling the waters of the Chaudiere River. Considerable difficulty has been experienced during the past few years on account of the excessive thickness of the ice coming down the river in the spring and causing serious damage. One of the suggestions made by the commission is that the extraordinary thickness of the ice during recent years has been caused by the operations of the Megantic Pulp Company, as a result of their closing their dams from Saturday to Monday during the winter, in order to accumulate water for their work at the beginning of the week. The report states that this practice results in lowering the level of other parts of the river and allowing the ice to sink to the bottom, after which it is soon enlarged because of the shallowness of the water surrounding it. When the dams are opened on Mondays, the rush of water passing under and over the ice quickly increases its size so that ice which formerly attained a thickness of from 3 to 4 ft. now, attains the abnormal thickness of from 16 to 18 feet. For these reasons, the commission advises the government that it should declare the Chaudiere a navigable stream in order to obtain power to compel the company to let the water take its natural course.

The Canadian Trade Commissioner for British Guiana, in a recent report upon the lumber trade says:—"Though properly a raw material, lumber may be considered here along with manufactured goods. There was a falling off in the importation last year, and the decline will probably not be made up, as the forest industries are receiving considerable attention, and saw mills are being erected on most of the forest areas. The short import was chiefly in yellow pine from the United States; spruce and other Canadian lumber was in average demand, and there was no fall off.

"There was a greater demand for shooks last year on account of the additional quantity of rum casks required. A shortage in the sugar crop, however, occasioned a decline in the importation of puncheon staves. The United States supply nearly all the staves, shooks and headings, except a small lot credited to Great Britain, probably from Norway and Sweden. Within the last few years Canadian manufacturers have entered the West Indies with shooks made of birch, and as the value of last year's importation of staves, headings and shooks into British Guiana amounted to upwards of $40,000, the item is one that should prove attractive to our wood working factories.

A new industry for British Columbia—one that promises to be a valuable side line to lumbering—has been inaugurated by the Powell River Pulp & Lumber Company at their camps at Turnour Island and King River this year. The company during the present season has stripped its hemlock logs of their bark with the intention either of exporting the bark for use in tanning factories, or if tariff difficulties prevent this, of building a small plant for the purpose of rendering the bark into tanning extract. According to Inspector Black of the Provincial Timber Department, who recently visited the company's camps, there are about four to five thousand cords of the bark stacked up ready for export, and stripping on a larger scale is to be done. If this process is followed generally among the coast loggers, it is possible that a very extensive business in hemlock bark and tanning extract will be brought to the Pacific coast. The stripping of the hemlock logs was not done primarily for the sake of the bark. The Powell River company had lost many large hemlock logs during the season owing to the logs being so full of sap when cut that they sink while being towed down the coast to the company's mill. The experiment of stripping the logs was tried, with the intention of allowing the logs to dry up enough to prevent the possibility of their sinking during transit. As they have to be stripped at the mill before being ground up for pulp, the extra cost of stripping them at the logging camps is not very great, and if the bark is readily exportable, it is calculated that a profit of about $2 a cord can be made by the new method. In addition there is the saving through preventing the loss of logs in towing.

New Brunswick Timberland Situation

Considerations to be Borne in Mind by Those Who Wish to Understand Requirements of Lumbering Industry—Suggested Remedies for Present Conditions

The government of the province of New Brunswick is face to face to-day with one of the most vital problems which it will ever have to solve, namely: the preparation of a new timber policy. There is no denying the fact that upon its forest resources depends much of the future welfare of New Brunswick. If a great fire were to wipe out the forests of the province, it would mean complete ruin to the people. The administration of the forest resources, therefore, is a matter which involves the prosperity of the people of New Brunswick in a manner which cannot be the case in regard to any other of its industries. All of the leases and other arrangements under which timber is being cut from Crown Lands within the province of New Brunswick to-day, will expire in 1918, and long before that date it will be necessary for the government of the province to announce the new terms under which it will permit lumbering operations upon Crown lands. The people of the province, in fact, expect that the government will make an announcement of the general features of its proposed new timber policy during the next session of the Legislature, which will take place some time during the coming winter. For this reason the Canada Lumberman has made inquiries of some of those who are most closely in touch with the timber situation in New Brunswick, in order to secure the opinions of those whose interests are involved and to present them to its readers for their consideration. We do not expect that the views expressed will be acceptable to all readers. The object of this article and of others which we hope will follow it, is simply to open the subject for discussion, in the hope that others, who have given the question their attention, will submit their views and bring about a general consideration of the subject which may be of value at the present juncture and assist the government in developing a plan of timberland administration that will be more in accord with the views of the lumbering interests of the province than have been the various policies of the past.

The views expressed in the following article are those of a man who has given close study to the whole situation. He is a man, moreover, whose whole lifetime has been devoted to lumbering and forestry matters and who has lived among forests of the east so long that he is acquainted minutely with the details which he discusses. We present his views, not in his own words in their entirety, but in the form of an article, any alterations which have been made, being simply to present the facts in more readable sequence. The ideas are his, not the Canada Lumberman's, although in most cases we are compelled by the force of his arguments to admit that there is behind them the reasonableness which brings conviction. The statement of the case from his point of view is as follows:

An Unsatisfactory Condition

There is so much dense ignorance prevailing, in regard to revenues from forest lands that any one who will give the matter conscientious study, and make public the unquestionable facts, will be doing a great service, not only to the individual owner, but to the whole Dominion. The practice followed in the province of New Brunswick in connection with permitting lumbering operations upon Crown Lands has been far from satisfactory, so far as the preservation of the interests of the people of the province is concerned.

This practice consists of charging a flat rate for any particular species of lumber, no matter where located, and, as a result, the lands which are most accessible and cheapest to operate have been cut very hard—more in many instances than they should have been. On the other hand the lands which are most remote, where the cost of cutting and driving lumber was materially greater, have not been cropped as they should have been, and, as a result, an enormous acreage must be allowed to rest for a long time before it can be of any value for the production of timber. Naturally this situation brings to mind the most vital question of all, namely: what is the annual increase in the volume of standing timber in New Brunswick? From personal knowledge and very extensive scientific investigation it has been learned that this increase does not exceed three per cent. annually, while in the majority of cases it is less than three per cent. It may be taken as a definitely settled fact that all of the spruce-growing territory in eastern America is subject to the same condition. Therefore, if a fair money value is placed on any spruce-growing territory in New Brunswick, the limit of income that anyone could even hope to secure from wild land territory, allowing nothing for expense, insurance or taxes, is three per cent. compound interest. It should not be imagined from this statement, however, that it is possible to make a three per cent profit. It must be born in mind that this three per cent. is the gross income, from which must be deducted all expenses for general superintendence, fire patrol and taxation, to say nothing of the decrease in acreage which must result annually from fires, no matter how closely the forest may be patrolled. With this slow rate of growth, any tract of land systematically lumbered to a certain grade or size cannot be lumbered a second time, and the cut confined to the same minimum grade, in less than twenty-five years. In other words, although farm crops can be harvested annually, and forest crops only once in twenty-five years, there is a persistent belief, based upon false information, that forest lands should bear the same rate of taxation as cultivated farm lands, or stocks-in-trade that are handled at a profit perhaps three or four times a year.

How Timber Owners Made Money

It is quite true that many timberland owners have become rich in consequence of their holdings of wild land. This is the reason for the existence of the incorrect belief that lumbering is an exceptionally profitable business and one that will stand taxation to an extent greatly in excess of other industries—a belief which is farther from the truth than those who entertain it can possibly imagine. This belief is based upon a misunderstanding of the source of wealth of the few fortunate ones who obtained title to their timberlands some forty years or more ago. In those days they paid for their timber, scarcely a song, and then they lumbered feverishly at a rate which recovered for them their entire outlay in an incredibly short space of time. Since that day there has been a constant appreciation in the value of timberlands, and consequently all revenues they have obtained from the sale of lumber during this long period have been net profits. For this reason, those who have not inquired into the situation as it stands to-day will clamour loudly for heavy taxation imposed indiscriminately upon all owners of standing timber. Nothing could be more unjust. Anyone who purchases wild lands to-day, unless they are wonderfully timbered, permitting of immediate operations upon a large scale, is more than likely to become a bankrupt in a short space of time.

A remarkable illustration of the peculiar and at the same time most unsatisfactory state of affairs in connection with the timberlands of New Brunswick to-day, is afforded by the case of a large timberland owning company, namely; the New Brunswick Railway Company, which secured its land many years ago from the government by way of a land grant in return for the construction of its railway. This company owns in wild lands, some 1,600,000 acres, located largely parallel to the St. John River, north of Fredericton and just back of the agricultural land held by the settlers in four counties, namely: York, Carleton, Victoria and Madawaska. The majority of this land is drained by tributaries to the St. John River, but a portion is drained by the Restigouche River and another considerable portion by the Miramichi River. The average cut of lumber from this territory for quite a number of years back has been about forty-five or fifty million feet annually. Until within the last two years, this company has followed the same practice as the Crown Lands office, namely: charged a flat rate for any particular species of lumber, no matter where located. They, too, found that this policy led to the exhaustion of timberlands located in easily accessible places and the neglect of those which were not so accessible. The New Brunswick Railway Company charges a higher rate of stumpage than is charged on Crown lands. For the sake of simplicity, however, it is interesting to imagine that their stumpage dues are placed at $1.25 per thousand, the same as is charged by the government. The face value of the stock of the New Brunswick Railway Company is $3,000,000—less than $2 per acre of its timberland holdings—yet during only two years of the past twenty has the company paid a four per cent. dividend upon this stock, although the revenues were obtained by cutting the lumber, which is virtually paying dividends out of capital stock. Calculating the revenue of the company on the basis of $1.25 per thousand feet—and deducting administration, taxes of about $10,000; scaling expenses of about $5,000, forest patrol and superintendence, it will be readily seen that the net revenue to the stockholders, even at a very low appraisal for the value of the land, would be extremely small.

Considering the government therefore, as in a position somewhat similar to that of the New Brunswick Railway Company, in that it owns large quantities of timberlands—the problem of timberland administration becomes one of great intricacy, appearing at first

sight to involve little possibility of profit either to the government or to the lumberman. The problem, therefore, is one which should not be approached without the advice and information of men who have made the question their life-long study. Some of the regulations which have been enforced in the past, clearly demonstrate the futility of approaching so great a question without a firm conviction that the means to be adopted will stand the test of actual practice. Take for instance the law which was passed recently, preventing the exportation of pulp wood. One need not spend many days among the lumbermen of New Brunswick in order to find a strong opposition to this law. It must be admitted on the other hand that there are those who will argue keenly that this law is an excellent one. The object, of course, was to encourage the manufacture of wood pulp and paper within the province of New Brunswick.

Those who believe that the prohibition of export is not a benefit assert that it will not have the desired result, and that it will prevent the exploitation of much valuable pulp wood, which, if cut and exported, would bring in extensive revenues to the people of New Brunswick. They admit that indiscriminate cutting of pulp wood would be very disastrous, but point out that within the province, as in other spruce-growing regions, there are vast areas which have never produced a mill log, but which would produce large quantities of pulp wood by thinning, and leave the balance of the stand of lumber in an excellent condition for rapid, thrifty growth. Without such thinning, the growth in these areas is actually nothing. Perhaps this statement needs explanation. In virgin growth the old trees are dying and dropping down as fast as the younger ones are growing, so that the annual increase is nothing. In cut-over land, on the other hand, the light and air are allowed to penetrate and the timber shows an annual increase of from two to three and one-half per cent.

Suggested Remedies

Under the conditions outlined above, it is natural to enquire what remedies should be recommended. Briefly speaking, the most practical solution of all these difficulties would be based upon regulations of the following nature:

First—A complete exploration, survey and mapping of all forest areas, with all the data referring to growth that can be obtained.

Second—A complete revision of the rates of stumpage to be charged for lumber, making the price correspond with the cost of lumber delivered at the mill.

Third—A repeal of the exportation law (which prohibits the cutting of pulp wood) and allowing the thinning process to be practiced, permitting the product to be sold to the best advantage.

Fourth—A complete repeal of the present settling laws so that only small tracts located at convenient points shall be available for settlers, and only such land as is suitable for agricultural purposes. This would prevent so large an amount of the Crown lands being practically stolen by nominal settlers, who go upon them and acquire title simply to obtain the lumber, and later abandon them.

Fifth—A careful revision of the taxation laws affecting wild lands, so that they shall not be taxed at all, or only subject to a normal tax during the long periods when they are not being cut. Even more just and equitable would be an arrangement to make them absolutely free from taxation at all times, charging only for the crop as it is gathered, at a fair rate.

Lastly—Placing the Crown Lands under the management of a non-partisan commission, so that their management should not be subject to any political influence. Such a commission should place in charge of these lands the very best intelligence that they can secure, in order to conserve them and at the same time to obtain from them the largest revenues that can safely be obtained from such forest areas.

Canadian Lumber—Swedish Machines

Interesting Operations at Nordin, N. B., and other New Brunswick Points—A Successful Undertaking Carried Out by Swedish Canadian Lumber Company

Swedish methods of manufacturing lumber have long been famous in the markets of Great Britain and European countries for the excellent quality of the lumber produced. Swedish machines have had much to do with this success and the careful attention to detail for which the Swedish workman is famous, have also been an important factor. When, some years ago, the Swedish Canadian Lumber Company was formed with Swedish capital behind it, lumbermen in Canada showed great interest in the proposition and the resulting organization of an operating company with a number of mills in New Brunswick has been favorably commented upon by all who have become acquainted with the methods and results secured. The chief idea behind the proposition was to demonstrate that a profitable business could be built up in Canada in which Canadian lumber would be manufactured with Swedish machinery and by Swedish methods. This idea has been proved to be correct and to-day one of the most successful and widely-known lumber manufacturing companies in Eastern Canada is the Swedish Canadian Lumber Company, of Nordin, N.B., operating mills at Nordin, Rexton and Richibucto, N.B.

The sawmill at Nordin was built in 1905 and the planing mill in 1906. The equipment of the sawmill includes two gangs of Swedish manufacture; one twin rotary, resaw, edger, lath machine, trimmers, etc. The planing mill equipment includes two large planing machines and two resaws. All the machinery in the two sawmills is of Swedish manufacture except the edger and slab resaw, The output of the sawmill is about 40,000 feet per day and the capacity of the planing mill is about the same. In addition to the above, the lath machine turns out 15,000 lath per day. The power for the mill is furnished by two Robb, Armstrong boilers and engine with a capacity of 250 horse power.

The limits from which the company secure their timber are located in the counties of Northumberland and Kent and cover about 250 square miles, most of the timber is spruce, but there is also a small quantity of cedar, hemlock and pine, and the licenses under which the company are operating cover all classes of timber.

The business at Nordin formerly belonged to the Rosebank Lumber Company, of Douglastown, and was taken over by the Swedish Canadian Company of the same place, who afterwards christened the town Nordin. The output of the mill is practically all disposed of in the markets of Liverpool, Manchester and Bristol. Of late the company has also been delivering some of its output in France, where it competes successfully with Scandinavian lumber.

Saw Mill of The Swedish Canadian Lumber Company, Nordin, N. B.

Mr. G. H. Hedelius, of Stockholm, Sweden, is President of the company. The manager is Mr. O. W. Nordin, of Nordin, New Brunswick. Mr. J. Andre, formerly of Sweden, occupies the position of assistant manager of the company and is in charge of the mill at Nordin. The mills at Richibucto and Rexton are in charge of Mr. A. Kulinder. Mr. H. Tideman is superintendent of the mill at Nordin and of the woods operations.

The Swedish Canadian Lumber Company's mill at Rexton, New Brunswick is equipped with a double cutting band saw, edger, lath machine, planers, etc. Its capacity is 45,000 ft. per day, and 20,000 lath. Its power equipment consists of two Robb boilers with a 240 h.p. engine.

The Richibucto mill is equipped with a rotary saw, edger, two planers, etc. Its capacity is 20,000 ft. of lumber and 10,000 lath per day.

The plant at Richibucto also produces electric light for Rexton and Richibucto.

New Brunswick Logging Conditions

Changes Which Have Occurred Since the Early Days—High Cost of Labor Resulting in Better Accomodation and More Careful Methods of Operation*

THE laying out and building of a lumber camp is an undertaking which always has its own individual problems connected with each new timber area in which a camp is to be located. In a good many respects the problems have been standardized, and yet there are always so many local conditions to be considered that each new camp laid out is, in a large measure, a new proposition. In Eastern Canada the chief features to be considered are often of a standard type although it cannot be said of any one camp that it can be laid out along definite principles which can be learned from the conditions prevailing in another camp, no matter how similar the conditions may be. Under these circumstances there is certain to be much interesting information for lumbermen in other parts of the country, in a description of the problems to be solved and the methods adopted in connection with the laying out of camps in a particular section of the country.

Lumbering in New Brunswick presents a number of interesting features for lumbermen in other parts of Canada. The ordinary lumber camp in New Brunswick is not unlike the camps in Nova Scotia, Quebec and Ontario. It is, however, in a special sense, the result of evolution and it presents features which, to the lumber jack of the earlier days in New Brunswick, would be cause for much astonishment. Generally speaking the chief changes which have taken place in the laying out of a modern camp are in the direction of providing greater comfort for the lumber jacks and for the horses, as well as providing better facilities for the care of implements and for the economic management of the camp in general. In the earlier days timber was large and profits were more certain. The timber owner thought less about the welfare of his employees and the care of his animals and tools than of the importance of getting the logs out in any manner at all. To-day timber is expensive. Good timber is scarce. Labor costs a great deal more and competition is so keen that profits have been reduced to a minimum. Logging has become a science and the financial conditions under which it is conducted have approximated more and more closely to those under which nearly every business operation of the present day is conducted. Cost accounts are carefully kept and every item of unnecessary expenditure is cut out so that as much as possible may be devoted to providing the best possible accommodation and food for the men and the animals which do the actual work. Labor, in fact, is the key of the logging proposition to-day and is the all-important element, whereas in the earlier days labor was scarcely given any consideration. Upon this alteration in the importance of the class of labor secured has hinged the most important of the changes which have taken place in the methods of constructing and laying out logging camps.

A Large Brow of Logs on the Ice

Unloading at the Landing

The original logging camps established in the great pine forests of the province of New Brunswick along the St. John River were simply enclosures, one or two logs high, from each side of which spruce poles were projected in the form of rafters to a meeting with each other from 16 to 20 feet in the air. Cross poles were laid upon the rafters and fastened by means of strips of bark. On top of this net work were placed spruce or hemlock boughs with their tops turned downwards, providing an effective shield against snow and a passable one against rain. Large openings were left in both gables. The doors were low and wide and of sufficient size to permit the hauling in of logs which were used for the large fire that was always kept burning in the centre of the camp. These logs were hauled in by horses and banked as in a bonfire, the smoke escaping through a hole in the roof. In fact it would not be difficult to imagine from the plan of one of these early camps that its inhabitants were akin to the Huron Indians who lived on the shores of the Georgian Bay and erected large council houses on a very similar plan. The great fire in the centre of the old time camp provided both heat and cooking facilities. In its coals were baked the beans, pork, bread, etc., which formed the staples of the lumber-jack's daily food.

The sleeping accommodation was of a similarly primitive nature. Lengthwise, on either side of the big camp building, were arrayed the camp bunks. The mattress consisted of spruce boughs supported above the ground by poles. This field-bed extended the entire length of both sides of the building. Blankets were sewn together to form the undersheet and cover the boughs. The upper sheets were of an exactly similar nature. For pillow the lumber jack used his dunnage bag, or his "turkey," a pair of boots, an old saddle; in fact anything that would serve to raise his head. It may well be imagined that when the camp was full, which was most of the time; the business of going to sleep and remaining there was a formidable one. The enviable position in this bed was near the centre of the row, as it was opposite the fire. The unlucky positions were on the

A Temporary Camp Building with Tar Paper Roof

Plan of a Winter Mill with Camps

ends of the lines which were far from the fire, and often were left without any covering.

From this early and primitive beginning the development commenced. One of the earliest improvements was the raising of the log portion of the camp to such a height that a man could stand up comfortably near the sides. Smaller and more numerous camps were introduced and finally the bunk house commenced to make its appearance, with crude fire places which gave way subsequently to huge cast-iron stoves fed with long lengths of wood.

Several cook houses, with plain dining rooms and a kitchen at one end of the building, were the next innovation. The horses, however, were still kept in a log barn very similar to the camp building, above described. The arrival of the bunk house soon led to the disappearance of the field-bed, which was superseded by rows of bunks, two and three tiers high in which only two men slept together and strong mattresses took the place of the spruce boughs.

In places where lumber was available, the log shanty gave way to the camp building of two thicknesses of wall boards set on end, nailed together with a roof overhead, and, as the camp shanty improved, tar paper was placed between and over the boards to keep out the rain and the biting blasts of winter. These buildings also permitted the use of windows.

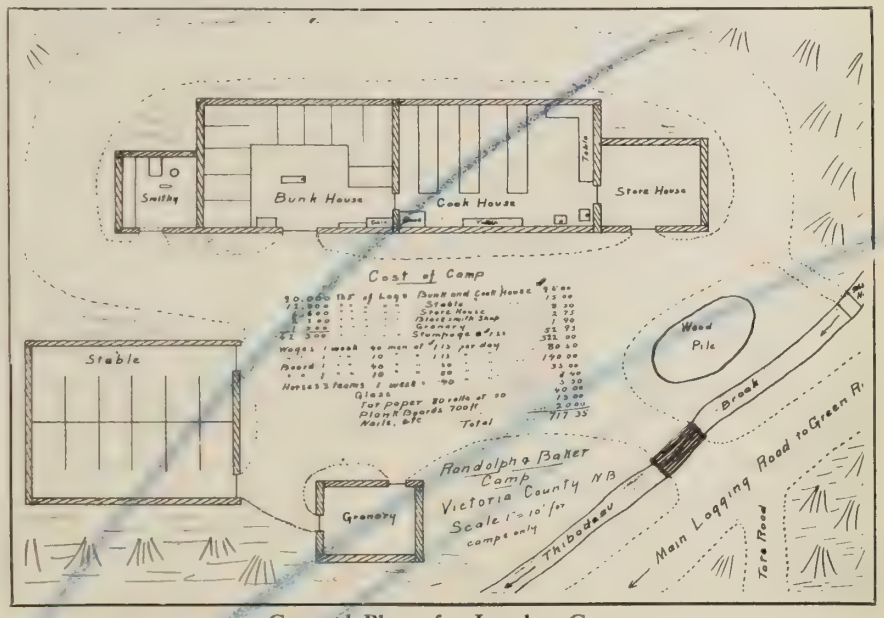
To-day the average set of camp buildings is more clean and comfortable than the average hotel in a country town. The lumber-jacks have their clothes washed at regular intervals and the camps are kept very clean. The food has been immeasurably improved as logging operators find that they cannot keep their men unless they are furnished with well cooked food. Fresh meat and vegetables are to-day upon the bill of fare in nearly every modern camp, taking the place of the "salt horse," "pea soup" and "hard tack" which formerly made up most of the lumber jack's food.

Improved Conditions of To-Day

In the old days the life of the lumber jack involved long months outside the pale of civilization. To-day he enjoys most of the luxuries of life that can be obtained in the best country village in the land. His hours of labor are not unreasonable. He has good food, good clean beds and in general, his life is vastly improved in comparison with the life which was led by the lumber jacks a generation ago. To sum the matter up in a sentence, the old life of filth, firewater and fighting have given way to wholesome cleanliness, intelligence and decency.

Along with the improvement in the manner of living, there has come about an improvement in the methods of work. A comparison of the logging methods in use during the early history of the St. John River with the methods at present in use will show a number of important improvements and illustrations. In the early days the lumbermen upon the St. John River only took out the best trees, and it frequently happened that during the process, more lumber was wasted than was actually secured in the tree itself. Trees were felled with axes and squared before being hauled to the river's bank by oxen or with block and tackle. No care was taken to protect the young growth or to destroy the brush that accumulated. Only the best part of the tree was taken and large tops were left which formed splendid material for the forest fires which followed so often and destroyed many thousand acres of valuable forests. We are accustomed to criticizing even the methods of logging in use to-day, claiming that they are wasteful. Nevertheless, they are greatly improved as compared with the older methods. Greater care is taken in the lumbering operations. Saws only are used to fell the trees and the logs are hauled out to the river bank by horses. The young growth is protected, brush is burned up and all of the tree is taken up to five inches at the top, leaving comparatively no waste.

Lumbering operations in New Brunswick to-day correspond rather closely with those in other parts of Canada. There are cer-



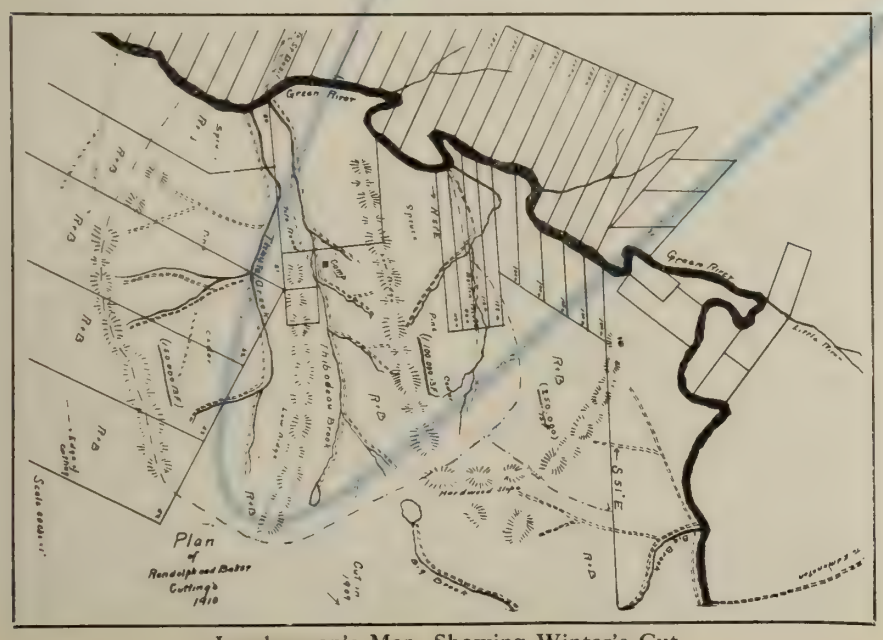
General Plan of a Lumber Camp

tain differences resulting from the nature of the country, but generally speaking, the problems to be solved in connection with the taking out of timber are much the same as they are in Quebec and Ontario. In the first place, a number of preliminaries have to be attended to, involving a careful study of the country to be operated, so as to determine the easiest, shortest and quickest way of getting supplies in and bringing lumber out. The location and the building of the camp involves much the same problems as in other parts of the country. The average camp established to-day in New Brunswick includes a cook house and a bunk house which for a crew of about sixty men would each be about 28 ft. by 30 ft. and 8 ft. to the eaves.

The swamping crew generally consists of about five men who attend to the swamping out and putting in shape of the main hauling road to the landings or to the mill. It is essential that these roads be laid out with much care, particular attention being paid to avoiding steep grades. In clearing the road, trees are cut close to the ground, large stumps are burned out, holes are filled in with short logs, bridges are put across brooks or streams and very rocky or swampy grounds are corduroyed with poles about six or eight inches in diameter.

Another gang, known as the brook crew, attends to cleaning out the brooks and streams down which logs are to be driven. Four or five men will compose an ordinary brook crew. They must remove all trees, roots, old logs, etc., which would interfere with driving. Large boulders have to be removed with dynamite. Bulk heads must be built across small gaps which would otherwise collect logs and form a jam. Splash dams have to be built wherever it is necessary to collect sufficient water to float the logs over shallow portions of the stream.

The yarding crew as a rule consists of seven men; two sawyers,



Lumberman's Map, Showing Winter's Cut

two swampers, one knotter, one teamster and one yard tender. The trees are felled and cut up into log lengths by the sawyers and the knotter then removes the limbs and places the company's mark on each log. Swampers in the meanwhile have brushed out a path so that the teamster can haul the logs to the yard.

At the yards the logs are stored till the snow comes and makes it possible to haul them to the mill or to the landings. A few logs are used as a foundation and the others are rolled into position on top of the foundation. One crew can, under average conditions, place at least 150 logs in the yard each day. The work continues until the frost and snow interferes and then the hauling commences.

As to the work of hauling, it is similar to the same operation in other parts of the country. Snow roads are built and iced with a water tank until they are in a condition to permit of the sleds being easily pulled along them. To keep the ice roads in shape, requires the services of two men to every mile and a half of road. These men travel back and forth over their sections all day long, removing all obstructions which accumulate during the day and night. They also keep the road built up, filling in hollows and levelling off mounds. The maintenance of a good ice road is, in fact, a very difficult operation, and one upon which the success of the camp operations very largely depend.

Double runner sleds or "bob sleds," as they are called, are used for transporting the logs. The sleds are built upwards and are about 5½ to 6 feet on the rockers. Each sled carries about twenty logs which are firmly bound on by chains and hauled to the landing where they are scaled.

Hauling Logs by Steam

The growth of the lumbering industry in New Brunswick has involved the cutting out of the timber in the more accessible parts of the province, making it necessary to go farther back from the drivable rivers and streams to secure supplies of timber. This necessitates long hauls before the logs can be placed in the streams, and an important development has been brought about by this condition. The steam log hauler, built by the firm of Alexander, Dunbar & Sons Company, Woodstock, N.B., is designed especially to overcome the difficulty arising out of these long hauls. The use of the steam log hauler has been steadily increasing and it has proved a most important factor in connection with logging in New Brunswick. The roads are built in the same manner as they formerly were when logs were drawn out by horses, with the exception that they must be 9 ft. wide instead of 7 ft. The work that can be accomplished in this manner as compared with the work of horses and the cost of the same is shown in the following tables:

Engine cost	$6,000.00
Other equipment	4,000.00
	$10,000.00

An equal amount of work performed by horses would show the following results:—

Twenty pair of horses at $500 per pair	$10,000.00
Sleds, harness, etc.	2,000.00
	$12,000.00

Cost of engine with crew per 24 hours	$ 45.00
Cost of horses with crew per 24 hours	112.00
A saving of	$ 67.00

In one season, therefore, it is possible to save almost the price of an engine on the work for which it would be necessary to employ twenty pair of horses. Other advantages are also involved in the use of a steam log hauler; for instance, when work is through, the engine stops and costs nothing. Horses, however, have to be fed and looked after and they can be worked at most for twelve hours a day, whereas an engine could be worked for 24 hours. More men are necessary to handle the horses than to handle an engine and they also involve an additional expense of about $50 per day. A number of these engines are already in use and it seems certain that in the near future they will be in very general use among the larger operators.

When the logs reach the landings, they are scaled by the company's scaler and his assistants. This work is similar to the scaling work in other parts of Canada. An average scaler and his assistant will scale from 2,000 to 3,000 logs per day.

The cost of logging operations in New Brunswick varies as in all other parts of Canada, according to the location of the limits in question. An idea of the expense, however, may be secured from the following estimate furnished by Messrs. Randolph & Baker, St. John, N.B. In their operations they estimate that their cost of cutting the logs and getting them to the booms at Fredericton, is as follows:—cutting and skidding—$4 per M; hauling—$2 per M; driving and rafting—$2.10 per M; total—$8.10 per M.

The New Brunswick log scale upon which operations in the provinces are based is a combination of the Vermont rule and the Maine rule. In cases of dispute it is the official scale in the province of New Brunswick. Its figures are as follows:

Diameter Size	Length of Log							
	12 ft.	14 ft.	16 ft.	18 ft.	20 ft.	21 ft.	22 ft.	24 ft.
	Contents Board Feet							
8	30	35	40	45	50	53	55	60
9	38	42	48	54	60	62	66	72
10	48	56	64	72	76	84	88	96
11	59	70	80	90	104	105	110	120
12	72	84	96	108	120	126	132	144
13	84	98	112	126	140	147	154	168
14	98	114	130	147	163	171	179	196
15	112	131	150	168	187	196	205	224
16	128	149	170	192	212	222	234	256
17	149	174	188	223	248	261	275	298
18	172	200	229	258	286	301	315	344
19	196	238	261	294	326	343	359	392
20	225	262	300	337	375	393	412	450
21	247	288	327	370	411	422	453	494
22	272	317	362	408	453	476	498	544
23	297	336	376	445	495	519	544	594
24	324	380	432	486	537	569	594	648
25	358	419	477	540	586	620	656	715
26	380	444	507	570	634	665	697	761
27	410	478	546	615	682	717	751	819
28	460	537	614	690	736	805	844	920
29	495	575	657	739	820	862	903	985
30	530	618	706	795	883	927	971	1060

The supplies required for a day camp of 60 men in New Brunswich are about as follows: .

⅛ bbl. beets, 10 lb. lard, ½ bbl. potatoes, 4 lb. salt, ¼ bbl. carrots, 1 lb. pepper, ¼ bbl. turnips, ½ peck beans, 5 bbl. water, ½ peck peas, ½ bbl. flour, ½ box prunes, 50 lbs. pork, 8 quarts molasses, ¼ of beef, ½ box evaporoted apples, 8 lbs. butter, 20 lbs. cream of tartar per week, 2 lbs. tea, 10 lbs. soda per week, 20 lbs. sugar.

The meals will average in cost from 8 to 15c. each per man.

In addition to the bunk house and cook house the camp includes a stable or hovel, built like the bunk house of logs and having a board roof covered with tar paper. The stalls are of double width so that each team of horses will be together. The hay and grain are kept at one of the stable.

The crew and their work are much of the same in all camps. The cook, teamsters and cookees turn out about five o'clock in the morning and the rest of the crew at five forty-five. Breakfast is served at six and the men are all ready for work at seven o'clock. The crews take a lunch with them to the woods and supper is served at six-thirty in the evening.

Toledo Fire and Marine Insurance Co. Proposed Enlargement

The Toledo Fire & Marine Insurance Company, the oldest of the lumber specializing stock fire insurance companies, which has been conducted successfully for many years with a capital of $100,000, purposes to adapt itself to new conditions by an increase of capital and surplus. This increase will enable the company to take advantage of the opportunities of a broader field than has been open to it under its smaller capitalization, and the new stock will be offered to lumbermen and millmen in Canada as well as in the United States. The plan for enlargement contemplates a $500,000 company, with $250,000 capital and $250,000 surplus.

For ten years the Toledo Fire & Marine Insurance Company has made a specialty of lumber and woodworking risks. It has demonstrated that the lumber trade, in all its ramifications owning close to ten per cent. of the aggregate insurable value of the country, constitutes a field for the operation of an insurance company well worth cultivating.

The Toledo Fire & Marine Insurance Company when organized in 1902 under its present management as a lumber specializing company, met with the instant appreciation of the lumber trade. It was the first stock company of its kind. By many years of prompt and equitable payment of losses, it has made itself known to lumbermen throughout the country as a reliable, dependable insuring organization. Its success resulted in the organization of other and larger companies, and while, with its $100,000 capital the company has been able to do a business consistent with its resources, it is recognized that with larger capital and surplus it will more readily satisfy the public demand and comply with various State requirements as to minimum capitalization.

The Need for More Companies

Great lumber manufacturing plants, wholesale and retail yards, city planing mills, woodworkers of every description and innumerable combinations and groups of such risks represent so great values subject to one fire, that a single fire insurance company operating conservatively can assume but a very small percentage of any single

risk, thus making a demand for the policies of many companies to make up the total insurance required. Thus wherever values are large, or many properties are grouped together making a large aggregate value, any strong company, such as it is proposed to create, can, on newly entering the field, with absolute certainty command its small share of these risks at many points. The aggregate of these lines obtainable throughout the country would in itself make a substantial business, and this is business of excellent quality, as wherever there are large values, fire fighting appliances and protective devices are freely installed. There is constant pressure on the insurance offices for more and better insurance by these large risks and groups of risks. The increase in number and value of such risks makes constant demand for more insurance companies.

History of the Toledo

The Toledo Fire & Marine Insurance Company was organized in 1848 with an authorized capital of $250,000. It operated successfully and retired creditably from active business in 1887. In 1902 the company, with head office at Sandusky, Ohio, was taken over by the present management, and with $100,000 capital paid in, made a specialty of lumber and woodworking risks. During the ten years ending January 1st, 1912, it received in premiums $1,080,255 and paid in losses $614,526. It paid in dividends to stockholders $103,000 or an average of 10.3 per cent., a reasonable earning in view of the difficulties confronting a company of small capitalization. It has established an excellent reputation and friendly relations with lumbermen throughout the country.

Many years of specialization in lumber and woodworking risks have gained for the company a clientele whose risks have proven profitable to the company at the rates established. With increased capital the company's policy can very readily be placed with lumber insurers of the best class throughout the country, and the company's present acquaintance in the trade will prove of great value in quickly developing an extensive business.

The company on entering the Dominion of Canada will make the customary deposit with the Dominion authorities of $50,000. As it is the desire of the directors that the new stock be well distributed throughout the field in which the company will operate, only an amount equivalent to the Canadian deposit will be held open for subscription in Canada.

The opportunity to subscribe to this portion of the new stock is being offered exclusively to Canadian lumbermen who have in past years done business with the company or its underwriting managers, the Lumber Insurers General Agency, through their Canadian office, Central Chambers, Ottawa.

Forestry Convention at Victoria, B. C.

Notable Address Delivered by President Hendry, Hon. W. R. Ross and Others—A Forestry School for B. C.—Successful Fire Protection Measures

The recent convention of the Canadian Forestry Association which was held at Victoria, B.C., was by far the most successful meeting of this kind that has ever been held in Canada. A brief report of the meeting was published in the last issue of the Canada Lumberman. Some of the interesting features, however, were unavoidably omitted from that report on account of the brief time between the holding of the meeting and the date of publication.

Among the most interesting features was the passing of a series of resolutions giving expression to the opinions of the association as shown by the addresses and discussion which took place at the various sessions. The chief resolutions passed were as follows:

(1) That the Canadian Forestry Association endorses the suggestions submitted by the British Columbia Lumber and Shingle Manufacturers' Association in favor of establishing a course in Logging Engineering in the new British Columbia University.

(2) Believing that actual working co-operation between public and private forest management is essential to mutual understanding and complete success, we urge upon Canadian lumbermen the study and emulation of the lumber owners' co-operative fire associations of the Pacific Northwestern States which are proving of great value not only in their own fire control, but also in bringing about closer and better relations between all agencies engaged in forest preservation.

(3) Whereas the proper disposal of debris resulting from lumbering operations is essential to the effective protection of forests from fire; therefore, resolved that the association urge upon the Dominion and Provincial Governments, the advisability as soon as practically possible, of adopting measures to this end.

(4) That the Canadian Forestry Association is of opinion that it is in the public interest that squatting or settlement should not be allowed on lands that are chiefly valuable for their timber, and that all non-agricultural lands should be reserved permanently for timber production.

(5) That it is important that all appointments in the forest service of the Dominion and Provincial Governments should be based on capability and experience.

(6) That the Canadian Forestry Association would recommend that the fire acts of the Province of Manitoba, Saskatchewan and Alberta which were enacted some years ago be revised so as to provide more efficiently for the prevention of fire and the punishment of offenders.

(7) That recognizing our common bond and common aims, we desire to testify to the achievements and practical assistance to the forest cause of the American Forestry Association and hope for increasing co-operation between our organizations.

(8) That this association congratulates the Government of British Columbia upon the excellent beginning it has made in the task of protecting the forests of the province and is of opinion that the force employed should be largely increased, that there should be increased expenditure not only upon patrol but also upon permanent improvements, such as the construction of trails, telephones and lookout stations, all of which will tend to make forest preservation more efficient.

(9) That this Convention endorses the action of the Dominion Government in setting aside forest reserves, that it urges further reservation of suitable areas and the retention of existing reserves in their entirety with the object of affording to the surrounding districts the best results for all time in regard to fuel and timber supply, grazing, the protection of game and regularity of stream flow.

President Hendry's Address

Mr. John Hendry, President of the Canadian Forestry Association, in his address, made special reference to the question of keeping fake settlers out of timberlands. His remarks in part were as follows:—

"We are coming further to clear realization that the two main enemies of the forests and of the continued prosperity of certain sections of the country, are fire and the pretended settler, that is, the man who goes in to defraud the country of the timber under the guise of settlement. These so-called settlers, after they have taken the timber, leave the land in such a state that it will neither produce crops of grain nor timber, and then move on to new forests to repeat the operation. If, on the other hand, the lumberman had had these lands under proper methods, they would produce timber for many years to come, and later on by plans of reforestry could be made to grow a new crop.

"Our first need, however, is to protect the crop we have. With care the timber in Canada will last many years and this care is our first consideration.

"First and most important of our duties is that we should satisfy ourselves that we have done and are doing all that we ought in regard to fire protection before we go on to reforestration. In fact, until we have banished fire from our forests money spent on reforestation will be simply thrown away. We must save what we have and use it as conservatively as possible, that is to say, reduce waste in the woods and the mill to the lowest point consistent with the economical handling of the product and the making of profit.

"This is easy to say and we have been saying it for some time, but we must realize that if our forests are not to be burned up, the governments of Canada, federal and provincial, must approach the subject more systematically than they have yet done. Each province must lay out its work just as systematically as a city fire chief would lay out his plans to cover the city, and besides there should be co-operation between the provinces and the Dominion, where their respective jurisdiction join or overlap. This, of course, means the expenditure of money, but upon what can money be better spent than on the protecting of our natural resources?

"To keep 'fake' settlers out of areas suited principally for timber, requires first a knowledge of the country, which will show where such areas are, and the power in the various governments to resist political pressure brought to bear upon them to allow pretended settlers to locate on what is chiefly valuable as timberland. Surveys should therefore be made as rapidly as possible to ascertain the areas of absolutely forest land, and the whole forest staff should be free from any partisan influence, so that it will not be silent when measures antagonistic to the good of the forest are proposed, or when parties endeavor wrongfully to enter upon forest lands. To obtain the best results the forest service should be placed under civil ser-

vice regulations whereby appointments, promotions and dismissals will be made solely upon merit. It is gratifying to know that British Columbia is taking a forward stand in these matters and that the forest service is now being organized, which bids fair to be the finest in the Dominion. This means the expenditure of a large amount of money, but so long as the service carries out the idea of protecting our forests with an eye single to the public interest I am sure the government will be sustained by the people in this work."

Guarding the Public Forests

Hon. W. R. Ross, Minister of Lands for British Columbia, delivered an interesting address upon the guardianship of the public forests of British Columbia. Referring to the work of the Forestry Commission he showed how it had led to the passing of an act for the systematic organization of forest work in the province. The two main questions to be dealt with had been the preparation of new legislation and the organization of a forest service. It had also been immediately necessary to enlarge the fire warden service for the dry season then approaching. This was successfully done by doubling the staff of fire wardens, dividing them into ten groups and providing for efficient inspection of their work. The 257 fires which had been fought during the season of 1911 cost the department only $30,000 and the up-keep of the patrol force had cost $112,000.

Hon. Mr. Ross then dealt at some length with the difficulties which had been experienced in securing capable and practical foresters for the carrying out of the forest legislation which had been passed. This, however, had been satisfactorily arranged. The forest act had become law just six months ago and it had created the new forest branch supported by a vote of $160,000, which, with the $230,000 contributed by holders of timber licenses and leases, by owners of timberlands, and by the government, to the forest protection fund would bring the total sum available up to $390,000 for the present fiscal year. Experienced men had been secured to take charge of each of the sections of the forestry work and they had been engaged in investigation work since April. The organization plans had been finally approved in June and the chief forester had taken up his duties in the middle of July. It was impossible, therefore, to give any report of actual field operations at this early stage. The work, however, had been vigorously begun and he hoped in the future to be able to report important achievements.

They were concentrating their attention at present upon the organization of a practical and efficient field force. Their plans would enable them to give far closer attention to the needs of each locality.

Nine million acres of forest in British Columbia were subject to cutting rights held by licensees. Nearly three million acres more were under lease or in private ownership. An unknown area, which they were beginning to think was much larger than had been supposed, still remained in reserve in the hands of the government. No systematic examination of these enormous areas had ever been attempted. Until they knew what timber they had and where it was, they could not tell whether their methods of handling it were sound business.

These considerations showed that they were now beginning the stock-taking of their forest resources. Eight parties were now in the field in charge of competent men, nearly all of whom had begun their careers by graduating either from the Toronto or Oxford forest schools. The survey work was being concentrated largely at first upon the regions north of the railway belt which would soon be opened up by the Grand Trunk Pacific and Canadian Northern Railways. They hoped to complete their general survey in a little over three years.

Problems for the Government

Hon. Mr. Ross referred to a number of other matters which were receiving the attention of his department. For instance, there were certain regions in the interior where it was feared that the forest was failing to reproduce itself. A careful examination of these regions was being made. A special study was being made of the effects and defects of the log scales in use in the province. Attention was being devoted to publishing reliable information to advertise British Columbia timbers and the forest industries of the province. A study was being made of timber waste in all its forms and a campaign of publicity was being carried on to combat public carelessness in regard to forest fires.

The forest act had established the forest protection fund to which all owners, lessees and licensees of timberlands were required to contribute, the government putting up dollar for dollar. The standard levy was one cent per acre with the proviso that whenever this proved insufficient there should be an automatic increase to whatever figure was necessary. Thirty-eight new fire districts had been created during the present season. By October 1st, forest protection would have cost during the present year, less than $180,000.

The question of waste in logging operations was also one which had attracted the attention of the department and was one of the most important with which it had to deal. To-day, for instance, each million feet of lumber manufactured on the Pacific coast involved the wholesale destruction of low grade material for which no market could be found. Before the problem of the low grade log they were as helpless to-day as they had been a few years ago in regard to fire protection. He hoped for co-operation between the operators and the forest service in studying methods for preventing this serious waste.

In conclusion, Hon. Mr. Ross said: "What we need to drive into the understanding of the people is that 'forestry,' as we practice it, means the scientific management of the government's immense timber business so that the citizen who would otherwise have to pay $15 in taxes, has only to pay $10; so that in years to come the citizens will have to pay still less; that while producing these effects on revenue, the system of forest finance will be so adjusted as to offer the maximum of encouragement to the growth of the lumbering industry; and—above all other considerations—so that our forest capital, the source of our prosperity, may be preserved intact."

A Forest School for British Columbia

An address by Mr. G. M. Cornwall upon the profession of the logging engineer was one of the most interesting features of the convention. He suggested that a course of study in logging engineering should be made part of the university curriculum. A general knowledge of the principles of steam, electricity and hydraulics were essential and the student should also acquire an actual working knowledge of the cutting and removal of timber. He should be a man of broad sympathy, capable of looking after the men in camp and of reducing the cost of logging operations. A difference of $1 per thousand feet in logging operations was easily made and would more than pay for the training of the engineer. A logging engineering course in a college should consist of three departments, which should be in charge of a practical logger, a cruiser and estimator and an instructor in mechanical and civil engineering. The student should spend at least eight months of each year in the bush and a certain time in a machine and blacksmith shop. He should learn to cruise and estimate timber, should have a practical knowledge of civil and mechanical engineering and be able to make topographical drawings with accuracy.

Hon. W. R. Ross made the announcement that a school of forestry would be established at the University of British Columbia.

Forest Figures in British Columbia

The protection of the forests of British Columbia from fires was the title of an address delivered by R. E. Benedict, assistant forester and chief of operation, of the British Columbia forest service. Mr. Benedict's address was replete with interesting statistics of British Columbia's forest wealth. Some of the facts included were as follows:—

The total area of British Columbia is approximately 250,000,000 acres. The government had established its fire protection service over 130,000,000 acres.

About 65,000,000 acres, on a conservative estimate, are capable of producing merchantable timber and valueless for any other purpose. The productiveness of this land varies from 1,000 board feet per acre per year, in particularly favorable localities on the coast, to 25 to 50 board feet per acre per year on the mountains of the interior. The average yield would amount to 100 board feet per acre per year at least.

This would give an annual production of 6,500,000 feet.

A fair estimate would place the mature and over mature stand at 20,000,000 acres and fully stocked second growth at 20,000,000 acres. The remaining 25,000,000 acres consisted of areas which had been badly injured by fire on which there is an inferior mixed stand of mature trees with more or less reproduction, or of land in the process of regeneration. There are practically no areas which are not regenerating.

It is a certainty that within ten years, the forests of British Columbia will increase their cut to four or five billion feet annually, which is just about the present cut of the state of Washington.

In twenty years time the production of lumber in British Columbia will only be limited by the supply, viz., six billion feet per year. It is likely that this limit will even be reached in fifteen years.

The stand of mature timber will, therefore, last from fifty to seventy-five years. At that time, the present stand of second growth timber will have matured. The annual production can, therefore, be maintained perpetually at six billion feet. This all depends upon the present stand of mature and second growth timber being preserved from fire.

The stake for which the forest protection force is working is, therefore, an annual crop of six and a half million feet of timber, worth to the government, say, six million dollars, and to the community $100,000,000.

A number of other interesting addresses were delivered upon subjects of practical interest to lumbermen and foresters. Some of these will be published in future issues of the Canada Lumberman.

Prairie Farmer Gets Cheap Lumber

C. A. Larkin During Western Trip Finds Prices Lower than in Ontario—The Shingle Market Situation

C. A. Larkin, Toronto

Mr. C. A. Larkin, President of the C. A. Larkin Lumber Company, Limited, who recently returned from a trip to the Pacific Coast, reports that everywhere in the west evidence of the prosperous condition of the lumber trade is manifest. Speaking of western conditions Mr. Larkin says:

"It will be somewhat of a surprise to many eastern lumbermen to learn that not only Douglas fir and spruce, but white pine dimension is selling in Manitoba at lower prices than in Ontario.

"Western newspapers have occasionally attacked the western lumber dealer, voicing the opinion that the prairie farmer was being charged exhorbitant prices for lumber required to build his home. Throughout the west retail yards are numerous and competition appears to be keen. Judging from the prices ruling in Ontario, which certainly cuts profits close enough, it is evident that the prairie farmer is getting a very fair deal so far as the lumber trade is concerned.

"The coast mills enjoy an immense trade with the prairie provinces. Many of the mills operate a system of line yards and readily dispose of their output through these yards. This trade, combined with the heavy local demand in British Columbia which is enjoying an unprecedented era of prosperity, is keeping the mills running to full capacity with very little stock piled in the mill yards.

"Some eight years ago a law was passed in British Columbia prohibiting the use of Japanese labor in taking out shingle bolts. Up to the present this law has not been enforced. It is said however, that it is to be enforced this season. The manufacturer is somewhat concerned, as the prohibition means an increased cost in producing shingle bolts. He claims that the selling price of shingles has not kept pace with the increased cost of production, to enable him to realize a fair margin of profit. However, it may be said that the shingle manufacturers are all very busy and have more orders on hand than they really know what to do with; the demand for shingles this year being in excess of the year 1911. One manufacturer, who seemed to be well informed on the subject, estimated the coast mills to be 300 cars behind in shipment of orders. Under these conditions it is not surprising that the manufacturers were considering this an opportune time for an advance in price. An advance has since been made; XXX are now $3.40 delivered on a 75c. freight rate.

"Combined with the present brisk demand and favorable future prospects, the manufacturers are undoubtedly placed in a sufficiently strong position to maintain the advance without difficulty."

Chapman on Forestry

The American Lumberman, of Chicago, has published an important and interesting volume on forestry, by Professor Herman H. Chapman, assistant professor of forestry at the Yale Forest School, and an author with a long and practical experience in forestry work. "Forestry," which comes from the American Lumberman press, is a practical exposition of all that the term means, stating in a clear-cut and incisive English that which has been accomplished and that which has been learned by foresters in the United States. It is a volume essentially written for men whose knowledge of Latin is limited, but whose knowledge of the practical assets of forestry and its handicaps is large.

No volume of present recollection is so simple, clear and untechnical. Theories which practical lumbermen have discounted are here discarded. Professor Chapman apparently aimed at just one thing; to write a volume that would sift all of the experiments and experiences and leave as the residue a logical statement of forestry in the United States, so far as it has progressed.

The early part of the volume, which treats of the growth of different species, is unusually entertaining, and the struggle of the tree in the forest for moisture and light is interestingly related. The influences of the seasons and of latitude are also clearly portrayed. Another section deals with natural reproduction, and it is shown how this may be best encouraged.

The author then takes up the practical subject of silviculture. He shows how it is at present handicapped by adverse taxation and inadequate fire protection. Forest fires and their prevention are carefully discussed.

The concluding chapter, "Forest Policy," is indicative of the interesting character of the whole volume. This chapter discusses the influence of forests on climate and the influence of forests on streams and soil erosions; Government regulation v. Government ownership; the history of national forestry in the United States; State forestry; agricultural soils v. forest soils; and the State as a producer of timber.

Any man who owns trees or who is concerned in their growth or cutting will find much valuable information in this book by a scientific forester who has been wise enough to record experience rather than theory and to explain simply and scientifically the proven principles most likely to be of interest and value to timber owners and those concerned with the forest. "Forestry" may be secured from The American Lumberman, 431 Dearborn street, Chicago. The price is $1.25.

A Sunken Forest in Ottawa River

Ottawa, Sept. 22nd.—Right at the Capital's side door-step there is a forest of logs sufficient to keep the mills of the two cities of Ottawa and Hull running for several years—millions of as fine logs as ever felt an axe. And yet lives are lost and money spent year after year in floating from far up in the north country, the supply that feeds these same mills which have the forest at their doors. Strange, it would seem if nothing more were said, but there is a reason. This is it.

The forest that exists only a few blocks from the House of Commons and which is of such great proportions is a buried forest. Until a few days ago few of the citizens of the Capital knew it was there. Some of the more canny ones, like J. R. Booth and Senator Edwards, knew of it, but even they did not know its immense size. It's at the bottom of Napean Bay.

This graveyard of sunken timber was discovered a few days ago through the judicial investigation that is being made into the contamination of Ottawa's water supply. Messrs. Noulan Cauchon and R. L. Haycock, consulting engineers, were instructed by the city solicitor to examine the clear water intake pipe which runs into Napean Bay. They examined it by means of divers' suits and apparatus, and reported their findings to the court of investigation.

"The bay is a graveyard of sunken logs. There are enough logs there to keep the mills of Ottawa and Hull running for several years," Mr. Cauchon told the investigation.

For years and years, ever since J. R. Booth first ran a one-horse saw mill at the Chaudiere, these logs have been piling up in Napean Bay. The bay is the booming ground of the Booth mills and every year millions of logs float down the Ottawa and come to rest there. Each boom deposits its quota at the bottom of the bay—logs that have become heavy with water and sink. Some of them are "dead" at the bottom of the river; others are floating about partway between the bottom and the surface, jostling each other and playing hide-and-seek.

And now that it is known that the quantity of these logs is so great, the question arises: can they be recovered? Lumbermen say they can be.

In fact, similar operations are being carried on elsewhere. There is machinery especially designed for the purpose and it is being used in Michigan and other places with satisfactory results.

Most of these logs belong to J. R. Booth, so the veteran lumber king may be said to have a fortune buried under the Ottawa River. Other lumbermen in the city state that they would be willing to undertake the recovering of these logs, but to do this Mr. Booth would have to relinquish his booming rights on Napean Bay. Mr. Booth himself may undertake the work some time.

In this connection it is pointed out that there is a question of national importance involved. The need of conserving the forests is recognized. In fact the government is doing its best to conserve them so that Canada may not be lumber starved in the future. Similar logging operations to those that have been carried on on the Ottawa river for years, have been carried on elsewhere. In all parts of the country where logging and booming have been done there must be other just such immense deposits of valuable logs.

Would it not be wise to have these logs recovered and used to feed the mills? If the supply at the bottom of the rivers is as great as suggested they would feed many of the mills for years. Then, while the mills are running on these, some of the standing forests might have a chance to develop and grow.

The Log Input for the Coming Winter

Reports Indicate Reduction in Ontario and an Average Cut in Eastern Canada—Foreign Markets Promising but Freights Excessive

From reports received by the Canada Lumberman it appears that the cut of logs in the woods during the approaching winter will be reduced in Ontario, while in Quebec it will remain about the same as last winter, and in the Maritime Provinces it is likely to be at least equal to that of last winter and possibly a little heavier if the present favorable indications in regard to foreign markets are justified by developments. Following are some of the letters which have been received upon the subject:

Reduced Cut in Ontario Woods

From a Georgian Bay company:—We hope to take out the coming winter about the same as last but how it will pan out for the season is another thing.

We will not put in as much timber as we did last winter. Probably about 75 per cent. of what we put in last year will cover it.—Little Current Lumber Co., Little Current, Ont.

We will take out the same amount of logs this winter as last. The hemlock cut will be about the same as last year, in Northern Ontario.—Hocken Lumber Company, Otter Lake Station, Ont.

As our limits were all cut off last year, we will not be operating in the bush this winter, and in the meantime, intend confining ourselves to the wholesale end of the business only.—De Laplante Lumber Co. Ltd., Tomiko, Ont.

From an Ottawa Valley company:—We are putting about the same number of camps as previous seasons. About 12 camps in all. We understand the operation in general in this district will not be so heavy as past seasons because of the surplus of logs now in the river.

We have six camps in at the present time, and expect to put in one more later on. We will operate to the same extent as last year, if not a little heavier. Men and horses are very scarce and wages a shade stiffer than last year.—The Pembroke Lumber Co., Pembroke, Ont.

From a large Georgian Bay lumbering manufacturing company:—We are putting in four camps and will take out about 10,000,000 feet, about the same as last year's operations. The cut along Georgian Bay will be considerably less than it was a year ago, on account of so many mills burning in the early part of the season.

We are operating in the woods to the same extent as last season, and we intend to cut as much stock. While there has been a fair price increase in most of the lines, this increase has not yet been equal to the increase in cost of manufacture, and we feel that higher prices should rule in all lines.—The C. Beck Manufacturing Co. Ltd., Penetanguishene, Ont.

From a Georgian Bay company:—Present prospects are that our operation will be about equal to last year. We just have one camp in to take out about two million feet, and expect to close the balance of next season cutting under contract. We have an option on further timber which, if we purchase, we may commence cutting this season, but at present this is indefinite.

From a northern Ontario company:—We will only run one camp on white pine and will have, say, 15,000 pieces of that grade and say ½ million feet of hemlock and ½ million feet of hardwood. The pine in this section is about done and we will only run one mill instead of two mills as we have been doing for some years. All the stock of pine, spruce, hemlock and hardwood that we have cut and will cut this season is sold.

From an Ottawa Valley company:—We are not putting in any camps of our own this season, but others are operating for our mill to about the same extent as last season. We have a good surplus supply of old logs on hand. With the exception of Booth, Shepard & Morse and J. J. McFadden & Co., the rest of the firms will, we think, operate in woods about as usual. We understand that the firms mentioned will reduce their cut.

We do not intend to install any camps during the winter of 1913, except a few small jobbers, and will purchase most of our stock from the farmers. We intend to stock five small mills and in this way expect to have four million feet sawn, including hemlock, spruce and birch. Wages and camp supplies are very high and at the present prices of hemlock and spruce we could not put in any camp.—Trout Creek Lumber Co., Nipissing, Ont.

We have in at the present time three camps and will take out about six million feet for 1913 operations. This will be made up as follows:—3,500,000 feet of hemlock; 250,000 feet of pine; 500,000 feet of balsam, ash and elm. The balance will be birch and maple. We do not think there will be as much lumber cut in Huntsville during 1913 as during 1912. Wages are very high and provisions almost on the prohibited list.—The Muskoka Wood Manufacturing Co., Huntsville, Ont.

From an Ottawa Valley company:—We purpose going on making our usual cut only, of about 25,000,000 feet. It is rumored that some of the Georgian Bay mills are reducing their cuts. We have heard of no one intending to increase. The labor question has become so acute, prices of all commodities that go to make logs are so high, and the advance which the manufacturer can obtain for his lumber is so small, that the question of lumbering has become a very serious problem. Together with all other high costs, he must reckon with the government for high additional stumpage and ground rent. All these additional costs come practically out of his stumpage value.

We will put in 8 camps this winter. We expect to cut 20 million feet of pine. This will be about the same as last year. I am unable to give you any reliable information as to the general operations for the coming season in this district, but presume there will not be as many logs taken out as last year, owing to the loss by fire of so many mills last spring.—Georgian Bay Lumber Co., Waubaushene, Ont.

Maritime Province Conditions

Regarding the woods operation generally in this section I should think the output would compare favorably with last year and the year before.—John E. Moore, St. John, N. B.

From a Miramichi River, N.B., company:—We have not yet decided the extent of our operations nor have we gone into the woods, while last year we had commenced all our operations by this time. We do not contemplate doing anything for two or three weeks yet. We have not yet fully decided the extent, but will probably reduce 50 per cent. The general impression here is that all operations in the northern part New Brunswick will be materially curtailed.

We expect to operate very lightly this season, and we think that probably four million would more than cover our expectations for the season, including what we are carrying over. Nearly all of this we expect to put into pulp. We expect to have about all shipped off at the end of the season. There is every indication of a very strong market at high prices next season.—Campbell Lumber Co., Weymouth, N.S.

Up to the present season at least 85 per cent. of all the stock cut in this locality was shipped to the English market but the high freight rates this summer have practically killed that trade, and while prices are good on the United States side for lumber suitable for the market, the operators feel that there is considerable risk in cutting too heavily with only that market to depend upon.—J. W. Kirkpatrick, Parrsboro, N. S.

Quebec Operations Increased

We expect to keep our mills up to the usual output next season.—The Lotbiniere Lumber Co., Lyster, P. Q.

We will put in about the same quantity as we did last year namely, nine million feet.—A. MacLaurin, St. Gabriel Lumber Co. Ltd., St. Gabriel de Brandon, P. Q.

We will cut this year about the same quantity as we did last, that is about 20,000,000 feet of spruce logs, as our mill capacity is for about that quantity and we do not care to operate only part of the season. Referring to the operations in general in this district, the opinion is now that they will be reduced about one-third.—Chaleurs Bay Mills, Restigouche, P. Q.

The appearance is that there will be an increase over last year, in woods operations in this part of Quebec, during the coming winter. There are very many however, who feel like ourselves, somewhat nervous about increasing lumbering operations, on account of the car situation being so bad. The future prospects, for car supply, are far from being encouraging.—Trois Pistoles Pulp & Lumber Co., Trois Pistoles, P. Q.

From an Eastern Townships, P. Q., company:—We expect to take out from six to eight million feet this winter. This is our usual cut. The market on the whole, is in about the usual condition. I think the local market is a little better than usual, but the English market is not so good, on account of the high ocean rates asked. I think the price of lumber on the English market is nearly the same this year as it was last year, but ocean freight rates have been going up so that there is less money in it for us than there was.

It is our intention to cut and deliver twenty-five million feet of timber this year. We are putting in more camps than last year, which means five million more of timber than we got out last year. In regard to timber operations in general in this district, everybody is delayed on account of scarcity of men, and I understand a number of the large concerns will not cut any logs this year, on account of scarcity of men and high wages. Men are being paid from $30 to $40 per month with board for bush work this year in this

district. Our business in general has never been so good as this year. Every stick of lumber we have in our yard has been sold, and would have been shipped out before this had we been supplied with cars.—Fassett Lumber Co. Ltd., Fassett, P. Q.

We expect this winter to cut about the usual quantity of material in our woods operations down here, that is, we will, the conditions being favorable, take out about the same quantity that we have every year for the last four or five years. We do not expect to make any increase. We will have about six camps, an average of about 50 men per camp and will cut all told probably 300,000 pieces of logs.

The situation, we think, this year is somewhat better than it has been for the last four or five years, so far as price on lumber is concerned, but owing to the great dearth of ocean tonnage, shipments from here to the British markets are practically at a standstill, as the lumbermen cannot get a better price in the English market than heretofore and the English buyer says that he cannot afford to pay the great increase in the cost of freight. Most of the lumbermen in this district are looking to the United States market and shipping the most of their output by rail and we think that for the next few years the United States market is the one that we will have to look to for most of our trade, unless the English markets very materially improve.—Cascapedia Mfg. & Trading Co., Chaleurs, P. Q.

Burning the Slash

The burning of slash was the subject of an address delivered by E. T. Allen, Forester for the Western Forestry Conservation Association, recently at the Pacific Coast Logging Congress. In the course of his address Mr. Allen said:—

It is idle to argue as to whether annual burning is good or bad, necessary or unnecessary, to be left to judgment or made compulsory. There are exceptions, of course, due to local climates or perhaps to rare individual circumstances, and the method of disposal may be different in Idaho from that in Washington. But on the whole we know that these immense accumulations of inflammable debris are our greatest single menace. Most of our bad fires start in them. Their menace increases yearly with their size and extension into new localities. On the face of it it is clear that they have been tolerated so long. It is also idle to talk of guarding slashings from fire, for we know they all burn accidentally sooner or later, usually at the very worst time. And if we were to guard them, at prodigious expense, it is two to one that they would breed insects nearly as dangerous as fire. Anyway, the law says we must burn them.

If you will analyze all the controversies you have ever heard on this subject, and be frank about it, you will admit that our chief trouble has been in trying to find a royal road by which we can burn safely and properly without cost. We have not tried to improve methods as much as we have tried to guess out times and ways to burn without improving them. We have been reluctant to face squarely the fact that conditions have reached a point where lumbering involves expense for this purpose just as it does for patrol and fire fighting. We sparred for time over these expenses once in just the same way—and lost a lot of timber by it, too. As a matter of fact, from now on slash disposal must be just as much a part of logging as falling or yarding, and must be given equal attention to insure efficiency as well as economy, or even more because mistakes cost more.

With this admitted, the rest becomes less confusing. Take fall versus spring burning, for example. This is a less important problem than we used to think it, for proper methods practically eliminate the spring danger. It is merely a question of paying for the insurance. Generally speaking, we should burn the summer's slash in the fall if we can, because it is cheaper to do it safely, but as a rule we should burn the winter slash again next spring. There is much to be said for burning again during the summer in many cases, with proper safeguards, for there will be no great dangerous accumulation to control. It really comes to just the same thing to advocate spring burning with another in the fall to get that much ahead on the summer slash. It all simply means to get rid of your slash as often as you can and generally you can, by taking sufficient precaution, because under such a system there will seldom be very dangerous situations. I refer particularly to actual slashings. The firing of extensive old burns covered with ferns and brush offers somewhat different problems, for they are often harder to surround and handle.

To anyone asking for a list of the precautions I have mentioned so often, I should begin with the most important of all and thus provide myself with a substitute. It is to have an expert do the burning and follow his advice in the individual case. The man who admits unfamiliarity by asking had best not do much experimenting if he can get the help of someone with experience. There has been too much insisting upon the burning of dangerous slashings by reluctant operators left alone to do it improperly and often after too long delay. I believe that until everyone has gained considerable practical experience, the expert slash burners of the several patrol associations should handle the risky cases, especially in those parts of the Northwest where broadcast burning, not piling, is the most practical.

The actual methods and precautions which have been developed by the men with the most experience, and their cost, will be described by the speakers who follow me. They will tell you how slashing fires act under different conditions and what control methods have been proved best. It is worth your while to profit by their discoveries, both lucky and unlucky, and which might cost you considerable to make yourself. On the whole, they will counsel spending some money, for it costs money to cut snags, clear fire-guards and put men around the fires. But they will tell you what is cheapest consistent with efficiency and safety and you can set it down as a certainty that to do anything wrong costs most in the end. Bear in mind, also, that the community has decided that the slash menace must go and your competitor is in the same boat that you are. He will not keep long any advantage through letting things drift while you are protecting yourself and the community.

Pioneer Lumberman Called by Death

H. F. McLachlin, Passes Away after Lengthy Illness—Successful in Business and Generous in Private

The late H. F. McLachlin, Arnprior, Ont.

After a six months' illness, Hugh Frederick McLachlin, president of McLachlin Bros. Ltd., Arnprior, Ont., one of the most widely known pioneer lumbermen of the Ottawa Valley, passed away at his Ottawa residence, on Friday evening, September 13th. The news of his demise, although not unexpected, brought great sorrow to all his friends.

The late H. F. McLachlin was born in Ottawa 69 years ago, the son of Daniel McLachlin, M. P. When a child his father acquired a small mill at Arnprior. On the retirement of Mr. Daniel McLachlin in 1869, the three eldest sons, Hugh F., Daniel, and John H., assumed control of the business. After the death of his two other brothers, Mr. H. F. McLachin formed a partnership with a younger brother, Claude. The latter died in 1904 and about that time the company was made a limited one with Mr. Hugh F. McLachlin as president and his son Daniel McLachlin, Arnprior, vice-president.

From the moment when Mr. McLachlin placed his hand on the controlling wheel of the huge saw and lumber business that bears his name, it has prospered and he leaves it now as one of the largest in the Ottawa Valley. Some idea of the growth and magnitude of the business may be had when it is learned that the capacity of the mills has been increased from 100,000 ft. of sawn lumber per day to 400,000 ft., under Mr. McLachlin's management.

Mr. McLachlin manifested at all times the greatest interest in the town of,Arnprior and his great benevolence while practised without any ostentation whatever, was well known to everybody in the town. Creed nor color mattered not to him and the case had but to be a deserving one to appeal to his generosity. Certainly no man has died more truly regretted by those who knew him, either as a personal friend or business associate.

The home life of the late Mr. McLachlin was as happy as his business career was successful. In 1878 he married Miss Mary Champney, of Yorkshire, Eng., who survives him, together with nine children.

Although so prominent a man, the deceased cannot be said to have taken a very active part in public life. In fact, his business seemed to be his greatest concern and he devoted himself to it with infinite care, patience and skill. Mr. McLachlin was a director of the Bank of Ottawa and a prominent shareholder in many other financial institutions.

A large number of prominent men in every walk of life, as well as great numbers from Arnprior attended the funeral on Monday, Sept. 16, to pay their last respects to a man whose work was not such as is recorded on the pages of political history but rather of such value that it could be written only on the memories of his friends.

Lumber Prices and the Box Situation

Box Lumber Prices Increased—Demand Greater and Supply Smaller—Causes of Shortage and Higher Prices—Consumers Objecting to Advanced Prices

THE increased commercial activity and general prosperity which have become so noticeable during the past two or three years throughout Canada, have brought about a number of important and interesting changes in the lumbering industry. Not the least of these is the fact that the low grades of lumber have at last obtained a definite value which makes them a profitable stock for the manufacturer to produce. It is only a matter of a few years since the low grades of lumber were being piled in the manufacturers' yards so rapidly that practically every yard became congested with them and manufacturers were seriously hampered in conducting their business. To-day the situation is exactly the reverse. Low grade stocks have been cleared off everywhere and the manufacturers of boxes who depend upon them for their raw material, not only find it difficult to secure sufficient stocks, but are obliged to pay higher prices, which are giving them considerable anxiety regarding the future profits of their business. Fortunately, at the present time the demand for boxes is so good that the manufacturers are able to select their customers with greater care than usual. They have thus been able to reduce the quantity of credit which they are giving, and in most cases to secure cash against their documents. The outcome of this situation is, that although they may not actually be securing higher prices for their boxes, they are obtaining quicker and more certain payments and the interest upon the money invested in their manufacturing processes is a less formidable element of cost than it used to be.

A number of interviews were recently secured by the Canada Lumberman upon this subject and they brought out some exceptionally interesting points. They demonstrated that the manufacturers of boxes in Toronto are practically unanimous in their views upon the present situation although they expressed a certain amount of diverse opinion upon some of the less important points. As to the demand for box lumber, there is no doubt about it being far greater to-day in Canada than it has ever been at any previous period. The indications, moreover, are that this condition will continue and that for some time to come, the demand for boxes will increase steadily. All the manufacturers of boxes in Toronto take this view of the situation, and in explanation of it, say that it is the result of the great increase in trade, and the wonderful prosperity which the country is to-day enjoying. Another factor of considerable importance is the large number of immigrants entering Canada. The arrival of these immigrants keeps up a steady demand for practically every essential article which goes towards the comfortable livelihood of a Canadian citizen. Many of these articles have to be shipped in boxes and the connection of the arriving immigrant with the demand for boxes is very definite and clear. So long as this immigration continues, and there is every probability of it doing so for some years to come, the demand for boxes is likely to be good.

Shortage Likely to Continue

Not only are the manufacturers of boxes in Ontario pretty well agreed that the demand will continue for some time, but they are also of the opinion that they can expect a shortage of supply during the next few years. The excessive cost of timber and labor in Northern Ontario, taken together with a number of serious fires, both in sawmills and in timber producing districts during the last year or two, have resulted in an excessive cost of manufactured lumber. Some mills have been forced by this, to cease operations. Among them have been a number of the largest producing mills in northern Ontario. During the past year or two, for instance, the following mills have ceased to operate or have been destroyed by fire: The White Pine Lumber Company's mill at Blind River, Ont., which as a rule turned out about 18,000,000 feet; Waldie Bros.' mill at Spragge, Ont., which had an annual cut of about 22,000,000 feet; Graves-Bigwood & Company's mill at Bying Inlet, which had an annual output of about 50,000,000 feet; Carney Lumber Company's mill at Owen Sound, with an annual production of about 10,000,000 feet; Keenan Bros.' mill at Owen Sound, with an annual production of about 4,000,000 feet, and the Parry Sound Lumber Company's mill at Parry Sound, with an annual production of about 30,000,000 ft.

It will be seen from the above figures that there is a shortage of some 134,000,000 feet, as compared with the cut of a few years ago. This will make a great decrease in the quantity of box lumber placed upon the market, in fact it has already been a most important factor in the box situation in Ontario. Those who are in a position to form an opinion upon the probable quantity of timber cut in the woods during the present winter report that it will be considerably less, even than during last winter, so that a further decrease in the output of the mills in Georgian Bay district may be expected next summer.

The Cost of Producing Box Lumber

It would be wrong in considering this situation, to imagine that the lumber manufacturer was getting more for his box lumber than a fair price. Anyone who is acquainted with the trade situation to-day, will admit that lumber manufacturers are at last securing only a fair return for their outlay after having gone through a long period of depressed prices during which they could not obtain even the cost price for box lumber. The cost of stumpage and the expense of logging operations have both increased greatly of late years and lumber manufacturers, although they are securing prices which are so much better than they were a few years ago, are really only doing a fair business from the financial point of view. One of the most important factors in the increased cost of operation in the woods to-day is the fact that lumbermen are taking out much smaller logs than in former years, and the actual cost of handling 1,000 feet of lumber when it is in the log state is greater than it used to be. It will readily be seen, therefore, that so far as the lumberman is concerned, the high cost of box materials represents nothing more than a fair return on his investment.

The effect of this situation upon the manufacturer of lumber is in many respects duplicated by its effect upon the box manufacturer. The manufacturer of boxes finds that the actual cost of the lumber for making a five-foot box has increased about half a cent. This does not represent the whole of the increased cost, as he finds that along with the increased cost of box lumber there has gone a lowering of the grade so that there is a greater waste in the making of boxes than there was before. With this situation to face, the box manufacturer has had only two solutions available for his troubles. He must either increase his charge to the box consumer or go out of business.

How Can the Situation be Improved?

Raising the price of the box to the buyer is not so simple a matter as it might appear at first. The man who uses the boxes is in the habit of considering that he sells only the contents of the box and gives the balance away. The consumer of boxes has not been accustomed to considering the cost of the box when estimating the selling price of his goods. Recent developments will make it necessary for the man who buys boxes to see that he gets value for them in the price which he obtains for the goods that are shipped in them. The low cost of the boxes was the only reason why this has not been done in the past. Box lumber is not likely to become cheaper again for a long time and the price of boxes is almost certain to show a gradual increase until it reaches a figure which makes the manufacturing of boxes profitable. About the only thing that can make this advance come about within a reasonable time will be that the users of boxes will estimate the cost of the box in the cost of their goods and thus be enabled to afford a reasonable price for the box.

One of the box manufacturers in Toronto, during a discussion of the subject, suggested that the box using firms in Canada ought to follow the practice of European firms, making a charge for all boxes. Many business houses in this country receive a definite charge on their invoices for the box and also for packing the same. There is good reason for adopting some such plan in Canada now that the cost of producing boxes is so much greater than it used to be. In cases where freight rates on empty boxes are not excessive it would probably be feasible to make a charge in the invoice for the boxes and allow a credit for them when returned.

Taking the situation in its various aspects it seems certain to-day that the price of boxes has gone up to stay up, as it will be impossible to secure cheap box lumber in the future. An advance much further in the cost of box lumber may bring into the market some substitutes in the way of lumber from the Southern States. This would check the advance of prices though it could scarcely be expected to reduce present prices. A manufacturer who has been looking into this closely states that at present prices the southern lumber proposition has no attraction. Apparently the user of boxes will have to pay higher for them in future and this little extra expense will become one of the factors in the increased cost of living.

Piece-Work System in a Large Handle Factory

By G. D. Crain

It begins to look as if the last word will never be said on the subject of piece-work. The difference or opinion that prevails is so marked, and the experiences which have been recorded are so opposite in character, that it seems certain that no hard and fast rule can be laid down as to the merit of the plan as applied to a wood-working proposition.

There is no doubt, however, that if the character of the work is such that the system can be used without danger of causing a deterioration in the quality of the output, the manufacturer is sure to be the gainer. The one big advantage, that of being able to figure costs with absolute accuracy, and without being forced to estimate labor expense, as is the case when no such plan is used, is alone sufficient to swing the balance in favor of the plan of paying by the piece instead of by the day. And in these days of sharp competition, it is just such accurate figuring that is necessary to land the business.

Piece-work seems to be the basis of a first-rate cost system, or, to put it a little differently, a cost system that is worth its salt usually brings out facts about the cost of labor on each piece, and thus enables the operator to get at a true basis from which to figure. It seems to be the consensus of opinion that few plants can use piece-work throughout, the character of the work in each department having to be considered, and, on the other hand, there are few where it cannot be applied to advantage in certain lines.

The writer recently visited one of the largest handle factories in the world. The plant covers several acres of ground, and operates scores of machines. Its warehouses are extensive, and it carries immense stocks of material and finished goods. The variety of operations, the number of employees and the extent of the business are such that it would appear that piece-work would be more or less difficult to use, yet those connected with the industry assert that it is practically the only system that has been used in the past twenty years, and that they would not consider paying their men by the day.

The only branch of productive labor that is paid on the day basis consists of the men at the saw. They take the bolts or billets and cut them to dimensions before they are put on the lathes. This work involves handling a great variety of stock, and as the lots which are manufactured are usually of special sizes, two or three dozen in each lot, it follows that constant changes in the adjustments have to be made, and that applying piece-work would result in more or less confusion. The result is that these men are paid by the day.

The lathe operatives, as well as the finishers and grinders are all paid by the piece, and in these important manufacturing departments, where the chief cost of production is centered, the plan has been found to be splendid. Every man does a full day's work every day, and there is no complaint of overwork. One man frequently handles three lathes, as he can easily do this by proper attention to his work. The operator probably would object if he were given charge of but two lathes, on account of the reduced output which would be secured. If these men were on day work, however, it is more than likely that some of them would think that the company was asking too much of them in requiring them to run three machines at once, and would incline to sulk. As it is, they are "on their toes" all the time, and their work is A-1 in all respects.

The finishing and polishing departments are extremely important, because the proper application of these processes determines the appearance and largely the value of the goods. If a man slights his work, he cuts down its value to a marked extent, and it would seem that if there were ever danger in putting men on a piece-work basis, it would be here. Yet the company asserts that its percentage of rejects caused by improper work in these departments is remarkably small, and officers of the concern believe that if day work were the plan, the number of poorly-manufactured handles would be considerably greater.

The whole story, as far as keeping the quality up is concerned, may be told in this word: inspection. The company, which has an unusually strong place in the handle field, and has a trade extending all over the world, is compelled to exercise extreme care in the production of its goods. At every operation the work is inspected, and poor specimens are ruthlessly thrown out, and are neither reworked or degraded. The inspection is in force not merely in one department, but before and after each process, and the final inspection is made just before loading into cars for shipment.

As a matter of fact, this system of inspection would be necessary to the proper manufacture of handles, even though day work were the basis upon which the efforts of the employees were paid for. In fact, it is believed that if the men were paid on a per diem basis, the percentage of rejects would be larger than it is. Now they know that any fault of theirs will be immediately turned up, and their earnings will be affected by any failure to do their work properly. If they were getting so much a day, without reference to production, the chances might favor a letting up of vigilance and a lowering of the standard of effort, with the natural result that the quality of the work would come down and the number of low-grade handles would increase.

This seems to reverse the usual order of things, for in most cases the manufacturer who has thrown out the piece-work system has done so because of the deterioration in the quality of the work. Thus the statement made above, that the vital point in the proposition is careful and efficient inspection, seems to be correct.

The system in use in this factory does not increase the amount of clerical work, nor require anything of this sort to be done by the machine operator, and, in fact, the latter turns in no reports at all. A record is kept of the movement of unfinished stock from the warehouse to the machine room. The number given to each lathe is recorded, and the man in charge of this work must see that the number he takes away balances with that brought in. If there are any defective goods, they are thrown out and a separate record of them is kept. The record turned in at the office is for the production of each lathe, which carries a number, and the work of the individual operator is thus kept tab on.

Another important point is that poor work is not an issue between the factory and the individual employee. It is a question between the foreman and the house. The manufacturer looks to the department head for good work, and if he does not get it, it is evident that he is not keeping sufficiently close watch on his men. In the lathe room, for instance, the patternmaker and his assistant are, ex-officio, foremen of that department, and they supervise the work carefully and see that it is not only well done from a mechanical standpoint, but that the correct measurements are maintained. Not a handle leaves the department unless it is properly manufactured.

The non-productive labor in the handle plant is on the day-work basis. It is conceivable that they could be put on a system whereby they would be paid according to the amount of goods handled, but here again the question of difference in sizes and kinds comes up, and the effort to pay by the piece would involve a vast amount of clerical work. Another department in which day work is used is that in which lumber is cut to size for use in crating. It is likely that the piece-work system would work to advantage here, though the plan of paying by the day has always been used. The Wood-Worker, Indianapolis.

Saw Speeds for Hard and Soft Woods

In general practice it is not customary to change speeds for different woods in mills where lumber is manufactured, says a writer in the Timber Trades Journal, but it is a manifest impossibility to carry the same feed in hardwood that is carried in softwood. The reason for this is evident to almost everyone who has had experience in the business. The "texture" of one wood offering a greater resistance than another necessitates a reduction in some direction to equalize the strain on the cutting tool, and usually the reduction is brought about by a reduction in the feed. There is a fixed scientific principle covering the question of speed, and there is still a great deal of room for improvement in lumber manufacturing methods through proper scientific experiment and research into the very important question of adaptation of speed to other conditions. The majority of sawmillers seem to work on the principle that the higher the speed the greater the capacity of the mill. Further, machinery manufacturers often encourage the millmen on the high speed proposition, and this view has held good so long that it is accepted without question, with the result that speeds in many both hard and soft wood mills are unnecessarily and injudiciously high.

The foregoing being granted, it is evident that the usual speed carried in large modern mills is not a proper basis to work from, for hardwood speeds. Excessive speeds are not to be advocated, and notwithstanding the fact that many millmen carry a circular saw speed ranging from 12,000 ft. to 15,000 ft. rim motion, and a log band mill speed of 11,000 ft. or more, experience and observation have demonstrated that a greater capacity and better lumber can be produced through the operation of moderate speeds. All points considered, there is no advantage in running large circular saws at a speed in excess of 11,000 ft. rim motion per minute, and I place the maximum judicious speed of log saws at 9,000 ft. per minute.

In support of the above, it may be mentioned that high speed invariably necessitates high tension in circular saws to offset centrifugal force, and detracts from the "standing up" qualities of the saws, while in band saws excessive speed increases the vibration and elastic "overthrow" of the saw out of all ratio to the excess speed and causes it to run in the cut under the slightest provocation.

According to estimates of the Northern Pine Manufacturers Association the timber cut in Minnesota for the year 1912 will total 2,000,000,000 feet. This includes all the hard and soft woods and that small enough to manufacture into laths.

3in. and 4in. COMMON LUMBER Con

The Latest and Most Modern Method for Obtai

A cost of 75c per thousand feet board measure

In many sections of the country, East and West, in spite of the utmost care in sawing, there accumulates a vast amount of common lumber 3″, 4″ and even 6″ wide which at times it is almost impossible to move without cutting the price several dollars per thousand. Most lumber manufacturers would be satisfied were it possible to obtain from their narrow width common lumber the actual cost and in most instances in order to move the accumulated stock quickly they are compelled to sacrifice.

By the Linderman method two 4″ strips can be joined to make 8″ shiplap at a cost which will not exceed 75c per thousand feet and a comparison of the figures between 8″ shiplap and 4″ common lumber at what it is sold for adding to it the cost of joining it together by the Linderman method and the cost of milling it, leaves a net increase in price of from $2.50 to $4.00 per thousand. 10″, 12″ or even wider widths can be built up in the same manner and at the same cost per thousand, no matter whether the lumber being worked is spruce, hemlock, fir, cedar or pine.

Narrow lumber can also be joined together for rough sheathing, partition work, barn or subflooring and other purposes.

There are eight different lengths of Linderman Machines built to work sto

erted into 8in., 10in. and 12in. SHIPLAP

g a Greatly Increased Price for Common Lumber

ds a return of from $4.00 to $5.00 per thousand.

Shorts and odd lengths can be joined to narrow widths making a composite board of any length desired up to 16'. This is accomplished by running a binding strip on the outside the full length desired and joining to it two or more pieces of miscellaneous lengths that will equal the length of the binding strip. To this can also be joined another series of short lengths so arranged that the butt end joints will not come opposite one another and to this then can be joined the second outside binding strip. Such a composite board will show tight joints not only where they are joined together on the edges but the butt ends of the boards will be tight making a board as strong or stronger than the natural wood. Such a product, while it may not bring a price equal to a wide board of the same dimensions, will yet yield a profit of several dollars per thousand over the cost of manufacture. In this way the cuttings from the flooring machines or from the saw mill can be converted into a marketable product instead of as now being sold for kindling or sent to the burner.

Full information and particulars in detail will be gladly given and we will arrange to work samples of your own stock if you so desire.

up to three, four, six, eight, ten, twelve, fourteen and sixteen feet long.

THE WOODWORKER

Fire Protection for the Woodworking Plant

By James Francis

Fire protection for small or isolated shops has worried the writer considerably very many times, and it must be confessed that the average woodworking shop is sadly deficient as regards fire protection.

Hardly one shop in a dozen is equipped with fire-fighting apparatus of any kind, save perhaps a few barrels, supposedly filled with water, but which contain usually a lot of sawdust and many foul smells where water has become thick with dust and contaminated from the organic matter composing the dust which found its way into the barrels.

Fire barrels are mighty good things and they have saved more than one shop in case of a fire starting, but like other things the barrels must be kept in shape by eternal vigilance on the part of the factory manager, superintendent and foreman. It will require the united authority of the three "powers that be" to keep fire barrels constantly filled with fresh water.

So great is the care and cost of keeping up the very slight protection afforded by fire barrels and buckets that it is the belief of the writer it would be far better to put the same amount of time and energy into the upkeep of a fire system which would be of some value after the fire got under some headway.

Preservation of the Fire Protection

To this end, the placing of a few lines of pipe, with hose connections and a supply of hose, would be better far than the fire barrels, but it is even more of a task to keep hose in fire-fighting condition than it is fire barrels and their contents. In fact, there cannot be found two shops out of twenty-five of those equipped with hose and water systems wherein the hose is of any value whatever when a fire calls suddenly for the use of hose and water.

What then shall the woodworker do to be saved from fire loss? What "system" can be installed which will not require constant supervision, frequent renewals of parts and the combined efforts of each and every man in authority to keep the apparatus in condition for fire service? Alas! Echo can't answer this question if it tries, for there isn't any answer!

But there is a way of protecting the shop which, though somewhat costly, may with reasonable hope of its being "on the job" when fire breaks out. This system is that of automatic sprinklers, the "dry" method being far preferable for wood-working shops.

Sprinkler systems may be installed which will "drown" out any fire which may start beneath them. I was recently in a factory in which the automatic sprinklers were so quickly located that it was stated they would deliver water enough in fifteen minutes to fill the room six inches deep! Not much chance for a fire to get along under that wet blanket!

But for the proper operation of automatic sprinklers there must be a sufficient water supply, under pressure enough to work when all the sprinkler heads are open. When "city" water is available the problem is easily solved, but for isolated plants, far from pressure water mains, dependence must be placed upon individual water works, and this brings up the matter of fire protection and steam pumps.

Pumps, Pressures and Engines

Usually a duplex steam pump is installed to furnish the required water pressure. This kind of a pump will do the work as far as volume and pressure of water is concerned, but it is about the most costly method of pumping water that can be used! Ordinary steam pumps of the duplex variety consume from 100 to 400 pounds of steam per horsepower each hour. The great amount of steam required is due to the fact that both cylinders take steam full stroke at full boiler pressure—or as near as the pipe arrangement will allow.

The shop engine, on the other hand—a common slide-valve engine at that, requires only 30 pounds to 100 pounds of water each hour per horsepower, according to the condition of valves and cylinders. This is sure some saving over 100 to 400 pounds of steam per horsepower hour! Steam pumps are usually specified for fire service on account of their convenience and on account of the fact that they can run, in case of fire, long after the main engine-room of the factory has been destroyed and engine-power put out of business.

Where to Put the Pump

A fire pump located in a woodworking factory is a rank proposition. It should by all means be located outside in a little building of its own. In city locations, where it is impossible to thus locate the fire pump, it should be placed, together with the boilers, in fire-proof concrete chambers with sufficient strength of wall and ceiling to withstand the impact of any adjacent walls or overhead floors which could fall upon the rooms in question.

A fire pump can never be depended upon unless it is kept running all the time. That is a well demonstrated fact. Any pump, either steam or of other kind, which is used only occasionally and in case of fire, will surely fail at some time of great emergency. No, the only way to keep a fire pump in condition is to keep it moving slowly all the time. Let it run, actually pumping water, but barely moving. In that way, and that way only, can a pump be kept in known condition for immediate fire service. And at that, repairs to the pump must be zealously looked after. Leakage past pistons or valves must never be tolerated, or the pump will fail in capacity in time of greatest need.

There is a way of maintaining adequate fire protection without keeping up a wasteful steam pump. In fact, there are two ways. One is to put in a belted pump or a geared or direct-connected pump and instal an engine with it of modern efficiency, say a small automatic engine which will work with less than 30 pounds of steam per horsepower hour. This arrangement permits a steam-pipe connection to the fire pump, same as when the duplex was used, avoiding failure of the fire apparatus by destruction of the shop engine-room.

The other way is to install a two-stage centrifugal pump, which is now available for fire service, and in fact for all kinds of high service business, including boiler feeding. This pump may be direct-connected to a steam engine and avoid all the constant trouble of piston packing and renewal with which steam pumps have been afflicted ever since there was a duplex pump.

The two-stage centrifugal pump also lends itself easily to being driven by an electric motor, and when current can be obtained from outside it forms an ideal fire-pump power arrangement. A very good way of connecting up the pump motor in an electrically driven wood shop is to put in the necessary double-throw switches which will permit, by merely throwing the switch-levers, to run the fire pump either by electricity generated by the shop engine or by "city" current.

Connected as above, there is almost a certainty that power will always be available at the fire pump and the insurance premium should be quite low with such an arrangement of fire pumps. It may be added that what has been said above regarding the cost of pump service for fire purposes is equally true of boiler feeding. The steam pump is the most costly way known of feeding a boiler, and the woodworker who desires to trap one of the "little thieves" described by Mr. Hobart in the July Wood Craft can do so by throwing the steam pump out of the shop, root and branch, and installing in place thereof either belted or electrically driven pumps, either rotary (centrifugal) or belt-driven reciprocating.—Wood Craft.

An Electrical Wood Sawing Trouble

The applications of electricity to factory purposes is not always unattended with difficulty, one of the chief troubles being due to the fact that in many cases it is very difficult to gauge the amount of power taken by a piece of machinery when it is in operation. It is true that the makers in their catalogues often give a figure for the horse-power taken by their machinery of different sizes, but such figures must necessarily be of a more or less approximate value, inasmuch as the work thrown on to an electric motor attached to such machinery varies with the class of work done by the plant, and the kind of material operated upon. Moreover, it is often found in factories that machines are frequently considerably overloaded, the work building up as the output of the factory increases. Hence manufacturers' catalogues are not always to be relied upon in installing electrical machinery. In addition to this there are often peculiarities with respect to the requirements of the drive which may not at first sight be appreciated, with the result that a certain amount of trial and error is necessary before an actually satisfactory run is obtained.

Where due account is not made of such circumstances there is a danger that the owner of the factory may come to premature decisions with regard to the availability of electric power for his purposes; and thus an electrical plant, if it be an innovation to him, may receive a stigma which it does not deserve. Due account should therefore be taken of these factors; and in order to illustrate how very real they are, it will be of interest to describe a difficulty which

was experienced in connection with the installation of electric power in a wood-working plant.

In connection with this installation, one of the requirements was to fit an individual drive to a log frame, used for the preliminary breaking up of the timber subsequently used in the factory. It was at first estimated that a 15-h.p. motor would be amply sufficient for the purpose. A shunt-wound machine was therefore fitted, but it was found that after a few hours' work the motor began to run very hot. In addition to this it was found necessary, on starting the motor—which was arranged for a direct belt drive—to pull the band round a little to give the motor a start; and on an ammeter being inserted in the motor circuit it was also discovered that a very excessive current was taken at the start. From the commencement this part of the installation was not satisfactory, and finally it was giving so much trouble that it was thought that the motor was seriously overloaded, and it was taken out and replaced by a 20-h.p. shunt-wound machine.

Even when this change had been effected it was still found that it was necessary to pull the belt for a short time in order to get the motor away, and the starting current was still very high. This pointed to a radical change in the design being necessary, and the 15-h.p. motor which had been scrapped was overhauled; and in order to overcome the lack of initial torque the field windings were compounded. This motor was then put back in place of the 20-h.p. machine, and it was found on switching in that it started right away without assistance, and also without the excessive starting current which was before noticed. Evidently in this case the trouble had been due to the fact that as the log frame was in the nature of a dead load on the motor from the very commencement of operations, and also as the saw was a reciprocating and not a circular one, the effort of the motor in starting up against the load and in getting the saw over its dead centre was too much for a shunt-wound machine. Hence it had a very weak field in starting, and a low torque. The compounding of the field windings effected the removal of all this trouble.

This is a case where, if the owner of the factory had been of a hasty disposition, he might have condemned the application of electric power for heavy purposes on the strength of the initial difficulty in starting up. But subsequent experience showed that very great economies were gained by using electricity in this particular instance, and the incident therefore goes to show that hasty judgments should not be given on motors of this sort until the necessary experiments incidental to every new installation have been tried.

A Panel Man's Argument

One of the good arguments which the panel manufacturer has in favor of his business and of the furniture manufacturer buying panels already made for as much of his work as possible, is that it insures time for the material to dry out or season between the time it is made and the time of the finishing in the factory, says the Hardwood Record. The furniture man can, of course, make up his panels ahead of time and let them season, but too often he does not, and unquestionably much of the fault that develops in veneered furniture is due to its having been finished off before the panels were thoroughly dry after the gluing up. Moreover the same trouble is found in solid furniture—that is, there are many instances of the finished article proving a disappointment because the lumber was not thoroughly seasoned when used and finished off. Because of troubles like this, the panel man argues that the furniture man can get better results, and often save money at the same time, by getting his panels from one specializing in panel manufacture, instead of making them himself. There are other arguments, too, such as the economy in manufacture and the high degree of perfection in work obtained through specializing, but the one that is the subject of this discourse is that which has to do with insuring dryness of stock when it is used.

The wise panel man not only figures on his panels drying out thoroughly before the furniture man uses and finishes them, but he also looks in the other direction and seeks for assured dryness in his own raw material. He carries a big stock of lumber ahead for core work, to insure thorough seasoning. Where possible he also makes up enough core bodies in advance so that they will have time to dry out after gluing up before putting on the face veneer. Or, if he makes a core of built-up veneer, this should really be thoroughly dried out before the face veneer is put on. The moisture resulting from gluing the face stock on should have time to dry out before the panel is used, which it presumably does between the panel plant and the furniture factory.

A lesson for both the panel man and the furniture manufacturer in this argument is that they should carry a good stock of raw material ahead. That is the one thing that makes possible thorough dryness, and prepares stock for working. When there was no car shortage and lumber was easy to get promptly, there was a natural disposition on the part of both panel men and furniture manufacturers to run with lighter stocks—to follow a sort of hand-to-mouth policy—because by doing so they could operate with much less capital and could save money ordinarily tied up in a big stock of raw material. The truth of the matter is that if there is any force in this panel-man's argument, it applies just as strongly to the raw material end as to the panels themselves. There should not only be plenty of lumber on hand, but a lot of it should be kept dried ahead and tempering in proper sheds to get out of it the moisture that comes and goes with the weather. Or, to put it another way: this argument means that the maker of furniture and the maker of panels should carry ahead much larger stocks of raw material, both lumber and veneer, than they ordinarily do, if they want to insure quality in their finished product.

One can often band-saw two or more thicknesses quicker and better than one, and can generally nail the pieces together, outside the pattern, in such manner that the nails will hold them until the last cut is made. Nailing inside the pattern is not only open to the objection that it mars the work, but pieces at all slender are liable to split in taking them apart.

Could Cut Six Billion Feet Annually in B.C.

The British Columbia provincial timber officials have just completed an estimate, which shows that one billion feet of timber per year is cut in this province. The same report states that six billion feet had been safely cut without diminishing the supply. The rate of cutting could be, therefore, increased six times and kept up for ever without depleting the supply, according to the statistics.

Personal Lumber Trade Items

Sir Rodolphe Forget, Montreal, has retired from the Board of the Wayagamack Pulp & Paper Company.

The W. C. Edwards Lumber Company, of Ottawa, gave 2,000 of its employees a day's holiday and transportation and ticket to the Central Canada Exhibition here last week.

Dr. B. E. Fernow, Dean of the Faculty of Forestry of the University of Toronto, has returned to Toronto from his trip to the Pacific coast, during which he attended the recent convention of the Canadian Forestry Association at Victoria, B.C. Dr. Fernow also visited California and made a special trip to see the famous redwood trees.

Austin Gillies, the Braeside (Ont.) lumberman, had a narrow escape from death a few days ago when the motor boat, in which Mr. Gillies and a party of twelve ladies were returning from a run on the Montreal River, near Cobalt, caught fire and forced Mr. Gillies to dive into the river to escape the flying bullets from a box of shells which exploded.

S. P. W. Cooke, Charles A. Baker and H. G. Hoppins have formed the Prairie Pacific Lumber Company, Limited, with offices at Moose Jaw, Sask. and Calgary, Alta. They will carry on business as wholesale lumber merchants and will be sales agents for J. Hanbury & Company, Limited, Vancouver, and the North Star Lumber Company, Limited, Elko, B.C.

Mr. W. K. Grafftey, of the Montreal Lumber Company, and Mr. Alex. MacLaurin, of the Campbell-MacLaurin Lumber Company, were present at a meeting of the Montreal Board of Trade Committee on export and interprovincial trade, held on Sept. 19th. The Committee considered the suggestion of Mr. Foster, Minister of Trade and Commerce, that a system should be evolved which would give the Government a close approximation of the figures, volume and importance of interprovincial trade exchange, and that business men of this country should enquire whether Canada cannot enlarge its export trade. Mr. R. Grigg, the Commissioner of the Department of Trade and Commerce, was present, and took full notes of the suggestion.

Mr. G. H. Cowan, of Vancouver, acting on behalf of the British Columbia lumber interests, interviewed the government officials at Ottawa and strongly protested against their action in refusing to collect duty on partially manufactured, or "sized" lumber until the appeal to the Supreme Court from the recent decision declaring such lumber to be dutiable, has been heard. The members of the cabinet who were present did not hold out any expectations that the duty would be collected in the meantime.

W. H. Maxwell, formerly of St. John, N.B., who was for many years engaged in the lumber business of that city, died at Berkeley, California recently, at the age of 76.

A meeting of hemlock manufacturers and wholesalers will be held on Wednesday, October 16th, at 2 p.m., in the Queens Hotel, Toronto.

The Retail Dealer and His Problems

Humour in the Lumber Yard—Handling Hardwoods

Lumber Yard Pleasantries

By the Lumber Doctor

If we were to sit down and think of all the unpleasant things about the lumber business or, for that matter any other business, it would not be a very inviting business to go into, but there are enough of these unpleasantries to make a boy think twice before determining that he wants to be a lumberman.

Well that doesn't make any difference, there are the good things about the business that more than make up for the disagreeable ones.

I just had a little experience yesterday when I was called up over the 'phone and a fellow who had the contract for a little house said, "Are your teams busy?" and, on being told that they were very busy said: "You will either have to send out and get that star flooring or let it go, for it is not even a good grade of No. 1. I ordered No. 1 at first and it would have been all right had it been a good grade of No. 1, but it was a common No. 2, and this star is not even a good grade of No. 1."

Now here I was busy as could be and teams all rushed. What should I do.

My first thought was to tell him to use it for No. 1, but my better judgment prevailed and I took a notion to fight it out. So I said to him, "Now you have the carpenters lay out every board of the star that isn't up to grade and I'll credit you for it." Then he said, "They will have to lay it all out." I said "No they won't," and he said "Yes they will." Then I inquired, "Are you at the building?" and he said, "No," but he finally agreed to go right out there. So I jumped into my new automobile and went out to the job, but no Mr. Contractor showed up. The men were there ready to lay the flooring, and it was fine. I told them to go and lay it, and lay out anything that wasn't just right. They said, "Oh, this flooring is all right. The only thing is that he tried to run in the No. 1 on the owner when star was specified, and was mad when he couldn't do it." Now then what do you think of that. You may find just such a thing tried on you sometime and this will serve to call your attention to it. Investigate it and you will find out that they are trying to work you, too.

Then I had a fellow raise the devil about some cement. I sold him some cement and he made a sidewalk out of it. The next day he called me out to look at it, as it popped up and, like the scab off a sore, peeled off and a fluid iron rust flowed out. The job was done in real wet weather, and I suppose the extraordinary behavior of the cement was induced by something in the cinders. Most "doctors" speak positively, but I am not so very sure, but am still investigating the matter and will ask for more time in which to make final report. I got the blame because I sold the cement. yet the same fellow had been using the same cement out of the same car and had no complaint. The is a cement pleasantry.

We have those applied to roofings, also. Our roofing concern applied a roof under a ten year guarantee. So one time during a storm the merchant whose store he applied it on sent me word to come down and see how the roof leaked. I was learning then, and went. I had no lightning rods at that time and ran the risk of going up on his roof and investigating. I found that the electrical workers had been working on the roof, and had cut out a piece of the roofing 12 inches by 18 inches, and had simply laid it back and poured tar around it. When the sun shone on the patch the tar melted and ran away and the water went through and down into the store. All this was a "Thank you" job for me. All went well for about a year, when during another hard rain the same fellow 'phoned me to come down at once, and I went again. He said: "Just look at the water pouring down onto these goods." I looked—and it was coming down pretty lively, in fact, lively enough for me to go and climb up and investigate. Upon inspection I found a transom leading into the skylight had been left open about two inches. This transom (or rather a window) on a pivot, was regulated with ropes and had swollen a little, and the porter did not take the trouble to pull it entirely shut, so I said to the manager: "Mr. W—, I have made my last run down here. You pay me $1 per hour or fraction thereof when you ring me out on a false alarm." I have never been called out since. (N. R.—Take notice how that brand of roofing was kept free from fault all through the deal.) That was a roofing pleasantry.

Paint? Yes, you want to know just one about paint. Guess I have a few on that line, but you don't want but one, for you have had the others happen to you.

Well, a fellow came in and bought some flat or velvet finish paint, asked no questions, and in a couple of days came in again and just raised the devil about it. Said he could rub it all off with his hand after it had dried.

I was awfully busy, but I stopped everything else and went out with him and found that he had put the paint on an old greasy wall that had been painted with oil paint, and one really could wipe it off with one's hand. I asked him why he had not told me about it, and he abused me for not telling him without his asking it, and said he would not pay me for a bit of the paint he had used until I gave him oil paint with which to replace this flat paint and had allowed him $2.50 for the work of putting it on.

I wanted to profit by this, and so I asked the next few fellows who bought paint, positively, what they were going to do with it, and what they were going to use it for, and they told me just as positively, that it was none of my business so long as they paid for the paint. Now, then, I hummed, "That's gratitude, yes, gratitude."

Well, I could go along this line and tell you all you would want to listen to, especially about side lines. But what's the use.

Loans

Have you ever noticed how the lumberman is always considered the "good fellow" in a community.

How much each year are you being imposed upon? How many dollars worth? I have not counted it all up, but I put myself at least $100 worth to the good every time I start to count it up.

The last thing in that line I have done to "stop the leak" is to issue an order, July 1st, as follows:

"Rule No. 77: Our heavy loss of fence stretchers and ladders has compelled us to adopt the following rule which will be in force on and after July 1, 1912. Advise and charge everybody 25 cents per day for first day and 5 cents per day for each additional day for every fence stretcher loaned; ladders 25 cents for first day and 10 cents for each additional day. This means that this must be enforced, and any employee who violates this must pay the rent himself. If a neighbor wants to borrow a ladder, get permission, but don't violate the rule." Then I had each one sign it.

I believe I can take anyone to my pile of ladders and show them that I am justified in doing this, for no less than a dozen had been used and will have to be sold at a sacrifice. Why should the lumberman have to stand for this? Why do we have to loan stuff for dancing floors, revival meeting benches, run boards for painters and scaffolding to paint churches? There is no reason why we should, but we do it—and they ask us to please lend it to them, and to come and get it.

But still it is a good thing to be called a "good fellow," and we would feel slighted if they did not call on us for our part of the accommodation work. But, on the other hand, if you watch your chances, you can make some nice money renting stuff out. But you have to have the backbone to charge, and to stick to the charge, in order to get the profits.

Keeping Stock

If a farmer drives into your yard with a couple of old "skates," with harness tied up with ropes and strings, and looking like they had not been curried for a month, and an old rickety wagon that looks like it would not bear up under a bundle of shingles, and had not been painted for a couple of years—you would not think he was a very good stockkeeper, would you? Well, I guess not. Now, then, there are others.

What does the well-to-do farmer think of you as a stock-keeper if you have your dimension lying topsy-turvy, all kinds of ways, and getting more crooked each hour of the day, and your flooring all scattered about twisting and getting dusty; your shingles all broken apart, and lath lying loose by the bundles, just as if they did not cost a cent a bunch; a lot of windows lying around with broken glass in them, and doors with panels broken out and so dusty and shop-worn that you can't tell if they are white pine, or cypress or redwood?

Then you will find piles of boards, dimension, sheathing, lath, flooring, ceiling and partition all on one pile; all kinds of molding all mixed up together. You will also find (Oh goodness, deliver me from that condition) some cement, lime and plaster-of-paris bins in which hundreds of dollars' worth of sacks are going to ruin and any amount of plaster and cement going to waste—all through a lot of careless fellows whose boss hasn't the ability to check this wanton destruction of property.

Now all these things most of you are guilty of—aren't you? You would raise hades with your poor wife, who is ten times better

than you are (I consider mine twenty times better than I am) because her house is not "up to snuff" if you should bring some fellow home to dinner unexpected to her, no matter if it were wash-day, house-cleaning time, or even if she wasn't well. Now you know it; be fair and be a man and admit it.

Then why aren't you that careful with your lumber yard, when people come in unannounced every hour of the day? Why don't you make your help clean up, and keep cleaned up?

I have a pretty clean yard, but I have to keep raising the devil with my yardman all the time about it. But I'll tell you confidentially that it isn't the Cain I raise as much as it is the nickles I fine him for not doing what I want him to do that keeps it clean. That's what counts. If he would read the lumber journals more he would get fined less, and draw more salary; and they are not hidden from him, either. Well, I will keep up the fines. The millenium will be reached when he understands what I want done and how I want it done.

Let's all try to keep our runways and driveways clean. It grows upon us, and gets to be a habit, just as the moss grows upon our backs if we don't keep up with the times. Let's blaze the way for the other merchants, not follow. I claim that I conduct my lumber yard and paint tore on as advanced a principle as others dare claim that they conduct their dry goods emporiums, their furniture stores, their grocery stores, their churches, their drug stores, or their saloons.

There is no excuse for the follow to put off his improvements. This thing of being on leased ground, waiting for a good crop, and moss-backism, don't go. Get off of leased ground onto your own ground; get into new quarters; get a better location; get the business—for if the stuff is in you it will win out for you. But when you undertake a thing, and say you are going to do it, then do it.

Sweep up, clean up, and have a way of keeping your stock that people will talk about, and the advertising you will get out of it will pay for the expense of keeping it in good shape.

Keep your piles of lumber, sewer pipe and all even across the top, and then they won't pick over them. No one picks over our piles, because they are so nice and straight that every piece looks nice. Now this sounds conceited, but it isn't. Try it yourself, but don't tell your employees that they must keep the piles straight and then go out and turn them over yourself. Practice what you preach and you will have better luck carrying it out. Now just think if you were to go into your local store to get a pair of socks and you should pick up a pair that looked like some "hobo" had tried them on, or if they were torn from handling. Well the people will have just the same right to think of your lumber that is split up, shop-worn, dustry, and the like, that you will have of their socks.

Some people don't care, but the majority are like you and I; they have a chance, and they take it.—The St. Louis Lumberman.

Neglect of the Planing Mill Resaw

By H. J. Kutz.

If anyone should travel all over the country among the saw mills at the present time, he would find nearly every one with a planing mill connected with it and in that planing mill he would find, in nearly every place, a resaw also connected with it because you can fill more orders of mixed stock and therefore more lumber can be disposed of than at a place where they haven't installed a resaw. To make a long story short, lumber companies find that a resaw pays. Instead of the other fellow resawing your lumber you can do it yourself—you can load more on a car and make more money.

But what I want to get at is the neglect some filers give the resaw because they consider it a secondary affair and a regular nuisance and the result is their employer buys just a few more saws than necessary and the cost of resawing is just a little more than with the filers that try and keep the little resaw in the same condition he does in the log-sawing mill.

I hate to acknowledge it, but I myself used to neglect my work a little on the planing mill resaw—i.e., the bench work and I had a few too many cracks and the saws were changed too often. The consequences were a new saw now and then where I might have prevented buying about one saw out of four at least, but it only took me about four or five months until I saw my mistake and ever since, I pay just as much attention to my little 6-inch resaw as I do my other 12-inch bands and 8-inch resaw in the mill.

I have been at a number of mills and about all had a small resaw and in every case I found the filers neglecting that part of their work more or less, and by so doing, they actually have more trouble, they have cracks, they have more brazes to make than the filer that keeps his resaw in good shape.

The reason these saws are neglected so much is nearly every time the big saws are changed the planing mill men also change their saw, and it causes that extra work, which isn't very agreeable to a filer especially if he wants to do bench-work on his big saws or has a braze to make—so in order to get rid of his resaw he grinds it up just as quick as possible and the resaw is obliged to run time after time without being looked over on the bench and therefore, it doesn't take long until it goes to pieces.

If filers would just stop to think and realize the amount of work a little 5 or 6-inch resaw does in a day when it's in good condition, and the strain on the blade they would certainly go over their saw more often and also save their employer from buying so many saws and save quite a nice amount of money in the cost of resawing in a year's time.

I file my resaw in about the same way as I file my other saws or on the same principle, only I run a straight back. I am very particular to keep it from getting short or the tooth edge will get loose and make snaky lumber. I don't run quite as much tension as the majority do, but what tension I carry in my saws I have clear across the blade and by so doing I have a better saw than the filer that uses a heavy tension and only tensions up to within 3/4 or 1 inch to the tooth edge. I keep tension on each edge of my saws and when the strain is put on them it makes the edges tight and they run good and when we happen to resaw 4-4 stock twice it won't run out of the cut which is easily done on a resaw within tension on the edges. But one thing I am very careful about is that I don't have too much strain on my saws; because with good even tension clear across the saw and sufficient hook in the teeth a saw doesn't require near as much strain as one with a "run" or tire and little hook in teeth. So permit me to state if this happens to hit a filer that neglects his resaws in the planing mill, don't condemn the machine if your saws don't run good.

Sometimes you find filers condemn the very best resaw machines—in fact, they condemn everything but themselves. It's a great mistake and allow me to say in conclusion, if the resaw in the planing mill isn't doing the work your employer was informed it would do—I say at least 75 per cent.—when he purchased it, the filer is to blame in nine cases out of ten.—Berlin Quality.

Hardwood in the Retail Yard

There is much more hardwood handled through the retail yard now than there used to be, and there may be considerably more if manufacturers of hardwood will study the trade and cater to it. This applies not merely to the woods used for siding and outside trim, such as poplar and gum in the South and basswood in the north, but to hardwood for interior trim and for planing mill work. More of the latter has been use, partly because the majority of retail yard men have put in planing mill equipment, and partly because the public is calling for hardwood. The point has been reached in the retail lumber business where practically every man in it finds it necessary to operate some planing mill machinery.

While visiting a newly equipped small planing mill and stock shed recently, the writer noticed that about a fourth of the planing mill stock shed was given over to storing hardwoods for mill use. That particular retailer was decidedly progressive and knew the full possibilities of his business for he had all the hardwood sorted for widths and lengths. The stock consisted mostly of oak, the mill being located in the South. A northern mill would probably have been stocked up on birch. The advantage in this method of storing is obvious—if a board of given size is required no piles need be torn down and built up again, for it can be gotten at once and without trouble. Further, the lumber is kiln-dried and ready for use when it is put in.

When the retailer was asked about this feature, and if he were able to buy that oak direct from the mill kiln-dried and ready for use, he said he could not, but that he had bought the stock and shipped it to a neighbor in town who owned a dry-kiln, and had it dried before putting it in stock. He explained further that he didn't know where to get stock kiln-dried at the mill, and that he did not feel justified in maintaining a kiln himself, as his concern does only a limited amount of work. His plan is to buy all the material he can use already worked to shape, and simply do the odd and special work in the mill, which is small compared to his retail yard and the amount of retail business done.

To properly take care of this kind of trade, the millman making oak in the South should not only be equipped to kiln-dry the lumber, but he might go further and fare better by putting in a machine or two so as to make oak casing and base to popular patterns and get retailers to carry it in stock the same as they do pine, and as they are beginning to do in birch. Then if the millman wants to work some of his low grade oak into flooring, it gives him a chance to drive a trade in mixed cars to the retailer, probably consisting of some dry stock to be carried rough for his own millwork, some dressed casing and base, and some flooring. There is a good field here—a field that may not look big in individual cases, but which collectively is very desirable. It is a market from which the oak millman can get more trade if he will go after it right. Trying right in this case "sounds like" dry-kilns and a planer at the hardwood mill, a thing that many in the trade have probably been avoiding too long.—The Hardwood Record.

The Year's Progress in Logging Science

Increasing Use of Electricity as Power in the Woods—Fuel Oil for Locomotives—Secretary Corwall's Report at Recent Logging Congress

Considerable progress has been made during the past year in the design of motors adapted to the heavy duty involved in logging operations. The utilization of a portable electric power plant for supplying the necessary current to operate isolated camps located at remote distances from power lines, or situated where it would not be compatible with economy for the camp to develop the necessary power, may prove a subject worthy of discussion. The commercial power lines should lend every encouragement in providing power for logging camps at moderate rates. The use of electricity in the woods will undoubtedly in the near future furnish a very large and profitable market for power.

The use of fuel oil in locomotives has been steadily on the increase for several years past, but it is only during the past year that any well-directed effort has been made towards utilizing fuel oil for the generation of steam in logging donkeys. The demonstrations which have so far been undertaken have proven eminently successful, both from the standpoint of a reduction in operating costs, higher fuel efficiency and in marked reduction in the fire hazazrd. From every standpoint the use of fuel oil is to be commended and I am quite sure that this subject will be discussed with intense interest at this session.

Compressed Air for Lowering Rigs

Several years ago the successful installation of a hydraulic log lowering machine was accomplished at Rainier, Oregon. Following this came the use of steam lowering rigs, one of which is now successfully employed lowering logs in the pine belt in California, a distance of some 5,500 feet, on a grade of fifty per cent.

The use of compressed air in a snubbing rig is something entirely new in its adaptability to logging purposes, and the presentation which will be made on this subject marks one of the innovations in the logging business.

The addition of an air compressor to the equipment of the modern logging engine, making available the use of pneumatic tools in railroad and trestle building, has already proved its value.

In this connection it is interesting to note that a patent has been granted for the application of air on detached logging trucks. This is a subject which has been given considerable attention from time to time, and if a solution has been reached it marks an important advance in the handling of trains on steep grades through the utilization of the detached logging truck.

The Northern Pacific and Chicago, Milwaukee & Puget Sound railroads have been testing out the various car bunks and stakes, with a view of equipping their flats for hauling logs. The essentials of a bunk are ease of operation, simplicity of construction, adaptability. Through the use of the automatic stakes the danger incidental to chopping the old wooden stake is obviated, to say nothing of the reduction of the time necessary for unloading cars, under the old plan. It is pleasurable to note that this step has been taken by the railroads in advance of any legislation which would most certainly be enacted in behalf of safety of the employee. The attitude of the railroads in this connection cannot be too highly commended.

Sanitation in Camps

An army travels on its belly. The same conditions apply to the industrial army, of which the logger is a conspicuous type. There probably has been no further advance made in the progression of the logging industry than the advancement which has been noted in the feeding, housing and care of the men. It pays to see that the men are regarded as more than inanimate objects. They have hopes, aspirations and a life to live; and in rounding out their lives it should be the aim of every logging camp operator to see how far he can go to surround his men with the ordinary comforts of home life, bathing facilities and a good bed, and as a consequence their tenure of service will be lengthened; and accidents become fewer, due to familiarity with the work in hand, to say nothing of increased efficiency.

Experience has shown that there is no food which can be partaken of by a hearty, strong man at 6 o'clock in the morning which will enable him to keep up the stroke continuously until the noon hour, without diminishment and impairment of his energies. It has been suggested that if some plan could be devised whereby the men could be fed in the woods a snack at about 10 o'clock, accompanied by a cessation of labor for a few minutes, and the same repeated at, say, about 3.30 in the afternoon, providing for only 30 minutes at lunch, that it would increase the output and conserve the energies of the men.

In all cases the food should be taken directly to the men, so as to save their energies for work instead of being needlessly exhausted through long trips from the scene of operations to the cookhouse. Too much stress cannot be laid on this matter.

Another point which is worthy of careful consideration is the providing of a heated car, to convey the men between the camp and the woods. To take men out in cold, wet weather, riding the hurricane deck of a flat car or straddling the bunk of a logging truck, is not calculated to increase the efficiency of the men whose bodies are chilled by this course of procedure. This is not only humanity but economics.

Community Welfare

Experience is proving that where camps are going to be permanent that it is well to secure as many married men as possible, and as the land is cut over, the more suitable portion be sold to the men for homes at low figures and on long time. The best cure for the I. W. W. plague— a people without a country and without a God— is the cultivation of the homing instinct in men.

Universities

The recognition of logging engineering as a distinct branch of mechanical science, is one of the actuating principles behind the creation of the Logging Congress. The hydraulic, electrical, gas and steam engineers have a distinct place in science, but to none of these departments of endeavor is brought greater skill than that which has to be shown by the ordinary logger in his efforts to remove the timber from steep hillsides and inaccessible locations to the mills at a minimum cost.

The term "logging engineer" is used in its broadest sense, for while the majority of the men who are able to successfully overcome Nature's obstacles, have not had conferred upon them any college degrees and in fact in many instances have been deprived of even the barest amount of education, have nevertheless under the necessities of the business and with their own fertile and resourceful brains, been able to perform feats of engineering which for skill and daring have never been equalled in any field of work.

To these men who have been able successfully to meet these conditions without the preparatory training along mechanical lines, it is proposed to supplement through the aid of the universities and colleges, a special training to fit young men who desire to graduate as logging engineers. This education must be from the stump up, not from the college down. It is pleasing to note that as a result of the Pacific Logging Congress the States of Montana, Idaho, Oregon and California are making some progress in this direction; while the great State of Washington, through its university, has taken very active steps in formulating a policy which must result in fitting a large number of young men for work in the woods.

In British Columbia, a new university is to be established and there is every reason to believe that this province will endow a chair of logging engineering as a part of its curriculum.

The Pacific Logging Congress seeks to aid in every way possible the development of this idea, and in the language of the politician, "points with pride" to the growth of the sentiment along this line; a recognition of the place that logging engineering legitimately occupies in the great lumber industry of the West; and of the influence of the Logging Congress as a factor in forcing this recognition.

The Tilting Dump

By James O'Hearne*

At the first Logging Congress held at Seattle in 1909, dumps of all kinds were so thoroughly discussed that we thought the subject had been settled for all time, but it seems that some of these subjects will not down.

The tilting dump is one of the many ways of unloading logs, having its advantages and disadvantages the same as other methods. No dump will suit all conditions; one giving the best satisfaction at our camp may not work at all at another; one that may be constructed at low cost in one camp may be almost impossible to build in another. So we will simply describe its construction and the work it has done for us, not entering in detail into the construction. Any camp using such dumps has blue prints of them which can be examined for the asking.

Details will differ in each dump, depending on the shore line and

* Address delivered before the recent Pacific Coast Logging Congress.

contour of location where built. We have used piles for foundation; it may be that in some places concrete could be used to advantage. Since putting ours in, ten years ago, we have entirely rebuilt it, strengthening many places that we found weak; and for the roller timber, or axis, to work on, we have put a set of heavy cast iron chairs on the sills and cast iron cylinders on the roller. This gives the dump a much freer motion than under the first arrangement when we lined wooden bearings with leather. The roller timber—a stick 42 feet long by 20 inches square—two stringers, and a floor of ties and latch timbers above them, make the platform of the dump upon which the track is laid. The latch timbers—five on each dump—extend about two feet beyond the ties on the land side and are fastened down by iron latches that hold the dump stationary while the train is crossing. The center latch timber, known as the trip timber, is longer and larger than the others; being 36 feet long, 9 inches thick, and 18 inches wide at one end, tapering to 12 inches at the other.

The dump is built in pairs, each 40 feet long with 30 feet of stationary track between. This arrangement allows logs of any length to be dumped. Two cars containing logs up to 40 feet can be spotted at once and dumped. To dump longer logs, one truck is spotted on each dump and the dumps tripped simultaneously.

The operation is simple, the cars being spotted, chains taken down, and latches knocked off. The center of the track is placed about 3 inches to the water side of the center of the roller timber, so that upon the removal of the latches, the weight of the car causes the platform to revolve 15 degrees on its axis, and the logs roll off. The dump is then brought back to position by the men walking out on the trip timber. Loads heavy on the land side will not trip the dump. Such loads are started by prying up on the trip timber. Slabs will not always roll off at this inclination, and to take care of these, we have a gin pole and throw them off by a pull from the locomotive. With three men working, the average time used is about 2½ minutes per load—a good part of this being used in taking down and putting up the binding chains.

Running water outside the dump facilitates the work by keeping the logs out of the way, though during slack tide, we have had no great trouble; the disturbance of the water caused by the logs falling in being sufficient to keep the dumped logs out of the way. Low water is a more serious drawback. If the logs do not float away, there is more or less breakage of cedar when the logs are thrown in on the pile that forms. For this reason, this would not be a satisfactory form of dump for camps that unload logs on the tide flats, often having not enough water to float logs.

The cost of the dump will vary with different locations, and the nature of the ground built upon. We encountered some quicksand and on that account put more piles in the foundation than was originally planned. The double dump complete can be built for a little more than $2,000 in any ordinary show. This does not allow anything for the timber used. We get out our own piles and hew the timbers, charging the dump for the labor but not the timber. The maintenance for the past seven years has been about $300 per year. During that time we have rebuilt the dump complete, the cost of rebuilding, naturally being less than the cost of first building—some of the piles and timbers and most of the iron being used in the second construction.

The dump has met our requirements well. Accidents to those working on it have been few. It is not hard on trucks or other equipment, and has taken care of any output we have had. We are now dumping about 350 thousand per day and could take care of much more.

Rough Ground Logging

By Fred R. Olin*

Our overhead system for rough ground logging, like almost all other methods in logging operations, is just a modification of other systems, with the addition of our own ideas to conform to needs and difficulties to be overcome of the special tract of timber to be logged. It is a well established fact that it is almost impossible to log any two pieces of timber with exactly the same methods—every tract of land, in fact every log, presents new problems.

The first attempt made at an overhead system was not just the success we had hoped it would be, principally owing to the length of our standing line, which was 2600 feet. We used 1¼ inch plow steel rope, but found it was not strong enough to do the work, and I doubt very much if a heavier line would have helped much, as the weight of this amount of line which hung free from the top of the hill to the bottom, together with the constant vibration, would break almost any line after a short time. We did manage, however, to keep it working for about a month, but the logs were small, averaging about 600 feet.

Before going any farther, I possibly would make myself better understood by going more into details as to the way in which we had our lines set out, etc., and what we were trying to overcome.

We had a small patch of timber about 2,600 feet straight up the hill from our railroad track. The slope was on an angle averaging about 30 degrees, steeper in some places and not so steep in others, making it expensive to build and operate a pole road, and out of the question to work an ordinary dirt road, or rather no road at all. We decided then to try an overhead cable, with a three-sheave trolley block to carry the logs down. This overhead cable was stationary, being fastened to the top of a high stump at the top of the hill, and to the bottom of a large stump at the foot of the hill along the side of the railroad. We then used a main line and trip line, but fastened to the trolley instead of the log, to bring in the logs and to take the empty trolley back to the top of the hill.

This overhead system we used just as a roading operation, having an engine at the top of the hill to yard the logs to a point just under the overhead cable. The logs were then hooked onto the trolley, and taken to the bottom of the hill where they were squared around and loaded on cars. This worked all right as long as we could keep the overhead, or standing line, up, but was rather slow even then as our lowering engine was of the ordinary type and had an excess of power and lack of speed. An engine for this purpose should be built for speed and not power, or, better yet, have three drums—two for speed, and one for power, the latter to be used in tightening up the standing line. It also should have extra braking power for snubbing the logs down the hill. At some points on the hill the logs would touch the ground, and drag. The main line would then come into play, and haul them over this place. The main line was also necessary in starting the logs down the hill, and in pulling them to their proper place after they had reached the foot of the hill.

From the results obtained at this operation, however, we came to the conclusion that 2,600 feet was too far for one span, and that 1¾ inch line was not heavy enough for the overload cable. We also found that too much time was lost in sending the empty trolley back for the next load.

Our next attempt, and which we worked with a much greater degree of success, was at our Camp Three on the Breitenbush River. Here the setting was somewhat similar to the one just described. After logging off the face of the hill with a yarding engine and the ordinary methods, we had left a large flat top of the hill too far to reach with the yarder, at the foot of the hill. We then moved the yarding engine to the top, and to get the logs from the yarding engine to the foot of the hill to the road engine, which already had its full distance to go, was where we used the overload system.

Our distance at this place, however, was only 1,800 feet, and we used 1½-inch plow steel for the standing lines. Here, in order to avoid the loss of time in sending the empty trolley back up the hill, we put up two standing lines with a trolley on each one. These two blocks were fastened together with a piece of 11-inch line, 1800 feet long, running through a system of blocks at the top of the hill so that when one block was at the top ready for a load, the other block was at the bottom of the hill with its load ready to be unhooked and sent back. In this way one block was always coming down with a load when the other was going back. The two standing lines were about thirty feet apart at the top of the hill, so as to avoid confliction in the lines, and at the bottom were just the width of the pole apart, so as to bring the logs to one point to be taken on in by the road line.

We used three-fourth line on both upper and lower drums of the lowering engine, as both drums had exactly the same work to do.

In this lowering operation we employed five men—one man at the top of the hill to hook on; one at the bottom to unhook; an engineer, a wood-bucker and a fireman.

The most we ever brought down in one day was about 100,000 feet, but this was not the full capacity of the overhead system, as we were, of course, limited to the capacity of the yarding engine.

I think if the logs were at hand at the top of the hill that this arrangement would be capable of bringing down 150,000 feet per day, and possibly more with an engine built for that purpose.

* Address delivered before the recent Pacific Coast Logging Congress.

Imports of timber into Australia for the first six months of 1912 were valued at £1,286,590. During the corresponding period of 1911, the value was £1,417,196. The exports of timber during the first six months of 1912, were valued at £403,945. During the corresponding period of 1911, the value was £452,712.

The Yellow Poplar Lumber Company of Coal Grove, Ohio, adwood in addition to poplar. They are making a specialty of quartered white oak, having a splendid source of supply of virgin white oak timber.

The Smart Turner Machine Co., Ltd., Hamilton, Ont., have received an order from the New Brunswick Pulp & Paper Co., Millerton, N.B., for one of their Duplex pumps.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Lumber Wanted

Several cars of good 1-inch No. 3 Common Hardwood, Birch preferred. State quantity, average width, and best price. Box 578, Canada Lumberman, Toronto, Ont. 18-21-5

Slabs and Cord Wood Wanted

Am open to buy any quantity up to 10,000 cords hard and soft wood slabs and cordwood. Write me. Horace Hartley, 19 ayor Street, Montreal. 15-19

Lumber Wanted

White Pine and Basswood Slabs wanted; from this season's cut; must be bright and of good thickness. Write stating how many cords you have, what you want for it on cars your station, and how much is ready to ship now. The Wm. Cane & Sons Co., Ltd., Newmarket, Ont., Canada. 17-19

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

FOR SALE—LUMBER, ETC.

For Sale

For quick shipment, 100 M. ft. 2-in. Birch, December, 1911, cut. No. 2 C. & B. at $20 per M. on cars. Farm Point, Que. Hall Bros., 174 Mutual Street, Toronto, Ont. 16t.f.

Cedar Shingles

Four carloads XX 16-in. Cedar Shingles, retailing at $1.75 per M. Price in car lots $1.15 at mill, C. P. R. or G. T. R. Lindsay, Ont., for quick sale. Terms 30 days net. Box 279, Lindsay, Ont. 19-22-24

For Sale

Fifty M. ft. 2¼-in. and 50 M. ft. 3-in. clear maple flooring, kiln dried, end matched, hollow backed, bored and bundled, at reduced prices. Can make prompt shipment. The Woodstock Lumber & Manufacturing Co., Ltd., Woodstock, Ont. 19-13

For Sale

For quick shipment, 800,000 ft. Birch. All grades and thicknesses.

200,000 ft. Soft Elm M. R. All thicknesses.

100,000 ft. Basswood M. R. inch.

100,000 ft. Maple. All grades and thicknesses.

Send us enquiries. The Meaford Lumber Company. 7-20

Lumber For Sale

4 cars 1-in. good cedar for boat building.
100,000 ft. 2 x 6 mill run hemlock.
100,000 ft. 2 x 8 mill run hemlock.
4 cars 2-in. white oak, sound and square edge. Apply to Geo. C. Goodfellow.
C Montreal, Que.

For Quick Sale

700 Acres Virgin Timber, Hardwoods, Hemlock. Estimate Five Million Feet. Owner must sell at once. Price, Four Thousand, half cash, balance two years, or $3,500 spot cash. This is a snap. Easy to take out. Contractor has offered to take off and put in lumber at track for about $11 per M. feet. Apply Box 598, Canada Lumberman, Toronto, Ont. 19-22-20

WANTED—MACHINERY, ETC.

Tramway Steel Wanted

Car load of 12-lb. Tramway Steel. Write particulars and best price. Mutchenbacker Bros., Mafeking, Man. 19-20-15

FOR SALE—MACHINERY, ETC.

For Sale

Large three band sawmill complete, blacksmith shop, docks and trams, located at Ford River, Mich. Will sell at a bargain. Address I. Stephenson Co., Trustees, Wells, Mich. 17-19

For Sale

Live sash and door factory with large and increasing general business in wide-awake British Columbia City employing 22 to 25 hands. Price $30,000. Will bear closest investigation. For complete information, write

L. D. McLEAN,
1015 North Park Street,
19-14 Victoria, B.C.

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 70 H. P. boiler, 60 H.P. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

For Sale

Established Lumber Business on main line Northern Division G. T. R., up-to-date circular mill, steam feed, edger, trimmer, etc. Capacity 20 to 25 M. per day. About 650 acres well timbered with Hemlock, Birch, Maple, etc., etc. Good roads all through bush. Down grade to mill. Private siding at mill. Box 587, Canada Lumberman, Toronto, Ont. 19-20-11

Bargain in New Chain

12,000 lbs. 7-16-inch log chain, galv., 30 ft. lengths.
10,000 lbs. ⅜-inch log chain, self-colored, 14-ft. lengths.
8,000 lbs. 7-16-inch log chain, self-colored, 30-ft. lengths.
1,200 lbs. ⅜-inch log chain, self-colored, 10-ft. lengths.
600 lbs. ⅜-inch log chain, self-colored, 12-ft. lengths.
500 lbs. ¼-inch twist chain.
4,500 lbs. ⅜-inch proof chain.
600 lbs. ⅜-inch B. B. B. chain.
10,000 lbs. 7-16-inch proof chain.
450 lbs. 3-16-inch long link chain.
600 lbs. 3-16-inch extra long link chain.
300 lbs. ⅜-inch extra long link chain.
All log chain with grab hook and ring. Prices on application. Address

HENRY A. HITNER'S SONS CO.,
19-12 Philadelphia, Pa.

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Wanted position as band saw filer to finish this season cut with the consideration of work next season. Can show first-class references. Reply to A. E. Cartmill, Fesserton, Ont. 19-21

Wanted position as Superintendent or Manager with a live lumber company; have had 14 years' experience and can get results. Best of references as to ability, etc. Box 572, Canada Lumberman, Toronto, Ont. 19-23

WANTED—Position as travelling salesman for wholesale lumber firm on salary or commission. Several years' experience in lumber business. Would accept position as office manager or head bookkeeper. First class references. Address Box 599, Canada Lumberman, Toronto, Ont. 19-29

WANTED—Position by young man as sawmill office manager or shipper. Ten years' experience with largest hemlock concern in East. References A.1. Address Box 560, Canada Lumberman & Woodworker, Toronto, Ont. 17-20

WANTED—Position as manager by man of experience both in the manufacture and selling end of hard and soft wood lumber in Canada and the United States. Am interested and employed as manager with company operating two mills, with whom I have been three years. Would invest some capital if mutually satisfactory. Am 38 years of age and can refer to present employers. Address Box 601, Canada Lumberman, Toronto, Ont. 19

WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

Lumber traveller wanted. Must have good connection with Ontario trade. C. A. Larkin Lumber Company, Limited, 240 Confederation Life Building, Toronto, Ont. 19-22

WANTED—An experienced salesman and shipper. One who can grade Birch. References required. Apply Box 591, Canada Lumberman, Toronto, Ont. 19-19

WANTED—Salesman with some knowledge of measuring and inspecting lumber, age from twenty-five to thirty-five years. Apply Box 568, Canada Lumberman, Toronto, Ont. 18-21-2

Wanted

A first-class man to take charge of a well equipped Planing Mill, and Sash and Door Factory. Only a man capable of estimating and drafting need apply. References will be required. First-class salary to right man. Reply to Box 497, Renfrew, Ont. 17-19

BUSINESS OPPORTUNITIES

For Sale

Timber limit, comprising 18 sq. miles, containing 25,000,000 feet mixed timber. Apply Geo. S. Nesbitt, Rupert, Que. 16-19

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 115 h.p. boiler, 100 h.p. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

WANTED—To hear from Box Mills in position to furnish boxes in car loads. Apply to Geo. B. Breon, Williamsport, Pa. 17-20

Advertiser wants to purchase small timber limit having at least ten million, sawmill, etc., or will consider half interest. Answer Box 573, Canada Lumberman, Toronto, Ont. F

FOR SALE—A farm, sawmill and timbered lands, also a quantity of choice clear soft pine plank sidings. Apply to Hugh Cameron, Canonto P. O., Ont. F

For Sale — Sawmill with Capacity

Of one hundred thousand feet per day. Located in Everett, Wash. Good rail and water shipping facilities. Ten and one-half acres of land with excellent mill pond. Price less than one-third of appraised valuation. F

Address, P. GARDINER, Everett, Wash.

Baughman's Buyer and Seller

The twelfth edition of the handy book for lumbermen just out. Revised, improved; see the new side tables, the metric system, tapering timber, to figure narrow flooring, moulding and box work, etc., five sections each indexed and separate work. Every page worth the price of the book. The book that talks to lumbermen. Not millions but more than seventy-five thousand copies have been sold to lumbermen. Bound in red flexible leather cover, $2.50 per copy prepaid. Orders mailed day received. Address H. R. A. Baughman, Indianaoplis, Ind. 19-22-18

PARTNERS WANTED

The advertiser has just built and equipped the best plant in Canada for the manufacture of doors and boxes, and wants one or two good men with capital to join him, one to take the financial end and office work, and the other a man with a good knowledge of the manufacturing end of the business. The trade in boxes will be local, but doors will be shipped to all prats of Canada as well as to England. There is not a large specialized door factory like this one in Canada to-day. The demand for doors is increasing rapidly, and car loads are daily being brought form the States which can be filled by a good Canadian plant. All correspondence will be treated confidentially. Address Box 600, Canada Lumberman & Woodworker, Toronto, Ont. 19-21-25

Important Sale of Valuable Timber Limits

Sealed tenders will be received by the undersigned up to and including the **20th day of December, 1912**, for the purchase of:

Limit No. 194 of 1873-74—River Jean de Terre—tributary to the Gatineau, containing an area of fifty (50) square miles, more or less.

Limit No. 195 of 1873-74—River Jean de Terre—tributary to the Gatineau—Island Lake, containing an area of fifty (50) square miles, more or less.

These limits comprise some of the best pine and pulpwood areas in the Province of Quebec.

Map showing location of these timber limits and report thereon may be inspected at the offices of the undersigned and from whom further information may be obtained.

The highest or any tender not necessarily accepted, and the acceptance of any tender will be subject to the approval of the Court.

Dated Ottawa, August 5th, 1912. 16-20

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A Complete Little Planer, Matcher and Moulder

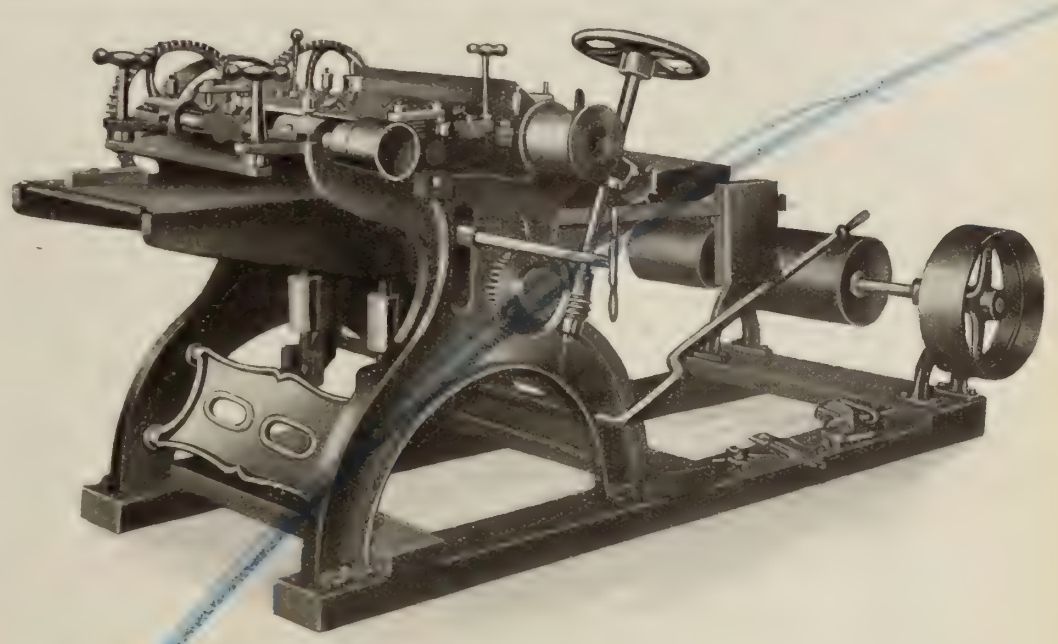
The Little Giant planer, matcher and moulder which is illustrated herewith is manufactured by the Josiah Ross Manufacturing Company, 1443-1459 Niagara street, Buffalo, N.Y. The company are now making this excellent machine with a moulding attachment, mounting the machine upon a wooden frame so that it can be moved from place to place, and making it one of the most complete little machines on the market.

This machine will plane stock 18 in. wide and 5½ in. thick. It will plane and match from one-half inch up to two inches on soft wood and from one-half inch up to one and a half inches on hardwood. It will match stock from 2 in. to 8½ in. in width. The surfacing capacity is from 8,000 to 10,000 feet of plain surfacing per day. The machine will match from 3,000 to 4,000 feet of 6-in. strips per day. In order to change from matching to surfacing it is only necessary to remove the matcher heads as the tops of the spindles are below the bed.

All the boxes on the cylinder after being babbitted are bored out to an exact size and the bearings are turned to an exact fit. The machine is ready to belt and go, and will do first class work right from the start.

The company also apply to this machine their Patent Adjusting Feed Device which regulates the feed so that the operator does not need to look after the machine, once he has entered the board. If the cut is too heavy it will simply reduce the feed until it can carry it through.

Only one driving pulley is used on the countershaft to drive both cutterhead and moulder-head. The machine is furnished with plain knives for the cylinder, one pair of matcher heads with knives, a set of wrenches and also a "jack" for setting the matcher knives in the heads. One pair of beading tools and one pair of novelty siding knives, or in place of them one pair of 3-in. moulding knives, are also supplied. The machine weighs 1,600 pounds, and is operated with five horse power.



The Little Giant Planer, Matcher and Moulder, Josiah Ross Manufacturing Co.

An Interesting Band Cut-Off Saw

A machine which is of much interest to lumbermen and pulp wood manufacturers is illustrated in the accompanying cut which shows the "Bryant" Patent Band Cut-Off Saw manufactured by Butterworth & Lowe of Grand Rapids, Mich. This machine is designed for cutting of logs, timbers, etc., to any length required. It is useful in making stock for staves or heading, veneer or basket work, pails and tubs, wood pulp, shingles, lath, pickets, bed slats, cord wood, or in fact any cross cutting of logs or timber that has heretofore been done by circular or drag saw machines.

These machines have been in general use for several years and have given splendid satisfaction. They are no experiment. Messrs. Butterworth & Lowe, owners of the patent, have made a number of improvements in the general construction and details of the machine since it was first put before public. It is in fact a thoroughly first class and practical device for its particular work.

A number of attractive features might be mentioned in referring to this machine. One of the most interesting is that the saw is maintained at a uniform tension by an adjustable coil spring. An adjustment is also provided to control the position of the saw on the wheels. The guide rollers, between which the saw runs, causing the quarter twist, are of chilled iron (set staggered), their yoke boxes being adjustable, thus insuring square cutting by the saw. The hardened steel back pressure rolls (which are adjustable) keep the saw teeth clear of the guide rollers as the width of the saw decreases by wear.

The operator raises the entire saw frame with saw to the height required, by pulling down on the rope having the balance weight attached, or by means of the endless rope at out end of the machine as shown. As the saw runs at 3,300 ft. per minute, the cutting is smoothly and quickly done. The power required and the loss in sawdust are very small. The machine requires only 3 horse power for the 24-in. size and 7 horse power for the 48-in. size. A 4-in. belt drives the 18-in. pulley on the 36-in. machine.

Some of the most important features in connection with the machine are that it requires no foundation or strong fastening; that the log needs no dogging or holding while being cut; that it has positive adjustments at all points; that it is perfectly balanced and easily handled without friction or other mechanical hoisting. For wood pulp work it is particularly adapted, leaving the sawed ends clean and smooth as the fine teeth travel rapidly in straight and parallel lines in one direction only.

This is a machine which it would be a distinctive advantage to Canadian lumbermen and pulp wood manufacturers to take up. It

The "Bryant" Patent Band Cut-Off Saw

has already been in general use in the United States as well as in Europe, England, Scotland, China, and Australia for upwards of 10 years, giving excellent satisfaction. An idea of its popularity may be gathered from the fact that the manufacturers recently shipped the 8th machine to Ashland, Kentucky, the previous seven orders having resulted from the first satisfied customer, without any solicitation. They also recently received a 4th order from Brewton, Ala., in a similar manner. Quite a number of second orders are continually being received from first class concerns.

It should require no argument to prove to a mill man or a wood worker that a thin band saw travelling at a high rate of speed and in one direction only will cut more rapidly than a heavy dray or circular saw and will require much less power, at the same time doing better work.

A letter to Messrs. Butterworth & Lowe, Grand Rapids, Mich., will bring full information regarding this interesting machine. Readers of the Canada Lumberman who are interested should write the firm and at the same time mention that they saw their advertisement which appears on another page in the Canada Lumberman.

A Remarkable Machinery Catalogue

The Clyde Iron Works, Duluth, Minn., have issued a catalogue of their hoisting machinery which is certain to win admiration and attract the attention of everybody into whose hands it comes. The catalogue is one of the most complete that the Canada Lumberman has ever been fortunate enough to receive. Practically no effort and no expense can have been spared in the preparation of this remarkable book. It is printed upon excellent calendared paper which brings out the illustrations in a splendid manner.

The book is filled with information of the most interesting character about the Clyde Iron Works' great variety of hoisting engines, both steam and electric. In addition to the illustrations and general information regarding the construction and nature of the machines, the catalogue contains a vast amount of valuable general information which makes it in reality a modern text book upon hoisting engineering.

Nothing need be said here about the excellence of the Clyde Iron Works machines. They are well known to the lumbering industry. It may be said however, that those who are acquainted with their machines in their own individual operations will be surprised, after perusing this catalogue, to find out what a variety of products the company manufactures. The catalogue itself is produced in a manner typical of everything else which this company does. It is complete and of the highest possible type of perfection. The company advise us that a solid car load of these catalogues has been ordered and will shortly be distributed throughout the length and breadth of the hoisting-machinery-using world. The catalogue is bound in cloth in a very substantial manner.

A Successful Exhibit of Saws

The A. J. Burton Saw Co., Ltd., of 374 Sparks street, Ottawa, Ont., had a good exhibit this year in the Dominion Exhibition at Ottawa. Saws large and small, circular saws, both solid and inserted-tooth, from one foot to five feet in diameter, and band saws from ¼-in. to 12-in. wide, single and double cut, shingle, jointer, and every other kind used in sawmills, were displayed. Their booth was unique in design, 18 ft. high, finished in oak. A large sign above declares it to be "Ottawa's Saw House." It was covered with saws of every variety. Of special interest were two large double-cutting band saws, and some smaller bands, forming perfect loops, with a large Patent IXL inserted-tooth saw in the center of the booth. The booth was beautifully trimmed with electric lights, the effect of which attracted much attention. The company were awarded a diploma for their sawmill saws. Mr. A. J. Burton himself superintended the exhibit.

A Remarkable Roofing Contract

A good indication of the popularity and utility of the H. W. Johns-Manville Company's roofing products is afforded by the fact that they have recently completed a remarkable contract for the Memphis Union Stock Yards at Memphis, Tennessee. These yards are generally considered to be the most modern and up-to-date stock yards in the world. They comprise auction and commission stables with a capacity of 2,000 horses and mules. A private mule barn with a capacity of over 8,000 head and an auction pavilion arranged for the selling of from 500 to 1,000 animals during the week.

One of the important features which had to be arranged for in the construction of these stock yards, was the covering of some 400,000 square feet of the buildings with a durable fireproof roof. The buildings are located alongside of a railway and the fire risk was so great that shingles or inflammable roofing could not be used. On account of the great amount of space to be covered, an unduly expensive roof or one that required painting, gravelling or frequent repairs was considered out of the question. After a thorough investigation, the J.-M. Asbestos roofing made by the H. W. Johns-Manville Co., New York, was selected for all the buildings.

This roofing is made of pure, long-fibred asbestos (stone) felt, securely cemented together with a combination of Trinidad Lake and other natural asphalts—two indestructible minerals. Approximately 400,000 square feet were necessary, or about ten acres.

Loading Logs by Overhead Rig

By O. J. Evensen*

Loading logs and keeping the yarding engine clear at the landing has been a great study for all loggers. There are a great many ways to load logs on cars, and the varying conditions and the lay of the ground that we have to contend with make it a very difficult proposition in some cases to find a suitable place for landing or rollway to load logs on the cars.

In some cases your railroad may be along the side of a hill and no possible chance to build a rollway or even have a landing place. We have eliminated all this trouble by using a special three drum four-cylinder loader as built by Smith & Watson, which will load from a yarder, delivering logs within 100 to 400 feet of the railroad and add at least 30 per cent. to the capacity of yarder.

This system of loading being an overhead rig, the device is very simple and is of special advantage by reason of its being quickly removed from one setting to another.

The device consists of two well guyed trees or gin poles, one on each side of track. The trees or gin poles can be anywhere from 200 to 800 feet apart to suit the conditions and allowing the receiving of logs on both sides of track with one setting of the device. A 1⅜ inch cable is stretched tight from one tree to another about 40 or 60 feet up from the ground. There is a special carriage that rides this line, which can be racked in either direction at a speed of 800 feet per minute, the two upper drums of this loader doing the racking. The lower drum is for the main line or lifting line, which is fastened as a tall hold to one of the trees used for the tight line and then passing through the two lower sheaves in the carriage, looping down to another special block in the bite of this line, which gives the engine a block purchase on the log. A chain bridle with large special hooks are fastened to this block.

This lifting line is handled entirely independent of the racking lines so that a log can be picked up or lowered while the trolley is being racked across on the tight line. We can pick up any size log and hold it with this machine, while the trolley is being racked .

One of the great advantages of this system of loading is that we are never blocked up at the landing and we can always pick up the log we want in order to make up a car load. This being an advantage over loading from a rollway or landing place, as it is always necessary to take the front log to load when loading from a rollway and in a good many cases this log is not the right size or length needed to make up the train load. Also if anything happens to the train the yarder can keep bringing in the logs, we have had as high as 200 M on a rollway in a case like this.

This system is always advantageous by reason of the size and length of timber it is capable of handling. We handle logs of a maximum length of 160 feet. The capacity of this system is varied only by the capacity of the yarder and we think this system will take care of all the logs two yarders can haul in under the tight line, and not delay the yarding engines in any way. Although we plan to reach out as far as it can and clear one yarder, in this way the yarder has a reach of 1,200 feet from railroad with only 800 feet haul.

By eliminating building all of our rollways and landings, this system of loading has proven to be the most inexpensive way we have found to load our cars, and the capacity of this new loader is probably 50 per cent. more than any other type now used.

Another special feature of this system is that we can always get a better setting for our yarding engines, placing a yarder say 300 feet away from railroad gives a much greater percentage of yarding on a straight pull.

This device with perhaps some improvements, some time in the future will be valuable for logging closer than we do now, for instance after a donkey has taken off what is profitable to log with steam, a second operation, before the railroads are taken up could be done with horses. For this the tight line could be extended 1,000 feet, and it would be very easy to clean up the ground this way, taking extra stumpage off at from 8 to 10 M feet per acre. Leaving the cut-over land in better shape for its future development as well as almost eliminating the present fire risk. However, this is far fetched, as this lumber would be all common and poorer, which at present price cannot be logged only at a loss and our law makers evidently think it is better to leave this on the ground and let it burn, even if in so doing it burns a few billions of standing timber occasionally, rather than protect this valuable and fast diminishing asset.

*Address delivered before the recent Pacific Coast Logging Congress.

Review of Current Trade Conditions

Ontario

The Ontario demand for B. C. shingles is still very brisk and an advance of ten cents has taken place. There has been an almost unprecedented use of shingles in the prairie provinces and consequently many of the mills are oversold and are refusing orders. The delivery question is becoming more serious every week on account of the shortage of cars for transportation, although this might be considerably relieved if there were more engines to move the cars. A prominent Toronto lumberman, just returned from a long trip, stated that empty cars were left standing on the rails sometimes for days because there were no engines to move them. The railways are taking steps to improve matters by sending out circulars asking their customers to unload cars sent them as speedily as possible. All the conditions indicate that the advanced price of B. C. shingles is likely to be maintained, and there is also a general advance in United States prices.

Hemlock stocks are very short and great difficulty is experienced in meeting the heavy demand. By the fall, very little dry stock will be on hand, and by the spring, prices will probably be considerably advanced. Some dealers who have been out of the hemlock trade for some time, are again handling it as they find that being able to offer hemlock, helps them considerably in disposing of their other lumber.

White pine sales have been very good during the last few weeks, but red pine and spruce are very scarce.

In hardwoods, there is not much offering from the mills at present, although stocks are moving freely where cars can be procured. Movements of export brick for Liverpool and London are rather slow, stocks which are usually moved in July and August being still in the yards. There is an increase in the United States demand, particularly for heavy birch, those requiring stocks being willing to pay from $2 to $3 a thousand more than last year, and there is no falling off in the shipment of stocks to United States consumers. Desirable stocks in basswood are scarce. Brown ash and elm are in good demand, both in 4/4 and thicker sizes. The demand for birch has run very heavily in Canada from one inch up to 8/4, and even mill culls in both birch and maple have been pretty thoroughly bought up. Prospects are good for the fall trade both in Canada and the Eastern States and apparently the Presidential election is not having the usual depressing effect on trade in the States.

Manufacturers of fine furniture report that they are overcrowded with orders at present and cannot get desirable stocks for immediate use. They have lately been ordering from hand to mouth and have consumed any surplus stock which they had accumulated. At the same time, the mills have no surplus stock to offer them. The result will probably be a stiffening of hardwood prices all along the line.

Exceptionally active business is reported from the Tonawandas, with remarkable price advances in several cases. White pine is moving rapidly and Norway is in splendid demand. Hemlock would be very active, if there were any stocks to speak of. Hemlock however, is almost off the market in all the important sizes. Shingles have followed the lead of laths which rose rapidly during the earlier part of September. Red cedar shingles reached $3.90 during the 3rd week of September. White cedars were close behind them. Lath are steady and firm at $4.10. Canadian hardwoods are steady and stocks are scarce.

Eastern Canada

Reports from New Brunswick are uniformly of an encouraging nature. The advance of the season is accompanied by higher prices for all wood goods. Spruce deals for the English market are practically all sold, and prices have come close to those of last year, being $15 for a specification of 50 per cent. 9 in. and up, balance 7 in. and 8 x 3. Scantlings brought $13 for 3 in. x 4 and 5 in. with $13.50 for the balance. Ends sold at $11 and fourth quality deals brought $13. These prices are all on the sellers' wharves. Indications are all very promising for a continuance of good prices for next year, both in England and the United States. Freight rates are still excessive to Great Britain, charters having recently been made for vessels at 65 shillings to Manchester from Bay of Fundy ports. To United States ports, freight rates are firm at about $4 to New York and $3.50 to $3.75 to Sound ports. New York prices for 2, 3 and 4 in. are unchanged at about $24.50. Shingles are scarce in New Brunswick and B. C. red cedars are selling at about 10c. above the price of New Brunswick cedars. There is a good demand for box shooks, and all the mills are sold ahead at prices about 10 per cent. higher than last year. Laths are in good demand and scarce. In New York, they are bringing about $3.85 delivered.

A steady demand continues for spruce lumber at Boston, although some dealers expected trade to be more active than it is. The past summer has been one of the best the retailers ever experienced. Most prices are firm. The asking price for frames is $24.50 to $25, but few buyers will offer the top price. Manufacturers expect the $25 basis to become fixed early in October. There is a fair demand for random at Boston, prices ranging from $22 to $22.50 for 2 x 4. Offerings of dry spruce covering boards are light and prices are firm. Hardwood prices are steady and the volume of trade is fair. Plain oak is generally quoted at $58 to $60. The offerings of good stocks are only moderate.

At New York, the demand for eastern spruce is fair and prices of all grades are steady. Yard stocks are not large. There is a strong demand for hardwood at New York, and prices are strong. Low grades are moving steadily. Plain and quartered oak are firm. The demand for hemlock at New York is strong and stocks are scarce.

Great Britain

The timber trade at London continues active. The requirements of the trade in packing boxes are large, but strong competition keeps the prices down. In other lines the timber trade is good with a fairly promising outlook. Deliveries at London docks for the week ending September 7th, amounted to 5927 standards as compared with 5716 standards during the corresponding week of 1911. At Churchill & Sims' recent auction sale, a parcel of first Quebec dry pine, 3 x 11—10 was sold at £37 10s. Some prime dry Quebec birch 4 x 6/19—9/16 brought 1s. 3½d. per cubic foot.

A decidedly better feeling is reported in the timber trade at Liverpool. The other important trades of the district are reported to be in sound condition and further improvement is expected in the timber trade.

The effect of the high freight rates is most noticeable in connection with spruce. Buyers who expected to get in at lower prices than those which have recently prevailed seem likely to be disappointed. Recent transactions in spruce deals both in cargo and part cargo lots have been at full prices, to cover the high freight rates and insurance. Arrivals are going direct into consumption to fulfil contracts made some months ago. Importers however, do not show much disposition to continue trade at present prices. The pine deal market continues unchanged, and shows little likelihood of improving sufficiently to cover the high prices required by importers to bring out their cost. Importers consider that the producers at Ottawa are taking an autocratic stand. The trade in birch logs and planks is dull, importers apparently waiting for exporters to meet their views of the market situation.

At Manchester, the trade has been shown an easier tendency of late. Spruce, however, is stiffer, especially for anything long. Stock a foot or two over the average brings 15 shillings per standard extra. A fair amount of trade is reported from Glasgow. The ship-building industry is quite active and is consuming large quantities of timber. Recent arrivals have been light and practically all of the stocks from Quebec have been going into consumption. Spruce is scarce and there is a strong demand for the small lots which are arriving.

United States

Reports from various parts of the United States show that the lumber business continues in a strong position. Retailers of all kinds seem to have been buying extensively since the first of August. Minneapolis reports regarding northern pine are to the effect that it is increasing in strength as the season advances.

Chicago:—There is a fair and steady trade in white and Norway pine, and most of the operators are reported to be feeling confident on account of the favorable crop results. There is a heavy demand for the low grades especially those which are used for box manufacturing. The upper grades have also had a good season. All classes of white pine are scarce. The hardwood list continues strong and indications are that higher prices will rule in the near future. Most of the buying to-day is for immediate delivery, indicating that consumers' stocks are low. Mill stocks also are reported to be broken. Plain oak continues in good demand and firm. An improvement is reported in quarter-sawed white oak, first and seconds and common. White ash is firm and scarce. There is a fair demand for hickory. Birch and maple are active. Manufacturers of maple flooring are well supplied with orders. The demand for hemlock continues strong with prices firm and trade active. Yellow pine stocks are light and prices continue firm at the recent advances. Shingles are rather quiet but prices are firm at $3.77 for red cedar clears and $3.34 for stars, Chicago basis. White cedars are unchanged and in fair demand. Lath are moving steadily and are firm.

Buffalo:—The trade in white pine is fair, the principal activity

Raft containing 6,000,000 feet towed from the Georgian Bay to our Mills Arrived in Sarnia on August 5th

BUY THE BEST

Retailers and woodworking establishments who like to get AI NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

How about PINE LATH? We have a fine dry stock of No. 1—4 ft. on hand for immediate delivery.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"RUSH ORDERS RUSHED"

SARNIA, ONTARIO

A. F. Holden, Pres. J. M. Diver, Vice Pres. and Gen'l. Mgr. E. C. Barre, Ass't. Mgr.

being in pattern lumber and the low grades. Stocks are scarce. Indications are that the box trade will have to search hard to find lumber at a reasonable price for next season. Pattern lumber also promises to be scarce. A fair trade is in progress in hardwoods, at steady prices, with an indication of higher prices in some lines. Plain oak is the leader and stocks are low. There is a fair demand for brown ash, maple, birch and chestnut. The indications are that the hardwood trade will continue active in the near future. Hemlock dealers are having difficulty in securing stocks. The demand is active and prices are firm. The demand for southern pine is strong and prices are high. Shingles are firm in spite of frequent advances. Stocks have shown an increase of late, but dealers expect them to move off rapidly.

Market Correspondence

Upward Movement in New Brunswick Prices

St. John, N.B., Sept. 21st. (Special corrospondence of the Canada Lumberman): As the season advances, the prices of all wood goods seem to be tending upwards. Practically all spruce deals for the English market have been sold, either to Messrs. Mackay, McKean or Moore, who are the English buyers at this port. We understand that prices reached nearly to the mark of last year, sales being made at $15.00 for a specification of 50 per cent. 9 inch and up, balance 7 inch and 8 x 3, with scantling. $13.00 for 3 in. x 4—5, balance $13.50, ends about $11.00, fourth quality deals $13.00; all on the sellers wharves, which is the usual way deals are sold here. It is to be hoped that prices will be maintained through the winter months, and that the year 1913 will open with a small quantity of deals on hand throughout the province, thereby making the chances of future sales very much brighter. At the present time it looks very much as if this will be the case. Of course all depends upon the state of trade in England and the United States which at the present time is good.

Freight rates to British Isles still continue to advance and it is understood that charters have been made for vessels at 65 shillings to Manchester from Bay of Fundy ports. This is the highest in recent years and it is felt that as freight rates are abnormal they cannot long remain where they are, but must recede. Very little space is available on liners from this port at present, to London. The space will be limited for some time, as the apple crop from Nova Scotia will get most of it thereby limiting the deals.

Freights to United States ports still remain firm at about $4.00 per m. and $3.50 to $3.75 to New York and Sound ports respectively.

Prices for 2, 3 and 4-inch in New York remain about the same, viz., about $24.50 base price, sliding up or down according to percentages of widths and lengths. Long specifications in the United States market have not been bringing the price they should, compared with the price paid for shorter average length and width stocks. Those who have handled car business in shorter average lumber have had good prices all through the season compared with the price for long average stock which must come from a log costing about $16.50 at the mill, compared with logs costing $11.50 to $12.50 per m. ft.

The shingle business is still in a state of shortage and many outside shingles are being brought into local supply. In fact a good many red cedar shingles are being brought from British Columbia and sold at about 10 cents per m. less than New Brunswick cedars.

Box shooks are in very heavy demand and all mills on this section are sold ahead of the saws for some time to come. Prices are about 10 cents higher than in 1911.

Local business still continues good and will probably do so until winter sets in, as some large new buildings are being erected and to be erected, the latest being the J. A. Pugsley Co. garage. Prices for all refuse inch, two and three inch remains firm and local stocks are low especially in one and two inch.

Laths are in good demand but very few are for sale in this section, as they were sold ahead for the season. New York prices remain at $3.85 delivered.

It is said that Donald Fraser & Sons, Cobano, Quebec and Plaster Rock, N.B., have secured options on the Scott Lumber Company's plant and timber limits, and also the Oromocto Lumber Company's limit, situated largely on the Oromocto. Should the Messrs. Fraser purchase these properties it is said they will operate the Scott mill at Fredericton.

The Provincial Lumber Co., Ltd., has been incorporated at St. John with Geo. McKean of this city president, W. E. Golding, treasurer, and Geo. E. Deming of New York, secretary. The new company will handle in the United States, lumber shipped there by Geo. McKean, who also handles large quantities of European and South American stocks, in all about 80 million sup. ft. They will also handle the stock of the Kent Lumber Co., Gold River, N.S., whose output reaches about seven and one-half millions of spruce, pine and hemlock. The new company will also handle the output of the River Valley Lumber Co., Oromocto, N.B., about five million feet, spruce pine and hemlock. This will give the company about twenty-five million to handle per year.

It is understood that all deals for European markets held by manufacturers have been recently sold, Messrs. Randolph & Barker and Murray & Gregory selling to W. M. Mackay, Messrs. Warner & Co. to Geo. McKean, Chas. Miller—Miller, Moore & Co. & J. E. Moore, to J. E. Moore Ltd., in all about 60 million feet, the price being about $15.00 per m. s. ft.

Prices Soaring at the Tonawandas

The Tonawandas, N. Y., Sept. 23. (Special correspondence of the Canada Lumberman): September business continues to show the strength noted earlier in the month. Steady and in some instances remarkable advances in prices do not appear to affect orders. There is a brisk demand for Canadian white pine. Norway or red pine is also feeling the general exhilaration of the market. Hemlock is not quite so active but that is perhaps explained by the long continued absence of the latter stock in local market in lots of any consequence. Where it was lath that went soaring early in the month, it is now shingles that are sky-rocketing. Red cedar clears almost touched the $4 a thousand mark the last week. The actual figures at high tide last week were $3.90. White cedars are running the reds a close second. Lath are stationary at $4.10 for a few days, but there are signs that they have not reached the high mark. Canadian hardwoods are steady. The demand would probably be greater were more to be had. Prices hold to normal with a tendency to advance, to meet the general ascendency of the market.

The best grades of Canadian white pine are bringing as high as $100 a thousand. The poorest culls are being sold for $20. No. 1 barn, and common or better are bringing correspondingly high prices with a steady demand for all grades. White cedar shingles are quoted as low as $1.50 and as high as $4. There is little stock on hand on account of the buoyancy of the market and dealers have difficulty in keeping pace with orders on that account. First grade pine lath, 1½ in. by 4 feet, is being quoted as high as $4.15 to-day. No. 2 grade nearly as good but showing a few sappy spots are being quoted below $4 but the supply is limited. Canadian stock of course takes its chances with western stock at the Tonawandas, but there is little Canadian lumber, lath and shingles on hand and the local market looks good for stock from across the border for some time to come. The practical certainty of fair weather well into October helps the optimistic feeling so thoroughly permeating all lines of lumber trade at this point.

Building is brisk. The growth of the Tonawandas, Buffalo and the entire Niagara Frontier has no better evidence than the amount of building visible from car windows or from autos in trips through the country. Several factories are being built in the Tonawandas and others are being enlarged. Houses are springing up everywhere, it would seem, between Buffalo and the Tonawandas to keep pace with the erection of manufacturing plants in the same section. A 25 per cent. better fruit crop than last year has brought prosperity to the farmers of western New York and the effect on the lumber trade is already apparent in increasing orders from rural supply points.

James P. Mackenzie, of the J. P. Mackenzie Lumber Company, returned to-day from a business trip to Toronto.

Thomas Charlton, retired lumberman, whose activity was chiefly in Canadian territory, and his wife recently celebrated their golden wedding anniversary at their home in North Tonawanda.

The break on the Erie Canal at Bushnell's basin is holding up considerable Canadian lumber that was consigned to tide water and points east of Rochester. Canal navigation will be extended fifteen days longer than usual, to November 30, because of the break.

The Canadian Pulp and Lumber Company of Niagara Falls have built a 400 foot conveyor for the unloading of wood pulp from boats onto Tonawanda Island at this port. Previously the pulp wood was shipped from Quebec to Niagara Falls by rail. The change from rail to water transportation as far as the Tonawandas and the remainder of the way to the Falls by rail will save greatly on freight charges.

The departure of a steamer from Buffalo recently with a cargo of lumber for Toronto is by no means an experiment as referred to by the local press. It is a well known fact that water shipments are much more economical than rail and cargoes of lumber have often left the Tonawandas and Buffalo by water for Canadian ports, principally Toronto. So little lumber goes north from the States however, at least from local ports and Buffalo, that most of it has gone over the quicker rail route. Some large shipments of yellow

pine and cypress have been sent by boat, but this was some time ago.

Charters were made yesterday for shipments from upper lake ports at $2.50 per thousand feet. Mixed cargoes are still bringing a $2.75 rate. Rates are holding firm and there are few boats to be chartered.

Car Shortage Restricting Montreal Trade

Montreal, Sept. 23rd. (Special correspondence of the Canada Lumberman): As the fall approaches, and cars are being sent west for the harvest, there are renewed complaints of a shortage in this respect. On all sides one hears strong remarks as to the way the lumber trade is being restricted by the inadequacy of the car service; and as time goes on, it is certain that the situation will become worse. Some wholesalers are fortunate enough not to depend mainly on the railways; water-carriage is their chief stay, and even in those cases, business is being upset by the poor supply of cars. Orders there are in plenty, and business all round is booming—but as the mills are unable to deliver the lumber in anything like sufficient quantities, many orders have to go unfilled, or are only partly filled. Some shipments are delayed over a month.

Most of the wholesalers have as much work as they can handle, and despite the difficulties attendant on the poor transportation facilities of the season, have made a record turnover. The big building programme has, of course, been an important factor in local trade, and, judging from the various projects contemplated, there is a prospect of the revival continuing. Prices have naturally kept firm.

The exceptionally wet weather has been all against the drying of stock, and the planing mills have had their own difficulties in this respect. Some of the new cut is in pretty good shape, but taken all round the season has been a poor one for drying.

Dimension timber is in good demand, in fact better than the supply owing to car shortage. The export trade is satisfactory, shipments to Great Britain being on a large scale. Much more would have been sent to the other side had there not been a scarcity of ocean tonnage and a lack of railway facilities.

In the paper and pulp market, prices of chemical pulp keep high, and appearances point to these being continued. The mills, too, are working at full pressure. Ground wood has eased off, on account of the heavy rains, giving large water powers and thus allowing increased production. The paper section is firm in nearly all departments.

Quebec Trade Quiet

Quebec, Sept. 21.—There is little of interest to report in the local lumber market. The recent advance in freight rates will, no doubt, check shipments to Europe this fall from the St. Lawrence. A steamer was recently chartered here to carry a cargo of deals from a Nova Scotia port to London at 67s. a standard. This is said to be the highest rate paid in twenty-five years. The demand for lumber for local consumption continues good with prices steady. Pulpwood prices remain firm at $7.50 to $9.25 per cord.

Increasing Demand on the Prairies

The demand for lumber and general building supplies in Manitoba and Saskatchewan during the month of September was considerably larger than at the corresponding time last year. The bulk of the business was, of course, done in the cities and towns, the farmers being too busy at harvest to purchase their lumber requirements. Representatives of the mills who have recently been in Winnipeg state that the volume of business so far this season has exceeded expectations. There appears to have been a continual shortage of cars for hauling lumber, even before the harvest, and it is being predicted that the situation will be critical when the fall grain movement starts in earnest.

How To Develop Foreign Trade

The development of foreign trade opportunities is a feature of modern business methods in Canada and the United States which has been an important factor in the success of the manufacturing industries of both countries. One of the first problems confronting a company which wishes to get into touch with foreign trade is to secure a list of possible customers, and having secured a list, to keep posted in regard to their requirements and continual alterations. In the United States, a plan has been developed of late which enables companies to secure information of this nature and at the same time to keep their names and their products continually before the best class of foreign customers. The Commercial Bureau Company, Hudson Terminal Buildings, 50 Church street, New York, have for the past few years, with the approval of the Department of State, been furnishing the United States Consular Offices in foreign countries with catalogues carefully and concisely briefed in card files. These files are prepared in the various foreign languages required and furnish a splendid medium for the use of foreign purchasers who wish to become acquainted with the manufacturers of any particular articles of which they are in need. The card files are sent out once a month and all additions or alterations to former files are also sent at the same time. In this manner manufacturers need simply to cooperate with the Commercial Bureau Company in order to be kept in continual touch with the best foreign opportunities for disposing of stock. The system is one which has already proved its exceptional value and which promises to become the most important of all agencies for the promotion of foreign trade.

Operations Commencing in New Brunswick Woods

A despatch from Fredericton, N.B,. says: Lumbermen are already engaged in hiring men for the lumber woods and report that the labor supply just now is not equal to the demand. The first crews left Fredericton about the third week in September. Wages this year will run from $25 and $28 up to as high as $34 per month, or about the same as last year. It is a little early yet to get figures as to the lumber cut on the St. John River, but it is said that it will be about the average. On the Restigouche, however, the cut will not be as large as last year, owing to the Shives Lumber Company having left about twenty million feet of logs on the landings last spring. The Restigouche booms handled the largest number of logs this season in their history, about 120 million feet of logs passing through. It is said that the freshets brought out some logs cut as long as seven years ago.

The Hollow Backing of Casings

In hollow backing casings it ordinarily does not make very much difference if the hollow back is a little to one side or the other, nor if it is made with a knife more or less in need of sharpening or full of small gaps. The prime object is to remove the back in the middle of the piece to get a good edge joint and have the shrinkage alike on both sides.

But I have noticed quite a number of cases lately where the hollow backing has been turned outward, to serve as the mold of the casing, and if the work on the hollow backing had not been quite as nice as that on the face of the casing it would not have answered the purpose. Of course, this refers to casings made with a full square edge that could be used either side up.

In one case the carpenter told me he had bought No. 3 casing and used the hollow back for a mold, the results being quite satisfactory, with a considerable saving in the cost. Stock that is a little thin in the running will work No. 1 when turned over, if the work on the bottom is nicely done. H. M.

National Hardwood Inspection Results

The National Hardwood Lumber Association report that during the month of August their total inspections amounted to 18,041,552 ft. an increase of 2,132,052 ft. over July 1912, which was the former month. This volume of work was accomplished with earnings of the inspectors, slightly in excess of the actual expense. The combined inspections for the first three months of the new fiscal year (June, July and August, 1912) amounted to 47,200,229 ft. which is an increase of 16,379,524 ft. over the corresponding months of 1911.

EDGINGS

Ontario

Robert Book, Smithville, Ont., will build a sawmill this fall. He already operates a planing mill at Smithville.

Evans Bros., piano manufacturers, Ingersoll, Ont., are calling for tenders for a dry kiln with a capacity of 30,000 feet.

S. Anglin & Company, Kingston, Ont., have just completed a contract for supplying all the interior and exterior woodwork for the new addition to the east block of the Parliament Buildings, Ottawa.

The Ludlam, Ainslie Sash & Door Co., Leamington, Ont., are preparing plans for the erection of a sash and door plant to cost $25,000 in the place of the one which was recently destroyed by fire. The company will require new machinery.

Webb Lumber Company Limited has been incorporated with a capital of $40,000 to manufacture and deal in all kinds of lumber and builders' supplies, with head office at Toronto. The provisional directors are R. W. Webb, J. A. McAndrew and W. H. Irving, all of Toronto.

Hon. Adam Beck, Continental Life Building, Toronto, has awarded a contract for the erection of a factory to cost $20,000 on Wilton avenue, Toronto. The architect is Jno. M. Lyle, 14 Leader Lane. The building is to be of three storeys and basement, stone and cement foundation.

The ratepayers of Aurora recently carried municipal by-laws granting to the Collie-Cockerill Company, makers of office furniture, a loan of $15,000 for ten years and a fixed assessment of $6,000 for a like period. The company will begin operations immediately on the construction of a factory. Its present plant is in Toronto.

The Cornwall Rossing Mill enterprise, Cornwall, Ont., which has been standing in abeyance for several years, is to be carried to completion. The erection of the plant was commenced six or seven years ago, but it was not completed. Operations have been resumed and it is understood that the plant will be in full running order and business commenced this fall.

One of the most disastrous fires that ever visited Parry Sound occurred recently when the veneer factory belonging to Messrs. George Neibergall & Son was completely destroyed. The fire is supposed to have started from a hot box and had made such headway before being discovered that it was impossible for the fire brigade to save any portion of the building. The total loss will reach from $75,000 to $100,000. There was $25,000 insurance on the building and plant, but none on the lumber, several piles of which were destroyed. Not only is the burning of this factory a heavy loss to the Messrs. Neibergall but it is a serious loss to the town as 55 people have been thrown out of employment.

Eastern Canada

The Grier Timber Co. Ltd., Montreal, Que., has been registered.

Lundreville & Langevin, sash and door manufacturers, of Montreal, have been registered.

Grenier and Binnette, Cowansville, Que., have been registered to carry on a business as sash and door manufacturers.

The headquarters of Beaurivage Lumber Co. have been removed from St. Agapit, Que., to Craig's Road, Lauzon, Que.

The Jas. McLaren Co., Buckingham, Que., are considering plans for enlarging their pulp works so as to increase their output.

R. B. Smith, Oromocto, N.B., is planning to erect a saw mill at Lakeville Corner, N.B. He will require saw mill machinery.

Ouellette, St. Pierre & Cie, Longueuil, Que., have been registered to carry on a lumber business and to operate a sash and door factory.

Walter Reed's lumber, sash and door factory at Montreal is reported to have been damaged by fire recently. The loss was covered by insurance.

Demase Lalonde, 1224 St. Lawrence Blvd., Montreal, Que., is planning to erect a sash and door factory on Christopher Colombe street. He will require steam boilers and woodworking machinery.

Bert Dunham has awarded a contract for the erection of a shingle mill at Lower Southampton, N.B., at a cost of $14,000. The Dunbar Engine and Foundry Company, Woodstock, N.B., secured the contract.

For the sum of $223,000, Shearer, Brown & Wills, Limited, lumber merchants, have sold a portion of their property to the Imperial Wire & Cable Company. The property fronts on Shearer, St. Patrick and Richardson streets.

The frame construction of the new shingle mill which is being erected by Messrs. Harrison & Hicks, at Dalhousie Jct., N.B., has been completed, and the mill is nearly ready for its machinery. The cost of the mill is to be about $6,000.

The Laurentide Company, having decided to remove its Sales Department from Grand 'Mere to Montreal, have taken offices in the Canada Life Building. Mr. J. H. A. Acer, treasurer of the company, is in charge of the Montreal office.

It is reported that Donald Fraser & Son, Plaster Rock, N.B., are considering the erection of a pulp mill at Edmundston, N.B. The manager is Mr. A. Fraser, Plaster Rock, N.B., and the engineer is Mr. Fleming, care Donald Fraser & Son.

Jas. Scott is preparing plans for the erection of a sawmill to cost $6,000 at Lower Woodstock, N.B. Mr. Scott's address is c/o Harry Dunbar, Woodstock, N.B., who is the architect for the new mill. The plant will have concrete foundation, will be of wood construction and a steam power plant will be installed.

Eastern Quarries of Canada, Limited, have been been incorporated with a capital stock of $25,000 to carry on business as civil engineers, designers,

builders, lumber and woodworkers, &c., with head office at Montreal. The incorporators are J. G. Ross, W. R. Smith, engineers, and P. F. McCaffrey, all of Montreal.

The Sydney Lumber Co., Dalhousie, N.B., are drawing up plans for the erection of a new saw mill costing $50,000, to take the place of the one which has recently been destroyed by fire. N. J. Gorman is the general manager and the plans are being supervised by Mr. M. J. Buttler, general manager of the Dominion Coal Co., Glace Bay, C.B.

The Great West Iron, Wood and Chemical Company, with head office at Dorchester, N.B., have under consideration the removal of their plant from Dorchester to Prince Albert, Sask., where they have been granted a fifteen-acre site. The directors of the company are D. B. Hanna, 30 Castle Frank Road, Toronto, and F. H. Phippen, Canadian Northern Building, Toronto.

The Howard Smith Paper Mills, Ltd., 138 McGill street, Montreal, are calling for tenders for the erection of a paper mill at Beauharnois, Quebec, to cost $400,000. The architects are the Stebens Engineering and Manufacturing Co., Watertown, New York. The plant is to be five storeys high, 165 ft. x 85 ft., two storeys, 200 ft. x 66 ft., and two storeys 100 ft. x 50 ft. The company will be in the market for construction materials, fire escapes and extinguishers, boilers, paper machinery, etc

It is expected that the reported new issue of Laurentide Pulp & Paper Company stock to cover the cost of the power development will amount to $2,000,000. It has also been reported that some of the interests identified with the Spanish River Pulp and Paper mills have been been buying Laurentide stock with a view of having the relations between the companies entirely friendly, owing to the possibility of a consolidation some time in the future. About six months ago the Laurentide interests were reported to be heavy purchasers of Spanish River stock, so that it would seem as if this kind of dealing was reciprocal

Western Canada

The Imperial Lumber and Elevator Co., Lewvan, Sask., have sold their business to M. J .Walker Lumber Co., Ltd.

The Dominion Lumber Co. Ltd., are opening a wholesale lumber business at Edmonton, Alta., and will handle a full line of lumber, laths, shingles, and mill work at wholesale.

The Phillips-Hoyt Lumber Company have opened an office and are handling builders' materials at West Burnaby, B.C. A new siding is being now put up for the company connecting with the B.C.E.R.

The Kerr & Adams Manufacturing Co., Humboldt, Sask., are erecting a planing mill of which the walls have already been put up. The building is of two storeys, frame construction and shingle roof.

The Leitch-McLean Lumber Company, Limited, with head office at Saskatoon, Sask., has been incorporated with a capital of $100,000. It will likely establish branches at several points throughout the province.

The Rogers Lumber Yards, Ltd., Moose Jaw., Sask., which was recently incorporated, with a capital of $2,000,000, contemplate the erection of several saw mills in the West. They are at present planning a mill for Moose Jaw, Sask.

The North Burnaby Lumber Co. Ltd., has been incorporated at Victoria, B.C., with a capital of $10,000 for the purpose of carrying on a general lumber and sash and door business in all its branches. The head office is to be at Vancouver.

The Canadian Puget Sound Lumber Company have awarded a contract for rebuilding their planing mill at Rock Bay, B.C., which was recently destroyed by fire. Parfitt Brothers, Vancouver, B.C., have secured the contract.

A despatch from Revelstoke, B.C., states that the Dominion Sawmills and Lumber Co. is now operating all four of its mills and owing to the improved market for lumber the company is likely to extend its mills and establish yards in the prairies.

A Port Moody, B.C., despatch says: After a long period of successful enterprise in connection with the Emerson Lumber Company, the management will shortly sell their interests to the National Finance Company. The new firm will take possession on October 1.

Johnstone Strait Lumber Company, Limited, has been incorporated with a capital stock of $500,000 to carry on a general lumbering business in all its branches, with head office at Vancouver. The incorporators are Wm. Bain, J. S. Lovell and Robt. Gowans, all of Toronto.

The Empire Lumber Company, Limited, Winnipeg, has been incorporated with a capital of $300,000 to carry on a general lumbering business. The personnel of the company includes G. N. Northrop, Minneapolis; U. Wurtels, Saskatoon, and M. C. Walston, L. H. Northrop and F. C. Cane, of this place.

A deal has just been put through in southern Alberta by which the Citizens' Lumber Company and the Pioneer Lumber Company, which are practically merged, with head office in Lethbridge, have purchased the lumber yards of the Farmers' Lumber Company at ten different towns. The latter company retains its yards at Lethbridge.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

1067. **Ash or hazel twigs.**—Inquiry is made for the names of Canadian shippers of ash or hazel twigs, ¾-inch, for use in the manufacture of handles for stone-breaking hammers.

1075. **Paper.**—A paper importer of Buenos Ayres desires to be placed in touch with Canadian mills manufacturing 'news print' paper. C.i.f. quotations Buenos Ayres to be addressed to the London office of the firm.

Rothfuss-Howard Iron Works
Williamsport, - Pennsylvania

The Largest Baseball Buildings in America are Covered with
J-M ASBESTOS ROOFING

The importance of **fireproof** construction was so vividly demonstrated to the owners of the baseball grandstand at the Polo Grounds in New York by the disastrous fire which destroyed their $200,000.00 structure last year, that they decided to take no chances of a repetition. They therefore built the new grandstand, shown above, of materials approved by the highest authorities on fireproof construction—steel, concrete and J-M Asbestos Roofing.

Being made from Asbestos rock fibres and Trinidad Lake Asphalt, J-M Asbestos Roofing is **all** mineral all the way through—nothing in it to rust, melt, crack or deteriorate with age. It will ordinarily last as long as the building it covers.

And it is the cheapest-per-year roofing because it is the only ready-to-lay roofing which never needs coating. Its **first** cost is the **only** cost.

The grandstands and pavilions at Toronto, Cleveland, Detroit, Boston, Minneapolis and Washington are also covered with J-M Asbestos Roofing. And the new grandstand and pavilion now being built at American League Park, Boston, will be covered with this practically indestructible roofing.

J-M Asbestos Roofing is suitable for any type of building, anywhere.

Write our nearest branch for Samples, Catalog No. 303 and full particulars of our Proposition to Dealers.

Shimer Cutter Heads and Cutters!

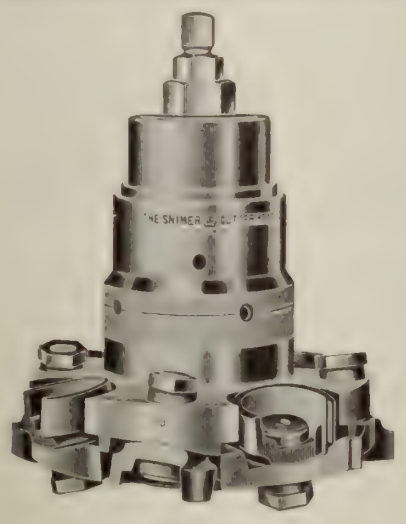

Fig 627

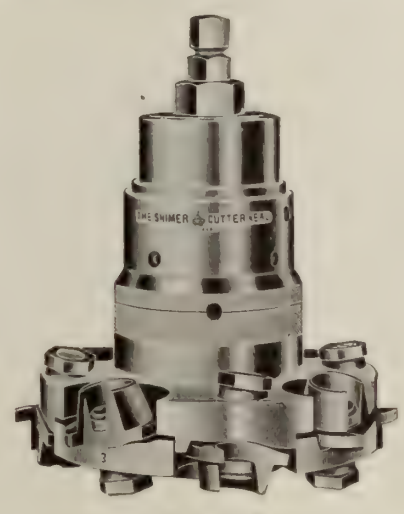

Fig 628

The "Shimer Limited" with Expansion, price $72.46 per set, complete.

The Tools You Need.

You will eventually realize that the Shimer Limited Cutter Heads are the tools you need to increase your output without sacrificing quality or increasing expense. You will find that the mills that are using them are perfectly satisfied and will give testimony to this fact.

We don't see how it could be otherwise. We have studied planing mill conditions for forty years and have kept pace with the changing conditions by designing tools that were safe, that were efficient, that were profitable to use because time and labor saving, that were lasting and that sold at low prices.

The Shimer Limited Cutter Heads sustain and enhance the reputation built up by our other tools. In addition to the special features which have made the Shimer Cutter Head famous, these new Fast Feed Heads have a self-centering device which clings to the spindle when drawn up, securing it firmly thereto. The bit seats also carry a larger surface and the bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to all parts coming into contact with the lumber. The Spindle gripping device is not only positive and effective in its purpose of holding fast to the spindle, but it also centralizes the Head on the spindle for a more uniform action of the Cutters.

The results of all cutters cutting is a smoother finish, notwithstanding the faster feed, and an output far in excess of former methods.

If you have a machine that will swing Heads of 6¾ inches diameter and feed over 150 lineal feet per minute, we would like to send you a set on 30 days' trial.

Take the measurements now and let us have your order at once.

Popular Cutter Heads

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set $40.95
Price with 6 bits to each head, the set 49.27
Price with 8 bits to each head, the set 57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—⅜ at $1.30 each and Bits for 2-in. thick plank at $1.63 each.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1¼-in. $31.20
Price, with 4 bits to each head, the set, 2-in. 33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and in interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1½-in. thick, $34.84
Price, with 4 bits to each head, the set, 2½-in. thick 35.88

Double Ceiling Heads

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling Heads complete with Bits, net, $40.94

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One Way Cutters

The Shimer Reversible Cutters for Single Spindle Shapers, Variety Moulders or Friezers, are carefully moulded opposite to the shape of the mould to be produced, in such a way as to have only the cutting edge touch the lumber. They are complete—inexpensive—time saving. We also make One-Way Cutters for the Double Spindle Shaper.

Thin Steel Knives

Advanced ideas referring to the planing and surfacing of lumber have developed into the use of the thin blades, made from high speed steel, which when properly tempered and treated, serve for one or two days of work on hard maple, oak or hickory.

These blades are known as our Bedee Knives and are recommended by users as the best that can be procured. For the benefit of those desiring to use this style of a knife we have facilities to furnish them in any length or thickness.

Write us about your requirements.

What J. D. Shier says about the Barkey Lumber Register

Barkey Bros., Stouffville, Ont.

Dear Sirs,

Yours to hand and noted. We have been using one of the George Lumber Registers for some years past and find it still working well. It gives very accurate measurements and have never known it to make a mistake. When in need of another we will certainly get one of the same kind.

We remain respectfully yours,

Feb. 5, 1908. J. D. SHIER, Orillia, Ont.

Can be used on any moulding or matching machine.
Ensures absolute accuracy and saves one man measuring.
Sent on 30 days' trial, return at our expense if not satisfactory

One piece frame for a No. 333 Matcher as it comes from foundry, showing extra heavy construction.

FAY-EGAN "LIGHTNING" "333" Matchers are built with a reserve power sufficient to take care of any increased service required by improved manufacturing methods—

—the extra heavy one piece frame gives the strength, the big gears cut from the solid and running in grease give the power, and construction throughout gives that reserve factor which makes the "333" a good investment not only for today but for many years to come—

—as a straight matcher the "333" has been an unqualified success, in spite of the fierce efforts of competition to keep it out of the field—

—the additional equipment made necessary by improved manufacturing methods—Profilers—Automatic Feeders—Twin Spindle Resaws—Horizontal Band Resaws—all of these we have added to the original "333" and its limit is not yet in sight.

"Can you say as much for the Matcher you are using?"—if not, write us for information on the "333."

Lumber Camp Ranges and Heaters

All Kinds of Stoves for Large or Small Camps

Our stoves are specially designed to meet all requirements of camp work.

We know exactly what is necessary and desirable in this class of stove.

We put into all our stoves the best of material and workmanship coupled with the best of expert experience.

The 'Leader Range' for coal and wood, shown in this cut is specially adapted to Lumberman Camps, Boarding Houses, Hotels and Railroad Construction Camp Work. We also make this Range with side hinge doors.

It is large, heavy and strongly built. Has good oven space and large heating surface. When a good, solid, reliable stove is wanted the 'Leader' will give satisfaction.

Write for our catalogue.

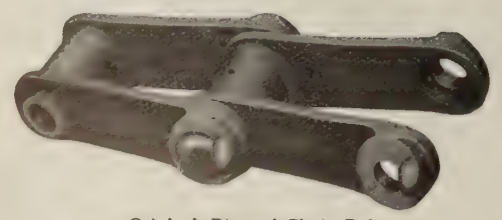
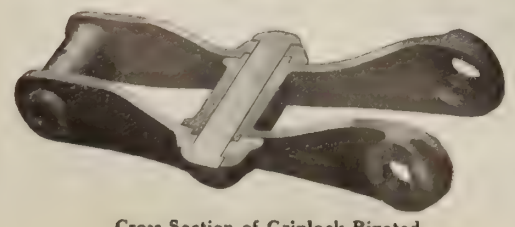
Manufacturers of Ranges, Heaters, etc., for Lumber Camps, Hotels, and Railway Construction



Griplock Riveted Chain Belt



Cross Section of Griplock Riveted

No More Breakdowns—No More Delays

This is the slogan that users of **Griplock** Chain Belt have adopted. No hooks to be opened up, no breaking of chain belt in **Griplock.** **Griplock** is so constructed that it will withstand the severest kind of service. It is built by the Chain Belt Company, Milwaukee, Wis.; a concern that fully understands the requirements of the Lumber and Saw Mill Trade.

We would be very glad to mail you sample links for your inspection.

Locomotive Boiler on Skids

The Great Pulling Power of a Little "Want Ad"

A "want" advertisement is a small thing both in size and in cost, but through a a small "want ad" great things have often arisen.
A subscriber to the Canada Lumberman and Woodworker recently inserted a small ad in the "WANTED and FOR SALE" Department of this paper and received

47 REPLIES

Have you some odd lots of lumber that you would like to move quickly?
Have you some second hand mill machinery you wish to sell or exchange?
Do you want to buy some special lots of lumber or machinery?
If so **YOU NEED** the assistance of the "Wanted and For Sale" Department.
Let us assist you in filling your next want.

American No. 2 Profiler

AMERICAN
No. 2 Profiling Attachment

The **AMERICAN No. 2 PROFILER** is the very latest in profiling devices.

The journals are equipped with our side clamping boxes, which are quickly removable for change of heads.

The rapidity with which changes may be made from one class of stock to another cannot be surpassed.

The attachment is belted from its own countershaft which enables it to be thrown in or out of use without interfering with the machine.

The **AMERICAN No. 2 PROFILER** applies to our No. 77 and No. 65 Planers and Matchers, and when used in connection with these machines will turn out stock at the rate of 200 feet and upwards per minute.

"Dolphin" Waterproof Belting

is the answer for belting troubles in wet places.

Leather belting is acknowledged to be better and cheaper than any other kind of belting for wet places, providing it is waterproof and that the laps will not come apart.

Dolphin Waterproof Belting is guaranteed to meet all these requirements.

Boss Line Lumbering Tools

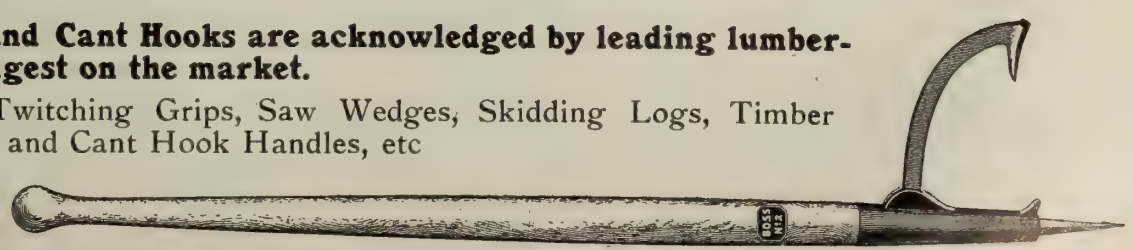
Manufactured by

The McFarlane-Neill Mfg. Co., Ltd., St. Mary's, N. B.

Forged Steel Socket Peaveys and Cant Hooks are acknowledged by leading lumbermen to be the lightest and strongest on the market.

Try our Steel Loading Blocks, Twitching Grips, Saw Wedges, Skidding Logs, Timber Carriers, Split Rock Maple Peavey and Cant Hook Handles, etc

Catalogues furnished and prices quoted on application



Make Your Power Transmission an Asset—Not a Liability.

When purchasing Belting don't come to conclusions quickly—the selection of a poor cheap belt might mean considerable loss of power and efficiency in your plant.

Beardmore Belting will save you this trouble and loss—it will also wear better and last longer than any other belting on the market. **Beardmore Belting** represents the maximum value obtainable in leather belting.

Made only from extra selected No. 1 Packer Steer Hides—tanned under the slow old fashioned process which positively ensures the long life of the belt.

Having everything under our supervision from the hide to the finished belt we are able to offer Leather Belting that we can fully guarantee.

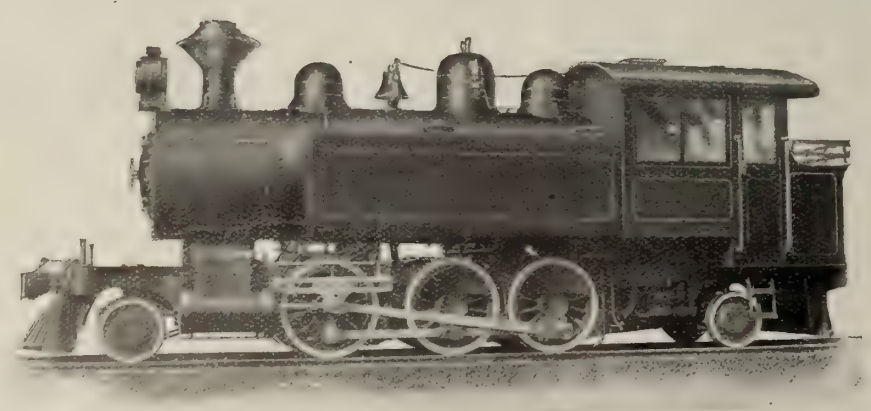
SELECTION OF LOCOMOTIVES

WHAT SHOULD BE KNOWN BEFORE YOU PURCHASE LOCOMOTIVES:—



Nature of the service.
Capacity of the cars and weight of train.
Character of track—is it new or old.
Length of haul.
Is time an important factor.
Do you want a quick locomotive or a big puller.
Distance from base of supplies and quarters for the men.
Water and coal carrying capacity.
All these items and more should be considered.
A careful study of conditions may mean larger profits.
Our experience may be valuable in considering them.
A dollar saved is more than a dollar earned.

Write or wire us, or better still, come to see us.

MONTREAL LOCOMOTIVE WORKS, LTD.

Dominion Express Building, MONTREAL, CANADA

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

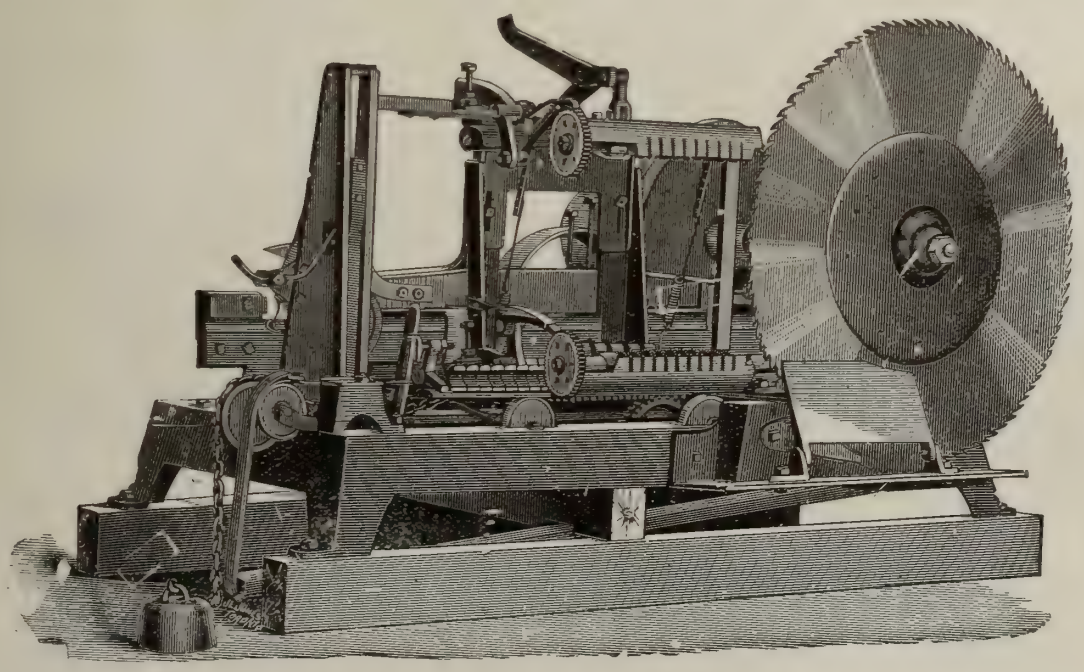
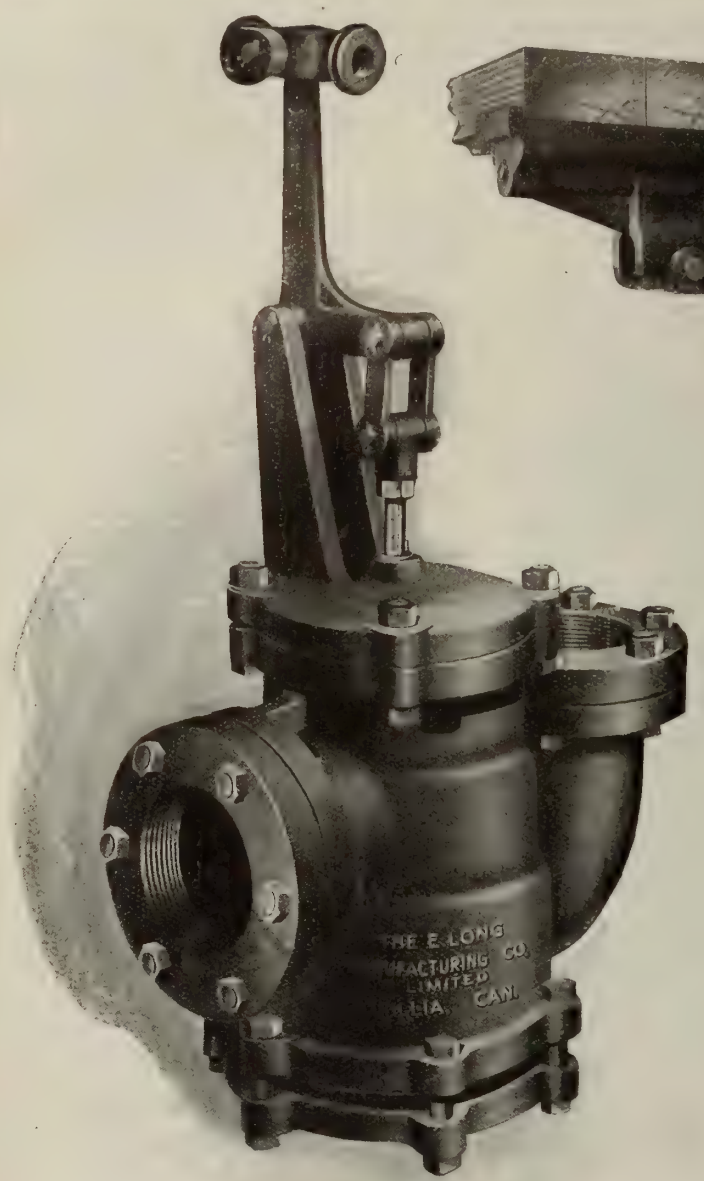
Mowry's Boss Shingle Machine



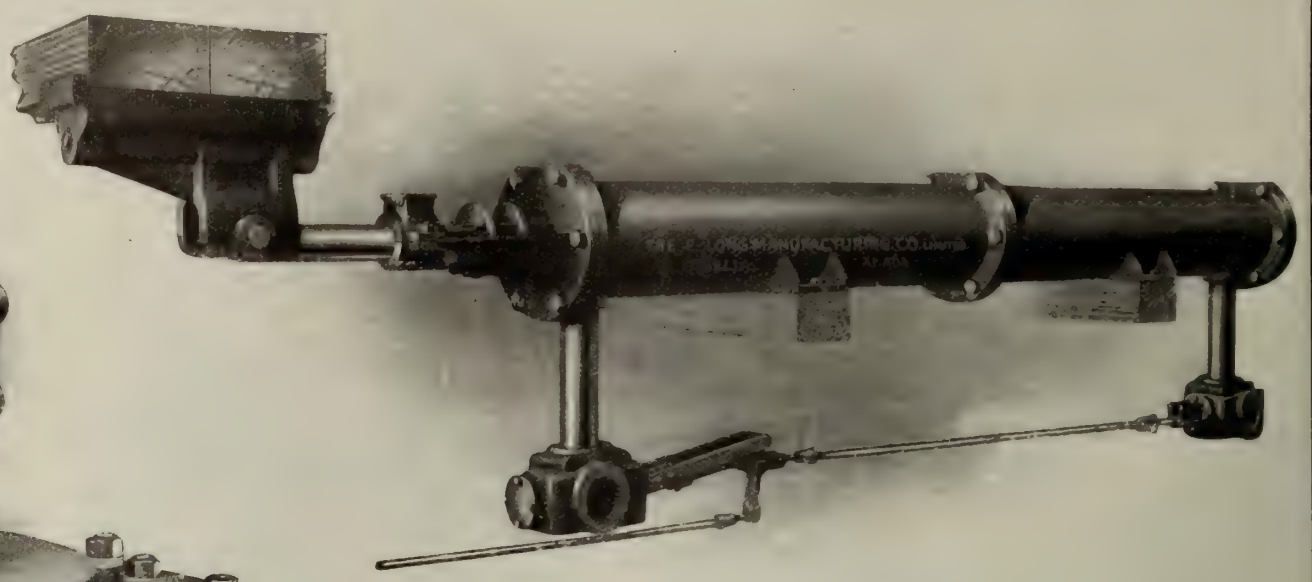
THIS MACHINE IS ONE OF THE BEST SINGLE BLOCK SHINGLE MACHINES MADE IN CANADA. Wherever introduced it has taken the place of all other shingle block machines. It is perfectly automatic in its action. The stroke is never longer than the cut, thus saving an immense amount of time, and by the touch of a lever the operator can make the machine butt all at one end, so as to bring the knots all at the thin edge. A patent brake relieves the machine of all jar when the carriage is stopped to change blocks. It has a powerful friction feed. It is altogether the simplest in construction of any machine built and combines so many advantages that it is far superior to any machine on the market. We build shingle machines both horizontal and vertical. SIMPLE. CHEAP. DURABLE. If you want a good shingle machine try the "Boss" and you will be more than pleased. One 40 inch saw and one 24 inch collar with each machine.

We also Manufacture all kinds of High Grade Machinery for Saw and Shingle Mills. Write for Prices

MOWRY & SONS, Gravenhurst, Ontario



Vertical Steam-Feed Valve



Direct Acting "Shot Gun" Feed

Built in sections to make up any length feed required, with 8 in., 10 in., 11 in., 12 in., and 14 in. bore.

We fit our feeds with **any style of valves required.**

Our "Gun Shot" feeds are money makers wherever used.

FULL PARTICULARS ON APPLICATION

We guarantee that our Valves will not stick or kick. They are perfectly steam tight and are without exception the most economical valves manufactured.

We not only manufacture a complete line of steam feeds, but also a complete line of steam actuated machinery for saw mills of any capacity.

Some Pages from our Catalogues

Every One Worth Reading

Since 1907 we have been publishing a new series of catalogues. These accurately describe and illustrate the line of Sawmill Machinery we now build.

They are printed in bulletin form. Each is descriptive of one machine or one style of machine only.

Which of these Shall we send you?

BULLWHEELS
CHAINS AND ACCESSORIES
LOG DECK MACHINERY
MEDIUM CARRIAGES
HEAVY CARRIAGES
CIRCULAR SAW FRAMES
BAND MILLS
EDGERS
CIRCULAR RESAWS
LATHMILLS AND BOLTERS
PLANERS AND MATCHERS
PORTABLE SAWMILLS
LIGHT CENTRE CRANK ENGINES
HEAVY SAWMILL ENGINES
McEWEN ENGINES
STEEL PLATE WORK

Mark with a cross the bulletins in this list you would like sent, or if you would like the complete set in the special binder cross out the lot and attach this sheet to your letterhead and send it to us. Do it to-day.

In this way you receive a bulletin that is easily handled or filed for reference. It describes only the machine you are interested in and this in a detailed way impossible in a general catalogue.

As our machines have changed in design to keep pace with changing sawmill conditions our bulletins have been printed to describe them. They illustrate our latest improvement in every line and are absolutely up to the minute.

In them we have endeavored to avoid exaggeration of any kind. The information they contain is accurate and trustworthy. Much of it is invaluable to the up-to-date mill man.

If you have any of our old catalogues on file destroy them now and ask us to send you our *latest* Sawmill Bulletins. A list of these is attached. We will send you individual copies or the complete set assembled in a handsome binder, just as you prefer.

Tear out this sheet and attach it to your letter head. We will do the rest.

NO FRAYING AT THE EDGES

Dick's Balata Belting possesses perfect uniformity throughout, whereby true and steady running is ensured, fraying at the edges rendered impossible, and perfect success in fork driving guaranteed. The combination of strength and uniformity in Dick's Belts is due to the process of solutioniz rg to which the textile portion of the Belting is subjected, and which thoroughly solidifies and unites the whole material. You can get all the facts in our Catalog No. 17.

The Steam Tension Band Mill

The steam tension band mill as we make it is entirely different from any other band mill made. Owing to the great success of this mill, many other manufacturers have added steam cylinders to their **standard** mills for operating the top guide and for raising and lowering the top wheel. Of course, these devices at their best are not all they ought to be, but the fact of their being there serves to emphasize the worth of the steam operated mill. Ours is the only band mill which has been **specially** designed from the beginning as a steam tension mill, and consequently the steam cylinders are placed where they should be, and work properly at all times, no matter what your boiler pressure or your sawing conditions.

The advantages of this mill are obvious—the time saved by having **both** the top guide and the upper wheel operated by steam is very considerable, while with our very sensitive steam tension, the saws are easily kept at exactly the right tension to cut perfect lumber, to say nothing of the longer life of the saws.

It costs you a little more to buy this mill because it costs us more to make it, but it saves you far more than the difference in cost in a very short time, and so it is worth more.

Built with 8 foot, 9 foot and 10 foot wheels.

May we send you our catalogue?

Timber Limits for Sale on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

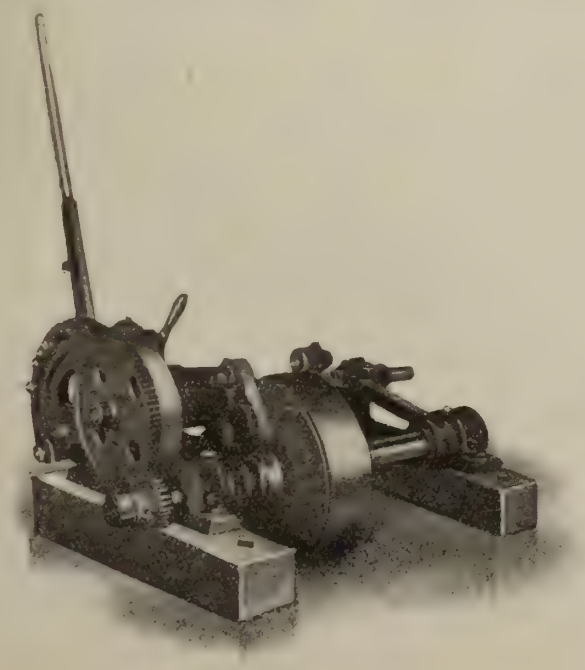
The Importance of Efficient Mill Machinery

In Millwork, where every portion of the equipment has to undergo the severest treatment with unusually hard conditions only the best machinery will serve. No mill can be run at a profit with inferior equipment. This is an expression of the opinion of men of wide and varied experience in the business.



P. Payette's Improved Mill Machinery, is built to stand all the strain and hard usage of mill work. This machinery is of the special Payette design and embodies many improvements, which add considerably to the efficiency of mill equipment.

The New Patent Saw Mill Dog which operates in soft or hardwood timber of any kind will do good even work in summer or winter with perfect safety.

Payette's Improved Set Works will set even thickness of lumber in all class of timber and will set any size log with perfect ease, Can be changed instantly so as to make either thick or thin lumber and can be put on any make of carriage.

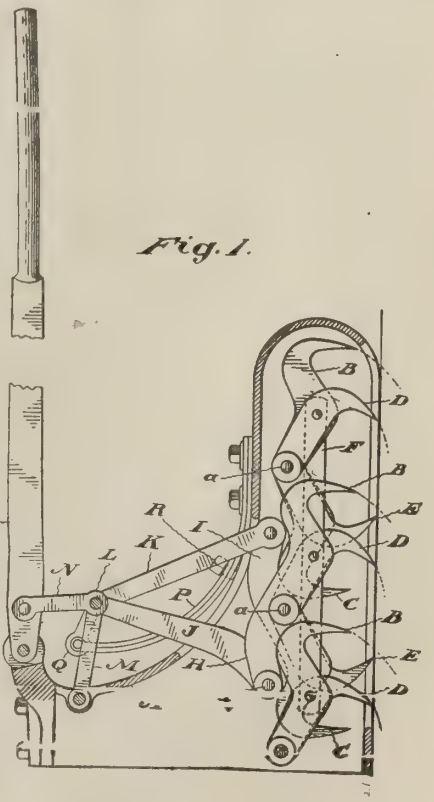


Fig. 1.

We want to prove to you the advantage of this set works in your mill and we are prepared to demonstrate its efficiency and superiority. Full information sent on application. Ask for our booklet on set works.

Cross - Cuts for Good Hard Work

The "SAW KING" Cross-Cut Saws have won exceptional favor throughout the trade by the good work they do, the hard wear they stand and their general reliability. These saws have stood the test of Camp and Mill and have proved their worth—their high quality steel and perfect tempering and grinding sets them far above the average and places them in a class by themselves.

THE "SAW KING" CROSS-CUT

The "Saw King" Cross-Cut Saws have merits possessed by no other saws. By looking at the above cut you will see that the chip spaces are wider and deeper in the centre than they are in any other part of the saw, thereby giving a capacity for the accommodation of the largest accumulation of sawdust, which is always in the centre of the saw. The chip spaces decrease in size from this point of the saw, as also does the quantity of sawdust. All users of saws know that the teeth at the centre wear much faster than they do at the ends, as the teeth are longest at the centre, it gives greater wearing capacity to the saw, and as the teeth are smaller at the ends of the saw and leaves the saw blades wider between the teeth and at the back. Where the blade is narrowest, it gives more strength and stiffness at the point where it is most required. The saws are tempered by our new improved process, giving them a keener cutting edge than any other Cross-Cut Saw made. They are thoroughly warranted. Any defective saws will be replaced by the seller.

A Belt which Conveys ALL the Power

Practical men know the drainage of power from a slipping belt, ***and because they know,*** they are buying

GOODYEAR RUBBER BELTING

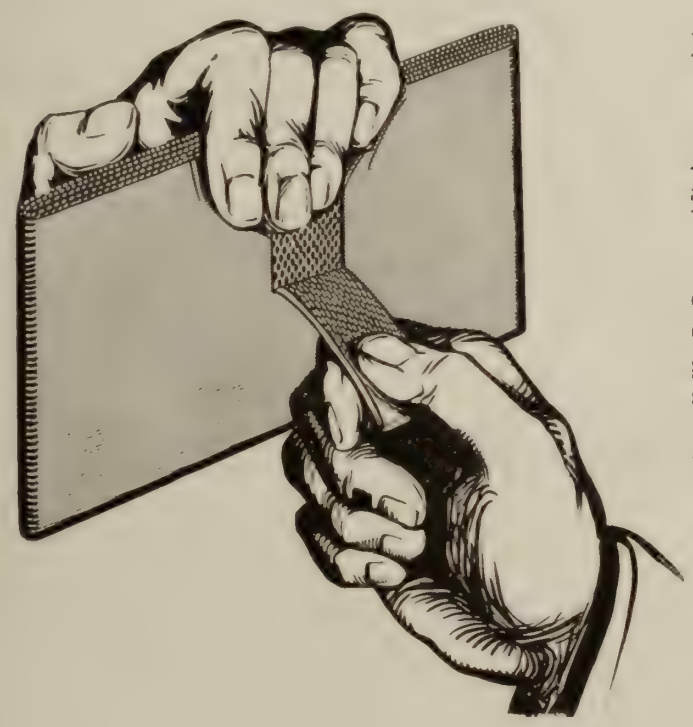
Which Neither Slips Nor Stretches

It is built up, layer upon layer, of close-woven, long-fibre, cotton fabric, rubberized and cured under Goodyear processes. And every Goodyear belt has in it the lowest possible minimum of stretch, because the belt is "cured" whilst stretched to the limit of safety in a special machine.

That is the Goodyear Method of Belt Manufacture

And the result is entirely satisfactory to belt users—a fact to which our enormously increased sales testify. What is the significance of this CONTINUED SALES INCREASE — 50% over last year? Simply that Goodyear Belting more than fulfills the claims made for it by the Goodyear people—who know what a belt should do, and make a belt to do it.

It has cost us less than $200.00 for claims or adjustment of every kind in connection with our total output for the past two years—a remarkable tribute to Goodyear reliability.



Look into the Belt for Yourself—Try to Tear It Apart.

Make a cut in the top layer—and then try to pull it apart. You will get a faint idea of its strength.

That is the result of forcing rubber at tremendous pressure through the fine cotton fabric—separating every strand—thus abolishing all internal friction or grinding. Whilst these layers of fabric are afterwards so compressed as to be almost homogeneous, the finished belt bends easily, the "duck" being so woven as to retain complete pliability in the finished belt.

For Main Drives and High Speed Pulleys GOODYEAR Belting is the Best

It has all the tensile strength necessary to absorb tremendous strain without slip, stretch or rent. The grip of rubber and the prodigious strength of hard-twist cotton fabric are united, and prove equal to every emergency.

Where the power transmitted is high, and great tensile strength is essential, Goodyear Rubber Belting proves its worth.

EVERY GOODYEAR BELT IS SUBJECTED TO A STRINGENT TEST BEFORE LEAVING THE FACTORY, and what is more, the materials used in the manufacture are also tested in the Goodyear laboratory before using.

IF YOU USE A BELT AT ALL IT WILL PAY YOU TO USE A GOODYEAR

Loss of power is loss of profit—and an inferior belt is dropping power all the time. Goodyear belting quickly earns its cost in power saved and trouble avoided.

TWO HUNDRED AND FORTY ROLLS—A TOTAL OF 72,000 FEET

We have just received an order for this quantity of GOODYEAR RUBBER BELTING from one business concern in the west, for the equipment of interior elevators. Such an order shows supreme confidence in the quality of GOODYEAR Belting.
If we have not just the belt you require we will make it for you.
In the choosing of belts our booklet would be of great assistance to you. We supply it free. Write to our nearest Branch for one.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, October 15, 1912 No. 20

The Pulpwood Problem

Irrespective entirely of the merits of the arguments which it contains, an article published recently by the New York Paper Trade Journal upon the proposed prohibition of the export of pulpwood from privately owned lands in Canada, is of exceptional interest, inasmuch as it presents in simple and remarkable terms the viewpoint of those in the United States who may be supposed to be most closely interested in maintaining the supply of pulpwood from Canada. The article is a frank assertion that Canada's position in the matter is paramount, and an admission that if Canada had sufficient pulp and paper producing plants, the proposed prohibition would be economically wise. The real argument of the article however, is that Canada has not sufficient plants to warrant the change to-day and that prohibition would break the market for pulpwood and be a great injury to all pulpwood owners. Incidentally the article hints that the proposal is backed by the paper manufacturers of Canada for the purpose of breaking the market.

The article under discussion is based upon a belief that the Government of Canada is lending a sympathetic ear to the proposal for prohibition. As stated in the Canada Lumberman of October 1st this assumption is not well founded at present. The Canadian government is not likely to act hastily in so important a matter and a commission of enquiry will probably be created to study the question before the government makes up its mind one way or the other.

The following extracts from the article in the Paper Trade Journal are reprinted, that our readers may understand the question from the United States point of view:

> The contention of the manufacturers is that Canada has been losing a large percentage of the profit which should have accrued to her by parting with her wood, instead of first converting it into pulp. So far this contention seems reasonable. But no men know better than those who are behind the movement for the tax, that Canada to-day is in no position to convert into pulp the wood she sends here. Notwithstanding the large number of mills built in the Dominion within the last few years, she falls a long way short of the necessary capacity to supply even a moderate proportion of the demand for pulp in the United States, and that it will take a great many years before she could hope to be so equipped. Meanwhile it is urged that no wood be allowed to go out of the country.
>
> The consequence of such action is very clear to foresee. There would be a cessation of cutting; hundreds of landowners would be deprived of the value of their property; thousands of men would be thrown out of employment, and those fortunate enough to secure the limited domestic market would have to part with their product at prices dictated by the purchasers. This surely would be a severe blow to the pulp wood industry of Canada.
>
> The Conservation Commission and the Forestry Association are favorable to the tax; yet if the views as expressed by the promoters of the idea are correct, there will be no curtailment to the cutting of the forests; for the same quantity of wood, it is claimed, will be required to meet the increased demands of the domestic pulp manufacturers. But without an immediate influx of manufacturing concerns into Canada, where is this increased demand going to come from? If it were possible, over night, to construct a sufficient number of plants to meet American requirements for pulp, they would have to be built of necessity in most remote sections of the country, many parts of which are at present inaccessible, and the difficulties of transportation would add so much to the cost of landing the finished product in this market, that the American consumers would, perforce, be obliged to turn to Europe. The Canadian owners of the new mills would then find themselves with expensive plants and costly limits and nothing else.
>
> The proposition, to business men on this side, appears to be an attempt on the part of the Canadian paper and pulp manufacturers to break the wood market. Nothing is surer than if the export tax is imposed, the price of pulp wood will fall thirty, perhaps fifty per cent., which would naturally be of substantial benefit to the mill owners of the Dominion.
>
> Of course in this event, they could no longer rely upon a free market for paper over here, for the tax would automatically restore the duty on news print and book paper.
>
> It has been conceded by the American Tariff Board that Canada can now manufacture paper in competition with the world. But the plants in a position to do this are comparatively few and this draws attention to the fact that the export tax would tend to concentrate the paper making business in the hands of the stronger corporations. It would be a restraint of trade that would work a severe hardship on the many for the benefit of a few. This restraint will be but the entering edge of the wedge which our good neighbors may be made to feel in due course when high financial interests own the water powers and the mills and make the wood market to suit themselves.

The most interesting feature of the above extracts is the reference to the dire consequences of a prohibitive tax, which would deprive Canadians of free entry into United States paper markets. There are those in Canada however, who believe that this has nothing to do with the situation and need cause Canadian paper manufacturers no worry.

Altogether the situation is both interesting and complicated and the duty of the Canadian government is clear, viz: to study the problem from every point of view and then solve it if they can.

Canada's News Print Production

The question is frequently asked if the news production in Canada is not likely to be overdone with the establishment of so many pulp mills, says "The Paper Mill." Recently the outputs of the Spanish River Pulp and Paper Company, the Lake Superior Paper Company and the Powell River (B.C.) Pulp and Paper Company have come on the market, and last week the mills at Sturgeon Falls, Ont., were put in operation, adding fifty tons more to the available daily supply. Other mills are well under way to completion. In the first place, it may be stated that the export of news print to the United States, during the last two years, has increased by over 12,000 tons per year. Last year 55,563 tons were shipped across the border and in 1910 the figures were 43,388 tons. A leading sales

manager stated this week that the demand from the Canadian West was increasing 20 per cent. annually, while foreign shipments were gaining all the while. Shipments are being made to South America, New Zealand and Cuba, as well as Great Britain and South Africa. The imports of news print from Canada to Great Britain in 1907 were only $325,000, while last year they reached $1,600,000, a gain of practically 500 per cent. in four years. The men back of the news print enterprises have little fear of the future and believe that the increased local and foreign demand will take care of the extra production which may come on the market in the next few years. If the mills now under way and those which have been incorporated within the past few weeks carry out their building projects, there will be nearly a thousand more tons daily of news print produced in Canada within the next two years.

Quebec's Enormous Timber Resources

A United States consular agent, in a report to his government upon Quebec timber resources says:

"The timber resources of Quebec province are enormous, though greatly diminished in past years by forest fires. The privately owned timber lands comprise about 6,000,000 acres, and are able to supply 500,000 to 1,000,000 cords of wood per annum for years to come. The island of Anticosti alone is able to produce 80,000 to 100,000 cords per annum for years, a good portion of which, however, will probably be converted into pulp in the near future, as a large mill is now in process of erection there. Pulp mills are also in process of construction in other parts of this district, so that the pulp industry, especially in this district, is bound to witness a great boom in the near future.

"The forests leased to lumbermen by the provincial government are called limits, and their total area covers about 45,000,000 acres. The first of these were leased in 1825 for nominal sums, such leases being good for one year only. Since 1841 such leases were made renewable from year to year, and they practically became private property, subject only to government regulation and the payment of certain stumpage dues.

"Lumbermen were originally required to pay as a guaranty one-quarter of the estimated stumpage dues annually. Later on a bonus was substituted for this payment in order to obtain such leases. Since 1868, however, leases were put up at auction sale, with the result that bonuses varying from $8 to $1,000 per square mile have been obtained at these sales.

About 69,000 square miles of forest lands of this province have thus passed under lease, and the premiums, or bonuses, as they are now termed, between the years 1867 and 1906 represented the sum of $3,250,000, or an annual of $63.74 per square mile.

"In 1851 an annual or ground rent tax was imposed, payable at each yearly renewal day of such leases. In 1868 such tax or rent amounted to $2 per square mile, which was increased to $3 in 1887 and to $5 in 1910. In addition to this, holders of timber licenses have to pay stumpage dues to the government for all timber cut by them on their limits, which dues are fixed for a term of ten years.

"Exports of wood and manufactures to the United States from the consular district of Rimouski during 1910 and 1911 were valued as follows:

"Lath, 1910, $114,064; 1911, $163,885. Logs, 1911, $50,100. Lumber, 1910, $1,036,460; 1911, $931,402. Poles, 1911, $5,909. Pulp wood, 1910, $118,352; 1911, $72,139. Shingles, 1910, $811, 077; 1911, $739,-334. Ties, 1910, $119,948; 1911, $93,477. Wood pulp, 1910, $186,123; 1911, $171,619.

"The decrease in exports of shingles was due to the low price in New England markets, which caused several of the mills to curtail production and some manufacturers to close their mills altogether. Inasmuch as the demand for shingles in the American markets is increasing and prices have improved, the logging of cedar has been increased and there is every prospect of the market being abundantly supplied this season. One of the largest shingle mills in this district was destroyed by fire in August last, but a new mill has been erected and equipment is being installed that will triple the output of the antiquated machinery in the old mill.

The decline in exports of lumber during the last year was general, shipments to foreign countries showing a greater percentage of loss than those to the United States. Had the shippers in this district been provided with adequate transportation facilities, the exports of lumber to the United States would doubtless have shown an increase over the previous year. Practically all lumber shipments from this district are forwarded by railway and these have been seriously hampered by a shortage of cars. A number of large mill orders were cancelled because shipments could not be made within the contract period, entailing serious loss to the manufacturers.

The pulp-wood limits at Bersimis, on the north shore almost opposite Rimouski, were successfully worked during the past season. Extensive logging operations were carried on, so that the product will probably be doubled next season. Shipments from this property were formerly made through this consulate, but these now go to Quebec.

A new company, financed with American capital, has purchased the pulp-wood limits at Manicougan river, and extensive preparations are being made to exploit the property. There is a fall not far from the mouth of this river capable of furnishing about 350,000 horse-power, and this is to be utilized in connection with manufacturing the product of the forest. A wharf is to be constructed near the entrance of the river so that vessels drawing ten to twelve feet of water may reach the wharf at high tide.

A Ship Without a Compass

One of the most difficult features of the lumber trade for anyone to understand—whether he belongs to the trade or not—is the absence, in practically all parts of Canada, of anything in the way of definite grading rules. If an inquisitive member of the trade were to investigate the causes of the disputes and other kinds of trouble which occur during his business year, he would unquestionably find that a large percentage of them are the result of misunderstandings which might easily be avoided if definite grading rules were in force. There are in fact, just two principal sources of dispute in connection with the lumber business. One of these is misunderstandings with the railway companies about freight rates and deliveries and the other is disputes among members of the trade in regard to grades. These two varieties of difficulty have characterized the lumber trade since its earliest days. A great deal has been done in the direction of reducing the sources of trouble relating to freight matters. Only spasmodic attempts have been made to simplify grading troubles and they have in most cases been fruitless.

The Canada Lumberman receives frequent letters from members of the lumber trade in many parts of Canada, asking for information upon grading rules and in practically every case, we are obliged to give enquirers the remarkable reply, that in connection with this great industry, there is practically no such thing as an official set of grading rules. When one considers what has been done in the United States in different parts of the country in connection with the same question, it is difficult to claim that similar results could not be secured in Canada. Take for instance the matter of grading hardwoods. Two important associations have been established in the United States and their rules are in force so generally that they practically regulate the whole hardwood trade of the United States. The rules of the National Hardwood Lumber

Association are also used to a large extent in the hardwood trade in Ontario. In Quebec they are supposed to be used, but are really unknown to a large majority of those who manufacture and sell hardwood in that province.

The question of grading is one which depends for its solution entirely upon those who are engaged in the trade. The government of Canada cannot be expected to establish grades by legislation. They have done so in connection with the grain trade and from all that one can gather, they would probably be greatly pleased to-day if they could escape the responsibilities which have been placed upon them as a result. Certainly, with the example of the grain trade before them, it would be difficult to induce the government to adopt similar measures in connection with the lumber trade. What the lumber industry needs more than anything else is that those who have made a study of its various branches and who are not so wrapped up in their own particular branch of the trade as to ignore the benefits of the industry as a whole, should take the trouble to organize grading committees to study the problems of grading in connection with each important variety of lumber. If this were done, we believe that sufficient information would soon be secured to convince most of the members of the industry that it is to their benefit to have grading rules adopted in connection with practically every variety of lumber. There are many varieties of lumber to be considered and many widely varying markets, yet we believe that the problem would not be nearly as difficult as it now appears if it were seriously considered by representatives of the different branches of the trade who have the interest of the industry as a whole at heart.

Last year a tentative experiment was tried by some of those who are interested in the white pine trade in Ontario. They studied the grading of white pine exhaustively and drew up a set of rules which were admitted by all who saw them, to be fair to all branches of the trade. These rules they presented to the Canadian Lumbermen's Association at its annual meeting last February, hoping to have them discussed and possibly adopted. They were not very sanguine of having them adopted immediately. Like all who take up an important reform of this nature, they realized that their plan would be open to criticism. They were however, disappointed in a manner which they were far from deserving. Instead of being criticized, their scheme was almost ignored. After the rules had been read before the association, a motion was carried that a committee be appointed to consider them and report. The committee appointed was composed pretty evenly of men who had expressed their disapproval of the plan and of those who had been instrumental in introducing it. Since that time nothing more has been heard of the matter. Perhaps the committee will report at the next meeting of the association, but those who have the plan at heart are not very hopeful of securing a favorable report.

A letter appears in the present issue of the Canada Lumberman from a hardwood manufacturer in Quebec who has given the question of hardwood grading a great deal of study. He brings out the remarkable fact that the hardwood trade in Quebec is doing business in the dark. After exposing the absurdities of the situation, the writer says, "The most necessary work to be accomplished for the lumber dealers of Canada is to get them to see the necessity of having a compass to go by." In this sentence he strikes the nail most forcibly upon the head. Everyone in the lumber trade knows that the absence of grading rules is a serious drawback to the trade and a source of great loss. When it comes to providing the trade with "a compass" however, there is an element of apparently great influence, which discourages any such plans. "The most necessary work to be accomplished," is therefore to get this element of the trade to appreciate the fact that their own interests should be made subservient to those of the industry as a whole, if they happen to clash. In reality there is no clashing whatever, so far as we and many highly esteemed members of the trade believe.

There is a misconception abroad throughout the whole lumber trade that the adoption of grading rules would work out to the disadvantage of those who have already established their own grading systems at considerable expense. We do not believe that this is the case. Rather, on the other hand, would it be an advantage even for these, if the other members of the trade were able to carry on their business according to definite grades. The only way in which a solution of this problem can ever be reached is by everyone sinking his own individual inclinations and deciding to assist in bringing order out of what is to-day one of the most remarkable instances of expensive chaos, that can be found in any progressive industry. We believe that if present conditions are permitted to continue for many years more, the lumber industry will not be able to classify itself legitimately as "progressive."

The Canada Lumberman is in a position to appreciate, perhaps more than members of the trade, the necessity for some such reform. So continually does it receive enquiries regarding grading rules, that there is only one conclusion which can reasonably be reached, namely, that a great many members of the trade are keenly anxious to have the reform brought about. For this reason we have frequently presented our views upon the subject and we hope to continue doing so until something definite has been accomplished. As to the actual working out of the reform, this must be supplied by lumbermen themselves. We can see no more reasonable solution than that those who are interested, should make a serious attempt to bring together a large number of others who are interested in the same branches of the trade and persuade them to draw up suitable grading rules and agitate until they have been definitely adopted by some responsible body representing the trade as a whole. We believe that the Canadian Lumbermen's Association is the logical body for putting grading rules into effect. In the past the association has done a great deal along other lines but has done little or nothing in the matter of solving this, probably the most serious problem of the whole trade. If the Canadian Lumbermen's Association wishes to make itself a really effective and valuable body, it can adopt no more promising method than to take up this problem and push it vigorously until the majority of members of the trade have been brought to see the situation eye to eye.

Praise for B. C. Forest Policy.

Prof. Ralph Hosner, superintendent of the forest service of the territorial Government of Hawaii, during a recent visit to the Department of Lands, Forests and Mines of British Columbia, expressed his appreciation of the forest policy which has been adopted in that province, as follows:—

"I do not know of a more thorough or more efficacious policy than your government has put into force. It is bound to have an immense effect on the prosperity of this province through the presenvation of its forests, which are probably the most valuable on this continent. Certainly the lumbermen of the country are looking to the forests of British Columbia for the big timbers that are called for, and the government of the province is taking steps that will, I believe, result in the exploitation of the forests in the best and most economical manner, bringing millions of dollars to the province.

"One thing that has to be guarded against is fire in the forests, the greatest enemy the forester has to fear. I understand from Mr. Macmillan that the system of fire ranging in British Columbia has been very materially improved this season, and that it will be still further strengthened and systematized as the years go on. This is a work in which every citizen should feel that he and she has a duty to perform in holding up the hands of the department. It may be a matter of a little time to educate the people at large up to the point of realization of the immense value of their timber, and the irreparable loss that is sustained in every way by any one of the forest fires that sweep over the country, but I am sure the people of British Columbia will quickly learn and will not begrudge the money that is needed to perfect the system of protection of the great asset they have in the forests."

How is Hardwood Graded in Quebec?

Strange Absence of Definite Rules for Guidance of the Trade—Inspectors Following Local Custom Rather than Systematic Regulations—A Case for Reform

Remarkable letter to the Editor in which a few unpleasant truths are told about Hardwood Inspection in the Province of Quebec.

So. Stukely, Que., Oct. 7, 1912.

Editor Canada Lumberman:

Yours of October 1st just received, and I note with interest what you say regarding the matter of the inspection of lumber. I am glad to know that people are becoming interested in a subject that has been allowed to remain too inert for the good of the trade.

I believe you are quite right in giving your correspondent the impression that the rules compiled by the National Hardwood Association have been adopted by the Canadian trade as far as any, but lest he get a very vague idea of the requirements of said rules, I would suggest that he be instructed that perhaps the average shipper knows as much about such rules as a teacher of a public school does about the Chinese language, and such lack of knowledge is not confined alone to the shippers, for perhaps I am safe to say that but few local dealers, or those inspecting in the local trade, ever saw a copy of the rules. We also have reason to fear that not many culling in this country for the United States market would care to be placed under an examination for their profession.

Were you to question the majority of the cullers in this province for their authority you would soon discover the fact that—they cull that way because the other fellow did, and so on, obtaining their knowledge by tradition which sometimes, perhaps, might warp the judgment of the National Hardwood man who had carefully studied the rules and was able to make a practical application of them.

I think I am safe in saying that seldom are any rules of inspection ever mentioned by the majority of Quebec dealers when quoting prices, and not having rules to go by, there is often much dissatisfaction in the trade.

It will be noted by a perusal of the directory of the National Hardwood Lumber Association for 1910, a copy of which is before me, that but two persons in the Dominion, up to that time, were enrolled as members of that association.* However, such is no excuse for being ignorant as to the requirements of the rules; which, we believe, are the most practical of any in existence, and which, we believe, should be universally adopted; for they may be obtained for ten cents by any one applying to the association, which is located in the McCormack Building, Chicago.

By the way, the writer is not a member, but has worn out one copy of their grading rules, endeavoring to know the reason for things, and this, he believes, has enabled him to avoid much trouble and to make friends instead of enemies.

We know of no other rules recognized in this province except those adopted by the Montreal Board of Trade in 1907, which are regarded, by some, as perhaps a mere joke. We do not wish to discriminate in our criticism against those manoeuvring on this side of the line, for the writer was once called upon to defend a shipment that had been consigned to one of the largest manufacturing concerns operating in that famous chair town known as Gardner, Mass. They claimed to buy all their stock on the National rules, but when put to the test, confessed that neither the manager nor their aged inspector, who bragged of extensive experience, ever saw a copy of such rules.

We might also recite other instances which show that technical knowledge of the inspection of lumber is sadly lacking, especially in this country, despite the above narrative.

Now, in reference to the trade across the water; while we like the market, and have never had a shipment turned down there, while doing our own inspection; to our mind, it is "peculiar to itself." It is no wonder that your correspondent is unable to secure copies of rules for inspecting for that market, for there are none. The shipper must first find out what the other fellow wants and then cater to it. While this may seem hard with the Atlantic between, it will be observed that while they have no printed rules, we are led to believe, the inspectors there have much the same ideas and with a bit of natural instinct, one can quite readily catch the idea. If not inclined to hold a penny so near the eye that a dollar is rendered invisible just beyond, he will get along quite nicely, while for a fancy stock of logs we prefer, as a rule, the United States market, we find that the Liverpool trade will accept pieces of cutting that the New York people would never consider; hence, to be successful one must know how to prepare stock for that trade, the requirements of which are vastly different from any of the United States markets.

It is evident beyond question that while the dealers of Ontario have quite universally adopted the National rules for the grading of hardwood, and have acquired a better knowledge of them, as a rule, than most Quebec dealers, we, the people of Canada are practically without a guide to go by when it comes to culling or grading lumber. The writer was eight days in a high court of this province as a witness among nineteen dealers, many of whom had been shipping for many years, and were I to write you the frank confessions made there before the judge, of ignorance of what constituted a mill cull, shipping cull, etc., you might think me writing a fairy tale, even the expert (?) from Montreal, I am very certain, never saw a copy of any rules for the inspection of lumber in his life.

The testimony of the expert (?) would be to a real inspector what the testimony of the man who had seen a "chest" foundered horse would be to a real, studied, veterinary.

Under such conditions is it any wonder that the shipper gets the idea that those in the market are sharks and the fellow at that end thinks that the shipper is something worse?

To the writer's mind the most necessary work to be accomplished for the lumber dealers of Canada is to get them to see the necessity of having a compass to go by, then let them all come together and either adopt the National or some other rules.

The writer is under the impression that there should be an association formed for the purpose, and I believe such pressure might be brought to bear on the British Board of Trade as would induce them to adopt such rules as are agreeable to dealers over there. Such an association should extend its membership to individuals on both sides of the water.

This matter has been on the writer's mind for several years and I am glad it is being agitated, for at present both the shipper and the buyer, as a rule, are at sea and each is wholly dependent on the good humor of the other.

As to the matter of soft woods, for the United States and domestic trades, we know of no rules in force except those applying to the specific markets for which they were intended, like those inscribed on the statutes of Massachusetts or those adopted by the Montreal Board of Trade, as above referred to, which, we believe, are not considered very practical.

Since I observe that your paper circulates both in England and Canada I am confident that a few properly prepared articles through its columns might induce measures to be taken for establishing set rules in the English market as well as in this country.

H. E. MILES.

*Editor's Note—The latest issue of the Hardwood Lumber Directory shows that the membership of the National Hardwood Lumber Association includes sixteen Canadian firms, fourteen of which are located at Toronto, one at Montreal and one at Meaford, Ont.

A New Way to Prohibit Pulpwood Export

The different proposals made from time to time to prevent the export of pulp wood from Canada have been of much interest to readers of the Canada Lumbermen. The latest development is a report emanating from Ottawa, as follows:—"Application has been made to the railway commission for permission to increase the present comparatively low rates on pulpwood carried to the American border. The railway companies claim that existing through rates on export pulpwood are not profitable and are unduly low, owing to rate-sharing conditions with the various roads across the line.

Furthermore the Canadian roads in Quebec, Ontario, and New Brunswick prefer to haul the pulpwood to Canadian pulp and paper factories, because in that case they also get the advantages of hauling the finished product. If the export freight rates are made higher, and the railway companies believe traffic conditions justify this, the result will be to make the price of pulpwood higher to the American buyer, since he must get his supply from Canada in any case.

But economic conditions already encourage the manufacture of pulp and paper in Canada near to the source of supply. If it is made still more expensive for the American mills to import their raw product from Canada it is believed there will be a steadily increasing incentive for the transfer of the American mills to this side of the line and for the erection of new Canadian mills.

At the same time the proposed equalization of rates on pulp-

wood to Canadian and to American mills should not affect the price now obtained by the Canadian sellers of pulpwood, since the source of supply and local demand are not affected.

The government, it is understood, looks on the proposal with favor and the railway commission may possibly take this into consideration when the rate increase application comes up for hearing about the middle of next month."

The Development of Grand Falls, N. B.

Fredericton, N.B., Oct. 2nd.—Further advices are to the effect that the pulp and paper mill project of the Grand Falls Co. Ltd., in New Brunswick will be of even greater magnitude than was at first announced. It is learned on good authority that the company, which has strong financial backing, will also operate a large saw mill, as well as engaging extensively in the development of the natural powers of the St. John River.

At Grand Falls at the head of the St. John there is a possible development of 80,000 potential horse power, which could be supplemented with the available power below the falls, where some of the largest tributaries of the St. John have their confluence with that river. Although there are no great falls below Grand Falls, the descent of the river would admit of fully three dams being constructed with a height varying from 15 to 20 feet, each of which would have a possible development of from 20,000 to 25,000 horse power. In all there would be about 150,000 horse power available at and below the Falls. This power would be continuous.

The largest of these powers to be developed at once is that at Grand Falls. The power, which the Grand Falls Co. Ltd., will develop, however, will greatly exceed the requirements of the pulp and paper mill and the surplus power will be available for the stimulation of industrial development at Fredericton, the capital of New Brunswick, where several large factories are now building.

As the company would have a large quantity of logs, which could be more profitably cut into sawn lumber, they will operate a large saw mill and use all the waste in the manufacture of paper. New Brunswick is annually allowing the trimmings, sawdust, edgings, slabs, etc., to go to waste, while this waste would be a great source of revenue to the province, if utilized as it could be.

The construction of the dams will afford transportation by water for the waste of the mills all along the river. The fact that it is waste is no objection to its being utilized for pulp. In fact experience of pulp makers on this continent has shown that the sappy portion of logs, which is thrown away in the shape of edgings and slabs, makes the finest and toughest paper, when made into pulp by the sulphite process. The manufacture of carbide is also likely to be undertaken as a result of the development at Grand Falls. Plentiful and cheap power is essential in the manufacture of carbide and with the railway freight rates in favor of the St. John River a large industry in its production is among the probabilities of the immediate future.

Fredericton, the largest centre in the western section of the province, will no doubt be greatly benefitted by the introduction of cheap power. The city possesses all the requirements of a large manufacturing centre. The city council has authorized the Publicity Commissioner to advertise a free site, free water and tax exemption to capitalists and manufacturers who will build up stable bona fide industries.

A New St. John, N. B. Firm

The Provincial Lumber Company, Ltd., has been incorporated at St. John, N. B., with George McKean, of St. John, president; William E. Goulding, of St. John, treasurer, and George E. Deming, of New York City, secretary. The new company will handle in the United States the lumber stocks of George McKean, who handles large quantities of lumber for the European and South American markets, to the extent of 80,000,000 feet per annum, and has been one of the largest shippers from Eastern Canada for years. His business in the United States has been wholly with outside wholesalers, but from now on will be conducted by the above company. They will also handle the stock of the Kent Lumber Company, Gold River, N.S., with an output of spruce, pine and hemlock to the extent of about 7,500,000 feet annually. The daily capacity is about 50,000 feet, and the mill equipment includes a circular and gang, with lath mill and planer attached. The new company will also handle the output of the River Valley Lumber Company, Oromocto, N.B., cutting about 75,000 feet per day during sawing season. The principal output is spruce, white pine and hemlock, with a combined output of 10,000,000 annually. Under this plan the New York office will have available for this market about 20,000,000 feet of lumber and a liberal supply of lath. The hemlock will include anything in the regular sizes up to 20 feet in length. The white pine is cut in 4/4, 5/4, 8/4 and 12/4 thicknesses, and can be shipped by rail or vessel, as can also the product of the spruce mills. George E. Deming, secretary of the company, makes his home in Hackensack, N. J., and will manage the New York office, which has been opened at 71 Beaver street, New York. He has long been identified with the local trade.

Proposed Enlargements to D. J. Buckley's Mill, Newcastle, N. B.

Mr. D. J. Buckley, French Fort Cove, near Newcastle, N.B., is well known throughout the Maritime Provinces as a progressive and successful lumberman. The accompanying illustration of his mill shows it as it has been during the past few years. Mr. Buckley at present has plans for enlarging this plant and expects during the season of 1913 to be manufacturing lumber, lath, etc., much more extensively than in the past. The present mill is equipped with two rotary saws (one of which was recently added) a double edger, and a lath machine. The product of the mill consists largely of spruce. Mr. Buckley operates upon limits at Barnaby River, Kaines River and Bay du Vin. His limits consist of about fifty-two miles of leased land and 5000 acres of freehold land. Upon thesehe has an excellent stand of spruce timber from which he manufactures a product which has become favorably known to the lumber trade. The mill at the French Fort Cove gives employment to about thirty men.

In addition to the above mill, Mr. Buckley operates two portable mills in the woods during the winter time. The market for his product is found in England and the United States. He also disposes of a considerable quantity of lumber to the coast trade in the Maritime Provinces and a small portion in Quebec province. The output is not entirely spruce, a fair amount of hemlock also being produced.

Mr. Buckley's plans for enlarging his mill include the installation of equipment for dressing lumber for the Ontario trade. He will extend the mill, put in planers and also erect a large drying shed. In addition to this he intends to install a couple of shingle machines.

D. J. Buckley's Mill at French Fort Cove, N. B.

Those who know Mr. Buckley and his successful business methods confidently expect that when these plans have been carried out he will be successful in enlarging in a satisfactory manner, the excellent trade which he has already built up.

Operations at the Douglas boom on the Miramichi River closed for the season of 1912 about Oct. 1st and work at the Mitchell boom will probably be cleaned up in the course of a week or so. A large crew of men have been transferred from the Douglas boom to South Bay where they will raft the three million feet of logs which broke away from the Mitchell boom during the mid-summer freshet.

The logs handled by the St. John River Log Driving Company this year will probably total between 90 and 95 million superficial feet.

The Partington Pulp & Paper Company, St. John, N.B., present owners of the Gibson lumber lands and mills, have closed their contracts with lumber operators for next winter's cut. The total cut on the Nashwaak River this winter will be only about 10,000,000 ft., or about half of what it has been in former years. This reduction is a serious matter for Marysville and the Nashwaak Valley, not only so far as the coming winter is concerned but also for next summer. Should the Partington Company start, as expected, the erection of their pulp mill at Marysville, the situation there will look much brighter, but nothing definite has been announced as yet.

The Log Input for the Coming Winter

Further Reports Bear Out Conclusion that Ontario Cut will be Smaller—B. C. Operators Expecting Good Trade Next Summer

Further reports which have been received by the Canada Lumberman, indicate that the quantity of logs taken out in the woods this winter will be considerably less in Ontario and eastern Canada, than during last winter, and that in the prairie and mountain districts the cut will be about the same, and possibly greater in the B. C. coast district. The following letters have been received since the publication of the October 1st issue of the Canada Lumberman:

Reports from Ontario Firms

From a large Northern Ontario firm:—We are putting in our usual number of camps this winter and expect to get out about the same quantity that we did last winter. It has been hard to get men with us so far, but they are coming a little better at this time so that we think we will not be disappointed.

From a large Ottawa Valley firm:—We have put in four camps on our limits. This is the same number as last year. We expect to take out between fifteen and sixteen million feet. It is our understanding that the rest of the operators in the Ottawa Valley expect to take out the same amount of timber as last season, with the exception of J. R. Booth.

We expect to operate five camps the coming winter, the same number as we operated last season, and to put in approximately the same amount of timber, that is about ten million feet. We anticipate a reduced cut this winter in our general vicinity as we understand that a number of concerns are reducing their output and we do not know of anyone who is increasing it. Labor is scarce and will probably continue so, at least until the mills are shut down.—Wolverine Cedar & Lumber Co., Little Current, Ont.

We did not put in any logs last season and hardly expect that we will this coming winter, as we prefer to let our timber lie for the present. We have not had many figures as to how much will be put in, as a whole, this coming winter, but we are inclined to think it will be considerably less than a year ago, which was less than the preceding year.

There seems to be a good market for the cheaper and lower grades of lumber, but the middle grades have not been quite so strong as they were in the past year.—Playfair & White, Midland, Ont.

From a large Georgian Bay company:—We are putting in this season, sufficient logs to run our mill. Last year we did not have quite so much and in consequence have done a little outside sawing at our mill, in order to run it the full season. In other words, our cut in logs for this logging season will be about 20,000,000 feet. So far as our neighbors are concerned, the cut will be much below that of last year, which was also less than the year before. This shortage in logging operations on the North Shore of Georgian Bay is due to various causes. In a few instances the lumbermen are cut out and have not acquired any more timber. In other cases saw mills have been burned, and pending the erecting of new mills they are not operating so heavily.

We expect to cut about the same quantity during the coming winter as we did last season. This will depend upon the supply of labor, which, from present indications is not likely to be all we could desire. We have already started a couple of camps and will start more as soon as harvesting operations are over and men offer more freely.

Supplies show no signs of being any cheaper although hay will probably be about the same on account of the heavy crop.

Lumber sales have been very satisfactory and we have experienced by far the best year in our history. Prices have advanced considerably during the summer and hemlock is approaching the figures we have always felt it should fetch, compared to the other woods produced in Ontario. It has been no trouble to sell stock of any kind. The trouble has been rather, to make deliveries as fast as we would like. Dry stock was cleaned up early in the summer and green stock has been shipped direct from the mill as fast as it could be sawn, as a result of which we have considerably less lumber on hand than we have had at this season of the year, for many years past. At the present rate of shipment we will carry but a small fraction of stock into the winter.

Cooperage mills in this district report a banner year and stocks entirely sold out.

Taken altogether, 1912 can be described as the best year for lumber that we have ever known and what is still better we believe the outlook for 1913 is fully as good, if not better.—The Pearce Co. Ltd., Marmora, Ont.

Quebec Operations

Our business this year, in round figures, will be the same as last—Price Brothers & Company, Limited, Quebec, P. Q.

From a large eastern Quebec firm:—This company is not planning to operate at all during the coming winter. We find that it is impossible to make money in manufacturing logs as small as 6 in. in diameter, which the Government requires to be logged in the woods. This company has a rossing mill, but, as the property is all on Crown land, they have found no sale for rossed wood in Canada, and the only way out is for them to put up a pulp mill. There is no water power on the property, so that there is nothing left but a sulphite or sulphate mill, and at the present time there are cruisers on the property representing sulphite interests.

Operations in general, along the whole Gaspe coast, seem to be curtailed or stopped altogether, for the above reasons, and most of the men have gone away to the Ottawa and other larger lumbering districts for work.

Reduction in New Brunswick

I do not think there will be half the lumber got out in this district this season that there was last. As for myself, I do not expect to get half the quantity that I did last season. I expect to get about two million superficial feet this year, where I got about five million feet last year. I have only three camps in, and do not intend to increase that amount, unless there is a decided improvement in the freight situation. As near as I can find out, what I have stated in regard to my own cut, will be repeated in this province by other operators to a large extent. The lumber situation in this province, this season, has been about as bad as it could be, owing principally to the high rate of freights asked by both steamers and schooners.—I. C. Prescott, Albert, N.B.

Critical Situation of Nova Scotia Industry

The demand for lumber from all markets this year has been such that the stocks will be practically cleaned up by the ends of the season. Owing to the rapid advance in stumpage values it is becoming more and more evident to timber holders in this province that the proper course for them to adopt is to cease cutting, allowing the timber to grow and secure their profit in the still further increase in stumpage values which must result, until such time as the value of standing timber makes the price commensurate with the cost of growing a forest.

Looking over the men engaged in lumbering in this province we fail to find any among those who have been cutting actively for a number of years, who have hade much profit from their operations. On the other hand those who have been letting their timber lands grow have seen them quadruple in value in the last five years. This condition will continue until the condition above indicated is reached.

While it is difficult for men who have been actively engaged in lumbering to cease operations suddenly, we are satisfied that there will be a general restriction in cutting during the coming winter. We shall not put in more than three or four camps, cutting possibly about two-thirds, at this point, of what we have been cutting for the past ten or fifteen years, this policy being adopted with a view to further curtailment in 1914.

Besides the facts above referred to the pulp industry is rapidly forcing its way to the front as affording the most remunerative manner in which timber can be used. In this locality we have a water power capable of producing 5000 h.p., running to waste ever since the country had a history. Tributary to this water power we have about 50,000 acres of timber land. It seems to be the only means of safeguarding finances to gradually cease the cutting of lumber and conserve our timber lands, with the object of being able to develop a pulp industry which will use practically all kinds of soft woods and yield a larger margin than is now secured from the lumber industry as conducted upon present lines. Our opinion is that this is the general view held by the lumbermen of this province.—Clarke Brothers, Bear River, N. S.

Operations in Prairie Provinces

We have two lumber camps in operation and expect to take out about six million feet of spruce lumber. This output would be about the same as last year.—Saskatoon Lumber Co. Ltd., Saskatoon, Sask.

From a large Manitoba firm:—I expect to operate four camps this winter with an output of about fifteen million. You ask me how this will compare with last year. In reply I would say I expect to have about two millions more stock than I sold last year. My present business requires from twelve to fifteen million per annum.

I expect the stock taken out this winter in northern Manitoba will be probably five or ten per cent. more than was taken out last year. Demand for lumber in eastern Saskatchewan and Manitoba, which is the territory in which I operate, is fairly firm and if weather conditions for the next two months are favorable for threshing and marketing the crop, I expect the prices will be a little firmer.

As you are aware crop conditions affect the lumber business very much in this country and it is just a little too soon to prophesy what lumber

conditions will be this coming year but the indications are that the prices will stiffen up a little and the demand will be good.

In western and northern Alberta competition is so strong and prices are cut so much by lumber firms shipping from British Columbia, Oregon and Montana to western and northern Alberta that I have not found it profitable to ship any lumber from my western mill to the prairies so far. In other words prices ranging in Saskatchewan for products of a spruce mill are higher than prices for the same material for points in northern Alberta and northern Alberta has been used as a slaughter market by mills shipping from the United States.

We expect to put in about twelve camps and take out about fifty million feet this coming winter. This will be about twenty-five per cent. less than last winter. In regard to operations in general in our district, the only operators in the immediate vicinity are the Prince Albert Lumber Co. They, we understand, do not expect to take out more than twenty million this winter. This would be less than half of what they did last winter. Considerably more timber was logged last winter than the mills will be able to cut this summer. Consequently, logging operations will not be quite so extensive this winter on account of the stock of logs on hand at the close of the present sawing season.—The Big River Lumber Company, Limited, Big River, Saskatchewan.

B. C. Interior Operations

From a B. C. interior, firm:—As we have a good part of our last year's cut, we shall probably only take out about 5 million feet this winter. As a rule we take out about 10 million. The demand for lumber appears to be good and prices seem to be strengthening.

Our logging operations for the coming winter will be in the neighborhood of twenty-five million feet; about the same as last season. The operations in general in this vicinity will be about the same as last season.—The Otis Staples Lumber Co. Ltd., Wycliffe, B. C.

From a B. C. Interior firm:—We expect to take out about three million feet of logs this winter. We find the lumber business fairly satisfactory, the demand being good though the prices are light. We hope that prices will advance.

From what we have seen of the lumber business the last year and a half if we had our money in our hand seeking investments we would invest in something besides the lumber business, but having it already invested we have to keep operating in order to preserve our principal intact. Our plant would deteriorate as fast when not being operated as when in operation.

Extensive Operations in British Columbia

Although we have a large tract of timber we have not touched it as yet, and we will be doing no logging during the coming winter.—J. Hanbury & Co. Limited, Vancouver, B. C.

We only operate one logging camp, and that is situated up on the west coast of Vancouver Island, about sixty miles above Victoria. We employ 140 men, operate four miles of railroad, five donkey engines, four yarders and one roader. We expect to cut about two and a half millions each month. —British Canadian Lumber Corporation Ltd., Vancouver, B. C.

Our output is normally about nine million feet per month. We propose to enlarge this, and next year to have a monthly output of not less than fifteen million feet. This will be considerably in excess of our past output. We propose to continue an enlargement of our operations, as we have approximately four billion feet of timber.—Canadian Puget Sound Lumber Company. Limited, Victoria, B.C.

We are in the coast district, and log the whole year round, in fact we do more in the summer than in the winter. Our average output is about 15 to 18 million feet per year, and as far as we can judge we will continue getting out this quantity. We find conditions are improving, and we anticipate that next year will be a better season than 1912.—The Abbotsford Timber & Trading Co. Ltd., Abbotsford, B. C.

From a large B. C. coast mill:—As you are probably aware, our logging operatiins extend throughout the whole year, both summer and winter.

We have four camps running, up the coast, which we expect to run steadily all next year. The output of these camps will be about 25,000,000 feet. This will be about the same quantity as the present year, which will supply our wants, as our mill capacity is about 25,000,000 feet per year.

Trade this fall is exceptionally good, both local and northwest markets. We have plenty of orders to keep us going steadily until the end of the year. Cars are scarce.

From a large B. C. coast firm:—We figure on operating one camp all winter of the capacity of about 80,000 ft. per day. Last year we did not operate for three months of the winter at all.

The outlook for operations in general in our district is quite bright. We anticipate a big market from the prairies. There are no large stocks of lumber on hand on the coast, and with a fairly active foreign demand we anticipate that prices will remain firm during the winter months, which is usually the quiet season of the year in the lumber business. We look forward to a good year in 1913.

From a large Vancouver firm:—Logging operations are not carried on to any extent here on the coast during the rainy winter months. In fact, our logging season extends over the spring, summer and autumn months, and the log hauling is done by machinery, or, to be more explicit, by donkey engines equipped with wire cables, the use of horses in connection with coast logging operations being practically a thing of the past. The bulk of the lumber manufactured at British Columbia coast points finds a market in Alberta, Saskatchewan and Manitoba. In view of the bountiful crop which has just been harvested throughout the Prairie West, it is evident that the lumber business in British Columbia will be in a healthy condition throughout the coming year.

We will manufacture about 20,000,000 feet of lumber the coming year which will be about 10 per cent. greater than the past year.

Logging on the coast is done more largely during the summer months than during the winter months, the rain interfering with the winter operations more than during the summer.

We are now running our mill night and day on account of the large prairie demand which we think will continue throughout the year on account of the large crops which have been realized. The outlook is very promising.—The Small & Bucklin Lumber Co. Ltd., New Westminster, B.C.

Our conditions are entirely different from those of eastern Canada, and our logging camps are operated during the winter unless shut down temporarily for a few weeks in January on account of cold weather or snow. We expect to operate our camps up to the middle of December, and will probably shut down until the middle of February as the weather is usually unsuitable for logging during the early part of the year.

We expect to cut about one hundred million feet next year, and think the market should be sufficient to absorb the output of the mills next year.

The United States mills have now sufficient market on their side of the line to keep them employed, and they are not using our market as a dumping ground, so that conditions should be very much better next year than they have been. The trade, however, will not be in a satisfactory condition until the tariff is changed so as to give proper protection during seasons of bad trade in the United States, or otherwise remove the tariff entirely, so that we have access to their market, and they to ours.—E. H. Heaps & Co., Ltd., Vancouver, B.C.

Will Enforce B. C. Marking Act

G. D. McKay, Provincial Timber Inspector, B.C., reports that after due consideration he has decided to enforce the "Marking Act," and more especially Section 90, which requires that all persons operating logging camps must first provide themselves with a stamp or stamps. The stamp or stamps will then have to be registered, and will conform with the class of land upon which they are operating, as per schedule following:

No. 1 is for license timber, and timber cut from this class of land must be manufactured in the province, as per part 10, of the Forest Act.

No. 2 is leashold timber, and is subject to the same regulations as No. 1 .

No. 3 is old crown-granted timber, and these lands are subject to sub-section 2, section 58, Forest Act, and are exportable under schedules 1 and 2 of that section.

No. 4 is crown-granted timber, after the 7th day of April, 1887, and prior to the 12th day of March, 1906. These lands are subject to a royalty of 50 cents on the thousand,, and are exportable.

No. 5 is crown-granted timber, 1906 and later, and is subject to a royalty of 50 cents on the thousand. This timber must be manufactured in the province.

No. 6 is handlogger timber, and is subject to the Manufacturers' Act, page 10.

British Columbia Timber Markets

Hereafter any person applying to register a timber mark will be given a mark, as follows:

For License Timber

1—A letter of the alphabet, other than I, O. X, Y, Z, followed by a number between 1 and 100. For example, "A 6." Start in F 1.

For Leasehold Timber

2—A number between 1 and 100, followed by a letter of the alphabet other than I. O, X, Y, Z. For example, "6 A." Start 1 H.

For Old Crown Grant Timber

3—A letter of the alphabet other than I, O, X, Y, Z, followed by a number with a crescent beneath. For example, "A 6." Start in K 1.

For Crown Grant Timber

4—A letter of the alphabet other than I, O (April 7,1887, March 12, 1906), X, Y, Z, followed by a number with a bar beneath. For example, "B 7." Start in L 1.

For Crown Grant Timber, 1906 and Later

5—A number followed by a letter of the alphabet other than I, O, X, Y, Z, with a crescent beneath. For example, "2 B." Start in 1 N.

Handlogger Timber

6—Either of the letters X, Y, Z, with a number. For example, "X 7." Start in X 1.

Forest Conditions in Quebec Province

How the Forest Branch has Secured Co-operation of Lumbermen in Preservation of Timber Resources—Plans for the Future

By G. C. Piche*

THE province of Quebec has had since 1909, a forest service and even a forest school, so as to recruit the necessary personnel. I believe that the other provinces will not be long in following the example of British Columbia in establishing a forest service, as they have also very large forests to preserve, and a forest service composed of competent engineers is absolutely necessary in our days, to administer the forest domain properly.

In the first place, in Quebec, we began by making a proper classification of the lands that are still vacant in our province. This is no small undertaking as we have over 200,000,000 acres that are not occupied by settlers. Of this, an immense proportion is not agricultural, and perhaps not more than 15,000,000 acres are fit for cultivation. Owing to the steady advance of prices of timber during the last decade a great number of persons had taken advantage of the settlers laws to purchase lots on which they were cutting the timber without fulfilling the conditions of their location tickets.

G. C. Piche, Chief of the Forest Branch, Department of Lands and Forests, Quebec, whose address before the recent Forestry Convention created much interest.

Selection of Lands

We have now finished the selection of the lands that are agricultural and non-cultivable in two counties, those of Bellechasse and Montmagny on the south shore of the St. Lawrence, and this summer we have had 14 parties working in the adjacent territories. It is the intention of our government to pursue the classification vigorously.

As soon as we have completed this task, we will begin the inventory of our forest resources. In the territories under license to cut, we leave the inventory to the initiative of the licensees. Already some have started this work, and I may name the Laurentide Paper Co., the Riordon Paper and the Riviere Ouelle Pulp Co., which have had their limits cruised and mapped out by experts and who also employ foresters. The inventory of the resources of the vacant lands will enable the government to dispose of the non-agricultural sections for the best use of the people.

We pay particular attention to the control of the logging operations made on timber berths. Our inspectors and rangers take special pains to see that all our regulations are complied with as rigidly as possible, i.e., that all trees are cut according to the diameter limits prescribed for each species, that the stumps are not cut higher than 18 inches above the ground, that all merchantable timber is cut into the tops up to 6 inches, in a word that the cutting is made in a manner as economical and profitable as possible to both the province and the lumberman. This means that in many circumstances our field men have to use discretion; but I may say that before we allow an exception, we always make a serious study of the case, and we are often accused of being stubborn, or hard to convince. Do not believe that all these reforms have been realized without some discussion. In many instances, it was only after the imposition of severe penalties that the men would conform themselves to our demands. But thanks to the help of the limit-holders, who have interested themselves in our efforts, we are now in a position to say with just pride, that the logging operations on the Crown Lands of Quebec are conducted economically, and that all that is merchantable is used of each tree that is cut, and this is as much as it is possible to do it under the local conditions.

Much Still to Accomplish

We have yet great progress to make. It is possible to reduce still greatly the quantity of waste—which does not exceed on an average of 20 per cent. of the cut—but this will come with the increase in price of the lumber, with the better facilities of transportation and with a more economical handling and use of the small logs at the saw mills.

We have still to find a way of disposing of the debris of the logging, but as this question involves too much expense, we prefer to make serious experiments before adopting any measure in this direction.

It will also be necessary to find a method for lumbering all the trees that are now growing in our forests. Owing to the difficulties of driving, most of the hardwood trees are left standing with the result that a great portion of the forest is not yielding any return, and the forest type is being modified almost completely after the exploitation. It is the ambition of the forester to bring the forest to a productive capacity as high as possible and to leave it after each cut in a better state than before. For many years it will not be possible to treat our forests as they should be, but we ought to lumber them in a better manner and to maintain at least the production of the valuable species to prevent the impoverishment of the cutover lands by the intrusion of inferior trees. This will necessitate some sacrifice, but will be fully repaid in the long run. This is specially true of the operations of pulp and paper companies which should cut more of the balsam in order to increase the proportion in spruce of their future tenements.

These results will only be obtained by a true co-operation of the forest service with the lumbermen. Our interests are mutual and we should work together to find means to make use of the hardwoods and of the inferior species, so that the future forest will be more productive, and will have a greater proportion of the best trees. To give you an idea of the results that could be obtained by a proper management of the limits presently under license in Quebec, I may say that the present cut of about one billion feet could not be increased by more than fifty per cent. under the present methods of lumbering, without endangering the future, yet it would attain if the 45 million acres that we have in license were treated according to forestry principles, ten billion feet per year, and if I translate this into revenue, instead of yielding to the Crown as it does now, a little over one million dollars in stumpage, it would give a return of ten times that amount.

The Log Scaling Problem

It is part of our duties to look after the control of the scaling of logs. This operation is very delicate and serious as our stumpage revenues are based upon the reports made by the scalers. These scalers, all appointed by a board of examiners, are under oath, and give fairly good returns. However, we have a body of rangers and inspectors, which numbered 115 last winter to check their work. We feel that we are getting all that is coming to us and the returns that are made are quite accurate.

This is not a bold assumption, but a statement based on my experience both as an employee of a lumbering company and as chief of the forest service during several years. I believe we owe this compliment to our lumbermen that they are conducting their operations in a very honest manner and that they are eager to do what is right and proper.

A special service, independent of our organization, has charge of the fire protection. Thanks to the co-operation of our lumbermen, who have assumed the charge of protecting their respective holdings since 1906, we have not to lament the loss of much forest through fire. The lumbermen of the St. Maurice River basin have recently formed themselves into a protective association. It would be unjust to the other provinces to say that the results obtained are due completely to our organization, but we feel that our efforts are being well rewarded, and the money expended in that direction is just as well invested as that paid to insurance companies.

Though our province is one of the richest in forest, we have many sections, particularly in the old villages, that are deprived of any timber growth. To obviate this scarcity, the Honorable Mr. Allard had a special law passed to permit the creation of special reserves known as township forest reserves, in which we would allow the farmers to cut a specific quantity of timber for their personal use. Each year a new area not exceeding one-twentieth of the reserve is opened, where they are allowed to cut under the direction of a warden, the quantity allotted to them. We charge them one stumpage due, that is, just enough to meet the expenses of the

*Address delivered before the recent convention of the Canadian Forestry Association.

system. We have now 120,000 acres under such reservation. Three township reserves were under operation last year, and the results have been so satisfactory that we cannot meet immediately all the demands that we receive from every section of the country. We will have by the end of the year about 200,000 acres set aside for this particular purpose.

Prevention of Waste

A good deal of the land that has been cleared since the opening of the province has been converted into waste either through fire or wrongful exploitation. According to the census we have over 2,500,000 acres in unproductive lands that will grow only a forest crop. As these lands are in the hands of individuals, we have started to encourage their reforestation. Our first step was to establish a forestry nursery at Berthierville to furnish the necessary stock. We have purchased some land near Lachute, composed of shifting sands that were beginning to cause great damage to the adjoining farms, last May we planted 25 acres of this as an experiment. The results obtained, up to the present are very satisfactory and the conversion of these dunes into forested land will be pursued this autumn. We will continue this work at other points, so as to encourage private initiative in this line. Several requests have already been received and the plants were furnished at half price. We will have several lecturers travelling the province during next winter inviting the farmers to put into value their waste lands and take better care of their woodlots.

The educational side in forestry has not been neglected by our government. As early as 1905, Sir Lomer Gouin sent two young men to study forestry at Yale Forest School, and on their return a forest service was organized, then in 1910 the Quebec Forest School was created with the specific object of recruiting a competent personnel for the administration and management of the forest lands belonging to the Crown or private individuals. The government gave a subsidy to Laval University for the establishment of the school, and each year ten scholarships are allotted to the first ten in a public contest. The total attendance at the school during last year was 40. At the contest which took place on August 19th last, 21 candidates were present.

It will soon be necessary to organize another school for the training of the forest rangers, and this will be done as soon as possible.

Preventing Fake Settlement

We have also to look after the repression of the frauds made on lots sold to settlers. To give you an idea of the work done, I will say that we have collected during these last four years nearly $225,000 in penalties imposed on timber cut illegally and thousands of sales were cancelled owing to the lack of improvements on the lots. A very severe inspection is made each year and no timber can be purchased or shipped without being covered by an affidavit which is certified to by one of our rangers. The result of this control has been a great reduction in the number of lots sold each year. Speculation or timber robbery is still going on but it diminishes every year.

We must confess that we have not been able to do much in the technical line partly because we had not the time for the necessary help and mainly because we thought it more rational to preserve first what was left of our forests. The next move should be to increase more and more the utilization of our forest resources. To do this and carry the other articles of our program it will necessitate a greater appropriation, which I believe our government will give us, and competent men whom we are now able to obtain through our school.

Quebec Cullers Report

The following comparative statement of timber, measured and culled to date, is furnished by the Supervisor of Cullers' Quebec, under date of Oct. 3rd:

	1910 Cubic Ft.	1911 Cubic Ft.	1912 Cubic Ft.
Waney White Pine	479,120	716,520	1,016,640
White Pine	10,720	10,680	1,760
Red Pine	21,920	27,720	12,200
Oak	222,200	69,400	87,000
Elm	246,800	221,680	275,520
Ash	1,360	120	520
Birch and Maple	40,680	62,320	38,640

Forestry Department Source of Profit

The annual financial statement of the Province of Quebec shows that the Department of Lands and Forests contributed $1,658,457 to the provincial revenue. The cost of administrating this department amounted to $316,455. A very few years ago this department was not even self-sustaining, but the remarkable development during recent years in connection with the pulp, paper and lumber industries has made it a fruitful source of revenue.

Personal and Trade Paragraphs

The Geo. Webster Lumber Co. moved their general and accounting offices to 21 Besse Place, Springfield, Mass., on October 2nd.

Mr. W. Price, of Price Bros. & Co., Quebec, P.Q., has been offered the position of chairman of the reorganized Quebec Harbor Board. It is believed that Mr. Price will accept the position.

At the adjourned annual meeting of the directors and shareholders of the Grand Trunk Pacific, held last week in Montreal, John R. Booth, head of the big paper and lumber mills at Ottawa, was elected a member of the board of directors.

W. H. Rowley, president of the E. B. Eddy Company, has been mentioned as a probable successor to Senator Frost on the Ottawa Improvement Commission. The appointment is made by the Government and no final decision has yet been announced.

A. D. McRae, vice-president and manager of the Canadian Western Lumber Company, and who also looks after the Mackenzie-Mann interests on the Pacific coast, has been gazetted honorary colonel of the Duke of Connaught's Own Rifles, a Vancouver regiment.

Mr. E. S. Jenison, formerly with the Henion & Hubbell Company, of Chicago, Ill., has been appointed manager of the Pump Department of the Canadian Fairbanks-Morse Company, Limited, who are now exclusive sales agents in Canada for the Triplex and Power Pumps, as well as the other lines manufactured by the Goulds Manufacturing Company, of Seneca Falls, N.Y.

Edgar W. Day, president of the British Trusts (Ltd.), of Edmonton, Alta., capitalized at $500,000, who returned recently from a trip of 800 miles by wagon into the Peace River country of northern Alberta and British Columbia, reports that there are hundreds of millions of feet of commercial timber in the region north and west of Edmonton. He was accompanied by W. E. H. Carter, of Toronto; his son, George Day, and a guide.

Mr. Roy L. Campbell of the Faculty of Forestry of the University of Toronto has recently been appointed to a post with the Department of Lands, Forests and Mines of the Province of British Columbia. Mr. Campbell, when taking up his new position at Victoria, will seek to interest the press, boards of trade, schools and in fact the people as a whole, in methods for the utilization of the forests which will increase rather than deplete the revenue of the province from this source.

Sir Lomer Gouin, premier of the Province of Quebec, accompanied by Hon. Mr. Decarie, provincial secretary, Messrs. L. P. Berard and Sidney Small of Toronto, under the guidance of Col. A. D. Davidson, inspected the Fraser Mills at New Westminster recently. Sir Lomer expressed himself as surprised at the magnitude of the mills and told Col. Davidson he doubted if there was another mill of equal size and such modern equipment in Canada. Sir Lomer took a keen interest in all the details and seemed to thoroughly enjoy watching all the workings of the plant.

Mr. Robert Bruce, of the firm of A. Bruce & Company, Glasgow, Scotland, has been spending a few days in Toronto and is now on his way to the West. Messrs. A. Bruce & Company are the builders of the plant at Fort Frances, Ont., for treating railway ties. Mr. Bruce intends travelling extensively in the west with a view to choosing one or more locations where his firm will build plants similar to the one at Fort Frances. They intend to go into this business on a large scale in Canada. The firm have had 60 years experience in England and Scotland, with a special pressing and creosoting process for timber.

Sir Ronald Lane, of London, Eng., president of the Peace River Trading Co., a subsidiary of the Western Canada Land Co., which owns more than 300,000 acres of land in Alberta, who was in Edmonton recently with a party of 20 British capitalists, has sent scouts into the Peace River country to gather information regarding the timber, mineral and agricultural resources of the district. The company, which already has trading posts at Lesser Slave Lake, Peace River Crossing, Dunvegan and Vermillion, expects to extend its operations to the Arctic circle. Trading with the Indians on a cash basis, retailing supplies and freighting, will be the chief business and in addition to this it is expected to install sawmills in various parts of the north country.

Hamilton, the manufacturing centre of Canada, has surpassed itself in the preparation of an excellent booklet, dealing with its numerous advantages and attractions. Both pictorially and artistically the booklet reaches a high standard, and the facilities enjoyed by this thriving city are brought home to the reader in terse and forcible language. An excellent map accompanies the booklet.

Jocko Limits Bring Record Prices

The timber berths known as Jocko No. 1 and Jocko No. 2 which were recently offered for sale by tember by the Ontario Government were secured by J. J. McFadden of Renfrew, Ont., the highest tenderer. Mr. McFadden's tender was as follows:

Jocko No. 1	$13.26	per 1000 for	pine	and	$2.00 dues
Jocko No. 1	3.00	per 1000 for	pine	and	1.00 dues
Jocko No. 2	12.10	per 1000 for	pine	and	2.00 dues
Jocko No. 2	3.05	per 1000 for	spruce	and	1.00 dues

The limits cover 25 square miles each and are situated in the townships of Garrow and Lockhart adjacent to limits belonging to the Hawkesbury Lumber Company. Mr. McFadden's tenders were considerably above those of the next highest. They are also the highest that the government has yet secured for the sale of timber.

It is interesting to compare the prices with those of a few former sales. In July 1907 a sale was made of timber on Franklin Island, Georgian Bay for which Mr. McGibbon of Sarnia paid $12.26 per M. bonus and $2 dues. Berth 22-10 a little back of the Soo was sold by the Government to E. B. Foss of Bay City, Mich., for $10.52 bonus and $2 dues. In 1910 an important sale of timber on the Mississaga reserve was made. At this time Booth and Shannon, Biscotasing, paid $5.50 per M. bonus and $3 dues for white and red pine. James Munro, Pembroke, Ont., paid $8.55 and $2 dues for red and jack pine and spruce. W. B. Russel, Toronto, paid $10.55 and $2 dues for red and jack jine and spruce. R. Friar, Pembroke, Ont., paid $11.37 and $2 dues for white pine. J. G. Forgie, Pembroke, Ont., paid $10.55 per M. and $2 dues for white pine and $8.55 and $2 dues for red and jack pine. A sale of damaged timber in 1909 brought the government $8.05 and $2 dues.

As a guarantee, Mr. McFadden is required to deposit the sum of $25,000 on each tender. Clauses in the call for the tenders mentioned that tenderers must state prices, (1) on condition that they cleared the ground of all debris, and (2) that the debris be left on the ground. Mr. McFadden quoted 50 cents a thousand higher than the above figures on each tender if the debris be left on the ground, but the Minister of Lands, Forests & Mines accepted the lower figure involving the removal of debris.

Boom Company Loses Action

The action recently brought by the Rainy River Boom Corporation against the Rainy Lake Lumber Company to recover certain sums of money for booming, sorting, rafting and driving the defendant company's logs in the Rainy River during the years 1906 and 1907, was recently dismissed with costs by Chief Justice Mulock.

The plaintiff company, incorporated under Minnesota laws, was authorized, by its charter, to erect booms in the Rainy River and to charge tolls for booming logs. The defendant company, in common with others, floated its logs down the Rainy River, this being the only practicable method, and plaintiff's booms, which were on the Canadian side of the river, were of some assistance in separating their logs from those belonging to others. The Rainy River is a navigable stream, and the international boundary between the United States and Canada runs up its thread, the stream being free to the citizens of both countries under the Ashburton Treaty. The plaintiffs' claim was based on implied contract and on the right under its charter to collect tolls.

Chief Justice Mulock held that there were no circumstances from which any implied contract to pay could be inferred, and that the plaintiffs could not force their services on defendants. That the plaintiffs' erections in Canadian waters were in violation of the treaty and wholly unauthorized, and that the plaintiffs had no right to divert the defendants' logs into foreign territory and seek compensation for services in respect thereof. That the clause in plaintiffs' charter permitting them to levy tolls was in breach of the Ashburton Treaty, and, therefore, ultra vires of the State legislature of Minnesota.

Record Timber Output in B. C.

The Provincial Scaling Department of British Columbia announce that the timber scaling figures for September reached the high mark of 81,600,000 ft. for the coast district. This represents the amount of timber marketed in the Vancouver district. The figures for the interior have not come in yet, but they are expected to total at least 20,000,000.

The scaling fees for the same period were $4,762.91 as against $3,000 last September. For August the fees were $6,000. This represents the fees for timber transfers several months back and does not correspond with the scaling figures of September.

The Timber Trade in Great Britain

Remarkable Activity in Shipbuilding—Good Demand for Canadian Wood Goods—Labor Situation More Promising

(Special Correspondence of the Canada Lumberman)

Glasgow, Oct. 3rd.—Since last report the general tone of this market has improved very much and the business passing in Canadian timber and lumber is quite satisfactory. Not a single cloud is at present on the horizon and consequently the industrial outlook is exceedingly promising for some considerable time to come—we in this country think—and not without justification that Great Britain has had sufficient labor troubles to last for many a long day. The freight situation is now the only difficulty. Not for many years has such a boom been experienced in the shipping world. Little more than a year ago the Clyde, the Tyne and other ports had many vessels laid up for a long spell through want of freights or the unremunerative rates offered. Now it would be impossible to find idle tonnage at any port in the United Kingdom.

The reasons for this bounding prosperity in every class of the British mercantile marine are not far to seek. Notwithstanding the recent serious labor troubles, with, however, only temporarily checked trade expansion, the scope of employment of British steamers has been extending to every quarter of the globe. Not only have freights generally continued firm, but the extraordinary demand for tank steamers or oil transportation has resulted in many vessels ordinarily employed as freight boats having huge cylindrical tanks fitted in their holds, so that they could be diverted into the oil trade as carriers of oil in bulk. The result of this great boom in freights is a still greater boom in shipbuilding. Undoubtedly disappointment was felt in many quarters that the launches on the Clyde for the half year ending June 30 were not the greatest in tonnage ever realized. The actual total was 289,641 tons, but it is now well known that by December, 1912, the tonnage launched will be the largest in the history of any year of this very important trade.

In this connection it is important to note that all the yards we flooded with orders for new construction and shipbuilders have found it practically impossible to guarantee delivery by any given date. The price of new vessels has advanced from £6 to as much as £8 per ton and still the demand shows no signs of slackening.

The boxmaking trade is very busy but buyers are finding it difficult to get supplies of spruce. In fact, never in the memory of the writer have stocks of this wood been so light. Every little lot arriving per steamer at the docks is quickly bought up at full prices.

Canadian up spruce deals: The demand is very strong, prices range from £8 12s 6d to £8 14s for 3-in. x 6-in., 3-in. x 7-in. and 3-in. x 8-in. with a few 3-in. x 9-in. included in the specification. 3-in. x 5-in. are selling steadily at £8 5s per standard. Very little Riga spruce is now coming into the market. This fact should further help the Canadian variety.

Lower port spruce deals: These can also find a ready market, but only very small lots are coming to hand by liners, prices are as follows: 3-in. x 11-in. and up, 16d; 3-in. x 10-in., 14¾d-15d; 3-in. x 9-in., 14½d-14¾d; 3 x 8, 14d; 3-in. x 7-in., 13½d; all ex-quay Glasgow.

First class Quebec birch logs—These are again in very strong demand, since last report, the very heavy stocks held here have been all sold. The market is therefore bare. Any lots arriving will be well sold at increased values. Present prices are, 14-in., average, 1s 9½d to 1s 10d; 15-in., average, 1s 10½d to 1s 11d; 16-in. average 1s 11½d to 2s; 18-in. average, 2s 1d to 2s 2d; all ex quay Glasgow. Quite a number of large buyers are at present in the market for 14-in., 15-in. and 16-in. average and nothing can be offered them from stock.

Quebec merchantable birch planks—The position of these is similar to last report, viz.: practically nothing arriving and very strong enquiry. All sizes are in request from 1-in. thick upwards to 4-in. As much as £12 to £12 10s c.i.f. Glasgow can be got for an average specification. It is thus evident that any consignments sent to this market will be quickly realized.

Quebec white oak logs—The demand is very active and the consignments that have arrived here have been all sold at very fair prices, for 5½ ft. cube the prices run from 3s 10d to 4s per cubic foot, c.i.f. Glasgow. Second class wood is also selling pretty freely, although a little is still held in first hands. In the writer's estimation Quebec oak logs will be well held and the tendency is for prices to go very high. The railway companies have placed large orders recently and it is known that they will be in the market shortly again for increased quantities. They have, for sometime, been holding off buying owing to the various strikes that have taken place, but now that these are over they have again to supply their wants. The railway companies have all shown increased traffic returns and this means increased freight accommodation both in wagons and carriages.

First class rock elm continues to realize high prices. The ship-

builders are buying up all the lots that come into the market and it is quite well known that sufficient quantities are not being imported to keep this market going. Consignments at any time will be welcome. Prices range from 4s 3d to 4s 4d per cubic ft. c.i.f. Glasgow for 35 ft. average 2nd class. Elm is also easily sold at high prices.

First class waney pine—The demand for this wood is improving and quite a quantity has recently been sold to one of the Clyde shipbuilders. Prices, however, continue on the low side and are about 5s 4d per cubic ft. for say, 27 ft. x 20-in. average, the same remarks apply perhaps more to 2nd class.

First pine deals—Fair lines have been sold ex the yards and also from the quays. Prices are steady with a strong tendency to advance for 12-in. and up x 3-in. £40 10s is being quoted c.i.f. Glasgow.

First pine strips—The demand for these is not so good. Prices range from 3s 4½d to 3s 6d per cu. ft. ex quay. Increased quantities of Californian strips are being imported and these are being retailed at 2s 9d to 3s per cu. ft. ex quay. These importations are telling very much on the Quebec variety. Consignments of strips should be carefully avoided for sometime to come.

General remarks—Practically all kinds of Canadian timber and lumber are in good request. The shipbuilding and allied trades have as much work on hand as will practically last for a year. United States lumber is also selling well. If we have no further labor troubles, this year should show a record turnover in all businesses, and especially in the timber trade of Glasgow.

Enterprise at Ottawa

One of the chief attractions at the Central Canada Exhibition at Ottawa this year was the "Boosters Industrial and Floral Parade" put on the first evening of the opening of the exhibition. Over five miles long, it showed to Ottawa residents as well as to thousands of visitors to the fair, that the Federal Capital has some really big industries which were splendidly shown up by the different floats representative of the manufacturing and business interests. It was the greatest demonstration of civic spirit and industrial life ever made in Ottawa and the costly and attractive floats and long array of commercial wagons was a credit to the promoters. This is, we understand, to be made an annual affair. The parade was of especial interest to the readers of the Canada Lumberman, in that the first prize for the best and largest turn out, a silver cup donated by Mr. T. Frank Ahearn, was won by the Estate of James Davidson, the well known lumber manufacturers. That a lumber manufacturing firm should carry off first prize in a parade such as this speaks creditably for the enterprize and progressiveness of the management. The firm had 29 wagons in the parade and every wagon was fitted up to represent the different lines turned out. Doors, sash, dressed lumber, refrigerators, boxes and box shooks were all represented in the different floats. The accompanying reproduction of a photograph taken in front of the factory on its return, shows a portion of the team and the manner in which they appeared.

First Prize Turnout, Ottawa Boosters' Parade, Estate of James Davidson

An Important New Company at Toronto

The Webb Lumber Company, Limited, a new company formed in August last, have taken over the yards and planing mill of the Gold Medal Furniture Company on Van Horne street, Toronto, the latter company going out of the lumber business entirely. Mr. R. H. Webb, the head of the new concern, is a lumberman of wide experience, who has been for some years in charge of the lumber business of the Gold Medal Furniture Company and who prior to that, was engaged in the business on the Pacific coast. The company have made large additions to their planing mill and are thoroughly equipped to handle all kinds of interior finish and planing mill work. One of the chief improvements is the equipment of all machinery with individual motors. No hemlock is used at all by this firm, only pine and hardwoods, as it is their intention to turn out only high class work.

The paper mill which is being constructed at Thorold, Ont., by the Montrose Paper Mills, Limited, is reported to be half completed.

Improvement in Trade at Glasgow

Edmiston & Mitchells in their quarterly timber circular, dated Glasgow, 30th September, report as follows:—Business in this market during the past three months has shown a very welcome improvement, more activity having been in evidence than at any other period of the year, not that trade has assumed actually brisk proportions—far from it—but the movement into consumption has expanded appreciably and gives hope of being at least maintained for some time to come. General trading conditions are fairly satisfactory, all the allied trades, with the sole exception of housebuilding, being comparatively well employed, and even as regards the latter a rather more hopeful feeling prevails, and some improvement is confidently looked for in the near future. Shipbuilders have continued extremely busy, entailing the necessity for large supplies of wood goods, and this is a source of demand that seems likely to exist on its present broad basis for many months yet.

Values all over have presented a very firm attitude, with a general tendency towards enhancement, due to the steady increase in freight rates, while the restricted nature of imports, together with the moderate stocks held on this side, have also had some effect on the higher trend of prices. It would seem that high-level mark has not yet been reached in the matter of freights, and such being the case, it is only natural to anticipate that values will further appreciate in sympathy.

The extravagant cost nowadays of some of the hitherto popular timbers has resulted in persistent endeavors being made to introduce cheaper substitutes, and that these have men with some measure of success is evident from the growing request for such woods as Californian yellow and sugar pines, Siberian pines, Gaboon mahogany, and various Japanese and Borneo timbers, while a corresponding shrinkage is observable in the demand for Quebec yellow pine, poplar, &c.

A prominent feature of the market has been the scarcity of American spruce, consignments of which have come forward sparingly and proved quite inadequate to meet the demands. Riga white deals have in consequence met with increased request, and the consumption of these has this year reached record proportions.

The Clyde Shipbuilding returns show that the output for the nine months amounts to 197 vessels of 472,706 tons, compared with 179 vessels of 429,878 tons in the corresponding period last year, and 226 vessels of 357,912 tons for the first nine months of 1910. There is every prospect now of last year's output being well exceeded. Orders for new work have been booked to a fair extent, and most of the yards have sufficient work on hand to keep them fully employed for a long time yet.

YELLOW PINE LOGS:—The import over the nine months to date amounts to 2,740 loads, most of which constituted deliveries against contract purchases. The consumption has not come up to expectations, as it was thought that, with shipbuilding so busy, good demands would be in evidence, but these have not materialized to

any extent so far. As it is, the consumption of 1,529 loads is not much better than that in either of the two preceding years. The stock on hand stands at 2,057 loads, and, if not heavy, is perhaps quite sufficient. Values are merely steady.

OAK LOGS:—A good demand has existed for first-class wood at firm values, and the stock of this nature in first hands is now practically exhausted. There is a considerable holding of second-class wood, which is meeting with a limited outlet.

ELM LOGS:—Arrivals have consisted almost entirely of contract wood, and the few small consignment lots that did come forward were promptly sold at high prices. First-class rock elm of large square is very scarce, and shipbuilders are having difficulty in getting their wants supplied. Values are decidedly firm.

BIRCH:—Quebec—The import of logs was very heavy, but the consumption, on the other hand, has been exceptionally good, and there is no great stock on hand now. Values have kept surprisingly steady. Planks are scarce and values are firm. Low Port—Arrivals of both logs and planks were moderate in extent, and were all disposed of "ex quay" on arrival.

DEALS,&c.:—Quebec pine goods, apart from sidings, have arrived in moderate quantities, which is perhaps just as well in view of the apathetic demands in evidence. Sidings have come forward much too freely, and, meeting with little or no request, went into store unsold for the most part. A few sales of first quality broad deals have taken place, but at values not in keeping with shippers' ideas, the fact being that there is little call for these in the market, and buyers can only be induced by the naming of cheap prices. A fair demand has been witnessed for second and third quality 3-inch by 11-inch and up, of which there is no stock in first hands now, and values are rather firmer.

Very few consignments of spruce deals have come into the market, the little there was being easily disposed of at good prices, and the supplies on hand now are almost nil. Riga goods have no doubt come forward in increasing quantities and gone far to fill the gap.

Current quotations are as follows:

First pine deals—Broads, £39 to £43; 11-inch, £34 to £36; Ends and non-dimensions, £24 to £27.

Second pine deals—11-inch and up, £25 to £27; Ends and non-dimensions, £16 to £18.

Third pine deals—11-inch and up, £16 10s. to £18 10s.; Ends and non-dimensions, £13 to £14.

Red pine deals—9 and 11-inch, £11 10s. to £12 10s.; Narrows, £9 10s. to £10.

First pine sidings and strips—9 to 10-inch, £30 to £32; 11 to 12-inch, £32 to £34; 13 to 14-inch, £34 to £36.

Spruce deals—9-inch and up, £10 to £11; 7 and 8-inch, £8 to £9.

Lower Port pine and spruce—9-inch and up, £9 10s. to £10; 7 and 8-inch, £8 5s. to £8 15s.

A Forestry Students' Camp

By R. B. MILLER, M.F.
Professor of Forestry
University of New Brunswick

There has been a growing feeling on the part of the Forestry Department of the University of New Brunswick that they should have a permanent building on their lands, within walking distance of the college, so that students might have, from the first, the right setting for their profession.

The Engineering Department last fall decided that instead of paying someone along the Keswick for the privileges of a camp site and for clearing out lines for imaginary railroads that the camp might be very profitably transferred to the college lands. Such cleared lines could then serve admirably, at little extra expense, for roads, trails, and fire lines, while the whole tract would offer almost inexhaustible opportunities for carrying on all lines of surveying. And in the picture of this closer co-operation between the foresters and engineers loomed large a roomy log camp with great open fire-place, instead of musty, smelly tents, with no chance for office work to deaden the dull monotony of the inevitable rainy days—often a total loss to the student and a sore trial to the instructor.

The result of a combination of these two desires has now embodied itself in a log camp, on a good trail running to Corbett's Brook, less than three miles in a direct line from the college buildings. Being situated in between two brooks an abundant supply of good water is assured.

A party of fifteen men, about the middle of October, chose and began to clear off a place for the camp on a slight ridge well up from the brook. On this first day a few began felling trees on the flat across the brook and around the camp. As it was desired to have the inside dimensions sixteen by twenty feet this meant that the logs must be nineteen and twenty-three feet in length, allowing a foot and a half projection at the corners. Straight, sound fir logs were for the most part chosen, varying in size from ten to fourteen inches in diameter at breast-height. A few straight and over-mature popple were cut and all trees were marked before cutting so that too heavy a thinning might not be made in any one place. About fifty trees were required in all, and every man was found eager to fell trees but not so eager to clean up the tops and pile brush afterwards. In pursuance with good forestry regulations it was insisted upon that the crews cut off and pile all branches before taking another tree—a decided innovation to those used to the ordinary lumbering methods in New Brunswick. This lesson will no doubt be a valuable one for all classes of students and will give them an idea of how the woods should look after lumbering in a conservative manner, with proper slash disposal.

Most of the New Brunswick boys, engineers as well as foresters, have been raised near the woods and are excellent axemen, felling their trees to a nicety and 'sampsoning' them over with a short pole to the desired spot, when necessary, with the skill of veterans. Many haggled stumps betokened the work of the inexperienced but these men hung to the task, despite blistered hands, until their trees were either down or comfortably supported by four or five others.

After felling came the sawing up into proper lengths, and several were initiated into the mystery of cross-cutting with the saw without causing the other man excruciating agony. Crews were then put to peeling the logs which, in knotty timber, is no easy task until the proper kink is learned.

The work of felling and peeling proceeded for a few Saturdays with a crew of men varying in number from fifteen to thirty, from all departments. Some logs were then carried on the shoulders of

Forestry Students' Camp in New Brunswick

the men across the brook and up the slope—no easy task with green, balsam-covered logs. Three of the men, who had seen lumber camps erected, began notching the corners and putting the first logs in place. As the logs were quite large and had considerable taper, in order to keep the walls level, some had to be notched very deeply, and in many cases small drop logs had to be let in between. The work was carried on at intervals until, at Thanksgiving, the camp was three or four logs high.

During this short vacation it was decided to push the work more rapidly and three men went out and made a temporary camp across the brook, putting up the usual 'lean-to' tent used by the guides and lumbermen.

The camp outfit was taken out by pack-horse in true western fashion, with the famous 'diamond hitch' (learned from a New

Reprinted from Canadian Forestry Journal

Brunswick guide) over all to advertise the fact that we were not 'tenderfeet,' even if we had never been west of the 100th meridian. The pack-saddle, by economizing with canvas girths and using straps of moose-hide, was constructed for us by the same guide at a cost of less than $10.00 and serves every purpose of the higher priced article for short trips. There are two ropes which accompany it, one about one-quarter of an inch in diameter and thirty feet long, and the other, used for the final hitch, a half-inch rope about 36 feet long (which seems of ample length the first time you see it).

With only three or four men working on the camp during this short vacation it was found impossible to carry big logs over the brook, although we found they grew perceptibly lighter after being peeled for a week or more. The ingenuity of the boys overcame this difficulty in short order. The broad girth of the pack-saddle outfit was passed around the breast of the horse (who knew more about the woods than we did, it proved) fastened in place by the smaller rope, and the long rope used as traces, being finally attached to a short spruce single-tree, with a long enough end left for a noose to take the place of logging tongs. By snubbing the ends of the logs and swamping out paths, enough logs were soon yarded for the rest of the construction work, and the walls soon brought up to a height of seven feet, which was considered ample. Rafters of round, peeled, spruce poles were then put up, about two and a half feet apart, and spiked to the side logs. The ones at each end of the building were made double, that is about six inches apart, so that the short logs forming the gable could be dropped down in between.

A tight sheathing of second-grade hemlock boards was then nailed on over the rafters and a layer of three-ply felt put on lengthwise, and the edges tarred, a roof warranted to last ten years or longer.

After levelling off the ground inside, sills of peeled logs were sunk about two feet apart and two layers of hemlock boards put down as a floor, the first layer of cheap material, the last surfaced on one side.

The chinking, or 'stogging' of such a camp is more of a task than appears at first thought. Moss was gathered from the high ground in the woods and carried in sacks to a place alongside the building, an immense quantity being required. This was pounded in with a tamp from the outside at first, but cold weather setting in, the rest of the camp was chinked from the inside.

The camp will become, in time, the center of a large field of future operations—the construction of roads, trails, and fire lines, telephone lines, of brush-burning, of thinnings and cleanings, of cutting of logs and cordwood, of surveying, mapping and estimating, and perhaps later of some experimental work in silviculture whose results may become an object lesson to owners of timber. The entire camp has cost not over $25.00 all told, and if Yale and the other graduate schools are hungering after demonstration forests of their own, which they can handle to get results and give their men training, we think we are fortunate, and the University of New Brunswick is fortunate, in finding such a tract lying at its backdoor and knowing that this camp is going to mean getting right down to the humus from this time on.

Such is, in brief, the history of the building of this camp which means to the foresters of the University a comfortable retreat for work and recreation. Not only has it given them some valuable construction experience not down on the regular schedule, and hence more valuable, but has, as its walls rose, log upon log, from the brown earth, built up that spirit of brotherhood and loyalty to class and school which we believe to be one of the strongest assets in the future. More than that, it has brought a little nearer to all that invisible spirit of the woods which the forester feels but cannot explain to others, that spirit which makes him a fighter and transcends salary or worldly honor and leads its recipient to struggle through muskegs and over mountains, along the unblazed trail—'a pioneer in a new profession.'

Lumbermen's Arch a Decorative Feature

One of the features of the decorations in Vancouver on the occasion of the recent visit of the Duke and Duchess of Connaught and Princess Patricia of Connaught, was the lumbermen's arch. It was a portico in the earliest style of Greek Doric architecture, and was a massive and attractive affair. Its base consisted of eight logs, 4 feet in diameter and 20 feet long. On top of these was a superstructure made of great beams and covered with split logs and shingles. Circular and cross-cut saws, peaveys and pike poles were on the arch. The feature was so very favorably commented on that it has been decided to re-erect the arch in Stanley Park as a permanent fixture. The committee of lumbermen who had the matter in hand consisted of J. Hackett, A. Cotton, Joseph Chew and F. Beecher.

The paper mill at Thorold, Ont., which is being erected by the Ontario Paper Company, Limited, is about half completed and the company are in the market for machinery.

Preventing Waste in Forest Products

Economy in Methods of Utilization—Education of Public to Use of Lower Grades—Co-operation the Great Requisite

By E. J. Palmer*

In approaching the subject of economy, it is necessary at the start to overcome a popular belief that true economy consists in the using of something that would either on the one hand be a total waste, or on the other hand be used to a much lesser extent, not taking into consideration the cost of such use.

If the cost of producing any article of commerce is greater than its value to the ultimate consumer, in place of its use proving an economy, it proves to be a loss.

Any operation proving to be a loss to an individual, is a loss to society as a whole, a natural product manufactured or produced in a useable form, has to show a profit to the producer in order to increase the wealth of the nation.

In considering forest products the majority of people are carried away with the belief that if a portion of our forest which has in times past been allowed to waste, can now be produced for consumption, that we are making a distinct gain and are increasing the wealth of the country to just that extent.

While it is true that it is not what a nation or individual makes, but what it saves, that constitutes its wealth, and with this in view, we as a people are making frantic efforts to make more from our forest wealth, but are losing sight of the fact that true economy calls for a profit to the producer.

Our forests are a vast heritage handed down to the present generation, to a large extent in trust, for the use of the generation that is to follow, and it is true that we should make every effort to conserve that wealth as much as possible, but must not lose sight of that fact that we have the present generation to serve, and our policy should be one that will not only conserve to the coming generation what rightly belongs to it, but will at the same time increase the wealth of the present generation, supply its demands and practise a practical economy in the handling of our forest products.

The waste in handling the products of our forests is enormous and a goodly proportion of such waste can be laid at the doors of the logger and sawmill man, but still the public is responsible for a considerable amount.

Educational Work Required

In order to permit the operators to practise greater economy that is practical, it is necessary that a great deal of educational work be done with the ultimate consumers of forest products. The consumer should be taught the difference in grades of lumber, should be shown why the higher grades cost more to produce, why it is waste to use a better grade than the work calls for, why long lengths of lumber should not be used when short lengths will do as well, in short the consumer should be drilled to the use of wood products without real waste.

With our present systems of handling logs in logging operations and with the nature of the timber to be handled, it is not practical to leave standing timber that is at present unmarketable, the fire risk being so great, and the cost of overcoming this risk by cleaning up brush, removing tops of debris, etc., being prohibitive; consequently it is necessary to remove at once all timber that is intended to be marketed at the one operation. It is therefore true that a great deal of useful material is left in the woods to be either destroyed by fire or decay.

If the public can be educated to the use of the lower grades of material, such as would be manufactured from the tops or small trees, or from defective trees, showing stain, shakes, etc., a great deal of material now left to be destroyed could be utilized, and a practical economy practised.

The manufacturers of wood and wood products must use the same energetic means of advertising as the manufacturers of wood substitutes and to my mind, the most important is to bring the public to the knowledge that it is a partner in the vast wealth of the country, and in increasing the use of wood and wood products they are increasing the wealth of the nation.

Under present conditions it is a hard matter to market much of the material now going to waste, the lumber manufacturing plants are largely built with an idea of handling large material—the machines used are of a heavy pattern, too slow and clumsy to handle to advantage small sized logs, but the time is coming, in fact is now here, when manufacturers in planing mills, must plan on handling not only the larger sized timber, but also on manufacturing short and small timber, either in the main plant or with auxiliary rigs.

Smaller sized timber can now be manufactured to a profit with suitable machinery, trees down to 9 in. in diameter at the top should

*Address delivered before recent Canadian Forestry Convention.

be utilized in the manufacture of lumber—this will result in a great economy.

The Use of Lower Grades

The manufacturers of lumber, assisted by the Government, should bend every effort towards educating the consumer to use a lower grade of lumber for many purposes, and should also invent uses for lower grade lumber in cases where other material is now used, when the tops of trees, strained and conkey logs can be utilized, a further great economy will be practised.

Preceding every logging operation should some the pile and pole outfit, and all this class of material should be removed before the larger timber is fallen. If the piles and poles are left until actual logging operations commence, much of the smaller material is broken and damaged by the larger timber.

There is a growing foreign market for poles and piles, and I think that the Government should encourage the exportation of this class of material, under proper supervision. There is no further manufacturing or labor spent on this class of product after it leaves the province and, with but a limited market in the Dominion, steps should be taken to push the market in other countries, as the bulk of the small cedar and fir trees are left in the woods, after logging operations are over to be destroyed by fire. A great economy can be practised in the utility of this asset.

The farmer and settler should be educated to leave the timber on his claim alone until he is in a position to absolutely clean up the land and put it under cultivation.

The people should be taught to think of timber in the terms of dollars and cents, so that it would be no more likely for a man to destroy standing timber than it would be for him to throw away a handful of dollar bills.

Practical economy can only be practised by the co-operation of all concerned, that is—the operator, the manufacturer, the consumer and the Government. Any economy that does not mean a profit to the operator and manufacturer is not practical and will not prevail.

In the collection of taxes and stumpage, the Government will be enabled to further practical economy, by making it possible for the operator and manufacturer to handle much material that is now going to waste. As long as the tax and stumpage on Government land is the same on large sound merchantable timber as it is on the small or unsound unmarketable timber, the operator is bound to leave the latter in the woods, as it would not be practicable to remove same, nor would it be an economy if same was removed at a loss.

In a word, to secure greater economy a market must be established for the material so saved. The operator and manufacturer with such large supplies at their back, are not very keen to establish such a market, and it is for the public and for the Government to create a demand for material that is now wasted.

Creating New Demands

There are certain operators and manufacturers who are farseeing enough to realize that a demand can be created for the material now going to waste, and are arranging their plants accordingly. These firms are making every effort to bring before the public the merits of wood paving blocks, the necessity of cheaper and better wood preservatives, the foolishness of using high grade material where cheaper material will do as well, such as forming for cement buildings, but these firms are meeting a very serious competition from firms who are logging in the old fashioned way, taking off the land nothing but the best of the timber, leaving all of the small growth, rough timber, defective trees, to be destroyed by fire after their operations are over.

These firms have no interest in the timber further than to get the best grades at the cheapest possible prices, their better grades of logs costing them no more than the logs of the firms who are trying to log the land clean, who consequently get a large percentage of cheaper grade material, and they are prepared to sell a high grade of material at the same price as the other firms offer a lower grade. This seems at first glance a gain to the consumer, but on second thought you will see that it is no gain to the consumer, who is using a good grade when a lower grade would do just as well, necessitating the waste of just that much of lower grade, and the loss to the country of that much natural wealth.

This competition is unjust, and prevents a great deal of true economy in the utilization of forest products. This competition can only thrive where no proper supervision of logging operations is carried on. It should be incumbent upon the operator to clean the land of all timber that can be marketed under existing conditions. It is the peoples right to insist that this be done—they are interested in this forest wealth, and the Government should see that no undue waste is made in handling the estate of the nation.

With an immense market on the prairies, right at our door, ready to absorb a large amount of material now going to waste, some steps should be taken at once to enable the manufacturer to get this material to the consumer with a margin of profit to himself. With the opening of the Panama Canal, and with the new railroads now building to the coast with easier grades, think if representations were made, that the railroads would be willing to co-operate toward the end of utilizing much of the forest products now going to waste, by establishing cheaper rates on low grade material. The heads of one of our transcontinental railroads recently made a statement to the speaker that the lumbermen of the Pacific coast were annually burning up 50,000 carloads of lumber on which they should be making a profit, and on which the railroads would be earning freight, and personally I think that this is a conservative estimate.

The Government, standing as the representative of the people, should insist upon the proper handling of our forests, by persuasion, by education, or by force, and the great annual waste (a loss to the nation which cannot be replaced) will to a large measure be stopped.

Practical Steps Suggested

Some practical steps towards this end can be instituted at once:

1. The manufacturers, with the assistance of the Government should educate our city engineers and councils to the use of wood pavements. The best pavement in the world is wood pavement when the blocks are properly selected, properly treated and properly laid.

The best wood paving blocks are manufactured from small close grained timber. A large quantity of this material can be secured from small second growth timber now left in the woods.

2. Manufacturers should be induced to pay more attention to the drying of cedar shingles: too many of them pay more attention to the under weight, than they do to the life of the shingle, and the shingles are cooked to death in the kilns. There is no better roofing material in the world than red cedar shingles, when properly manufactured and properly dried, and if dipped when laid or properly painted, they are far more superior to any of the patent roofings now on the market, and just as nearly fireproof. Vast amounts of No. 2 cedar is now left in the woods, suitable for this manufacture of shingles. The market for shingles can and should be extended, and by judicious advertising, in which the Government should assist, and this can be done with very little delay.

3. The market for poles and piles should be exploited at once. Treating plants should be erected for the handling of this class of material. The Government should aid in extending the export trade in piles and poles.

4. In all government works, where lower grade material can be used to as good advantage as higher grade material, shorter lengths used in place of long lengths, etc., specifications should be so drawn up. For instance a great deal of common cedar could be used in the shape of mud sills, blocking, etc., for which fir is now specified. This can be manufactured out of a rougher grade of cedar log which now largely goes to waste.

5. A systematic campaign of advertising should be carried on by all manufacturers, and the assistance of the public should be secured in the utilization of odd and short length material, lower grades of material where they will answer the purpose, and new uses for timber demonstrated to take the place of wood substitutes, and remember that every thousand feet of logs utilized by busy manufacturers into lumber means $10.00 distributed to labor.

Indispensible to Lumbermen

A twelfth edition of Baughman's "Buyer and Seller, the Handy Book for Lumbermen," has just been published. Since its last appearance this work has been thoroughly revised and many important additions and alterations have been made. The information has been so carefully compiled and the explanations given are so lucid, that it is an easy matter even for a layman to find the information he requires. For anyone engaged in the lumber trade the book is of great value. Baughman's Buyer and Seller is published in the large or desk size and a smaller edition for the pocket. The book is of inestimable value to lumbermen, carpenters and builders and may be secured fro H. R. A. Baughman, Indianapolis, Ind., U.S.A.

Lumber manufacturers in the province of New Brunswick have been greatly handicapped during the present year on account of the excessive freight rates upon lumber to the Old Country and to the markets in the United States. It would not seem reasonable that these rates should continue without corresponding increases in the price of lumber and the manufacturers were confident that such an increase would come about during the present year. That their faith was justified is illustrated by a letter recently received by the Canada Lumberman from a prominent firm of manufacturers of St. John, N.B., who say:—"As we told you recently we feld that the English market would advance. Our faith has been justified and we have reached about last year's prices for our deals. If things hold as they are now, without any great strikes or political outbreaks in either England or the United States, we ought to have a good year in 1913."

Topographical Surveys and Logging Plants

By H. P. Henry*

At the best, logging is an expensive proposition, and the almost universal experience of operators in this section is that they cannot ignore the topographical features of their holdings, as costly blunders are sure to occur, unless carefully laid out plans have been adopted at the beginning of an operation.

The "easy chances" have many of them disappeared, and operations must now be extended to the less accessable areas, where logging is growing to be more and more a mechanical and engineering problem.

No department of the lumber business offers such opportunities for losses—or for a lessening of expense by well laid and carefully executed plans—as does logging.

The man who builds a house without a full set of plans, usually has to pay for a whole lot of "extras." The "extras" of the logging business are frequently your lost profits.

Despite the fact that modern logging must be carried on on a scale which requires the investment of large capital, and the expenditure of immense sums of money, many outfits leave the location of their railroads, and the planning of logging operations, to incompetent employees whose mistakes lead to "extras" in the way of wrongly located spurs, excessive grades, poorly placed landings, and long donkey hauls, etc., all of which add very greatly to the cost of logging.

We will show in this discussion that topographical surveys and comprehensive logging plans will do away with these unfortunate and useless blunders.

As to cost: This work can be let under contract to a reliable and responsible firm which charges according to the character of the country from 15 to 30 cents per acre. The work will be done by competent and efficient engineers, especially trained in this line of work.

Taking 25 cents per acre as an average cost in difficult country, this will amount to $160 per section and about $5,760 for a solid township of 23,040 acres, more or less. In easier country the cost would be less.

This covers the cost of a careful topographical survey which, when completed, will show the contours of the hills, the exact location of the main line and branch lines of railroad, in such a way that comprehensive logging plans can be worked out for your entire operation.

It would be advisable to have an estimate made of the timber on each ten-acre tract at the time the "topog" is made, to determine just how to locate the road to handle such timber. Such estimate of timber will cost from 10 to 15 cents per acre, in addition to the cost of the topographical survey.

If your tract is smaller, there is all the more need of your having careful plans of your future operations, as the small logger can less afford the loss of money caused by a bad blunder.

The cost per thousand is practically nil. For a section carrying 32 million feet, the cost at $160 would be $.005, or five mills per thousand.

Generally speaking, this work will pay for itself by virtue of undoubted savings which it will bring about in two departments of logging operations, namely:

A. Railroad Construction and Operation.

B. Yarding and Roading Expense.

Under the railroad division of this work there are six points to which I will call your attention at this time:

1. There is a certain amount of mileage which it will be absolutely necessary to construct in logging your tract of timber. It can easily be seen that the mileage actually built can be greatly increased by a lack of comprehensive plans.

As a general rule the bottom of a ravine or water course is not the best place to build your railroad. However, it often appears to be, to a superintendent who hasn't the necessary engineering ability or experience, or time to properly investigate the country prior to locating his railroad, and he constructs his line up the most available water course, until excessive grades stop him; then he resorts to switch backs, and when he can get no farther, puts in a couple or three donkeys. If by lack of a comprehensive plan you build about one extra mile of spurs in logging thirty-six sections of timber, you have paid for the cost of a topographical survey. Besides that you have added very greatly to the cost of your logging.

2. Under this topic comes also the construction of spurs without any definite knowledge of the tonnage that will come out over each road. To build either too cheaply or too well in any instance, is an expensive error. A topographical survey and estimate of timber shows the territory and timber which will be served by each spur.

3. Another error in railroad construction occurs when an operator builds blindly ahead figuring that he can "get over the divide all right," only to find his mistake, have to tear up a mile or two—or more—of track, and get a fresh start from lower down, very frequently building this second line through denuded territory. This construction is wasted.

4. By having a contour of your lands, the daily cost of operation of your railroad will also be lessened through the elimination of the excessive grades and curves, usually found in an unplanned operation. Steep grades are hard on rolling stock, use up lots of fuel, and generally provide an occasional wreck for excitement.

5. Another important consideration is that by knowing all the data brought out by a careful survey of your tract, you can intelligently determine the exact size, power and type of locomotive you will need. You would not then buy a rod engine, when a geared locomotive should have been purchased, or vice versa.

6. There are many other important details too numerous to mention, which are indicated by a "topog," such as the location and amount of water available for donkeys and locomotives, roads, trails, burns, clearings, and other physical features.

B. Even more important than plans for the location of your railroads, which will only cost about $500,000 for a township, is the planning of your logging operations on the entire tract for years in advance; as the cost of yarding and roading will cost in the neighborhood of $1,250,000. Under this subdivision, we may note the following points:

1. By a careful and detailed study of the maps furnished by the firm which does your work, you can easily determine just about where each landing should be, as you can see at a glance how much, and just what timber should come to each landing to the best advantage; and even though you may not plan to build an adjoining spur for several years to come, you will know how far to yard your timber, without getting onto ground that will be more accessible from the other proposed spur.

Very recently, an operator on the Columbia River whom I know, saved thousands of dollars by seeing, through reference to his "topog" map, that his superintendent's proposed extension of a spur up a steep grade to get out a certain body of timber, would be a mistake. As it is, that particular timber will not be taken out for a number of years, and will come out from the other side of the hill, at a greatly lessened expense. Many times these "hard shows" of which we hear so often, could have been avoided by waiting a few years, and taking the timber from the other side.

2. By having a map you and your superintendent can plan out all important details of your operations to the very best advantage. But should you intrust some of the minor plans to him, you have a means of preventing errors of judgment on his part, before they have cost you money.

3. All of you have heard of instances where a logger has a body of timber that is "inaccessible" by rail, and he puts in several extra yarders, cleans up the timber, and then finds out that he must later build his railroad through this denuded land from another direction, in order to reach another part of his holdings. A "topog" would have avoided such an error.

4. Many outfits have to keep up a regular average output. To do this when your whole crew is working in a hard country, strains your organization to such a point that your cost per thousand is raised to a figure really higher than the show warrants, as nothing seems to work together. A "topog" will help you to plan your work so that only part of your crew has a hard show, while the balance is working in an easy country, and you thus maintain your average at a minimum of expense.

5. You can plan the moving of your donkeys to much better advantage, if you have a "topog." Many times the cost of that spare donkey you think you need, would be saved by planning ahead more.

Another suggestion that is in point is that a contour map will be valuable in the opening up, subdivision, and sale of your denuded land. This should be apparent without further detailed discussion.

Having made the above suggestions as to the admitted advantage of having this work done, the next point we should discuss is the method to be pursued, and the degree of accuracy to which it is necessary and practicable to go.

A study of the proceedings of previous sessions of this Congress indicates that the only method that has been suggested as being practicable for the taking of "topog," is by means of the aneroid, either alone, or in connection with the barograph.

Now, for certain purposes, such as detedmining elevations over a small scope of comparatively easy country, the aneroid might be O.K., but when you use it to contour a large tract of timber, which is to be logged by rail at enormous expense, the questionable accuracy of that instrument becomes too serious an objection for its use—either alone, or even with the barograph.

Where hundreds of thousands, and even millions, of dollars are to be spent in logging operations, your levels need to be taken with mathematical exactness, so that no serious errors can creep in.

* Paper read before Pacific Logging Congress at Tacoma, Wash,

If this work is to be done at all, you will want it done so that it can be absolutely relied upon in the future. You pay out good money, and you want something in return that is correct.

It is the concensus of opinion among men familiar with the work of the aneroid, that it cannot be relied upon for accurate results over any extended scope of country, even when operated by very experienced men. Local storms on one side of a divide, differing climatic conditions at the same hour in camp and on the work, drafts of air of varying density, etc., etc., are contributing factors, even where your results are checked with a barograph.

The aneroid has even been known to register a raise, when being carried down hill.

Without entering too greatly into uninteresting detail, I will say that by this new system of topographical work, the contours obtained by the aneroid are checked up every half mile with lines of spirit levels previously run by regular engineering instruments, and which are practically true elevations. By thus checking up every half mile, the aneroid is not given a chance to get off very far, and if it is off, the variance is caught, and the ground platted as it really is.

Furthermore, if an important divide is located in the interior of a section, the aneroid is not relied upon, but the true elevation is run out with compass, chain and level. Thus in running out your line later, you have practically exact levels, and do not have to figure on any margin of safety, as your plat indicates the true elevation of any controlling points.

I think that you will agree with me, that when careful, accurate work of this character can be contracted for, at from 15 to 30 cents per acre, there is no need of relying upon the vagaries of an aneroid. This work is even more detailed and painstaking than that done by the United States Geographical Survey in making many of their quadrangles. There is absolutely no guess work about it.

I do not wish to appear to suggest that a "topog" is your only and sole hope of dividends; and it is not necessarily true that you will find it best to adhere to the original plans in all details, but it will always be something for you to "shoot at." Most of the members of this Congress are responsible for "dividends." On account of press of other matters, you are generally forced to delegate to someone else the details of planning your operations. Your confidence is possibly never shaken in the ability of that employee until, after a "hard show," your investigations prove that a mistake has been made. It seems that many of these "post mortems" could be avoided by having a "topog" made. By adhering to, or improving upon, the original plans, you can be positive that you are taking out a maximum of timber with a minimum of expense.

It is hoped that the suggestions made, may be the means of so calling this subject to the attention of loggers, that more contouring and planning may be done, and that as a consequence, more of the famous "Scientific Management" may be used in logging operations.

THE WOODWORKER

Cost of Manufacturing Wooden Boxes

The cost of box-making was discussed very thoroughly at the recent meeting of the National Association of Box Manufacturers, held at Detroit, and a most interesting and valuable report was presented by a special committee on cost finding. The report, which was unanimously adopted, was as follows:

We recommend that a committee of nine be appointed to investigate and adopt a uniform method of figuring boxes with a proper cost finding system, that said committee be authorized and directed to employ an expert to assist in developing and installing said system in different zones. Further, this committee recommends that the members of this Association agree to accept the recommendations of this committee and agree to install the system until it has been fully developed; but before this resolution is moved and passed, I have been asked to make a few remarks along the lines of what we have been working on in Buffalo and Tonawanda. We went at this question, feeling that if we could figure out a uniform method of figuring cost, that it would cure probably 90 per cent. of the low prices. The first thing we did was to ask twelve different members to figure four classes of boxes in feetage. We found that the variations in feetage between the high and low, was 12½ per cent.; in other words, there was a difference, with all good intentions, of $3.00 a thousand in boxes right there. We then made up a set of rules that would cover up discrepancies in the different methods of figuring, which I will read to you in a minute. Now, to bear out my remarks, I am going to pass around the uniform card that we adopted and explain it to you. It is not foisting any system on you, it is simply to point out that there is a way in which this committee, when appointed can work out some method that we all can use, and a discrepancy of feetage and the other discrepancies that one man loses sight of and another loses sight of, can be met and overcome, and I think we want, in all good part, to take the recommendation of that committee, whatever it is, and carry it out. This committee will be one from each zone; one from Buffalo, Tonawanda, Cleveland, Bay City, Chicago, Norfolk, etc., and if we can adopt a uniform method throughout the United States in figuring, it doesn't mean that you will follow any set prices for waste or anything—you will have as much competition as before; one man's overhead will be different from his neighbor's, but he will supply the overhead in the same method as his neighbor, so the relative difference won't be great. All manufacturers pay about the same price for lumber and the item of feetage is about the same so you will arrive at pretty near the same result, and instead of going out with a price of twelve cents, you will find that your price will be higher, fourteen or fifteen cents. (At this point the speaker passed around in the audience the typewritten recommendations for uniform method of figuring shooks and nailed boxes.) Now, you will see the heading of it gives the style of the box, the number of the box, and the length, width and depth. Now, under the heading of lumber on the side there, we have the ends, the cleats, the sides, the tops and bottoms. We figure out the num-

ber of feet for each one of those sides, because oftentimes, you might use different priced lumber in the bottoms and different priced lumber in the cleats and on the sides. We adopted a rule that any one-piece side box 8 in. in depth and deeper—we arbitrarily arrived at an arbitrary differential of $2.00 a thousand more for 8 and 10 in. than the cost of your lumber, on the theory that the market price for that wider lumber was more, and then that allowed a man who wanted to work up his narrow lumber and had two-piece sides—it brought the two-piece side lumber a little below the price of one-piece, because a man is not going to buy a two-piece side box unless it is cheaper than a one-piece side box.

In our matching after a series of tests in order to give an easy method of figuring, we found that 5 per cent. added to the width, if your bottom is 14 or 15 in., say, that 5 per cent. covered the matching as an average proposition. There's our item for gross feet. Then we started lumber, as you see, at the cost price delivered at the mill; then we added a column for milling, because different parts may be milled in different ways; then that starts out in prices per 100 boxes, then the manufacturer puts in what his expense is on waste, then you bring down into that column the value of your lumber; then, under labor, we itemize the different items. We stopped at the 1,000 feet figure as absolutely wrong. Between No. 5 and No. 6 there was a difference of 100 per cent. in labor cost. Between No. 5 and No. 6 and between some other two, there was fifty per cent. difference, and a man figuring per 1,000 feet, was simply striking a happy-go-lucky guess as to whether he hit the average or not. We find that No. 5 was high in cost on 80 per cent. of his boxes. When he got the order he got 80 per cent. of the high-priced orders and was way behind in his profits. Then again, your waste will vary individually. If you have a long box, like a soap box, there is more waste than on a smaller canned goods box; so each box should be figured individually; then you can put these cards into a drawer and the next year, when your customer comes around, all you have to do is to pull the card out and you don't have to figure them over again. In itemizing all the different operations—when you figured per 1,000 feet, you didn't get in a whole lot of things, like cutting and rip-sawing, matching and driving up, resawing, printing, including ink, nailing, handholing, grooving, mitering, cleating, putting together—whatever you do in there, you figure out the cost of those different operations and that becomes your labor cost. Then we found there was an item of lost labor, as we called it; then there's an item of non-productive labor for sweepers and all of those things. We kept the productive labor separate from the non-productive pay roll and found what per cent. of the labor that was and added that in. Then our overhead, we found there were as many different ways of spreading overhead as there are hairs on a cat and we adopted this plan—we say to a man, "You've got a carload of crates with 24 cuts in it; there are 22,000 feet in that car. If you saw a carload of apple boxes that has six cuts in it, if the price per 1,000 for overhead is $2.00 and you are through to-night, in that case you are earning $44 by night, but if you are sawing three days, you earn $44 at the end of three days." We had to arrive at some way in which the overhead would follow labor. Now, there's lots of labor on a beer box. We arrived at a per cent. and the way we arrived at that per cent. was this; we took our entire labor cost last year, the total amount of money paid out for labor, the total amount last year for overhead and the overhead was such and such a per cent. of that labor, then if labor costs 4 cents to make a box, and your overhead is 75 per cent. of your labor, the overhead is 3 cents. If your labor cost is 1 cent. the overhead is ¾ of a cent; but at the end of a day, every saw has equalizers, and then there are your profits and freights.

Now we come to this sheet; this is what we call a proof sheet. I may have sold Mr. Porter 1,000 boxes. This proof sheet is simply a series of columns to prove out your figuring at the end of the month. The first column is net feet per 100 boxes. You take a card out of the file and transfer these figures on to this sheet, the actual net feet shipped, and then the percentage of waste you figure here, which is so many feet, and when you come to the end of the month, your net feet is so much and your waste is so much and that may total 1,000,000 feet. After this thing is filled out by your bookkeeper it is turned over to the accounting department and the number of feet actually brought in is put down. You find there's 1,100,000 feet brought in, so you are short 100,000 feet; or maybe you are on the right side of it. It proves up whether you have been paid through your invoicing for the feet you drew. If you are short, or if the value of the lumber drawn in was more than you were paid for, that comes from the fact that in cutting up a board, you might strike a rotten end and it might be laid aside to be put into a cheaper box and immediately there's a drop there. We covered that after running this thing two or three months. You find that drop in every factory, unless you are cutting one grade of lumber. Then we arrive at the per cent. of what that drop is and cover it with that per cent. so the invoice in the following month will bring it up and cover that per cent., and it is the same with labor. This item of labor is just transferred on here, labor per 100 boxes, total, so much. At the end of the month you have been paid through your invoices for so much labor. Your ledger shows that you paid out $500 more labor than you got paid for—either your figuring is wrong or something else is wrong and you go hunting for it. This is simply a proof sheet that most every firm has a man figuring on. This puts it up to the head of the firm to know whether he is being paid through his invoices the full amount of what he is contributing; and the same in freight and overhead expenses. Your expenses are so much a hundred boxes. At the end of the month, you've got your overhead figured up and tested with your ledger and can see if you have been paid. That's what we call a proof sheet. The two work together. We found that invaluable, because it's human nature, when you see a thing wrong in front of you, you correct it; you go at it right off to find out where the trouble is, and if you can't find it, you cover it by your precentage. The method of figuring has been wrong somewhere, and that's the proof of it. These rules that we made up are as follows. I will just read them quickly. This is only an amateurish proposition, but it has been very effective with us and it is held out to show that some such system can be worked up and when worked up, it ought to be accomplished, because uniformity of figuring will cure our troubles.

RECOMMENDATIONS FOR UNIFORM METHOD OF FIGURING SHOOKS AND NAILED BOXES

Style No. 1 Box

One Piece Throughout.

Figure even widths only; any width over stock width to be figured on next highest even width.

Any or all Parts Matched.

On matched parts add 5 per cent. to net feetage of part matched, except on 2 pc. parts, where stock width will work to best advantage, in which case do not add for matching.

One Piece Parts.

Figure as on straight one piece box.

Any Part of Two or More Pieces Not Matched.

To be figured net frontage.

General Rules for Above

Add to inside length exact thickness of ends for figuring lengths of sides, tops and bottoms, except where lengths will fall on any ⅛ in., in which case use next succeeding ¼ in.

Example: For ⅞ in. ends add 1¼ in.
13/16 in. ends add 1¼ in.
11/16 in. ends add 1½ in.
9/16 in. ends add 1¼ in.

In figuring width of tops and bottoms, and actual thickness on sides.

NAME	SIZE OF BOXES	Style	Quantity	Net Feet Bd. M. Per 100 Boxes	ACTUAL NET FEET, Bd. M. In Boxes Shipped				WASTE
					Dove Tailed	Nailed	Shooks	%	Actual Feet Bd. M

Material diagram suggested by the Cost Committee

except where width falls on any ⅛ in., in which case use next succeeding ¼ in.

Style No. 2 Box

All parts unmatched to be figured on actual cutting lengths and widths.

On any matched parts add 5 per cent. to net frontage to cover matching. Cleats to be figured on actual cutting lengths, and ripped ⅛ in. narrower than figured.

Example: 1½ in. cleat rip 1⅜ in.
2 in. cleat rip 1⅞ in.
2½ in. cleat rip 2⅜ in.
3 in. cleat rip 2⅞ in.
(See second paragraph, General Rule).

Style No. 3 Box

Same rule to apply as on Style No. 2 as regards Ends, Sides, Tops and Bottoms, and Matching.

Cleats to be figured on length of longest edge.

Widths, same as Style No. 2.

Style No. 4 Box

Same rules to apply as on Styles No. 2 and No. 3.

On Cleats—apply same rule as on Style No. 2.

General Rule No. 2

1st. Always figure feetage of each part of box separately, using Leaver's Box Estimator.

2nd. All cleats to be figured (whether made from whole lumber or waste) on net contents, and on account of increased cost and decreased output we recommend advanced prices for cleats over and above base price of shooks, on the following scale. Cleats containing:

1 to 3⅜ ft. net per 100 cleats, add .....100 per cent.
4 to 5⅜ ft. net per 100 cleats, add ..... 75 per cent.
6 to 15 ft. net per 100 cleats, add ..... 50 per cent.
16 to 30 ft. net per 100 cleats, add ..... 20 per cent.
31 to 50 ft. net per 100 cleats, add ..... 10 per cent.
50 ft. and over net per 100 cleats, add price of shook.

3rd. Do not figure to ⅛ in. on any dimension; use next succeeding ¼ in.

We recommend the following methods of figuring:

Stock widths 8 in. and up $2.00 M higher than promiscuous.

Lumber—Rough, at mill, per M ft.
Mill work, per M ft.
Waste, per M ft.
Labor—Cutting and ripping, per M ft.
Matching and driving up, per M ft.
Resawing, per M ft.
Printing, if any, including ink, per 100 impressions
Nailing, if any, per 100 boxes,—according to style and size.
Hand holing, if any, per 100 holes.
Grooving, if any, per 100 grooves,—according to length of groove.
Mitering, if any, per 100 boxes.
Loading, per M ft.
Tying, per M ft.
Non-productive labor, on basis of producing labor, estimated 25 %.
Materials—Glue, per M ft.
Nails, per 100 boxes; on cleating figure one nail to each 2 in. or fraction thereof; on nailed boxes, figure one nail to each 2 in. or fraction thereof on sides and bottoms across ends. Add side nails in bottom.
Twine, per M ft.
Fasteners, per 100 boxes.
Wire, per M ft.
Overhead expenses—On basis of labor.

See examples following:

Style No. 1 Box—18 x 14¼ x 8 Nailed up; printed. 2 sides in 1 color.

⅞ 1 pc. End D2S
⅜ 1 pc. Side D1S
⅜ 3 pc. T & B D1S&M & Glued

	Feetage			
End 14¼ x 8 x ⅞	1,584	at $30.59	per M ft.	$4.85

			$15.41
Profit, 10%			1.54
Price per 100 shooks, f.o.b. mill			$16.95

Thickness shall be figured as follows:

1/4 in. D1S 1/3 of 5/4
5/16 in. D1S 1/3 of 5/4
3/8 in. D1S 1/2 of 4/4
7/16 in. D1S 1/2 of 4/4
1/2 in. D1S 1/2 of 5/4
9/16 in. D1S 1/2 of 5/4
5/8 in. D1S 1/2 of 6/4
11/16 in. D1S 1/2 of 6/4
3/4 in. D1S or D2S full 4/4
13/16 in. D1S or D2S full 4/4
7/8 in. D1S or D2S full 4/4
15/16 in. D1S or D2S full 4/4
1/4 in. Rough 1/3 of 4/4
3/8 in. Rough 1/3 of 5/4
1/2 in. Rough 1/2 of 4/4
5/8 in. Rough 1/2 of 5/4
3/4 in. Rough 1/2 of 6/4

We established a uniform method of figuring thickness. We have found fellows that would go to work and work their heads off picking out lumber that they could get ½ in. and ⅜ in. and call it 1 in., and we remedied that as shown above. Now, the object in presenting this thing was to convey to your minds the fact that it is possible, having been demonstrated, that a set of box makers can work from one uniform system of rules, and we recommend strongly to the committee that the Association empowers this committee to work out such a system of rules and uniform practices that we can all adopt and that we do adopt them when we get them and that this committee have authority to employ somebody that will make it his business to go around in zones, go to Bay City, for instance, and stay there until he explains the whole thing and get them to work on that basis. You leave them to put in their own figures; we are not asking them to agree to anything, but we know the advantage of starting from a common standpoint, and they will have no trouble at all. That is the only object in printing this out, to show that it is possible. We have accomplished it in our section and cured a lot of our troubles and the other day, on some boxes where we all figured in competition, without anybody knowing the other fellow's figures, there was a difference of only .59 of a cent. on a box that cost $1.40—and nobody knew the other fellow was figuring on it. The object is simply to arrive at some common practice, and that shows how close we can come. Our trouble in the box business is that everybody does it differently and I hope that the Association will appoint such a committee. The committee was authorized to make up a list to cover the different zones and we recommend the following persons for this proposed committee:

I might just add one thing; in working this thing out, all differences have disappeared between us and it is astonishing, when we first tackled it, what different results we got from what we had been doing, and yet, as we studied each individual item, our members couldn't see where they could cut them in any case, and they'd go to the customer with that cost before them and put their feet in the ground and stand there till they got their order.

About the Humble Bung

Consider the bung.

The bung is the blushing violet of the wood specialty field. Modest, unobtrusive, it performs its work, and it is seldom that the calcium light is thrown in its direction, or that industry stops to give to it the meed of praise which it deserves. But regarded as a commercial proposition, the bung is some product. Like the pin, nobody knows what becomes of it, and yet it takes millions to supply the demand.

A lot of time and thought are spent on devising the best plans of making tight barrels. Manufacturers of machinery for making staves and barrels have worn permanent corrugations in their lofty brows figuring out new ideas, and incidentally providing a round hole for the bung to stop. Few of them, however, have ever thought much about the bung itself. It has been taken for granted.

Every little barrel has a bung-hole all its own, and consequently needs a bung to stop it, once the package is used for the purpose intended. But this is not all. The barrel frequently lasts for many successive uses, and each of these require a new bung. Thus the whisky barrel, that aristocrat of the tight package field, can be utilized

* Reprinted from the Hardwood Record.

but once by the distiller, but after it passes from that industry it goes to the vinegar, pickle or oil handler, and requires a brand new bung in order to carry out its work in the new field to which it is introduced.

The beer-keg, as most lumbermen know, is a busy little worker, lasting for a couple of years or more, with re-coopering, and after the thirsty consumer has emptied it each time, back it goes to the brewery—but minus its bung. Therefore the brewer is a regular customer of the bung manufacturer, and the quotations on bungs, f. o. b. the Brauhaus, as we of the Vaterland have it, are studied just as carefully as the stove founder looks at pig iron prices.

The bung is one of the most versatile members of the forest products family. Instead of being exclusive and snobbish, as for instance, the whisk stave is, and insisting that only wood is good enough for use in its production, the bung embraces them all with a wide and inclusive affection that bars the gates to no wood that has enough clear material to fill the bung-hole in a tight and workman-like manner. In fact, while the bung is usually made of poplar, it is not unusual to find oak, gum, cedar and even pine figuring in its manufacture. Poplar, however, is the father of the bung, and Mr. Poplar Bung is the most important member of the Bung family circle. Oak Bung is a rather sizable youth, but Gum Bung and his little brothers are merely small shavers who are given a place at the second table and not allowed around when company is present. That, however, doesn't affect the truth of the statement that bung manufacturer permits the use of a wide variety of woods.

It is rather surprising to the uninitiated to learn that the bung requires a pretty good grade of lumber. At first blush it would seem that the bung producer would make money by buying up low-grade material, working up the good and throwing away the rest, since a bung of standard dimensions is 1 15/16 inches across the top and is one inch in height, so that not a great deal of material is required to make it. The bung factory manager has evidently learned by experience that the losses through waste, as well as the expenses of handling and inspection, are so great as to justify him in specifying a rather good grade, and consequently the bung gets No. 1 and No. 2 poplar, for instance, and correspondingly good quality in oak, gum and other woods which are used in this business.

The board which goes into the bung factory must be clear, and must be without sap stains or worm-holes. Poplar is easier to get in what might be called the "bung grade," and this may account for its precedence in the matter of consumption. It must be a lot of satisfaction to the kings of the poplar forests as they expand to magnificent height and develop trunks which are round and plump and straight, to realize that their choicest boards, next the heart, may one day find their way into that most exclusive of manufacturing plants, the bung factory.

While the bung itself is a hail-fellow-well-met, those who are interested in him are not of that type. They require that the lumber which is seeking preferment in the choice business of bung manufacture must stand more rigid inspection than almost any other class of material, and the board which crosses the factory threshold has been given, in effect, a passport to the 400 of Bungdom.

In the same connection it should be noted that the factory processes of bung production are not generally known, for most of them are controlled by secret devices which their proprietors are not desirous of making public. In fact, it is said by some that one of the largest bung plants in the country, which has made millions for its owners, is not only closed to visitors, but is not even viewed by employees who are not needed in the operation of the machinery. The latter is specially designed for the purpose, but it is said that it has not been patented because of the fear that others might adapt the idea and thus get in a position to utilize similar machinery. As the field is necessarily a limited one, these precautions are worth using.

The standard bung, as stated, is 1 15/16 x 1 inch in dimensions. There are a great many bigger bungs made, however, some huge casks requiring bungs that have a longitudinal diameter of four in. As a rule though, inch lumber is the thickness usually bought, while two, three and four inch stock is purchased in smaller quantities for the purpose of taking care of special orders for the more important and heavyweight members of the Bung domicile.

It is a little puzzling to figure just how many bungs are produced. If one were to base an estimate upon the requirements of new barrels alone, the figures would not be impressive. There were 355,000,000 tight barrel staves made in 1910, and assuming that the average requirements per barrel involved 20 staves, this meant that not quite 18,000,000 barrels were made. In the same year 26,000,000 sets of heading were manufactured, indicating that the barrel production was somewhere between the two figures just noted.

These figures cover new barrels only, while millions of old barrels are constantly requiring reinforcements in the way of additional bung supplies. The beer trade alone must be an enormous consumer of bungs, while the various classes of trade which use and re-use their packages are proportionately larger consumers than those which use a barrel but once, as in the whisky distilling business. In the re-handling and rectifying of whisky, of course, the barrel may see additional service, so that in this trade alone there are a lot more bungs needed than the known production of whisky packages would suggest.

With this in mind the estimated production of a large bung factory in an Ohio Valley city is easier to understand. It is said to consume close to 10,000,000 feet of lumber a year, most of it poplar and oak. Figuring on the basis of the standard bung dimensions, there would be a production of thirty bungs per foot, allowing for waste. On this basis the production would amount to 360,000,000 bungs a year—a truly amazing total, which makes the modest bung a commercial factor of more than ordinary importance. These figures may be out of line somewhat, but inasmuch as they are based on the operations of but one plant, they show pretty plainly that the bung business, taken as a whole, and considering that it is based on the requirements of so insignificant a thing as a barrel-hole, is some business.

Milton, the blind poet, wrote something in his later years which pointed the thought that inactivity does not necessarily mean idleness. He realized that the fallow mind may conceive and create some great production which would have been impossible had the ordinary affairs of life engrossed it. He felt, therefore, that he might truly say for himself,

"They also serve who only stand and wait."

The lumber poet may disdain composing a sonnet addressed to the bung; yet it is deserving of some such treatment, and of having its virtues handed down to posterity in enduring fashion. While the bung plays a minor and inconspicuous part, unaggressive, yet steadfast and efficient, it bears out the truth of the Miltonic declaration that service is not a matter of active effort, but may consist of calm and patient bearing of the load. The bung, especially in its relation to the booze-barrel, holds many a load in place, so that the quality of its service and its intimate bearing on the needs of mankind are undisputed.

Consider the bung.

The Preparation of Core-Stock for Veneered Doors

By G. D. Grain, Jr.

The manufacture of core-stock for veneered doors is a process with which the average planing mill operator is familiar. Methods vary so greatly in this connection, however, that it is probabe that an effort to determine which is really the best plan would be worth while. Take for example, the matter of cutting to dimensions. Some mills glue no stock in and attempt to get no core material ready unless they have a specific job into which the material is to go. Then they cut the stock to the exact sizes which are required, glue them up and lay the veneers.

The weak point of this system is the large amount of handling required. The number of short pieces which have to go through the glue-room and be gotten in shape for use is large, comparatively, and the cost of handling them is much greater than if it were possible to do the same thing with a smaller number of pieces. Also, a good deal of time is lost in waiting for the core-stock to reach the stage where it can be veneered, and frequently a special order is delayed just on that account.

A plan which has been found more satisfactory is to cut a large amount of material intended for use in cores to standard lengths and widths, such as 7 ft. 1 in., 7 ft. 7 in., or 8 ft. 7 in., cutting the offal to smaller sizes for use as rail stock. This stock is glued up in 10½-in. widths, for the most part, other dimensions being provided for special purposes. The stock is glued up in bundles and bolted together. Then it is stored in a room especially prepared for the purpose. Before it is manufactured, the stock is edged and cut to the proper dimensions for the sizes desired, and the result is that the manufacturer has constantly at hand a full supply of core-stock, ready to use, practically.

Suppose an order comes in requiring this material. Instead of having to do all the work of cutting to size, gluing and waiting for it to dry out thoroughly, all that is necessary is to take as many bundles as are required from the storage compartment, rip them to the desired widths, shove them through the planer and then lay the veneers. The time saved amounts to a good deal, and in the case of a hurry-up order, this counts for a lot.

In cases where a comparatively small lot of doors are being made up, the process of getting the stock through the glue-room would tie up the equipment longer than the importance of the job justified. On the other hand, with the stock ready for use, as much or as little can be had as needed, and when it is made, a maximum amount of cores can be put through at the same time, thus economizing in labor and equipment.

When a carload of material is cut up into core-stock, it frequently happens that the work can be done at a time when there

is no pressure either on the machines or the glue-room. In other words, the superintendent can take advantage of a possible lull to get the work through and out of the way. If this plan is not used, and the necessity for getting the core-stock in shape bobs up at a time when other work should have the right of way, it is not only likely to cause loss of time in getting out the doors, but also interferes considerably with the routine of the plant.

Under the plan used in some mills, of doing nothing toward the manufacture of their core-stock until they are ready to manufacture the doors, it takes a week to put a piece of work through the mill. Under the other plan, such a job can frequently be gotten through in two days. It is just a question of getting the material ready, as far as can be done, and then utilizing it as necessary. Handling the longer lengths through the glue-room is a big advantage, and the labor cost involved is materially reduced when this plan is followed.

A lot of small planing mills which make up only occasional orders for doors, use a lot of built-up material in their veneered doors. Some of them have begun to question the advantage of this plan, and have looked more at the labor cost involved than they have done before. When odd lengths are used, and various thicknesses are glued up into core material, it is certain that the labor cost involved in preparing it is immense compared with the process of manufacturing core-stock from regular board material. The first cost in the latter case is larger—but think of the lessened cost as far as handling and labor are concerned.

Then, too, the amount of glue used is not only an added item of expense, but contains possibilities of trouble. The more joints, the more apt is a defect to develop. That is a truism in businesses where veneer-laying is a factor. While it is true that most of the doors made of built-up core-stock give good service and never cause any trouble, the possibility is always there.

In putting together core-stock, whether by the method of manufacturing from regular sizes or from scrap, it should be remembered that the chances usually favor the use of too much glue rather than too little. The amount of glue used should be as little as is necessary to do the work, for if more is put on there is a good opportunity for the joint to be uneven. While a fairly cheap glue can be used for this work with good results, it is a better plan to use as good a grade as the value of the job will stand, remembering that good glue not only flows more easily, but gives a greater coverage than a cheaper grade. And, as in the case of lumber, the first cost of glue is not the determining factor as to its ultimate value.—Berlin Quality.

The Retail Dealer and His Problems

The Slow Pay Customer—How to Handle Him

Getting the Money

"What is the most efficient method of collecting from slow-paying customers that live a long distance from our place of business, when correspondence proves of no avail and the agent's presence is required in the yard?"

"What is the best and most satisfactory manner in which to handle a bunch of hard-headed customers in regard to sending out statements?"

"How can I handle slow collections?" (This question from one of the most successful collectors.)

These three questions cover practically the same subject—collections—and as may be seen were submitted by as many different managers operating yards under the same general conditions and the same line of customers that are to be found in a country where trade is dependent largely on the crop yield and the prices obtained for it. 'Tis true, of course, that the lumber business is affected everywhere by the same causes, but where the country is comparatively new and the territory large there are a few things in credits and collections that differ somewhat from what they are in sections where they are more densely populated.

As I think over my experiences in the '70's and early '80's it seems remarkable now how we used to give credit to men we knew little about and who lived twenty to thirty miles distant. Indeed there was one time in 1876 that I had over $2,000 standing out among the customers who lived over fifty miles away. But then it was only a part of the great faith which we had in the country as a whole. Dwellers on the new prairie in those days gambled with life in many ways and the people were no more financially reliable than was the country in the producing of crops. As with the land, we took the people generally at their face value and trusted largely to luck to make our collections. Practically everything depended on the crops because this was before the appearance of the eastern money loaner with his ten per cent. mortgages. I was running a yard then in Nebraska within a few miles of the northern line of Kansas and all of my long distance customers were in that state, so that the trouble of collecting the slow ones was increased for this reason. Notwithstanding all this, however, I never had to have recourse to the law to collect these slow accounts although I had some pretty close shaves from being obliged to do it. I probably should have done some suing if the parties had shown themselves in town so that the papers could have been served on them, but they were too wise to be caught that way, so they stayed on their side of the fence and let me do the worrying. It was a long trip to make on the stage route but I made it several times that fall and the next spring to get in personal touch with the delinquents. The fact of my coming that distance was conclusive evidence to them that I meant business and I did too, for I considered no excuses of any nature short of death. I have taken chattel mortgages on anything of value and where the party had already mortgaged everything he had in the world, I got his personal note with the names of one or more of his friends as securities. These I left with the local bank for collection. But, oh, what a job it was to get such a class of business rounded up and settled. I lost a few dollars from parties who had moved away.

An Experience That Paid

It was a hard experience, but it was a valuable one to me in my experience afterward in the matter of collections, for I learned that where long distance, slow-paying customers paid no attention to the requests for payment sent them through the mail, there was nothing else left for me to do but get a buggy and go out to see them and give them the alternative of giving a secured note or being sued for the account if they had not the money at the time. This is the last resort in such cases, but I would advise never to take such a step unless with a full determination to carry out the purpose formed before making the trip. Don't go out and have him put you off with verbal promises. Insist on having those promises put in writing and in legal form and if necessary, have them secured in one way or another. The fact of your presence being required in the yard should be no deterrent from a trip of this kind. I always considered that the payment or securing of a long-winded or doubtful account was as good, if not better than the making of a good sale. At least I always felt more pleasure over it.

Of course there are some slow paying customers living at long distances from the yard who are able to pay their bills and for this reason are slow. They come to town but seldom and therefore are far removed from the personal influence of their creditors and their work at home is such that they are not going to make a trip for the purpose of paying an account no matter how old it is.

How to Avoid Trouble

There is only way I know of that will obviate all this trouble and in the majority of cases make it unnecessary to go out after them and that is either to take a time note or before they leave the office make out a statement of what they are taking out of the yard and have their written agreement to pay interest on it after the time limit you are giving them. If you do this you may be sure that it won't pass from their minds for very long after it begins to draw interest and yours will be among the very first accounts they do settle when they have the money. In this way you transfer a part of the worrying to them. I know, however, the objection that will be raised to this and it will be that "the other fellow won't do it and if he don't then I will have to do as he does in the matter."

It is curious how one dealer will allow another dealer to control his business in the matter of credits, but such is the case and the so-called "independent dealer" is not independent at all only as he owns his yard and does his own buying. The rest of his business is subject to the control of his competitor. You may think this is a funny way of looking at is but examine the question yourselves and see how much real truth there is in it. If you don't elect to follow the natural business course I have indicated as above then there is no use in complaining about the long winded customers living so far as to be only reached through the mail, but be satisfied to take

your chances along with the "other fellow" who doubtless thinks of you as you do of him in this matter as well as of the other things in the competitive struggle for business.

The Agent's Presence in the Yard

is no doubt considered by him a necessity and therefore a handicap to him in his collection business. I used to think so myself when conditions made it necessary to run a one man yard, but when I got to having one or more men helping me I trained one of them so that I could leave the yard for a day or two if necessary. It is one of the most natural things for a man to think that his presence is necessary every day in his yard and more especially if he is a man-of-all-work as most of the retail yard managers are. They acquire a habit of routine and a way of doing things and thinking that no one else can do as well as they can. They are so adjusted to all this that they fear things will get out of adjustment if they leave them for any length of time. Now the fact is, a good deal of this is mostly imagination on their part. There is something wrong about a system that won't run a few days without the hand of the "boss" guiding it.

I have known a good many housewives who were so devoted to their housekeeping duties that they never thought it was possible for them to leave home and go on the vacation which they greatly needed. If perchance they were forced to leave to attend the funeral of a distant relative or for some other compelling cause they worried all the time of their absence for fear something would go wrong at home. On their return, however, they were surprised and a little disappointed to find that the machinery of their household was running along as smoothly as though they had been at home. Sooner or later every individual in this world wakes up to the consciousness that he or she is not indispensable. It comes with a shock sometimes and in a way that we don't like, but it comes. Ever since I had a second man I endeavored to train him in the methods of doing business. I taught him how to measure and figure lumber and weigh and figure coal so that when I left the yard to go away on business or for other cause I could go without worrying that things would not go on right. Rarely, if ever, have I found on returning that anything serious was out of the way. If my helper was not this kind of dependable man I didn't want him. I have trained more than a dozen men in this way who left me to become managers of other yards and it is a matter of pride with me now that I have done this. The business of a yard is not wholly confined to the details about the yard. It is important of course to be "on the job" and all that sort of thing. I don't believe in going up town or out to a ball game and letting the yard run itself with no one but a watchman to see that nothing is taken.

The "Watchman" Should be Competent

to do the business in your absence, but there is a class of business away from the office that needs attending to as well as the ordinary routine. Only a small proportion of the people in the community are ever seen at a lumbering yard and therefore this business is to get acquainted with the rest that don't come and in the mixing up with them the dealer, if he keeps his eyes and ears open, very often learns something that is directly to his interest and advantage. Another part of this business is the looking after of men who owe him. He frequently can learn in this way that he is giving a certain party too much credit; that another is preparing to move away from town or that a certain farmer who has been owing him a bill for a long time is going to market his hogs soon and as old accounts are not always the first paid he is thereby given a chance to get in his work at the opportune time.

The Sending of Statements

The question relating to the sending out statements to "hard headed" customers no doubt was asked by a manager who has arrived at that period in his experience where it puzzled him to account for the dislike of some men to receive such a common thing as a statement of their indebtedness through the post office. I remember how greatly surprised I was when I had my first experience in having a farmer come into my office "mad as a wet hen" because I had sent him a "dun," as he called it, through the mail. He was too angry to talk with me about it but slammed down the money and the statement and walked out without waiting for the receipted bill which I afterward sent him with a diplomatic worded letter explaining the business reasons for doing it. Of course I lost his trade for some years afterward, but in time he became better acquainted with business methods and eventually came back again with sort of half apology for acting the way he had.

For a time it put a damper on my efforts in this direction to "stir up the animals" among the delinquents. But when I too became better acquainted with what was fair and right in business methods I lost all sensitiveness and reluctance about sending out statements through the mail or requests for settlement. I got some pretty hard "jolts" though before I had educated my trade into understanding that such a thing was no more than a business right that I had of asking for my money when I needed it.

The fact is the majority of dealers in those days did business by what we would call loose methods nowadays. It was the almost universal custom then to give farmers credit and the farmers would extend the time of payment to suit their own convenience. I don't know how much this custom is followed among the country dealers at the present time but whenever it is it is sure to breed in the farmers the idea that they are not fairly used if they get a "dun" for the account before they are ready or disposed to pay it and they are equally sure to resent any attempts to press them. Every manager will save himself trouble in this regard if he will take the pains to carefully explain and make a credit customer understand that he will be as free to ask for his money when the account becomes due as the customer is in coming in and asking for the accommodation of the credit. This I consider is one of the most essential things in the giving of credit to everyone else as well as the farmers. It is hardly conceivable that any sensible mind will take offence at such a proposition if put to them in the right way and it requires no argument to a farmer understanding this to show him that a dealer must have recourse to the mail to notify him that his account is due. He knows very well if he owes money to the bank that he will get a notice when his note is due and a request to take care of it besides. He is accustomed to the bank's doing it and he thinks nothing of it. In like manner will he so regard the lumberman's statement sent him through the post office if he understands it to be the regular thing.

"Hard-Headed" Customers

The term "hard-headed customers" has a peculiar significance to one whose trading is largely with the farmers. When I was a boy I used to hear of a certain farmer that was known as "Hard-head Johnson." I didn't know at the time what it meant. I supposed it was a nickname from some physical peculiarity and it was many years before I learned that it was owing to his sordid selfish nature and the cunning shrewdness of his character making him an unusually hard man to deal with. Since then I have met and dealt with a number of just such men and like the men I've described they were mostly farmers. As a rule they were able to pay their obligations, but they seemed obsessed with their idea of figuring and scheming to beat me down to the lowest notch in prices and then wanted to run an account on those terms and pay it whenever they saw fit. "Dunning" them for it never seemed to have the slightest effect on them and it would require a surgical operation to reach where they were sensitive to other people's rights. These men are to be numbered with those of others coming under the head of

Slow Collections and How to Handle Them

My notion is that there are two classes of accounts that are slow of collection, one is the class I have above named, and the other, those that are doubtful because of the inability of the parties to pay. You can force the one to pay, but the other you cannot and the trick is to get it out of the latter by other ways than by legal forcing. There were but few of the early settlers on the prairie land of the west who could pay the large amount of cash necessary for the purchase of a harvester. Consequently they had to buy them on time, giving their notes running through a term of years. The failure of crops caused a large percentage of these notes to be practically valueless at the time, but as the subsequent years grew better and the farmers were getting on their feet again the holders of these notes began to send out expert collectors to try and see what could be done to realize on them. The first lot got what money they could and security for as much as possible. The next year another set of men were sent out and they in turn did what they could to reduce the amount of what was outstanding and very doubtful. As one of them told me "we are going through this country with a fine tooth comb." And so they did but there was still left a considerable residue of those unpaid machine notes. To finish up these a class of triple extra good men were sent out and they literally camped down with the delinquents until most of this residue was either paid or secured. I have listened to some wonderful stories told by these experts of their experience of effecting a settlement in cases where the other two sets of collectors had passed as hopeless. There were no lawsuits or any threatening or force used whatever, but through the sheer force of magnetic personality these men effected their purpose and this is about the only way this class of "slow collections" can be made to settle. What one man cannot do another can for it is a matter of constant hammering with tact and personality. There are no particular rules to go by in effecting a settlement with a party who refuses to pay and who is execution proof, but the trained and stronger mind can do it through the subtle force he exercises over the weaker.—C. K. Ketridge in the Mississippi Valley Lumberman.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

WANTED—One hundred thousand feet 1-inch Mill Cull Basswood, delivered Ottawa. Address, stating price, The Continental Bag and Paper Company, Limited, Ottawa, Ont. 20-28

Lumber Wanted

Several cars of good 1-inch No. 3 Common Hardwood, Birch preferred. State quantity, average width, and best price. Box 578, Canada Lumberman, Toronto, Ont. 18-21-5

Wanted

100,000 hewn Cedar Ties for delivery during 1913. State what you can supply and quote price or we will make offer. Box 622, Canada Lumberman, Toronto, Ont.

Birch Wanted

We desire to buy 100 M. to half million feet 4/4, 5/4, 6/4, and 8/4 log run No. 2 common and better Unselected Birch. For sufficient quantity will send representative to load stock. Terms cash upon inspection. Apply to Louisville Point Lumber Company, Louisville, Ky. 20-43

Lumber Wanted

Four, five and six quarter, Spruce, Hemlock and Norway, four, six, eight and ten inches wide, rough, also surfaced. White Pine Mill Culls and Lath. Box 615, Canada Lumberman & Woodworker, Toronto, Ont. 20-34

We use yearly five hundred thousand to one million feet of Birch, Basswood and Ash in our business and are open to contract with responsible mill men for same. We would be willing to advance money on the logs and also on lumber as sawn. Write us, Manufacturer, Box 619, Canada Lumberman, Toronto, Ont. 20-37 T.F.

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

FOR SALE—LUMBER, ETC.

For Quick Sale

700 Acres Virgin Timber, Hardwoods, Hemlock. Estimate Five Million Feet. Owner must sell at once. Price, Four Thousand, half cash, balance two years, or $3,500 spot cash. This is a snap. Easy to take out. Contractor has offered to take off and put in lumber at track for about $11 per M. feet. Apply Box 598, Canada Lumberman, Toronto, Ont. 19-22-20

For Sale

For quick shipment, 100 M. ft. 2-in. Birch, December, 1911, cut. No. 2 C. & B. at $20 per M. on cars. Farm Point, Que. Hall Bros., 174 Mutual Street, Toronto, Ont. 16t.f.

For Sale

Five thousand pieces small posts, 3-in. to 4½-in. top, peeled and in good shipping condition. The Baker Lumber Company, Lindsay, Ont. 20-23-30

Cedar Shingles

Four carloads XX 16-in. Cedar Shingles, retailing at $1.75 per M. Price in car lots $1.15 at mill, C. P. R. or G. T. R. Lindsay, Ont., for quick sale. Terms 30 days net. Box 279, Lindsay, Ont. 19-22-24

Lumber For Sale

4 cars 1-in. good cedar for boat building.
100,000 ft. 2 x 6 mill run hemlock.
100,000 ft. 2 x 8 mill run hemlock.
4 cars 2-in. white oak, sound and square edge. Apply to Geo. C. Goodfellow.
C Montreal, Que.

For Sale

We have the following stocks of lumber piled where it is necessary for us to move it quickly on account of our insurance. We offer it at attractive prices for quick sale.

3,500 ft. 5/4 No. 2 shop.
4,500 ft. 5/4 No. 3 shop.
4,000 ft. 5/4 stained saps.
8,500 ft. 5/4 outs from fine com. and bet.
20,000 ft. 5/4 No. 1 mill lumber.
14,000 ft. 5/4 No. 1 barn.
7,000 ft. 6/4 No. 1 barn.
8,500 ft. 5/4 No. 2 barn.
4,000 ft. 6/4 No. 2 barn.
58,000 ft. 5/4 No. 3 barn.
20,000 ft. 6/4 No. 3 barn.
3,000 ft. 5/4 No. 1 box.
13,500 ft. 5/4 x 5-in. mill run.
6,000 ft. 6/4 x 4-in. mill run.

Write or wire for quotations, Cleveland-Sarnia Saw Mills Company, Limited, Sarnia, Ont. 20-41

WANTED—MACHINERY, ETC.

Tramway Steel Wanted

Car load of 12-lb. Tramway Steel. Write particulars and best price. Mutchenbacker Bros., Mafeking, Man. 19-20-15

FOR SALE—MACHINERY, ETC.

For Sale

Two Steam Engines, Boilers, Saw Mill Machinery and Barkers, all in good condition. Apply The East Canada Power & Pulp Company, Limited, Murray Bay, P.Q. 20-22-38

For Sale

Established Lumber Business on main line Northern Division G. T. R., up-to-date circular mill, steam feed, edger, trimmer, etc. Capacity 20 to 25 M. per day. About 650 acres well timbered with Hemlock, Birch, Maple, etc., etc. Good roads all through bush. Down grade to mill. Private siding at mill. Box 587, Canada Lumberman, Toronto, Ont. 19-20-11

Saw Mill For Sale

Huntsville Lumbed Company, Limited, will in the future only run one of their two double cutting Band Mills, which is now cutting fifty thousand feet per day.

They will sell the same with engine, boilers and all other machinery along with building. Also will sell blacksmith's tools and a number of saw-log sleighs and chains.

Huntsville Lumber Company, Ltd.
20-21-42 Huntsville, Ont.

Camp Outfit For Sale

Complete Camp Outfit for sale, including:
Six set of New Log Sleighs, complete
Four set of Old Log Sleighs, complete.
Snow Plough.
Tank Sleighs.
Stoves.
Blacksmith's Outfit.
Anchors, Chains, Etc.

The Cavendish Lumber Company, Ltd.,
20-22-33 Lakefield, Ont.

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Wanted position as band saw filer to finish this season cut with the consideration of work next season. Can show first-class references. Reply to Box 620, Canada Lumberman, Toronto, Ont. 20-22-21

Advertiser, with practical knowledge of the lumber business, wants positio nas Manager of a lumber yard in Ontario or live town in Canadian West. Have best of references. Box 623, Canada Lumberman, Toronto, Ont. 20-40

WANTED—Position by young man as sawmill office manager or shipper. Ten years' experience with largest hemlock concern in East. References A.1. Address Box 560, Canada Lumberman & Woodworker, Toronto, Ont. 17-20

Wanted

A position as mill superintendent. Have years of experience handling men in Sash, Door and Planing Mill business, can estimate and handle plans of any kind. Reply Box 612, Canada Lumberman & Woodworker, Toronto, Ont. 20-21-32

Thoroughly experienced office man. Canadian, age thirty-five, married. Expert bookkeeper and cost accountant, sawmill, wholesale and box factory. Experienced selling yellow pine; also seven years experience white pine, United States and Canada. Desire change to healthy location with good schools. Prefer position as assistant manager or office manager. Haven't lost a day in thirteen years. Reply, Box 613, Canada Lumberman, Toronto, Ont. 20-22-31

WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Salesman with some knowledge of measuring and inspecting lumber, age from twenty-five to thirty-five years. Apply Box 568, Canada Lumberman, Toronto, Ont. 18-21-2

BUSINESS OPPORTUNITIES

WANTED—To hear from Box Mills in position to furnish boxes in car loads. Apply to Geo. B. Breon, Williamsport, Pa. 17-20

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 115 h.p. boiler, 100 h.p. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

Baughman's Buyer and Seller

The twelfth edition of the handy book for lumbermen just out. Revised, improved; see the new side tables, the metric system, tapering timber, to figure narrow flooring, moulding and box work, etc., five sections each indexed and separate work. Every page worth the price of the book. The book that talks to lumbermen. Not millions but more than seventy-five thousand copies have been sold to lumbermen. Bound in red flexible leather cover, $2.50 per copy prepaid. Orders mailed day received. Address H. R. A. Baughman, Indianaoplis, Ind. 19-22-18

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

PARTNERS WANTED

The advertiser has just built and equipped the best plant in Canada for the manufacture of doors and boxes, and wants one or two good men with capital to join him, either a man to take the financial end and office work, or one with a good knowledge of the manufacturing end of the business. The trade in boxes will be local, but doors will be shipped to all parts of Canada as well as to England. There is not a large specialized door factory like this one in Canada to-day. The demand for doors is increasing rapidly, and car loads are daily being brought from the States which can be filled by a good Canadian plant. All correspondence will be treated confidentially. Address Box 600, Canada Lumberman & Woodworker, Toronto, Ont. 19-21-25

Auction Sale of Valuable Timber Limits and Equipment

On Friday, November 15th, at 2 p.m., in Room "G," King Edward Hotel, Toronto, the timber on the following limits, held under license from the Ontario Government, will be disposed of absolutely without reserve, for the purpose of closing out an Estate:—

The N.E. ¼ Township of Mills.
Berth No. 2 Lount.
Berth No. 3 Pringle.
Berth No. 4 Pringle.

At the same time a complete Camp outfit will also be offered without reserve.

The Limits will be sold either separately or en bloc.

For all necessary information apply to

UNION BANK OF CANADA,
Eastern Superintendent's Dept.,
20-21-36 Toronto, Ont.

Important Sale of Valuable Timber Limits

Sealed tenders will be received by the undersigned up to and including the **20th day of December, 1912**, for the purchase of:

Limit No. 194 of 1873-74—River Jean de Terre—tributary to the Gatineau, containing an area of fifty (50) square miles, more or less.

Limit No. 195 of 1873-74—River Jean de Terre—tributary to the Gatineau—Island Lake, containing an area of fifty (50) square miles, more or less.

These limits comprise some of the best pine and pulpwood areas in the Province of Quebec.

Map showing location of these timber limits and report thereon may be inspected at the offices of the undersigned and from whom further information may be obtained.

The highest or any tender not necessarily accepted, and the acceptance of any tender will be subject to the approval of the Court.

The Toronto General Trusts Corporation,
30 Slgin Street, Ottawa, Ont.
or
Messrs. Aylen & Duclos, Barristers,
Castle Building, Ottawa, Ont.
or
Messrs. Belcourt & Ritchie, Barristers,
Castle Building, Ottawa, Ont.

Dated Ottawa, Aug. 5, 1912. 16-22-35

For Sale—A Snap

Ten sets Sleighs. Runners 4-in. x 7-ft., 5 ft. wide. Bunks 8 x 9 x 8 ft. Bench 9 x 10 x 6 ft. $15.00 per set. Box 603, Canada Lumberman, Toronto, Ont. 20-23-27

Grinding Log and Band Resaw Wheels

Owing to the considerable tension of the saw blades on the wheels the wear on the wheel faces is often considerable, and to secure good work and an even bedding for the saw they should be ground to a dead true surface periodically, say, not less than once a year, says the Timber Trades Journal. The concensus of opinion is now in favor of a perfectly flat wheel face, and this should be obtained by grinding the wheels mounted on their own spindles till they have both a perfect running and standing balance. The greatest amount of wear will usually be found near the tooth edges of the wheels, more particularly on the lower or driving wheel, where there is a greater accumulation of dust and an increased driving strain on the blade. Should the front edges of the wheels be allowed to wear the strain on the blade is thrown towards its back, and the teeth edge of the saw, being slack, will be liable to "snake" and cut untrue, and at the same time twists and cracks in the blade may be set up. We are afraid the periodical trueing up of saw wheels is sometimes neglected, and the saws are wrongly blamed for turning out bad work.

There are two systems in general use for grinding up band wheels—viz., an ordinary grinding lathe equipped with an emery wheel or a separate portable grinding machine in which the emery wheel is feathered on a spindle and driven by the frictional contact of the emery wheel with the band wheel face which is set in motion. The latter plan is the simplest and cheapest, and if the girder is subsequently made and properly applied it is quite effective. In addition to the emery wheel the grinder should be fitted with a turning tool attachment, as, should the band wheels be much out of true, a good deal of time may be saved by taking a light preliminary cut with the turning tool, the wheel face being afterwards finished by the emery wheel. The grinding machine should be of very substantial construction, and provided with a single lateral feed and two independent direct feeds, one for the emery wheel and one for the turning tool, so that they may be used independently or together if desired.

Notes on Hardening Steel Cutters

It is impossible to give exact instructions as to the hardening of cutters, as the amount of heat required to harden different samples of steel varies considerably. The exact temper necessary can only be ascertained by one or more trials. The following notes on tempering are given by Powis Bale, who says:—"It is very important that all cutters be heated as evenly as possible. In heating cutters for tempering they should be repeatedly turned over in the flame or fire and withdrawn from it now and then. In tempering any kind of cutting tools care should be taken that there is a gradual shading of color. If there is a distinct line between the colors it is liable to chip at this line. The point to aim at is to have the edge of the cutter tolerably hard, and this hardness to be gradually reduced the further you get from the cutting edge.

"The process of tempering should be gradual, as the steel becomes toughened better by slow heating than if the process be performed abruptly. When the proper heat has been reached the tool should be removed from the fire and not allowed to "soak," as is sometimes done.

"Bear in mind in tempering steel any excess of heat over what is absolutely necessary is detrimental, as it opens and makes the grain of the steel coarse. The right color to temper to varies with the nature of the steel and the hardness required. With ordinary steels a brown yellow slightly tinged with purple is usually suitable. When the exact shade of color has arrived dip and withdraw the tool several times; and do not plunge it at once into the hardening mixture or water. The following mixture can be recommended for tempering: Take four parts of powdered yellow resin and two parts of train oil, carefully mix them, and add one part of heated tallow. The object to be hardened is dipped into this and allowed to remain till quite cold. Without having previously cleaned it, the steel is again put into the fire, and is then cooled in boiled water in the usual way. With some grades of steel salt water has been found an excellent hardening mixture."—Timber Trades Journal.

Sawmill Refuse as Fuel

"The Value of Sawmill Refuse as a Fuel in Gas Producers," is the title of an interesting paper which was recently read before the Association of Engineering Societies in America, by Mr. Charles E. Snypp. In the course of the paper the author remarks: "The refuse that we use is known as 'cypress hog.' It consists of about fifty per cent. of sawdust and fifty per cent. of chips such as are discharged from the 'hog,' which is a machine used by sawmills to destroy their refuse. This material runs from 30 to 55 per cent. moisture, and this moisture seems to be necessary for best working conditions. We have to guard against the sawdust blowing over into the pipes which conduct the gases to the wet scrubber. This is probably a local trouble, due, no doubt, to the strength of the blast that we use in order to get capacity. We have been able to realize full capacity using sawmill refuse, and our engines deliver a brake horse-power on about 4½ lb. of this fuel. The changes necessary to fire sawmill refuse are merely the removing of the coal dump hoppers and substituting a hollow cylinder about 10 ft. high, slightly tapered and made larger at the bottom, and fitted with a slide gate at both top and bottom. These slides are worked with levers and the sawmill refuse is locked into the producers through these tubes. To start firing a producer with sawmill refuse it is not necessary to have an underlying bed of cinders or ash to cover the blast pipe."

Woods for Pattern-Making

Some interesting data concerning the relative merits of the different woods employed for pattern-making purposes has resulted from investigations at several large American pattern shops. These go to show that the woods chiefly used are Canadian pine, cherry, and mahogany. Canadian pine has always been used primarily in the manufacture of patterns, and still furnishes the principal supply of material for this purpose. Owing to the high price, however, California sugar pine is substituted to a considerable extent in many American shops where large castings are made. Sugar pine is regarded as the best substitute there is for Canadian pine, but it is not as satisfactory for the reason that the tiny "sugar streaks" in this wood are prone to ooze resin even through the varnish finish, which often results in a tough casting.

It has been estimated that patterns made in cherry and mahogany can be used several thousand times, whereas American pattern-makers say a softwood pattern would endure only about one-quarter as long a period. Constant use will gradually wear off the sharp edges that are all-important in the forming of an accurate mould. When this occurs the usual remedy is to chamfer down the blunted corners and set in duplicates of cherry or mahogany. In core boxes, it is a common practice to glue a hardwood veneer over the pine. Only small or delicate patterns that are liable to be subjected to unusual wear are always made of hardwoods. The larger patterns, such as gear wheels, have their teeth made of hardwood, and the frame work of pine. Generally speaking, any wood that tends to either shrink or swell is poor material for pattern-making.—Timber.

Power Lost in Transmission

We have had some interesting reading and figures on the above subject lately. We have been shown that engineers reckon on 3 to 6 per cent. for shafting losses, while there are cases on record of 69.9 per cent. h.p. being lost. Why is that? some may say. The engineer's allowance of 3 to 6 per cent. must be totally inadequate. No doubt it would have been considered a very small percentage some few years ago, when plain bearings and heavy iron shafts were in universal use. To-day it is to my mind quite ample, providing care has been exercised in the purchase choice of power transmission materials — steel shafts, roller or ball bearings, etc., etc., and what is even more important is having a capable man to instal or erect your power equipment. Any handy-man can rig up a line of shafting, but a practical and experienced millwright should be employed if you want a good job and want to run your plant economically.

The most important point of all, however, is the placing of machines or tools. This is an expert's work, while there are a few consulting engineers who have made woodworking machinery plants their specialty. I have been fortunate enough to observe the improvements that have been made in various factories simply by placing the machines correctly. It all sounds so very simple and very easy that we cannot wonder at many mill owners trying it themselves and finding out when too late that they had put their foot in it.

Now my point is simply this. Power can be transmitted in any factory at five per cent. loss if expert advice is obtained and acted upon—direct drives, group drives, step loose pulleys, friction clutches, roller and or ball bearings, solid foundations, good belts, etc. All those items help toward the economical transmission of power, but it wants a capable man to arrange the plant properly.

A great artist was once asked how he produced such beautiful pictures. He replied "Simply get the right color and put it in the right place."—J. M. N. in "Timber."

Notwithstanding the many disappointing undertakings in the way of making hardwood small dimension stock of various kinds, the quantity of this class of material used is increasing right along. Some make a success of this work as a separate and independent institution, but it seems that the greatest success in making small dimension is in doing it as a side issue to sawmilling. It is an opening that should appeal especially to small sawmill men.

We have the following stocks in good shipping condition.
1-in. Birch, No. 1 com. and better, 167,000 ft.
1-in. Birch, No. 2 com. and better, 70,000 ft.
1¼-in. Birch, No. 1 com. and bet., 30,000 ft.
1½-in. Birch, No. 1 com. and bet., 30,000 ft.
2-in. Birch, No. 1 com. and better, 30,000 ft.
3-in. Birch, No. 1 com. and better, 30,000 ft.
1-in. Maple, No. 2 com. and bet., 60,000 ft.
1½-in. Maple, No. 1 com. and bet., 70,000 ft.
3-in. S. Elm, No. 1 com. and bet., 39,000 ft.
2-in. S. Elm, No. 1 com. and bet., 12,000 ft.
1-in. White Bass, 10,000 ft.
1½-in. White Bass, 1,000 ft.
Want to buy Elm and Hemlock.
Please let us hear from you.
The Meaford Lumber Company
Toronto office 539 Lansdowne Avenue.

Review of Current Trade Conditions

Ontario

There has been very little change in the lumber situation generally during the past two weeks. Owing to the wet weather which has been experienced of late, work in the woods has been very expensive. There is also a scarcity of labor and men who are willing to work are demanding high wages. The situation in this respect may improve somewhat in the next few weeks if work in the towns and cities becomes scarce owing to building operations being suspended, but should the weather remain open, very little relief is to be expected.

Little or no improvement has been found in the car situation and from all the reports received it is difficult to ascertain whether the shortage is more acute in the east or in the west.

The United States demand is still very strong and the export market has a tendency to improve very materially.

The hardwood market is very firm and trade good. There is an almost unprecedented demand for the lower grades and undoubtedly the coming winter will see all the yards clearer of low-grade stocks than ever before. Desirable stocks in all thin sizes of birch such as 1 in., 1¼ in., 1½ in. and 2 in. are very scarce. So also are 1 in. ash and 1 in. elm. Prices may be expected to go up in these lines.

The higher and lower grades of white pine are active, but the intermediate grades are moving very slowly.

There does not seem to be any likelihood of a fall in the demand for all kinds of lumber. Present indications are that prices may be expected to remain firm if they do not increase materially. The heavy demand this year will undoubtedly have a bearing on next year's supply and a considerable shortage is freely expected by some members of the trade for some time to come.

Eastern Canada

If it were not for the unprecedented shortage of cars for shipment of lumber, the trade in Eastern Canada would be enjoying to-day, more activity than it has experienced for some months past. Reports from Montreal are of an excellent demand for all kinds of lumber and an exasperating difficulty in delivering stocks to customers. There are, in fact, still on the books to-day, orders for stocks which were given to mills as far back as July and which are still unfilled. Prices in general are firm and stocks which can be shipped are scarce. At Montreal there is a particularly good demand for one-inch spruce.

Reports from Boston indicate a firmer tone in the demand for eastern spruce. Manufacturers are suggesting an increase in price, but the demand has not quite warranted one as yet. A few frames are being held at $25, but $24.50 is the general price. Retail yards are carrying moderate stocks and will be obliged to buy if the fall demand is at all active. There is a fair demand for random at Boston and prices are steady. Dealers are asking $22 and $22.50 for 2 x 4. Spruce covering boards are in good demand and stocks offered are light. Hardwoods are firm at Boston with stocks light. There is a fair demand for quartered oak and prices are firm. Plain oak is steady and in good demand. Thick stocks of brown ash are selling well and stocks are light. There is a fair demand for maple and also for birch.

At New York a good demand is reported for eastern spruce from the retail yards. Prices are steady and stocks seem to be well assorted. Spruce lath are strong. Hemlock prices at Boston are about $23 for eastern clipped boards. Offerings of dry lumber are small. New York hemlock prices are firm and stocks are light. Mill men are reported to be in control of the situation.

Great Britain

Many features of interest to the lumber trade are to be noticed in Great Britain to-day and probably the most important of these is the fact that the ship-building industry is enjoying remarkable prosperity. Ship-builders have found it practically impossible to guarantee delivery by any given date and as a result the price of new vessels has advanced of late from £6 to as much as £8 per ton. In spite of this the demand for new vessels shows no indication of decreasing. Another feature of the excellent demand for lumber, is the fact that the box-making trade is busier than it has been for years and buyers are finding it difficult to secure stocks of spruce. Stocks of spruce in fact are lighter to-day than they have been for many years past and every small shipment arriving is quickly taken up at full prices. At Glasgow the demand for spruce deals is exceptionally strong with prices ranging from £8 12s 6d to £8 14s for 3-in. x 6-in., 3-in. x 7-in. and 3-in. x 8-in., with a few 3-in. x 9-in. included. For 3-in. x 5-in., the price is steady at £8 5s. At present very little Riga spruce is coming into the Glasgow markets.

A strong demand continues at Glasgow for first-class Quebec birch logs. Stocks have practically been reduced to nothing. Prices at present are 1s 9½d to 1s 10d for 14-in. average; 1s 11d to 2s for 16-in. average, ex quay Glasgow. An improvement is reported at Glasgow in the demand for first class waney pine. Prices, however, are still rather low. Practically all varieties of Canadian timber and lumber are in good demand at Glasgow and the indications are that a record year's business will be shown at the end of 1912.

At London a fair amount of business is reported of late. Overside deliveries are exceptionally brisk and stocks are not accumulating extensively. Values as a rule remain steady.

Deliveries at London docks for the week ending September 21st amounted to 8,939 standards, as compared with 5,289 standards during the corresponding week of 1911.

Reports from Liverpool all indicate that the general trade of the country is in an excellent condition and yet the timber trade does not seem to have felt the improvement to anything like the same extent as other branches of commerce. Offerings of spruce deals for arrival are very light. Shippers are apparently playing a waiting game. Holders of stocks of spruce deals seem to be following suit and are not selling at present unless they obtain full prices. Unquestionably prices will not last long at their present level. Arrivals of pine deals are about up to the average in quantity, but the trade is rather quiet on account of the high prices. Freights continue to rule high with little indication of a decline. Freights which were around 35s to 40s per standard not so many months ago, are to-day around 60s to 70s per standard, and in spite of the high prices, tonnage is difficult to secure. At Manchester, trade is reported quieter as a result of the completion of many of the building contracts.

United States

Reports from the principal lumber consuming points in the United States show that extensive demand for lumber is still continuing. The furniture factories in particular are filled with orders up to their capacities. Wholesale lumbermen report that the greater part of their orders are for immediate delivery. Contractors and builders are using great quantities of lumber and the present excellent weather conditions are encouraging the utmost activity in building operations.

Chicago:—The trade in northern pine is exceptionally brisk and it is a difficult matter to secure sufficient stocks. Assortments are very difficult to make up satisfactorily. The whole story with the wholesalers is that they find it much more difficult to secure lumber than to sell it. The entire range of prices is exceptionally firm. In the hardwood trade the most noticeable feature is the fact that lower grades are moving actively. Stocks of low grades show no indication of accumulating. Yards and factories are sending in orders steadily and factories are also in the market for large supplies. Plain oak is very firm both in regard to demand and price. A fairly active trade is reported in quartered white oak and prices are a little stronger than they recently were. Among the northern woods, birch is the leader and prices are firm. Maple is also quite active. There is a fair demand for rock elm and soft elm and stocks are scarce. Basswood is moving actively, except in No. 1 common. Manufacturers of maple flooring report plentiful orders. The demand for hemlock continues very strong. It is expected that at the close of the season, stocks in manufacturers hands will be smaller than they have been for several years. Manufacturers ars showing a tendency to conserve their stocks and hold out for higher prices. The demand for southern pine yard stock is rather quiet at Chicago. Manufacturers' agents however, are taking it easy and not trying to force sales, as the car shortage has made it almost impossible for them to fill orders. All prices are firm. The demand for red cedar shingles has shown a slight decrease during the past fortnight. Clears are bringing $3.72 and stars $3.34, Chicago basis. The trade in white cedar shingles continues satisfactory with prices firm. Lath are strong and in good demand.

Buffalo:—The demand for northern pine continues fair in all grades, with the heaviest enquiry for the upper and lower grades. Stocks of these are small and prices are strong, and there is considerable doubt as to whether stocks of pattern lumber will be plentiful enough to last through the winter. It is believed to be certain that prices of pattern lumber will advance. There is also a probability that box manufacturers will experience some difficulty in securing their stocks. The demand for hardwood has improved during the past fortnight and now covers a large range of orders. Yard stocks are in good condition. Maple and birch are particularly active. The same conditions apply to the hardwood trade at North Tonawanda. Hemlock prices were recently advanced 50c. by the Pennsylvania mills. This is the fourth advance during the past

Partial view of booming ground and timber yards

BIG VALUES

Lumber buyers looking for Big Values will find our stock equal to the most critical demands because we do not manufacture finish or mouldings, allowing our Upper grades to go into boards or rough stock.

We want a chance to quote you on

Norway and White Pine Lumber and Lath,

Heavy Timbers up to 60 ft. in Pine and B. C. Fir

"RUSH ORDERS RUSHED"

twelve months. The demand is quite active and available stocks are smaller than they have been for years. Michigan manufacturers are also asking higher prices and their stocks are growing scarce. North Tonawanda shippers will not be able to secure sufficient stocks of hemlock for winter consumption. Only those dealers who made plentiful purchases during the early part of the year are now able to offer hemlock. The situation in connection with North Carolina pine at Buffalo is quite acute. Consumers are ready to take whatever they can get if they are sure of prompt shipments and it is a hard matter to get hold of any considerable amount of stock. The demand for shingle and lath continues strong with prices above the customary level for this time of year.

Market Correspondence

Ottawa Lumber Trade in Good Shape

Ottawa, October 7th.:—(Special correspondence of the Canada Lumberman). With the approach of winter the prospects for a record business during the next few months were never brighter in the history of Ottawa. This is the testimony of the leading lumbermen in the city and district.

"Prices were never better and the business outlook never brighter than at present," says Mr. Gordon Edwards, general manager of the W. C. Edwards Lumber Company. This is corroborated by many others in the trade. All this season's cut in the woods has been sold by J. R. Booth. The James Davidson Estate have enough orders on their books to keep them going until Christmas. Most of their men are working overtime three nights a week. An order for several thousand boxes has just been secured from Dominion Canners Ltd.

George M. Mason Ltd. report that they were never so busy as they are now. The orders they have on hand will keep them busy until towards the end of January.

The number of men going to the lumber camps from Ottawa and district will be considerably less this year than in previous years. The reason for this is that there are now more logs on the Ottawa river than ever before. Within the last few months three big lumber mills were burnt down, in the Ontario district and many logs which otherwise would have gone to these mills are coming down to the mills along the Ottawa.

J. R. Booth will have 12 camps less this year than last, so that, as the average number of men in a camp is 125, these 12 camps will mean a difference of 1,600 men. For several years Mr. Booth has been putting more logs into the water each year than the mills at the Chaudiere could cut and the result is that he does not require so many from the woods this year. It is said that if he did not put a log in the water for the next three years he would have enough with those in the Ottawa now, to keep his mills busy for that time.

Wages this year for lumberjacks are a little more than they have ever been before. The average for good men is from $30 to $35 a month with board and transportation. But experienced men are scarce. "Greenhorns" are swarming into the offices of employment agents here, wanting to be sent to the woods, only to be turned away when it is learned that they cannot use an axe or make themselves handy around the shanties. There is a great demand for horses for the camps and the supply is not able to meet it.

A Large New Forest Reserve

The Forestry Department of the Dominion Government has decided to set apart this year, several new forest reserves. The largest of these will be on the shores of Lesser Slave Lake, near the Peace River district. It will measure about 4,788 square miles and contains about 350,000,000 ft. of good timber. The reservation is recommended as a reserve supply for that section of the country, to meet its requirements, when, at a future date, it is more thickly settled than at present. Another reserve will be near Lake La Biche, Alberta, another in Northern Saskatchewan, one in Manitoba and the pine forest reserve north of Prince Albert, Sask., with others in British Columbia will be extended.

It is officially announced that the Riordon Pulp and Paper Company of Hawkesbury, Ont., will shortly issue $1,500,000 in bonds. A number of prominent Ottawa capitalists are interested in the Riordon company, which, it will be remembered, recently secured control of the business of G. H. Perley & Company. The company controls 1,184 square miles of timber limits in Quebec valued at nearly two million dollars.

The Car Shortage—Relief Promised

The shortage of cars is making itself felt to the inconvenience of lumbermen in Ottawa. Until about two weeks ago the teamsters employed by the C. P. R. in Ottawa were on strike for about two months and during that time freight became badly congested. The strike is now over, but the C. P. R. is not yet handling freight in a normal way. Lumbermen have been unable to obtain all the cars they required for some time. Immediate relief, however, is promised by the railroads.

The Canadian Trade Commissioner in Norway reports that mechanical wood pulp has recently increased in price there and is now quoted at $9.60 per ton as the lowest price.

Canada exported during the 12 months ending July last, timber to the value of $41,092,560 as compared with $42,992,252 in 1911.

The E. B. Eddy Company is assisting the city of Hull to build a long model road in one of the suburbs of the city.

Senator W. C. Edwards, head of the W. C. Edwards Lumber Company of Ottawa, accompanied Sir Wilfrid Laurier to Cornwall on Monday, September 30th, where the ex-premier opened his political tour of Old Ontario.

Mr. J. R. Booth, of Ottawa, has given permission to Messrs. Laurin & Leitch of Montreal (contractors for repairing the intake pipe under Nepean Bay through which the city of Ottawa gets its water supply) to help themselves to any timber in the booms they want for the work. Mr. Booth has told the contractors that they need not discriminate in their choice. His object in allowing this privilege is to render what assistance he can so that Ottawa will soon have a pure water supply.

At the recent convention of the Canadian Manufacturers' Association held in Ottawa, Mr. Gordon Edwards, of the W. C. Edwards Lumber Company, was chairman of the banquet committee, and his father, Senator Edwards, was chairman of the reception committee. On the last day of the convention Mr. W. H. Rowley, general manager of the E. B. Eddy Company, gave a garden party at his home, Stadacona Hall, to the delegates and a number of other prominent people among whom were Premier and Mrs. Borden, Sir Wilfrid and Lady Laurier, Chief Justice Sir Charles and Lady Fitzpatrick, His Grace Archbishop and Mrs. Hamilton, and others.

Steady Trade at Montreal—Car Shortage Continues

Montreal, Oct 10th; (Special correspondence of the Canada Lumberman).—There is still an excellent demand for all kinds of lumber, the only unfavorable feature being the continued shortage of cars. Some orders given to the mills as far back as July are still unfilled, and one wholesaler could only obtain 17 out of 80 cars ordered last month. The outlook is far from satisfactory in this respect. The transportation department of the Board of Trade has taken up the question of the embargo put by the C. P. R. on cars of the C. N. R., Grand Trunk, and Intercolonial Companies consigned to the C. P. R. terminals. This only affects cases where public track deliveries are concerned, and does not apply to private sidings. Representations have been made to the Railway Commissioners at Ottawa, it being contended that the C. P. R. is acting illegally in enforcing the embargo. The C. P. R. state they have quite enough to do to handle their own traffic without taking care of that of the other companies.

This condition naturally tends to a scarcity of lumber, and also to keep prices very firm. There is practically no outstanding market feature, with the exception that there is an exceptionally good call for spruce, especially one inch.

A lot of construction work is still going on and many important projects are under consideration. The building permits for last month show a gain of $988,142 as compared with the corresponding period last year, the total being $2,146,018. For the nine months the total is $13,325,394, an increase of $1,815,964.

Canal barges are very plentiful, and the mills in the province are shipping as much as possible by this means of transportation. It is stated that the export of pulp wood is showing a falling off, and that it has resulted in an unusual number of barges being free, for this time of the year.

The exporters to Great Britain and the European continent are rushing their lumber to the other side, in anticipation of the closing of navigation, but operations have lately been greatly interfered with by the heavy rains.

Decreased Cut on the North Shore

Thessalon, Ont., Oct. 2; (Special correspondence of the Canada Lumberman)—There will be a large decrease in the output of logs in this district this season. Some of the firms have got through and others are not doing so much owing to the scarcity of labor and the high cost of supplies. The lumber market is very good, particularly for culls and red pine, which are bringing record prices.

The Edward Hines Lumber Company, of Chicago, are at present examining the limits of the Thessalon Lumber Company with a view to the purchase of the entire plant. We would like to see such firms as the Edward Hines Company making investments on the north shore. We also had Graves Bigwood & Company here looking over

which insures a good blade. Points and Shanks are scientifically and correctly designed. Machine milled, making them fit firmly in the plate. Yet, Points can be easily inserted or removed. Here's a saw that will stand heavy feed. Will run well in Frozen Timber. Will give you the satisfaction and service that you have a right to expect from an Inserted Point Saw. All Simonds Inserted Tooth Saws, Splitting Saws, Rift Saws, and Groovers are fully warranted. Get further details about them.

Especially prompt deliveries on standard sizes. Write any branch.

SIMONDS CANADA SAW COMPANY, LTD.

VANCOUVER, B. C. MONTREAL, P. Q. ST. JOHN, N. B.

some timber limits and if we have the good fortune to have these firms locate here it will be a great benefit to the business on the shore.

The mills are running full time and will run until the lake freezes and the ice makes.

The Thessalon Lumber Company are sawing for the Hope Lumber Company, the latter having had the misfortune to have their mill burnt down. The mills at Bruce Mines and also the Spanish Mills Company are cutting for the same people.

Lumber is being shipped as fast as boats can be secured to carry it and some cargoes have been shipped during the summer almost green.

Wages in the woods run from $30 to $35 per month and fare from Montreal, which is $20 more, so that the labor question is a serious problem.—Algoma.

Steady Trade at Quebec

Quebec, October 9; (special correspondence of the Canada Lumberman):—Business in timber and lumber is not booming here at present although there is a good steady trade. A good deal of square timber and deals is leaving here for Europe, while the shipments of pulpwood from this port and the lower St. Lawrence continues very brisk.

The Chicoutimi Lumber and Pulp Company has just concluded a contract with an English firm for 50,000 tons of pulp, shipment of 5,000 tons to be made each year for ten years to Queensboro on the Thames near London. The prices agreed on have been kept private.

A number of paper makers arrived here from England during the past week. They are going to work in the new mills at Jonquiere on the Saguenay. There are three hundred yet to arrive. These, with their families, will start quite a village in the district.

Prices for pulpwood remain steady at $7.50 to $9.25 per cord.

Spruce Deals Higher in England

In reference to the market for spruce deals in England the Timber Trades Journal in a recent issue says: The c.i.f. spruce market has strengthened since our last report; advanced prices have been paid for the small quantity offered, and we understand that these prices are not yet at the top. This may be all right, but there is not much room for further advances, otherwise it will put a stop to business for this class of wood. It is at more than its intrinsic value now, and, compared with Baltic whites, it is stiff. In view of the probable continuation of high freights, if shippers intend to sell they will have to reconsider their ideas of f.o.b. values to balance the advances in transport rates; otherwise spruce will become prohibitive.

Exceptional Scarcity of Stocks at Tonawanda

The Tonawandas, N.Y., Oct. 7.—(Special correspondence of the Canada Lumberman): There is little change in the local market with regard to Canadian stock, from a fortnight ago, unless lath and shingles are harder to get and the coarser grades of lumber such as No. 3, 4 and 5 boards are scarcer. A local dealer who handles Canadian stock exclusively said to-day that building is so brisk in Canada that there are practically no lath or shingles on the market for the wholesaler. The cut of all the big mills is brought up months in advance and there is no sign of improvement. The result: Canadian shingles and lath are still at the high mark and will, if anything, go higher. There is almost a parallel situation with regard to No. 3, 4 and 5 boards. These coarser grades are being taken in Canada as fast as they are made and buyers of Canadian stock in the States have practically given up hope of buying extensively in these grades any more this fall. The better boards, such as No. 2 and better are fairly plentiful, said the same local dealer. Prices on the latter are stationary and averaging about the same as a year ago. Prices on the coarser grades are of course well up and are $3 and $4 higher than at the same time last fall. Norway pine is another item that is in demand. It brings $3 more a thousand than last fall. This same local dealer, who in his quest for lath, shingles and the coarser stocks goes over the line once a week said. "Building in Canada is absorbing everything. We buyers on this side can't find much stock that has not been spoken for before it is on the way to the mills to be sawed. The building game is wonderfully active and, comparing territory for territory, the United States is running a poor second."

Repairs Completed to Erie Canal

The break in the Erie canal at Bushnell's basin which tied up shipments of lumber for an entire month, is now repaired and cargoes will be moving eastward again tomorrow. The request for an additional two weeks of canal navigation beyond the usual closing date, November 15, is being opposed by barge canal contractors.

Rates of $2.50 from Green Bay and $2.75 from the head of Lake Superior are being paid by lumber shippers beginning October 1, and the prediction is made that the rate will reach $3 before the season closes. There is more lumber moving eastward on the Great Lakes just now than any other period this year and leading shippers predict that the impetus will continue until the last boat is down for 1913.

The customs reports for the month of September show that approximately 50,000,000 feet of lumber arrived at the Tonawandas by vessel. For the same month last year, the total receipts were a few feet more than 47,000,000 feet, which gives September 1912 a better record by nearly 3,000,000 feet than September 1911. The lumber receipts were divided as follows: Tonawandas, 8,867,613 feet as against 13,011,417 feet in September last year. North Tonawanda, 40,984,200 this year as compared with 34,105,700 in September last year.

Among the local firms that have been stocking up heavily is White, Gratwick and Mitchell who have already brought down from upper lake ports and chiefly from Canada, a total of 30,000,000 feet which will be added to largely during the next two months. The Eastern Lumber Company has also received about the same amount. Considerable Canadian stock shipped during the last few days of September in order to escape the increase in shipping rates on October 1 is due to arrive to-day or to-morrow.

Tonawanda Trade Notes

The Frontier Club, headquarters for local and visiting lumbermen, has moved from the Hotel Sheldon block to Webster street where quarters formerly occupied by the Niagara White Pine Association have been leased.

Mr. O. C. Smeaton, retired lumberman, and collector of customs at North Tonawanda, is spending part of his vacation in Canadian cities.

Mr. William T. Charlton, who spends the summer superintending logging operations in Canada, has returned to his home in North Tonawanda.

The prevalence of favorable weather has given an impetus to building all along the Niagara Frontier. A scarcity of labor is the only obstacle to what would otherwise be ideal conditions. The difficulty in getting workers is affecting the cost of handling lumber. Wages are higher than ever in the lumber yards and it is nothing unusual to pay $2, $2.25 and in some instances $2.50 a day for pilers. It isn't so long ago that all the lumber handlers wanted could be had for $1.50 a day. No let up in building is expected until winter makes it impossible to work out of doors. This will probably not be until well into January.

Exports from Fredericton District

United tates Consular Agent W. W. Heard, Fredericton, N.B., recently gave out statistics of the exports from this consular district to the United States as entered at his office for the quarter closing on September 30th. The statement shows a large increase as compared with the same period last year, the amount being almost doubled. For the same quarter in 1911 the total entries amounted to $178,677.52, while for the past quarter the entries amounted to $340,341.46. The increase is largely accounted for by one item, that of spruce lumber, the exports of spruce for the past three months to the United States amounting to $213,179.31, or more than the total exports in the quarter last year.

The items for the past quarter are as follows:

Cedar poles	$ 630.05
Fir	443.15
Hemlock	15,238.87
Laths	24,178.27
Pine	6,408.30
Poplar	96.00
Maple blocks	200.00
Shingles	13,377.22
Ship knees	135.00
Spruce	213,179.31
Lumber, mixed	5,293.75
Birch	195.17
Total	$340,341.46

First of the 1913 Calendars

The McGibbon Lumber Co., Penetanguishene, Ont., have given evidence of their enterprising business methods by distributing to their friends, well in advance, an attractive calendar for the year 1913. As a forerunner of the calendar seoson, the selection of the McGibbon Lumber Co. is most promising. If the balance of the calendars issued for 1913 are up to this standard, the recipients will be exceptionally fortunate. The picture which decorates the calendar is a beautiful reproduction of an oil painting by Kaufman, entitled "The Forest of Montainebleau." The color scheme is a rich representation of the splendor of Autumn.

What J. D. Shier says about the Barkey Lumber Register

Barkey Bros., Stouffville, Ont.

Dear Sirs,

Yours to hand and noted. We have been using one of the George Lumber Registers for some years past and find it still working well. It gives very accurate measurements and have never known it to make a mistake. When in need of another we will certainly get one of the same kind.

We remain respectfully yours,

Feb. 5, 1908. J. D. SHIER, Orillia, Ont.

Can be used on any moulding or matching machine.
Ensures absolute accuracy and saves one man measuring.
Sent on 30 days' trial, return at our expense if not satisfactory

STOUFFVILLE - ONTARIO

EDGINGS

Ontario

Messrs. Gill & Fortune, who operate a large planing mill at Trenton, Ont., recently suffered a severe loss, when a large frame building containing 30,000 ft. of planed hardwood lumber was destroyed by fire. The origin of the fire is unknown.

F. R. Fisher, Newmarket, Ont., is interested in a new furniture factory which it is proposed to erect at Stouffville, Ont., at a cost of $75,000. The building will be of steel and concrete construction, 200 ft. by 50 ft., and will be equipped for the manufacture of office furniture, fixtures, etc.

The Eastern Trading Co. Limited has been incorporated with a capital stock of $12,00 0to deal in lumber, timber, railway ties and pulpwood of every kind, with head office at Ayer's Cliff, Ont. The incorporators are L. L. Clough, A. A. Clough, and G. M. Rexford, all of Ayer's Cliff.

Hay & Company, Limited, have been incorporated with a capital of $200,000 to carry on business as lumbermen, saw and planing millers, woodworkers, etc., with head office at Woodstock, Ont. The provisional directors are Malcolm Douglas, manager, and Thos. Lyall, manufacturer, of Woodstock, Ont.

Pembroke Shook Mills Limited have been incorporated with a capital of $100,000 to manufacture shooks, packing cases, &c., and deal in lumber and lumber products of all kinds with head office at Pembroke. The provisional directors are J. T. Stuart, H. S. Lees and J. M. Telford, all of Hamilton, Ont.

An offering of the 6 per centfl first mortgage sinking fund bonds of the Toronto Paper Manufacturing Company, Limited, is being made by the Dominion Bond Company, Limited, of Toronto, Montreal, Vancouver and London, England. The total issue is $5,000,000, and, in addition to the bonds, there is outstanding $750,000 in common stock.

The Dennis-Canadian Lumber Company, which holds options on 100,000 acres of timber lands in the province of Ontario, was recently formed at Grand Rapids, Mich., with a capital stock of $500,000. It is estimated that the tract owned by this company contains 800,000,000 ft. of lumber, principally hardwood, and they will shortly erect a mill costing $370,000.

Hon. Adam Beck, of London, Ont., who controls woodworking factories in Montreal, Hamilton and London, for the manufacture of veneer, thin lumber and boxes, is arranging to merge them into one company under the name of the Beck Manufacturing Company, with a capitalization of $500,000. Another plant will be erected in Toronto on the corner of Wilton avenue and River street, at a cost of $60,000. In organizing the new company the co-operative principle will be adopted. The heads of departments, the managers, and employees who have been for a number of years in the company's service, will be given stock and have an opportunity to add to their holdings from time to time.

Benson & Bray, who for the past five years have conducted a planing mill business at Midland, Ont., are erecting a large factory near the site of their present mill, which, when completed, will be one of the largest and most up-to-date on the Georgian Bay. The main building, which is now up, is of solid brick, slow burning mill construction, 240 x 74 feet, two storeys. It is being fitted throughout with the Automatic Sprinkler System of the General Fire Extinguisher Company. Everything is of the most modern construction and the building is being equipped throughout with the latest labor-saving machinery. Private switches running up both sides of the building will give splendid railroad facilities. The firm anticipate having the plant ready for operation by December.

Eastern Canada

The Christie Woodworking Co. Ltd., St. John, N.B., recently suffered loss by fire.

A big pulp and paper mill project is now spoken of for the head of La Poile Bay, on the south coast of Newfoundland. This will have the advantage of an ice-free port, open all the year round. There are great regions of pulp timber in that part of the country.

The Canadian Pulp Mill Machinery Company has completed its organization for the manufacture of a complete line of pulp mill machinery in Canada. The business is under the direction of A. R. Paull, late president and general manager of the Glen Falls Machine Works, Glen Falls, N.Y., who is devoting his entire time to the Canadian end. He is the president and managing director of the Canadian business which have their head offices in Montreal.

The firm of Shearer, Brown & Wills, lumbermen and contractors, Montreal, has been reorganized, Mr. Brown and Mr. Wills withdrawing, and the firm being continued under the name of the James Shearer Co., Ltd. A new planing mill and saw mill have recently been erected.

Mr. J. Gilman Shearer is the president and managing director; Mr. William Smith a director, Mr. S. H. Bell, secretary, and J. W. MacAnally, treasurer.

B. Grier, Limited, Montreal, have given up their retail business, and have sold their stock of timber and lumber in Montreal to a new company recently formed under the name of the Grier Timber Company, Limited, who have also taken over the leases of the yard at William street and the yard adjoining basin No. 4. The office and mill at 1056 Notre Dame street west are now closed and the new address of B. Grier, Limited, is 1006 Eastern Townships Bank Building, Montreal.

The Horwood Lumber Company are erecting a pulp mill at Campbellton, Newfoundland, a milling settlement in the District of Twillingate. The erection of the mill will cost about $250,000. For a number of years the Horwood people have been carrying on an extensive lumbering business at Campbellton, and their new venture is an off-shoot of their old and well-established business. They have a large tract of land thickly wooded with spruce and fir, very suitable for the manufacture of pulp.

Messrs. H. Ramsen and G. Hardy, who planned the Harmsworth and the Albert Reed mills, are now planning another big mill at Glenwood, Newfoundland, on the Gander River, for a party of Americans, of which J. Loizeau, of

New Jersey, is head. Last fall they spent several weeks on the river making the necessary surveys for water power and transport facilities and were so pleased with their observations that they have since been busily engaged preparing plans, etc. The Gander River has for many years been the scene of great lumbering activities, and millions of feet of white pine have been shipped yearly to foreign markets, besides what has gone to the local trade.

The Chicoutimi Pulp Company, whose plant is located at Chicoutimi, Que., has just entered into what experts designate as the largest pulp contract ever made in the world. The company has agreed to furnish Lloyds, Limited, London, Eng., with 50,000 tons of pulp yearly for a term of ten years, and the contract should mean considerable activity in Chicoutimi during the next ten years at least, as the company gives employment to a large number of men. The pulp will be taken by steamer to Queensboro, on the Thames, near London, and thence lightered to Edward Lloyd & Co.'s mills. This concern has the largest news mill in the world, besides seventeen other paper machines.

The recent consolidation of the Riordan Paper Company and the G. H. Perley Lumber Company under the name of the Riordan Pulp & Paper Company, has brought about one of the strongest organizations in the pulp and paper business. Both the merged companies were going concerns and had built up splendid connections with the trade. In order to provide enlargements to their plant and for other purposes, the new company is making a bond issue of $1,500,000 six per cent, first mortgage. These are redeemable in 1942 at 105. The Riordan Pulp & Paper Company possesses 1,100 miles of pulp and timber limits in the province of Quebec, four up-to-date sawmills, a paper mill at Merriton and a sulphite mill at Hawkesbury, the latter being the largest sulphite mill in Canada

Over two hundred men are engaged in constructing at Beauharnois, P.Q., a mill for the Howard Smith Paper Mills, Ltd., recently formed. The company will manufacture the highest grades of bond and ledger papers, and hope to supply the market with a class of paper which is now largely imported. The directors of the company are C. Howard Smith, president; J. S. Newman, vice-president; J. J. Meagher, F. G. O'Grady, H. C. Courtney, with T. A. Hubley as secretary-treasurer. The building is to be five storeys high, and will be large enough to accommodate machinery twice the capacity of that to be installed, which will be capable of turning out five tons per day. The Canadian Light & Power Company will supply 500 horse power of electrical energy.

The mill of the Colhoun Lumber Company at Lanse Aux Cousins, near the town of Gaspe, was recently destroyed by fire, together with 6,000,000 ft. of lumber. The loss is estimated at $140,000 or $150,000 and although the exact amount of insurance is not known, it is hardly probable that it will cover the loss. The will, which was one of the largest and most modern on the Gaspe coast, was built about fifteen years ago, but was recently remodelled and improved. The rotary equipment had a capacity of 60,000 feet of long lumber a day. Besides the rotary, the mill was equipped with a lath machine with a daily capacity of 45,000, and eight shingle machines with a daily capacity of 160,000. His Honor Lieutenant Governor Wood is president of the company, other principal stockholders being John C. Calhoun, the manager, Harry F. Calhoun, secretary-treasurer, and T. B. Calhoun, the well known lumberman and millman of Calhoun's, N.B. It is believed that the company will rebuild, as it has valuable timber areas in this district.

By November 30, the four dams of the East Canada Power & Pulp Co., Murray Bay, P.Q., under construction on the lakes will be completed, giving the company three months' storage, and enabling the plant to turn out 145 tons of pulp per day during the months of May, June, July, August, September and October. The spring and fall rains will provide the rest of the water needed, thus ensuring, says Mr. William Whyte, the manager, an output of 25,000 tons per annum. Mr. Whyte states that the company will be able to pay the bond interest of the company out of the May, June and July operations. The company, he says, will develop 9,000 horse power. Its limits extend over 400 square miles, 80 per cent. of the cut being black spruce, and Mr. White claims that the dry wood pulp produced is the best in the country. A contract for a five-years' cutting of logs has just been signed, at a low rate, the quantity to be used being about 32,000 cords a year. Sir R. Forget, the president of the company, announces that the September interest on the bonds will be paid at once.

Western Canada

The mill of Campbell River Lumber Co. Ltd., Hazelmere, B.C., is reported to have been destroyed by fire.

The large mill of the United Lumber Company, at Nanoose, B.C., is now in operation. It has a capacity of 140,000 feet of lumber daily.

The Cowichan Lake Lumber Company is planning to erect a saw mill at the lake. The company's timber limits comprise about 11,000 acres near Cowichan Lake.

The Adams River Lumber Company, which has a large mill at Chase, B.C., has acquired an additional 25,000 acres of timber within ten miles of its mill. The land is estimated to contain 250,000,000 feet of timber.

Cushing Brothers, Ltd., Calgary, Alta., are figuring upon establishing a branch sash and door factory at Lethbridge. W. H. Cushing visited Lethbridge recently and conferred with officials of the Board of Trade, who are ready to make several attractive concessions.

Work was started in August on the Cowichan Lake extension of Island division of the Canadian Pacific Railway, running from Duncan Station, 18 miles, to that resort. The contract was awarded to the Island Lumber Company.

A Vancouver, B.C., report says: The Powell River Pulp and Paper Company has discovered a new source of income, and the find indicates the possibilities of increased revenue if careful consideration is given every feature of business. The company cut large numbers of hemlock logs for its mills, saw and pulp, but found the timber contained so much sap that the logs often sunk in the water while being towed to the mill. To allow them to dry out, the bark was peeled off in the woods, and as this had to be done anyway before the timber went through the pulp process, the extra cost was not great. Now they have found that $2 a cord can be obtained for the bark, which is used for tanning purposes. If tariff difficulties prevent export, the company may erect a plant to render the bark into tanning extract.

Scant 2″

Merchantable Spruce

2″ x 9″ & 2″ x 10″

10 to 13 ft. Long & 14 to 17 ft. Long. Cut early 1912.

THE best way we know for a filer to learn about ***Aloxite Saw Gumming Wheels*** is to have him try one out—put it to the severest test—then compare its work with the results he is getting with other wheels.

In the ***Aloxite Wheel*** he will find a saw gummer that will cut faster, cleaner, cooler—no burning or case hardening of the saw teeth—it will hold its shape—show long life—require but little dressing.

Aloxite is hard, sharp, tough—the best of all abrasives for steel work—every wheel is made right—right grit and grade—right bevel.

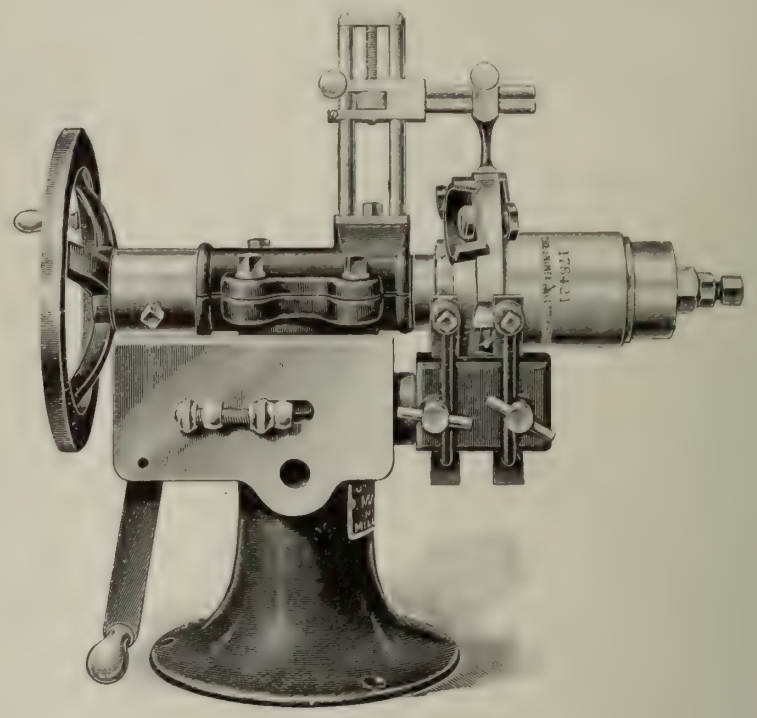
The Shimer Cutter Head Jointing Machine

In connection with the new Shimer Limited Cutter Heads which have been advertised in the Canada Lumberman for some time, and which have made good in so many mills, the makers have also brought out a Cutter Head Jointing Machine, which is not only suitable for the new heads, but which has been adapted to their other makes as well. This machine with the use of files, joints the edge of the bits to bring them within a common cutting radius, so that each knife edge does an equal share of the cutting. Its careful use will improve the quality of work done and enable the operator to increase machine feeds if desired. The machine is also made with tracking attachment for setting the bits before jointing and it can be used as a filing stand for holding the heads while being sharpened with a file. The stub is ground to exact size of matcher spindles and all parts are carefully tooled, making the machine a very useful adjunct to the planing mill.



A New Shimer Product

Further information and literature describing this and other tools will be sent upon application to Samuel J. Shimer & Sons, Milton, Pa., or Galt, Ontario, Can.

A New Crowell Tool Catalogue

D. J. Crowell, of Buffalo, N.Y., manufacturer of the Crowell Patent Saw-Fitting tools, has issued a very attractive catalogue of his saw swages and swage shapers. The catalogue gives full particulars of the various swages and shapers manufactured by Mr. Crowell, and explicit instructions are included as to the proper method of using these tools. Useful information is also given for young filers, as to the correct and incorrect way to operate and adjust swages. Mr. Crowell has favored the Canada Lumberman with a souvenir watch charm and will be pleased to send a similar one to any saw filer who will mail his address to him at 6, The Terrace, Buffalo, N.Y. The Crowell tools are so well known that we need say nothing for them to those who have used them. Those who have still to try them will unquestionably serve their own interests by writing Mr. Crowell and at the same time mentioning the Canada Lumberman.

Federal Engineering & Supplies Taking New Quarters

Federal Engineering & Supplies Limited, 284 Yonge street, are making arrangements to move about November 1st to the new Lowes Building at 90 Sherbourne street, Toronto. They find their present premises are not commodious enough, and they have taken two floors at the latter address. The Federal Engineering & Supplies, Limited, are carrying a large stock of Scandinavia and Lanco Balata Belting; also incandescent lamps, chemical fire extinguishers and electrical specialties.

Grand Rapids Dry Kilns in Canada

The Grand Rapids Veneer Works have recently closed contracts to supply dry kilns for the Canada Furniture Manufacturers, Limited, Berlin, Ont., and Woodstock, Ont., and also for the Gall Lumber Company, Limited, Toronto.

Bain Sleighs for Logging Operations

Famous for their great Capacity and Light Draft

LOGGING is a severe test of a sleigh.

The best is none too good, even though you may pay considerably more than for one which possibly may appear to be just as good.

It is only by actual test—the test of time and hard usage—that the difference is apparent, and the increased first cost is forgotten. **The quality is remembered long after the price is forgotten.**

The cross chain couplings allow great flexibility and the hind bob follows in the tracks of the front when turning. Some prefer the short reach for well broken roads as a sleigh so fitted can be backed same as a wagon.

Swing bunks are an advantage in the bush, as they can be swung parallel with the runners when driving without a load.

Any of these sleighs except the heavy sloop can be fitted with 38, 40 or 42 inch bolsters for general work.

Our new catalogue No. 30 tells all about it and is yours for the asking.

The Bain One-Beam North Shore Sleigh

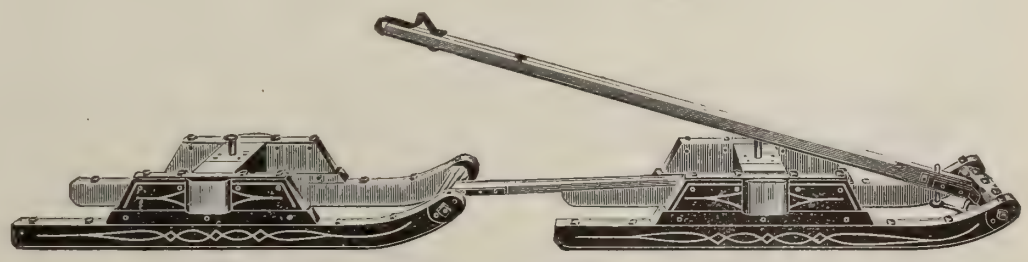
Steel Shoes; Swing Bunks or Bolsters; Cross Chain Coupling; 2 ft. 10 in. or 3 ft. Track. Clearance under Beam 9½ inches

The Bain North Shore Sloop Sleigh

Steel Shoes; Cross Chain Coupling; 2 ft. 10 in. or 3 ft. Track. Clearance under Beam 7 inches

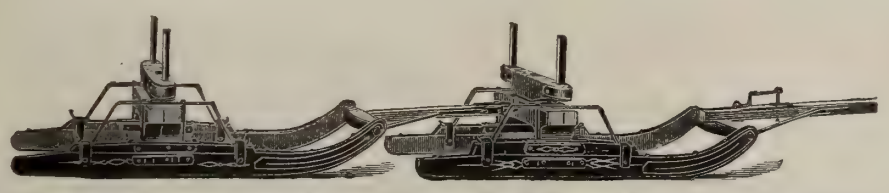
The Bain Heavy Sloop Sleigh

Steel Shoes; Cross Chain Coupling; Furnished without Bolsters but with king bolts front and rear; 3 ft. 4 in., 4 ft. 4 in. or 4 ft. 8 in. Track. Clearance under Beam 7 inches.



The Bain Heavy Sloop Sleigh

With Short Reach Coupling



The Bain Double Beam Manitoba Sleigh

Steel Shoes, Short Reach Coupling, 3 ft. track. Clearance under Beam 9½ inches

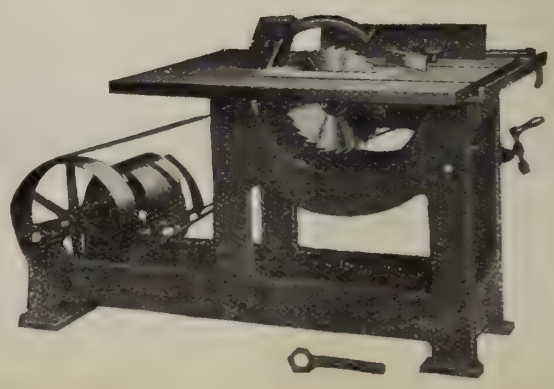
Silver's New Woodworking Machines

Saw Tables, Jointers, Swing Saws, Band Saws—tools of good, honest construction, newest improvements and conveniences; patterns fresh from the designers.

JOINTERS—8, 12, 16, 20, and 24-inch.
BAND SAWS—20, (foot or belt power) **26, 32, and 36-inch.**
SWING SAWS—6½, 7, 7½ and 8-foot lengths
SAW TABLES—Two Styles

Silver's machines are high pressure machines. They will do your work and do it well, save you money and labor, suit you in sizes and in prices too.

Post up on these tools. Ask for our 1911 catalogue and special prices at once.



THE SILVER MFG. CO.

375 BROADWAY **SALEM, OHIO.**

The value of

"AMPHIBIA"

(WATERPROOF)

Leather Belting

lies in the service it renders for each dollar you put into it. The "first cost" may be a little higher than any other belting but this difference is per foot length only. This per-foot-length price is no criterion of belt value, only service counts and

"AMPHIBIA"

costs less per day of service

We can prove this by the records of "AMPHIBIA." You can prove it by specifying "AMPHIBIA" next time and keeping tab on it.

"AMPHIBIA"

An Important Test of Vi-Balata Belting

A recent test made by the well-known Testing Engineers, Messrs. Kirkaldy & Sons, London, England, gave the following breaking strain:

6" x 4 ply broke at 13,000 lbs.
or
9,000 lbs. per Square Inch.

Vi-Balata Belting is absolutely water-proof and is not in the least affected by extremes of temperature. Best possible results guaranteed.

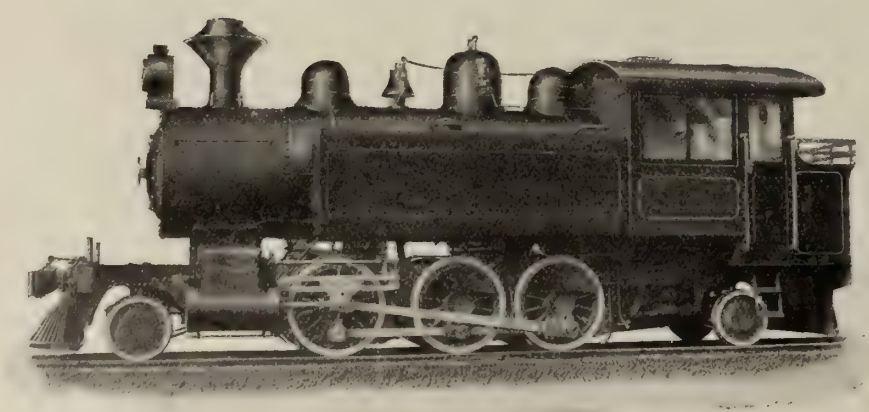
SELECTION OF LOCOMOTIVES

WHAT SHOULD BE KNOWN BEFORE YOU PURCHASE LOCOMOTIVES:—



Nature of the service.
Capacity of the cars and weight of train.
Character of track—is it new or old.
Length of haul.
Is time an important factor.
Do you want a quick locomotive or a big puller.
Distance from base of supplies and quarters for the men.
Water and coal carrying capacity.
All these items and more should be considered.
A careful study of conditions may mean larger profits.
Our experience may be valuable in considering them.
A dollar saved is more than a dollar earned.

Write or wire us, or better still, come to see us.

MONTREAL LOCOMOTIVE WORKS, LTD.

Roller Bearing Chains Drive Berlin High Efficiency Matchers

Don't haul your profits to the scrap pile

THE roller bearing chains used to drive Berlin High Efficiency Matchers are by actual test capable of standing a strain of 18,000 lbs.

Broken gears being the biggest item of upkeep expense on all gear driven machines, there grew a demand for a more durable drive. Our engineers met the demand with the roller bearing chain. All but 5 gears have been eliminated. Think of the enormous saving in a year.

You know what broken gears mean when you have rush orders. It's worth many dollars to have a machine that you can drive to its capacity without fear of a breakdown.

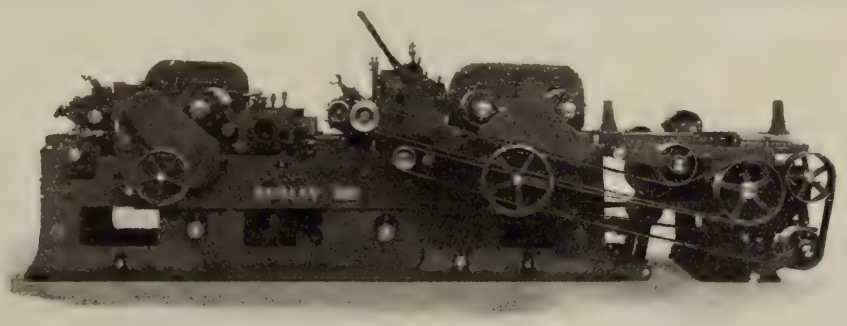
The new Berlin Matchers stand up under the strain of heavy runs for years without a cent of repairs.

On gear-driven machines, one and never more than two teeth of a gear are doing all the work at one time; while with the chain, the strain is distributed over half the circumference of the sprocket. Compare these two methods and you readily see the many advantages of the chain and sprocket.

Chains mesh better over the teeth of the sprocket, which means that vibration caused by the driving mechanism is reduced to a minimum. Lack of vibration insures a smooth finish on the stock—consequently a saving in grades.

Strength of the Chains

The chain used on Berlin Matchers is capable of lifting 18,000 lbs. In actual work on the matchers it never has a heavier pull than 700 lbs. This shows the reserve strength we have provided—more than 25 times the strain ever put upon it when running at highest speed.



Berlin Construction is Standard

Berlin Engineers have led the way in matcher construction. In fact, Berlins have proven so satisfactory, do their work so much cheaper, and with so much less power, that evidences of Berlin construction can be seen in other machines. Berlin Matchers are insurance against mismanufactured stock.

Things that go to make Berlin Matchers the most efficient, are round cutter heads with 6 Pyts steel thin knives—side and profile heads carrying milled high speed steel bits—devices for grinding and jointing all bits without removal from the head—automatic takeup boxes on cutter and side head spindles—independent gravity tighteners on the slack side of all belts and the many quick, easy and accessible adjustments provided.

Economical upkeep, durability and ease of operation are responsible for the splendid success of Berlin High Efficiency Matchers.

Go and see one running. Ask the man who owns one. We gladly invite the opinion of every user for your consideration.

Let us tell you where you can see one in operation. Write our Matcher Department today for full information.

The First American Saw Steel

The great and powerful place which American steel has assumed in the world is all the more remarkable when it is considered how hard was the early struggle to give it standing. Yet in the face of every adverse condition the industry has developed and grown and to-day it cannot be successfully contradicted that America is not only the largest and most critical consumer of steel in the world, but also the greatest producer as well, and this despite the fact that some years ago the entire country sent abroad for all its steel.

This is true, not only of rails, plates, structural steel, wire and the commoner grades of steel, but also of the higher grades of steel, such as Tool steel and Alloy steels.

At the present time Henry Disston & Sons use a greater quantity of tool steel annually, for saw-making purposes, than any other single American manufacturer, and all of it is produced in their own plant. The history of this plant is unique because it is the first successful crucible steel melting plant in America to make saw steel.

The fact that saw manufacturers were forced to secure all their steel plates from abroad, and these seldom free from flaws, led Henry Disston in 1855 to establish his plant for producing special saw steel. His extensive and careful study of the problem, together with much costly experimenting, resulted in the production, not only of the first saw steel made in America, but the first really perfect saw steel made anywhere.

So great was the prejudice, however, against American steel that Henry Disston was compelled to conceal for a time the fact that he made his own steel, but it was not long before its good quality became known.

Demand on the part of the lumber manufacturers for increased output caused untold difficulties for the saw manufacturer. Forcing results in the saw mill necessitated the making of a steel which would withstand the much greater strains and at the same time possess a longer life. Since its inception, Disston Saw Steel has kept pace with the increasing requirements of the lumber manufacturer so that it possesses, to-day, all the qualities necessary to make it the best steel for saws produced anywhere in the world.

Disston not only made the ***first*** American saw steel, but to Disston steel is due the present high standing of American Saws throughout the world.

Shimer Cutter Heads and Cutters!

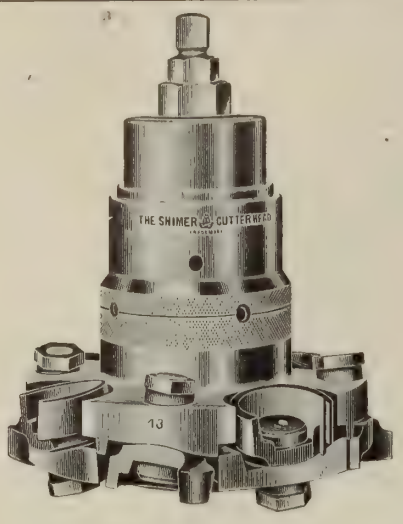

Fig 627

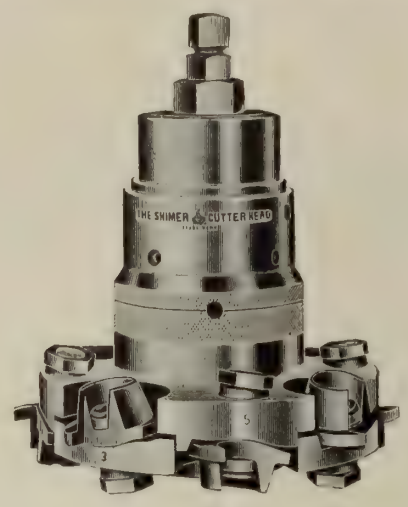

Fig 628

The "Shimer Limited" with Expansion, price $72.46 per set, complete.

The Tools You Need.

You will eventually realize that the Shimer Limited Cutter Heads are the tools you need to increase your output without sacrificing quality or increasing expense. You will find that the mills that are using them are perfectly satisfied and will give testimony to this fact.

We don't see how it could be otherwise. We have studied planing mill conditions for forty years and have kept pace with the changing conditions by designing tools that were safe, that were efficient, that were profitable to use because time and labor saving, that were lasting and that sold at low prices.

The Shimer Limited Cutter Heads sustain and enhance the reputation built up by our other tools. In addition to the special features which have made the Shimer Cutter Head famous, these new Fast Feed Heads have a self-centering device which clings to the spindle when drawn up, securing it firmly thereto. The bit seats also carry a larger surface and the bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to all parts coming into contact with the lumber. The Spindle gripping device is not only positive and effective in its purpose of holding fast to the spindle, but it also centralizes the Head on the spindle for a more uniform action of the Cutters.

The results of all cutters cutting is a smoother finish, notwithstanding the faster feed, and an output far in excess of former methods.

If you have a machine that will swing Heads of 6¾ inches diameter and feed over 150 lineal feet per minute, we would like to send you a set on 30 days' trial.

Take the measurements now and let us have your order at once.

Popular Cutter Heads

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set $40.95
Price with 6 bits to each head, the set 49.27
Price with 8 bits to each head, the set 57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—⅜ at $1.30 each and Bits for 2-in. thick plank at $1.63 each.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1¼-in. $31.20
Price, with 4 bits to each head, the set, 2-in. 33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and in interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1½-in. thick, $34.84
Price, with 4 bits to each head, the set, 2½-in. thick 35.88

Double Ceiling Heads

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price. Double Ceiling Heads complete with Bits, net, $40.94

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One Way Cutters

The Shimer Reversible Cutters for Single Spindle Shapers, Variety Moulders or Friezers, are carefully moulded opposite to the shape of the mould to be produced, in such a way as to have only the cutting edge touch the lumber. They are complete—inexpensive—time saving. We also make One-Way Cutters for the Double Spindle Shaper.

Thin Steel Knives

Advanced ideas referring to the planing and surfacing of lumber have developed into the use of the thin blades, made from high speed steel, which when properly tempered and treated, serve for one or two days of work on hard maple, oak or hickory.

These blades are known as our Bedee Knives and are recommended by users as the best that can be procured. For the benefit of those desiring to use this style of a knife we have facilities to furnish them in any length or thickness.

The Great Pulling Power of a Little "Want Ad"

A "want" advertisment is a small thing both in size and in cost, but through a a small "want ad" great things have often arisen.
A subscriber to the Canada Lumberman and Woodworker recently inserted a small ad in the "WANTED and FOR SALE" Department of this paper and received

47 REPLIES

Have you some odd lots of lumber that you would like to move quickly?
Have you some second hand mill machinery you wish to sell or exchange?
Do you want to buy some special lots of lumber or machinery?
If so **YOU NEED** the assistance of the "Wanted and For Sale" Department.
Let us assist you in filling your next want.

One piece frame for a No. 333 Matcher as it comes from foundry, showing extra heavy construction.

FAY-EGAN "LIGHTNING" "333" Matchers are built with a reserve power sufficient to take care of any increased service required by improved manufacturing methods—

—the extra heavy one piece frame gives the strength, the big gears cut from the solid and running in grease give the power, and construction throughout gives that reserve factor which makes the "333" a good investment not only for today but for many years to come—

—as a straight matcher the "333" has been an unqualified success, in spite of the fierce efforts of competition to keep it out of the field—

—the additional equipment made necessary by improved manufacturing methods—Profilers—Automatic Feeders—Twin Spindle Resaws—Horizontal Band Resaws—all of these we have added to the original "333" and its limit is not yet in sight.

"Can you say as much for the Matcher you are using?"—if not, write us for information on the "333."

The American No. 111 Band Resaw

was designed for the application of Ball-Bearings—that's the reason why it is a thorough success The adjustment is perfect, the alignment of the wheels is a thing you can depend upon. Some manufactures have tried Ball-Bearings on their machines, and abandoned them—simply because the mechanical construction—(all right for ordinary babbitted boxes, perhaps)—would not do for Ball-Bearings.

Let us send you a large illustration of the best BALL-BEARING BAND RESAW on the market.

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

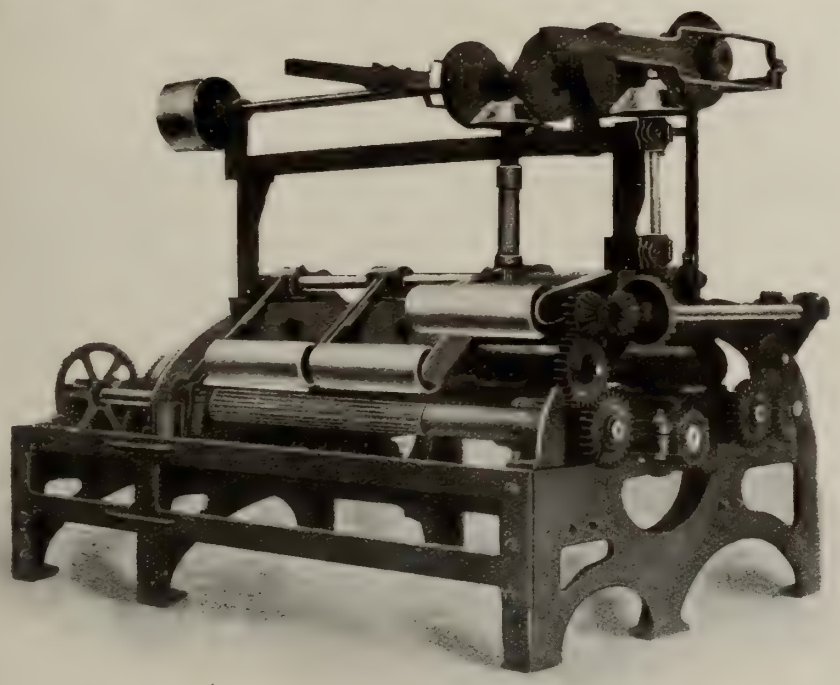
Head Office. Saginaw, Michigan, U. S. A.

Mowry's Jumbo Edger



Our latest model is an improvement on the one illustrated here

Mowry's "Jumbo" Combined Gang and Edger is the most useful mill machine on the market to-day.

It embodies every detail of construction essential to an adequate gang edger. ¶ We have some very flattering testimonials for our "JUMBO."

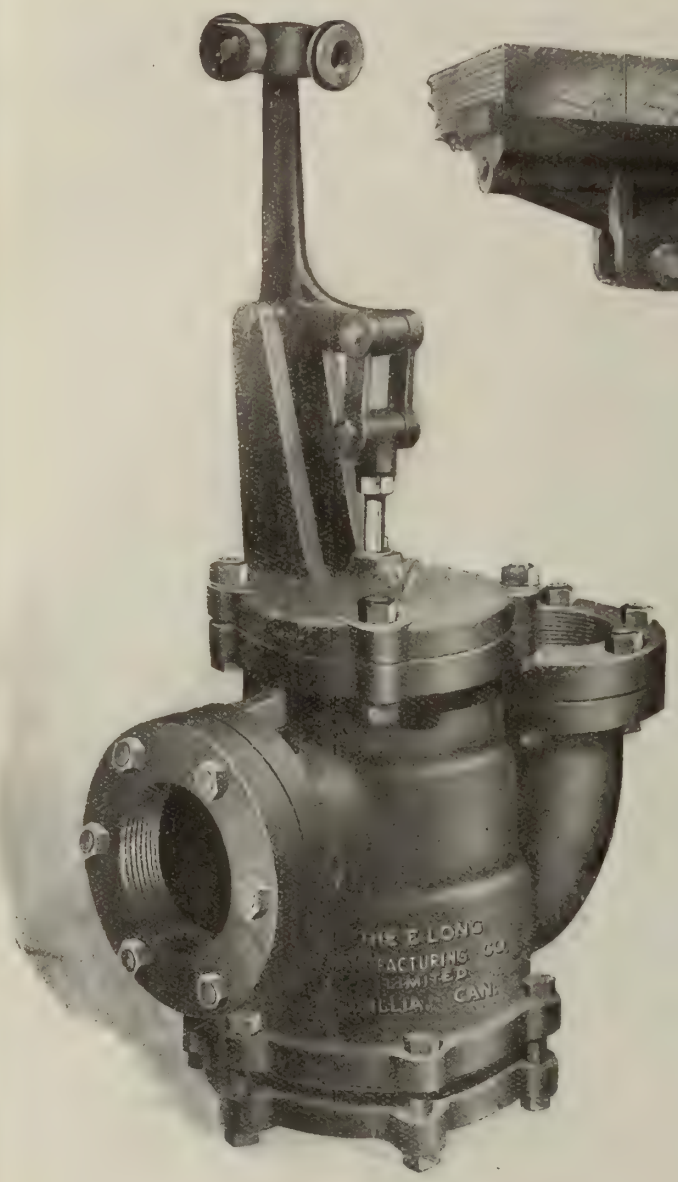
Mandrel: 4½ inches by 10 feet 6 inches long.

Drive Pulley: 20 inches, 20 inches.

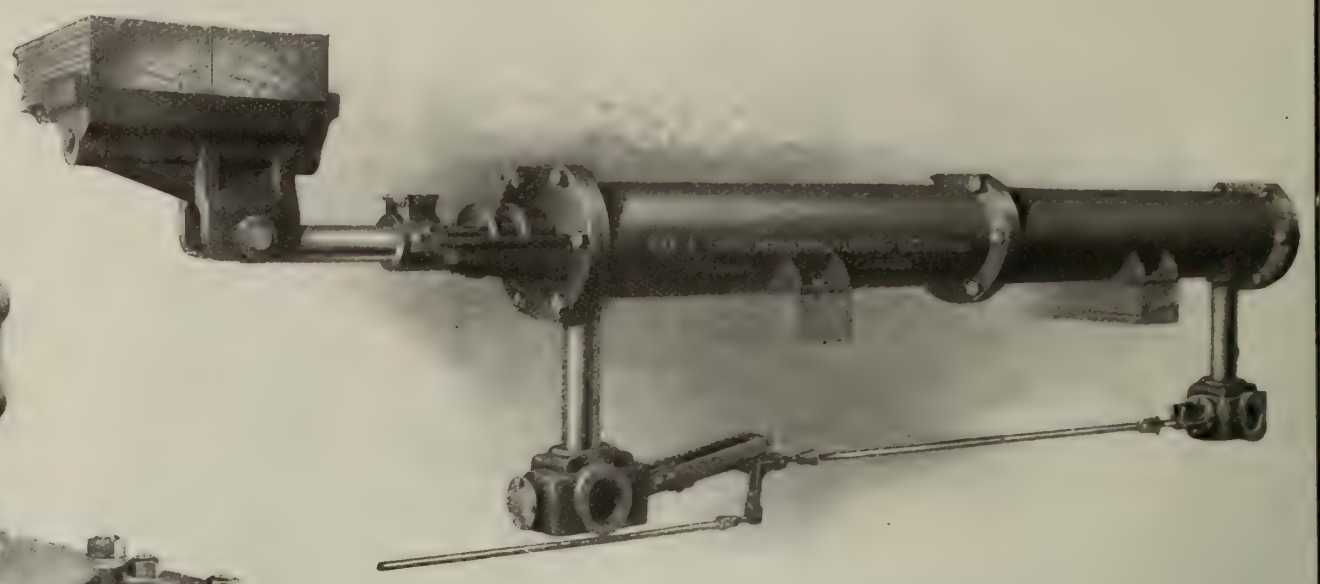
Saws: 2 movable saws on edger side (more if desired) 8 stationary saws on gang side, 2 water boxes.

Let us quote you when you are in the market for Saw, Lath or Shingle Mill Machinery or Repairs.

MOWRY & SONS, Gravenhurst, Ontario



Vertical Steam-Feed Valve



Direct Acting "Shot Gun" Feed

Built in sections to make up any length feed required, with 8 in., 10 in., 11 in., 12 in., and 14 in. bore.

We fit our feeds with **any style of valves required.**

Our "Gun Shot" feeds are money makers wherever used.

FULL PARTICULARS ON APPLICATION

We guarantee that our Valves will not stick or kick. They are perfectly steam tight and are without exception the most economical valves manufactured.

We not only manufacture a complete line of steam feeds, but also a complete line of steam actuated machinery for saw mills of any capacity.

Some Bulletins We Issue

Our new series of catalogues accurately describe and illustrate the line of Sawmill Machinery we now build.

Printed in bulletin form, each is descriptive of one machine or one style of machine only.

You receive a bulletin that is easily handled or filed for reference. It describes only the machine you are interested in and this in a detailed way impossible in a general catalogue. Every page is worth reading.

Here is the List:

BULLWHEELS
CHAINS AND ACCESSORIES
LOG DECK MACHINERY
MEDIUM CARRIAGES
HEAVY CARRIAGES
CIRCULAR SAW FRAMES
BAND MILLS
EDGERS
CIRCULAR RESAWS
LATHMILLS AND BOLTERS
PLANERS AND MATCHERS
PORTABLE SAWMILLS
LIGHT CENTRE CRANK ENGINES
HEAVY SAWMILL ENGINES
McEWEN ENGINES
STEEL PLATE WORK

Which Shall We Send You?

Mark with a cross the individual bulletins in this list you would like sent, or if you would like the complete set assembled in a handsome binder cross out the lot and attach this page to your letterhead and send it to us to-day.

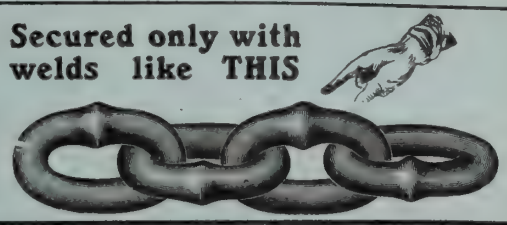
Sold by **McKinnon Chain Co.** BUFFALO, N.Y.

Secured only with welds like THIS



GREAT STRENGTH & DURABILITY

Dick's Balata Belting, the best known fabric belt in the world, is specially distinguished for great strength and durability. Most gratifying results have been obtained from Dick's Belts as regards retention of strength. There are cases on record where Dick's Belts have been running for over twelve years and not only have retained their strength, but show not the slightest signs of wear and tear.

Write for Catalog on "Transmission Appliances."

The Steam Tension Band Mill

The steam tension band mill as we make it is entirely different from any other band mill made. Owing to the great success of this mill, many other manufacturers have added steam cylinders to their **standard** mills for operating the top guide and for raising and lowering the top wheel. Of course, these devices at their best are not all they ought to be, but the fact of their being there serves to emphasize the worth of the steam operated mill. Ours is the only band mill which has been **specially** designed from the beginning as a steam tension mill, and consequently the steam cylinders are placed where they should be, and work properly at all times, no matter what your boiler pressure or your sawing conditions.

The advantages of this mill are obvious—the time saved by having **both** the top guide and the upper wheel operated by steam is very considerable, while with our very sensitive steam tension, the saws are easily kept at exactly the right tension to cut perfect lumber, to say nothing of the longer life of the saws.

It costs you a little more to buy this mill because it costs us more to make it, but it saves you far more than the difference in cost in a very short time, and so it is worth more.

Built with 8 foot, 9 foot and 10 foot wheels.

May we send you our catalogue?

Timber Limits for Sale
on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

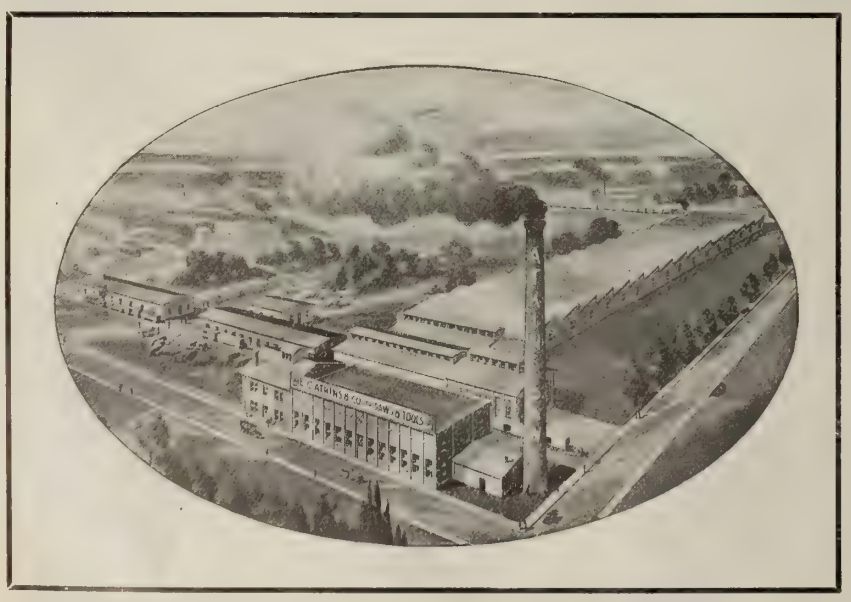
ATKINS STERLING SAWS

Made in Canada



Band,

Circular,

Cross Cut

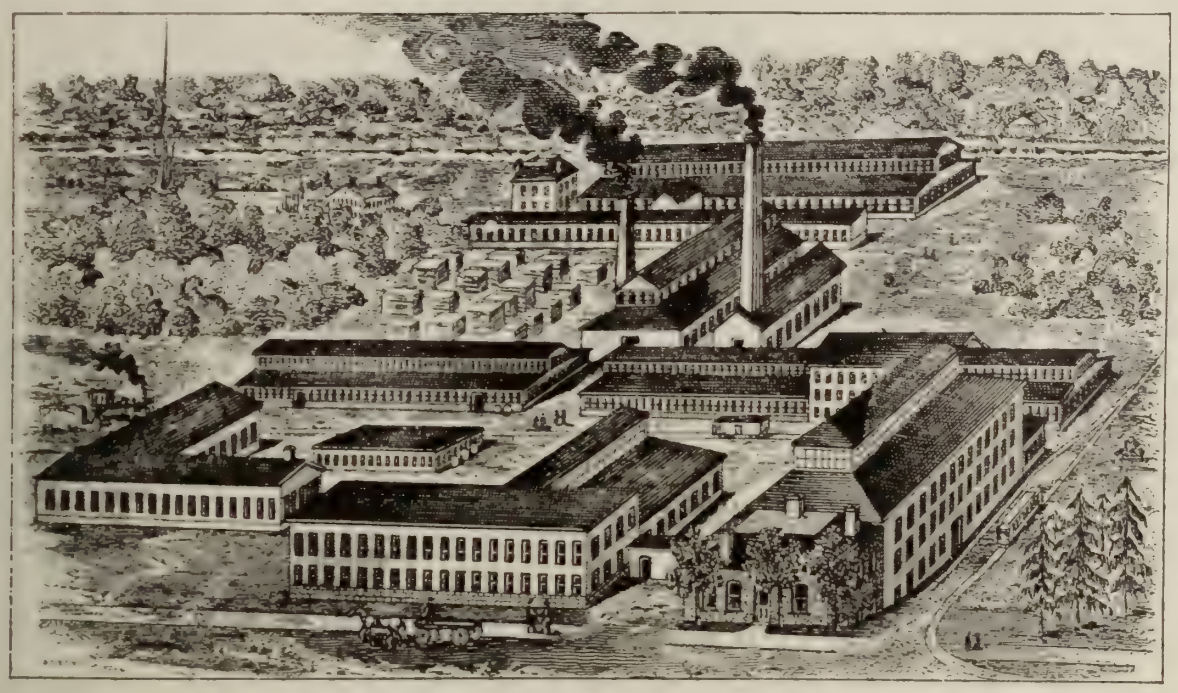
A Perfect Saw for Every Purpose

E. C. ATKINS & CO., Makers of STERLING SAWS Factory, HAMILTON, ONT.

Vancouver Branch, 109 Powell Street

MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made



The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario

GARLOCK PACKINGS

Garlock Regular Rings

For all general purposes outside of high pressure work. This Packing is a special grade thoroughly lubricated with the celebrated "Garlock" compound, and is the perfected result of over thirty years experience in manufacturing fibrous Packings.

Garlock Square Duck Packing

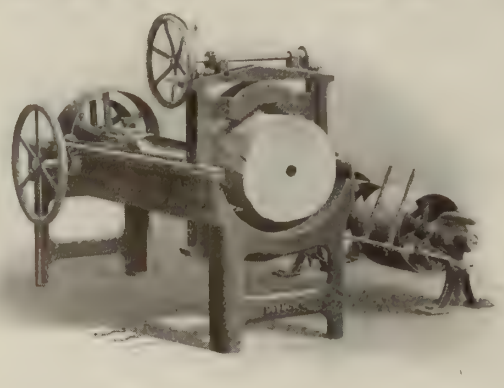
THE GREATEST FEATURE about the

" DEFIANCE " WOOD-WORKING MACHINES



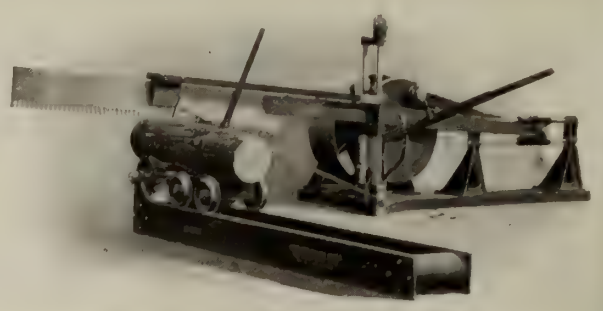
No. 1 Heavy Hub Boring Machine

Is the unequalled regularity with which they perform their work, which has given them their supremacy.

Of course, there is nothing new about that, for uniformity has characterized DEFIANCE machines since 1857.

The newness of our tools is in the general design, and the improvements we are making on them daily are really astonishing, to say the very least.

Always use Defiance Machines for Defiance Results



No. 1 Improved Drag Sawing Machine

There's a reason for it and their users will tell you so. Educate yourself with one of our catalogues and then write us for prices.

DEFIANCE MACHINE WORKS, 426, Perry St., Defiance, Ohio, U.S.A.

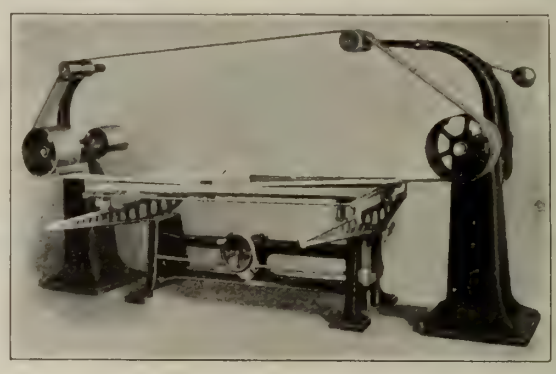
INTERIOR FINISH AND MILL WORK SHOPS

Here is a Sander built for YOU



NO. 131 BELT SANDER

It produces a better and more uniform finish on all kinds of interior trim **at a cost that is down to a manufacturing basis.**

It is made to handle the endless variety of work that comes up in your line—irregular shapes, frames, doors, etc., as well as flat work, and can be expanded to finish any length of stock up to 20 feet or more.

Of a generous capacity and convenient in operation, it is very easily and quickly adjusted to economically care for frequent changes in sizes and shapes of work—a necessity in your business.

Without a skilled operator, it puts on the " finishing touches " usually given by hand, and it never gets out of order.

Write for our special No. 131 Circular and liberal terms

SAULT STE. MARIE, ONTARIO

A Belt which Conveys ALL the Power

Practical men know the drainage of power from a slipping belt, ***and because they know,*** they are buying

GOODYEAR RUBBER BELTING

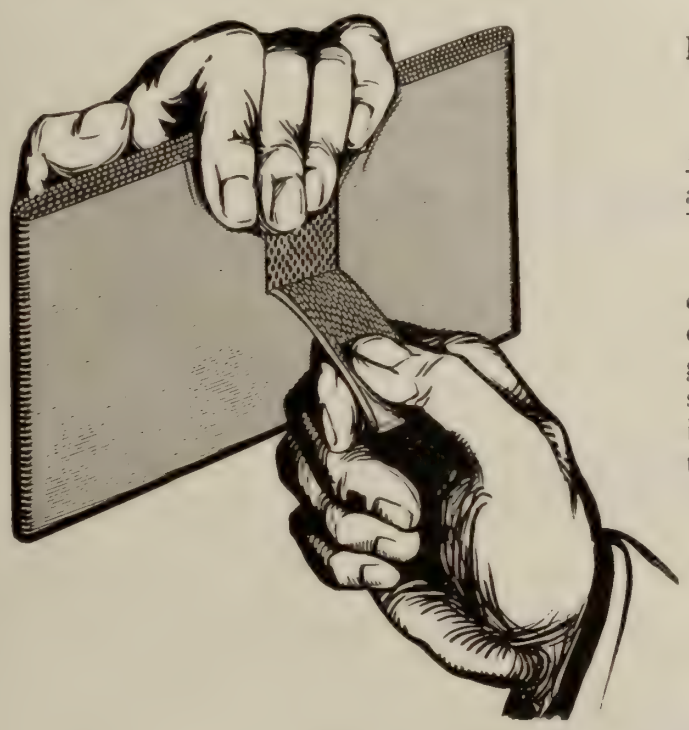
Which Neither Slips Nor Stretches

It is built up, layer upon layer, of close-woven, long-fibre, cotton fabric, rubberized and cured under Goodyear processes. And every Goodyear belt has in it the lowest possible minimum of stretch, because the belt is "cured" whilst stretched to the limit of safety in a special machine.

That is the Goodyear Method of Belt Manufacture

And the result is entirely satisfactory to belt users—a fact to which our enormously increased sales testify. What is the significance of this CONTINUED SALES INCREASE — 50% over last year? Simply that Goodyear Belting more than fulfills the claims made for it by the Goodyear people—who know what a belt should do, and make a belt to do it.

It has cost us less than $200.00 for claims or adjustment of every kind in connection with our total output for the past two years—a remarkable tribute to Goodyear reliability.



Look into the Belt for Yourself—Try to Tear It Apart.

Make a cut in the top layer—and then try to pull it apart. You will get a faint idea of its strength.

That is the result of forcing rubber at tremendous pressure through the fine cotton fabric—separating every strand—thus abolishing all internal friction or grinding. Whilst these layers of fabric are afterwards so compressed as to be almost homogeneous, the finished belt bends easily, the "duck" being so woven as to retain complete pliability in the finished belt.

For Main Drives and High Speed Pulleys GOODYEAR Belting is the Best

It has all the tensile strength necessary to absorb tremendous strain without slip, stretch or rent. The grip of rubber and the prodigious strength of hard-twist cotton fabric are united, and prove equal to every emergency.

Where the power transmitted is high, and great tensile strength is essential, Goodyear Rubber Belting proves its worth.

EVERY GOODYEAR BELT IS SUBJECTED TO A STRINGENT TEST BEFORE LEAVING THE FACTORY, and what is more, the materials used in the manufacture are also tested in the Goodyear laboratory before using.

IF YOU USE A BELT AT ALL IT WILL PAY YOU TO USE A GOODYEAR

Loss of power is loss of profit—and an inferior belt is dropping power all the time. Goodyear belting quickly earns its cost in power saved and trouble avoided.

TWO HUNDRED AND FORTY ROLLS—A TOTAL OF 72,000 FEET

We have just received an order for this quantity of GOODYEAR RUBBER BELTING from one business concern in the west, for the equipment of interior elevators. Such an order shows supreme confidence in the quality of GOODYEAR Belting.
If we have not just the belt you require we will make it for you.
In the choosing of belts our booklet would be of great assistance to you. We supply it free. Write to our nearest Branch for one.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, November 1, 1912 No. 21

New Brunswick Pulpwood Problem

The act to prohibit the export of pulpwood cut from Crown lands in the province of New Brunswick which was recently put in force, has not entirely met with the approval of those who are engaged in the pulpwood business in New Brunswick. The general belief at the time of the passage of the act was that it would encourage the erection of pulp mills in New Brunswick, and in this way be a great benefit to the people of that province. That there are two sides to the question is forcibly illustrated by a letter which was recently written to the Editor of the Chatham Gazette by Mr. J. W. Brankley, manager of the Miramichi Lumber Company, at Chatham, N.B. Mr. Brankley is a man who has studied the lumbering industry in most of its branches and who has become a recognized authority upon many of its important questions. His views, therefore, are of much weight and readers of the Canada Lumberman will be interested in learning what he has to say upon this subject. We take pleasure, therefore, in reproducing Mr. Brankley's letter, as follows:

"I noticed an article in your paper a short time ago explaining the new Crown Lands Act which came into force on August 1st last, an act which is generally regarded by people of Chatham as one very much in the interests of this community. If you would permit me, I would like to point out one or two matters in connection with the pulpwood business which have so far escaped the attention of the people who speak about this matter. The new act, of course, prohibits the exportation of pulpwood from Crown lands, but leaves it free to be exported when cut from private lands.

"This possibly may be a good thing for the country which has the wood and the water power necessary for the operation of pulp mills, particularly ground wood pulp, but unfortunately this section of the province has no water power to speak of, with the exception of Grand Falls, and this power is in the remote northwestern section of the province.

"The Mirimichi Lumber Company of Chatham, of which I am general manager, in addition to its lumber and deal business also engages in the rossing of pulpwood. It may be well to enquire whether it is a wise provision or not to stop all further use of wood cut from Crown lands for this purpose. Now in the first place, a great deal of the wood that is used in rossing mills comes from the tops of trees that are cut for the saw mill and these tops when cut down to six inches at the top end are of no earthly use for the saw mill (for I have already bought from a prominent saw mill owner over a million feet of small logs that he stated he could not possibly use for his mill and would be a dead loss to him), but instead of leaving these tops of trees in the woods (as a great many saw mill men do because of the fact that it does not pay them to bring out such small timber and cut it up into deals or boards) we bring down all this small material and use it in the rossing mill. This material where the saw mill is concerned is lost to the province. The rossing mill, on the other hand, pays men to bring this small stuff out of the woods (only that which is cut from the tops of trees, for the Government will not tolerate cutting anything that will not give nine inches at the top end of a butt log), pays the government not only the regular timber stumpage fee, but an additional twenty per cent. because it is destined to be made into rossed wood for exportation; makes it a commodity on which a mill is kept running, employing over a hundred men day and night (as a recent article in your paper set forth) and keeps a line of steamers loading here during the entire season with an outlay per season of $35,000, for labor and pilotage. This amount you must admit is a very large sum to pay out during one season.

"Another point about the rossing mill business is this: there are in this province many sections that by reason of the nature of the land and climatic conditions are capable of producing only a stunted or undersized growth of timber. It can never reach any large growth and for this reason would never be utilized by anything but a rossing mill. In fact no saw mill could use it. This timber is made valuable where a rossing mill is located and it becomes as valuable to the province and the citizens of the province as any other timberland in that province.

"Now another point I make is this; that by accounts carefully kept and worked out there is twenty-five per cent. more money expended and labor employed on an acre of land for pulp logs that go to a rossing mill than on what saw logs can be got from that acre in particular.

"Thus you can see that the rossing mill not only utilizes timber that is othewise lost to the country but removes from the woods a very probable source of danger (that would be caused by fire) to the standing timber growing on these Crown lands and private lands.

"Now, Sir, I ask you if it would not be better for the government to encourage this kind of operation and the running of a rossing mill than to harass and attempt to destroy such an industry in the province and particularly on the North Shore where the number of industries is none too large at the present time. Should not some consideration be given to the men who have put money into this business as well as into any legitimate line of industry?

"I am constrained to make these few remarks by reason of the erroneous impression that I find prevails in many sections in regard to the value of the rossing mill business in this province and I trust that you will receive them in the spirit in which they are meant."

In connection with the above letter it is instructive to note what the government has to say upon this subject in the annual report of the Crown Land Department for 1912. Honorable J. K. Fleming, Surveyor General, in his report wrote as follows:

"As foreshadowed in the last report of this department, steps were taken at the last session of the Legislature to enact a law to prohibit the exportation of pulp wood cut from our Crown lands. In doing this we were following in the line of the provinces of Ontario and Quebec in preserving this class of wood with the object of manufacturing it into pulp within the boundaries of our own province. It was thought that out of fairness to those from the neigh-

boring Republic who had invested in properties of this kind, a certain time should elapse before placing the principles of the bill into operation, and accordingly it was decided that pulp wood should be prohibited from exportation on existing licenses on and after the first of August, 1912. While it is true our water powers are small in extent, in comparison to Ontario or Quebec, upon which depends so largely the successful manufacture of pulp, still it was felt that the enactment of such legislation would be an incentive to utilize such water powers as we have, thus affording employment to a large class of our own people in an industry derived solely from our natural resources. When it is considered that a cord of pulp wood loaded on the cars in this province is sold on an average of $5 a cord, the price of this same cord when manufactured into pulp would average at least treble that amount. To extend this argument further and manufacture this pulp into finer grades of paper, a huge industry would be the result. The prevailing opinion throughout the Dominion to-day is to preserve our natural resources, and so far as this province is concerned there is no question more vital to our interests than that which relates to the pulp wood industry.

"The most serious aspect of the pulp wood problem is not in the prohibition of its export, nor in regard to the difference of its value when manufactured into pulp or paper, but in the cutting down of our young forests which should be left to grow and mature and thus keep up our forest supply.

"There is no doubt that the price of pulpwood is a strong inducement for our wood land owners to ship the young growth and turn into money what is considered only idle capital; but such a decision in the end not only impoverishes the owner of the land but lays waste the forest growth, provides fuel for fires in the slashings made and injuriously affects the forest floor. We have much to learn from countries of the old land, Germany, France, Sweden, and even in our own mother country, in our forest management and the marketing of timber. Conditions in these countries are, of course, different from ours, but the same principles prevail as to forest cutting and the care of the forest from fires. In some of these countries a tree must be planted for every one cut down; the whole of the tree, even to its branches, is marketed, and large areas are annually set out with young trees in order to perpetuate the forest. The forest floor is cleared of all material of a combustible nature and such a degree of perfection is attained in fire ranging that damage from this source is reduced to a minimum. In Great Britain a great movement has commenced under government auspices to replant waste ground, and millions of pounds in money have been provided to carry out this project. In the United States the forest problem is now being grappled with as never before. Great national forests are set apart under the care of trained foresters. The era of the land grafter has gone, and the cry has gone over all that mighty land to preserve the forests for the present as well as for future generations, and to save what is left of ruthless devastation by the hand of man and the ravages of fire.

"Is it not then opportune for us to husband our forest resources, to pass wise laws to preserve them from destruction and to vote what moneys are sufficient to carry these laws into effect?"

The Economy of Artificial Drying of Lumber

The science of drying timber and lumber has made great strides of recent years and has of late been so thoroughly mastered, that it is possible to-day, in practically every case to avoid the former outlay which was necessary for seasoning timber in the open air before it could be used. It is just a question to-day, whether, even in all cases, it does not involve a loss to season timber or lumber by the natural process instead of using modern dry kilns. Aside altogether from any question as to the relative merits of the natural and the kiln-dried lumber, the question of cost is so serious as to make it necessary for all who have timber or lumber to sell to consider the pros and cons of the question closely. When there is no immediate hurry for making lumber dry, the question becomes solely one of expense. The cost of keeping timber or lumber away from the customer for a year and sometimes as much as four years, is a serious matter. It adds much to the first cost of the product as it keeps just so much money idle all the time and it requires additional expense in rents, taxes, etc., upon the ground which is used for storage space.

The manufacturer of lumber is necessarily involved in the outlay of large sums of money in his manufacturing processes. In most cases it is the best part of a year before a log which he has cut in the woods can be turned into lumber in his mills. In many cases it is as much as two years. During all this time his money is earning no profit for him. This expense has to be put into the cost of the finished product. When once the log has reached the mill it is necessary, therefore, to use every possible speed in transforming it into a product which can be disposed of for cash. If it is further necessary to wait for a year or perhaps four years until the product of the log can be sold to a customer, the amount of idle capital is greatly increased. Perhaps this capital should not be called idle as it is really performing the duty of permitting the transformation of the log into the article which the customer requires.

Nevertheless it is idle to all intents and purposes if it is being used in financing an old-fashioned method of manufacturing which could be supplanted by a modern method involving less expenditure in capital and time.

The Timber News, of London, England, in a recent issue, discussed this problem from the point of view of the hardwood manufacturer. Its remarks being as follows: "In business one of the factors of success is the facility with which capital can be used. When it is locked up in timber, plant, or other accessories to modern industry it must be charged for in determining the selling price of the article manufactured. When it is possible to lessen the amount of capital invested in the business, it enables the manufacturer to either have a larger profit or to reduce his prices for the manufactured article, the lessened price creating a greater trade and so in this way increasing the manufacturer's bank balance. Perhaps in no other industry is there such a large amount of capital locked up as there is in the hardwood trade. One has only to walk through the East End of London to see stocks of cut timber that must run into many thousands of pounds in each yard, tier after tier of valuable hardwood being air seasoned, not for a few months, but for years. All this must tell on the cost of the timber. Not only is there the charge of storing it, but at the very least five per cent. must be charged to give the merchant some return for his outlay. This over four years means twenty per cent. on the first cost of the timber, and when it is valuable hardwood, this is no small sum. Not only is there this extra cost upon the timber before it is realized in hard cash, there is also the locking up of a very large sum which could be used very advantageously in the business. But it may be asked: What is to be done, timber cannot be sent home half seasoned? We are well aware of the fact that it would not be pleasing to any manufacturer to receive green timber, when for special reasons he requires it bone dry. Then why not take advantage of a proper system of drying timber? Drying timber by artificial or mechanical means is no new thing, yet it is strange that far too great a number of timber merchants, and others requiring dry wood, will go on the same old way—pile the timber out in the smoke, and lock up an enormous capital in their stock, instead of installing a proper apparatus for drying timber.

"It is not as though timber-drying plants are new things. Numbers to-day are drying timber fresh from the sawn log, leaving it in such condition that it is fit even for the best cabinet work. Indeed, the whole case is on a par with the modern gas engine. Thirty or so years ago the gas engines then on the market were very unsatisfactory. It was almost a matter of chance whether they would go or stop. The reputation of that gas engine remained long after the engine had been modernized into the perfect machine of to-day. So with the drying kiln. Years ago, before the theory of drying timber was understood, any heat, anyhow, was applied to green wood. The results, it need not be said, were more or less disastrous. Half-baked wood is of little use for cabinet or other work requiring seasoned

wood. It was perhaps perfect wood when it went into the drying stove; when it came out a boa constrictor would look straight to some of it. Cracks and other defects would show; indeed, the valuable wood would be spoilt for all practical purposes. These results were talked about, and the general impression grew that it was impossible to dry wood by mechanical means. Such impressions, today, are entirely wrong. Modern drying apparatus dries wood equal to four years' open-air seasoning."

Why is Grading Problem Neglected?

The absence of any definite grading rules for hardwood lumber in the province of Quebec, has always been a source of wonder to those in the trade who give the matter sufficient study to appreciate the great inconvenience and serious loss which it involves. The Canada Lumberman has frequently endeavored to stir up those who are in a position of influence in the lumber trade to introduce reforms in connection with the grading of lumber, which would bring a certain amount of order out of the present ridiculous situation existing in so many parts of the Dominion. The hardwood situation in Quebec is not by any means alone in its peculiarity. It is in fact only one instance of the inexcusable neglect which has permitted the lumbering industry in Canada to develop along lines totally at variance with modern business principles. In Ontario likewise, there is practically nothing in the way of systematic grading or inspection of the chief classes of lumber produced by the mills of that province. The same applies to the soft woods of Quebec as well as the hardwoods and also to the lumber products of the Maritime Provinces. When we come to western Canada the situation is more promising. In fact the people of British Columbia and the prairie provinces have succeeded in bringing about a systematic division of their lumber products into practical grades, in such a way as to greatly simplify the business of handling lumber. The British Columbia Lumber and Shingle Manufacturers, Limited, and the Mountain Lumber Manufacturers Association, have adopted excellent systems of grading lumber which have been used with success by practically all who are engaged in the trade in those parts of Canada.

Under the above conditions it is all the more strange that eastern Canada has not been able to throw off the incubus of old-fashioned methods and to follow in the steps of those who have kept up with the march of progress. In the United States as well as in western Canada, grading rules have been very largely adopted. The two large hardwood associations in the United States are notable examples, and so successful have they been that one of them, the National Hardwood Lumber Association have found it both necessary and profitable to invade Canada. This invasion is of a decidedly peaceful and beneficial nature and if they can establish their grading rules in connection with the hardwoods of eastern Canada they will perform a service for which they will deserve the thanks of the whole hardwood industry of this country.

There are many in the lumber industry who disapprove of any proposal to bring about a systematic and uniform grading of lumber products. What their reasons can be it is hard for others to appreciate. Practically the only reason given, is that local markets require different grading, and also, that an old established firm, having developed its own system of grading, would be at a serious loss if it were to be obliged to change its system in order to fall in line with a uniform one. We do not believe that this latter reason can be taken seriously by those who put it forward or by any others in the trade. As to the former reason, we believe, upon the testimony of many prominent and successful lumbermen, that the varieties in grades required by the local markets are not by any means so important as some people have been lead to believe. It is not essential moreover, that cast-iron grading rules should be drawn up to apply to every market. The urgent necessity is for preparing some definite, and at the same time broad, definitions in regard to the chief terms used in describing lumber of various qualities, which will enable the buyer and the seller to understand intelligently just what kind of a product he is talking about with his customer.

It should not be possible for instance at this late date in the history of the lumber industry to sell a man a shipment of firsts and seconds and to deliver him first, seconds and No. 1 common in the confident expectation of putting the deal through. Nevertheless this is just what is done in a great many cases and it almost seems as though many dealers base their whole business system upon the principle of delivering a lower quality than they contract to sell. Every lumberman understands this situation pretty thoroughly, and many of them in conversation will admit that they would like to see a big reform brought about, but when it comes to inaugurating a reform there are few who will take up the work and many who will seek to prevent it.

Elsewhere in this issue will be found a brief letter from a lumberman of Montreal, a lumberman whose standing and reputation are high among his fellows in the trade. He puts the matter briefly and forcibly. We hope to have his views at a later date in detail to present to our readers. In the meantime we would appreciate it greatly, and we believe the trade would benefit considerably, if others who have its interests similarly at heart would contribute their views for publication. We would at the same time respectfully request them to discuss practical methods for bringing about a better state of affairs.

Editorial Short Lengths for Busy Readers

There were 13,683,770 cross-ties purchased in Canada in 1911, according to statistics compiled by the Forestry Branch of the Department of the Interior.

This is an increase of 4,469,808 (48.5 per cent.) over the number purchased in 1910. The increase is largely due to railway construction.

Eighteen kinds of wood were used, jack pine standing first in importance, numerically, with about 40 per cent. of the total. Tamarack stood second with almost 19 per cent. and Douglas fir with 14 per cent. and hemlock with 12 per cent. occupied third and fourth places respectively.

The average price of ties in 1911 was 39 cents, one cent more than in 1910. Southern pine ties at $1.10 imported from the United States were the most expensive, and spruce ties at 26 cents were the cheapest. The sawn tie is increasing in favor, evidently, as 70 per cent., or 3 per cent more than in 1910, were the product of the mill. Sawn ties cost, on the average, 41 cents a piece, or 4 cents more than hewn ties.

Only 206,209 ties, or 1.5 per cent. of the total number purchased were given preservative treatment. However, this is practically a clear advance over 1910. Two treating establishments are now in operation. On the average, the treatment of ties prolongs their life by ten years. It is estimated that at least 350 million feet, board measure, could be saved annually through this process.

The value of capital invested in timber and lumber and their re-manufactures in Canada at the time of the taking of the census for the year 1910 was $259,889,715. Ten years previously the figures were $89,959,336, and for the year 1890 they were $74,263,668. These figures show the following increases: From 1890 to 1900, 21.13 per cent.; from 1900 to 1910, 188.90 per cent.; from 1890 to 1910, 263.49 per cent. During 1910 the amount paid in salaries and wages totalled $46,035,618. In 1900 the total was $23,473,558, and in 1890, $18,658,719. The increases during these years were as follows: From 1890 to 1900, 25.80 per cent.; from 1900 to 1910, 96.12 per cent.; from 1890 to 1910, 146.72 per cent.

New Brunswick Timberland Situation

Conditions Which Make the Preparation of a New Forest Policy Urgent and Difficult — Stumpage Dues, Fake Settlement and Pulpwood Export

That the province of New Brunswick has a difficult and at the same time, a most important problem to solve to-day in connection with working out an effective and successful forest policy is realized by all the people of that province who have given the matter their attention. It is late in the day for an eastern province to take up such a question but it is possible nevertheless to work out a policy which will result in saving the forests as a revenue producing asset for all time to come. The government—as pointed out in the Canada Lumberman of October 1st—is now giving the subject its attention and is expected to announce during the next session of the legislature, either the policy in detail or the main principles upon which it will be based. Under these conditions the Canada Lumberman has considered it advisable to secure the views of men prominently connected with the lumbering industry of the province, whose experience justifies them in expressing their opinions.

The article published in the Canada Lumberman of October 1st discussed the problem in a general manner, referring to conditions which have led up to the present timberland situation and giving the suggestions of a prominent timberland owner in the direction of reform. The remedies which he suggested were briefly as follows:—

1st.—Making a complete survey and estimate of the forest areas of the province.

2nd.—Basing stumpage rates upon the cost of logs delivered at the mill.

3rd.—Encouraging the thinning process in connection with spruce forests by permitting pulpwood cut from Crown lands to be exported.

4th.—Confining settlements strictly to agricultural lands, so as to prevent fradulent settlement carried on only to secure the timber, after which the land is abandoned.

5th.—Revising the taxation of wild lands, either (a) by removing the taxation or (b) making it nominal during the long period when forests are not being cut, or (c) charging only for the crop as it is gathered at a fair rate.

6th.—Placing the Crown lands under the management of a non-partisan commission, so as to remove them entirely out of politics and ensure their being managed from the point of view both of conservation for the future and receiving the largest practical annual revenue.

With the exception possibly, of the suggestion that the government permit the export of pulpwood, these proposed remedies will meet with general approval and there are many in the province to-day, who will agree also that the restriction of the export of pulpwood is not altogether a blessing. The above suggested remedies are not to put forward as a detailed solution of the problem. They are necessarily only general but they are presented in the belief that along some such lines the government will be able to work out solutions to the many difficult features of the situation, which will be both practical and satisfactory to the lumbering interests of the province and to the people themselves.

Forest Areas Should Be Explored

In regard to the first recommendation, everyone realizes that it is essential to the future prosperity of the province of New Brunswick that its forest areas should be completely explored, surveyed and mapped, and that at the same time all possible information should be secured regarding the rates of growth. It is difficult for the uninitiated to understand why this has not been done. It is one of those unexplainable things which result from the natural development of conditions, unregulated by attention from any one who takes sufficient interest in the situation to prevent the great waste incident to operations which are not guided by care for the interests of posterity in the natural resources of the country. The government of the province of New Brunswick to-day has a great opportunity at hand. It has in its power to make a name for itself as one of the most capable governments that the province ever had; if it will give the new forest policy sufficient study to ensure that the forests will be placed upon a permanently paying basis. It may be thought an easy matter for a publication to criticize, while at the same time, failing to offer valuable suggestions for those who are in charge of the affairs of the country. However, we take it that the duty of the press of the country is to point the way and that whenever criticism is necessary or advisable, it is not essential that the press should decide the details of reform. In the present case indeed, we realize fully that no publication could hope to grapple in a capable manner with such a situation as that in New Brunswick to-day, or even to offer suggestions which would be certain of success.

The second reform suggested in the article brings up the main problem of securing, for the people of the province, a fair share of its resources and at the same time encouraging the development of the lumbering industry. Whatever system of stumpage dues is decided upon by the government the dues themselves must be based upon these two principles, viz., the owners of capital invested in the lumbering industry, and the people of the province as a whole are each entitled to share in the country's natural wealth; the one in proportion to the capital and labor devoted to the industry and the other to such an extent as will give them a safe and fair revenue. The only proper policy will be one which will work out fairly to both interests.

Fortunately it has been demonstrated in other parts of the world and is being shown in a notable manner in British Columbia to-day that the interests of the public and the interests of the lumberman are to a large extent identical. It should be a simple matter for those who are acquainted with the essential facts to draw up a list of stumpage dues which would accord reasonably well with the profits secured by lumbermen in cutting the logs, while providing a good revenue for the province.

Lumber operating conditions have changed greatly of late years. The most important alteration being the great increase which has taken place in the cost of labor and supplies. At the same time, each year has witnessed the carrying of logging operations farther into the most inaccessible parts of the country so that it costs proportionately more in labor to get out a log to-day than it did in the early days when the timber was more accessible. These conditions are all understood by those who are engaged or interested in lumbering and should be given careful consideration in drawing up any new set of stumpage dues.

The fourth suggestion made was that the present settling laws should be revised. Everyone who knows anything about lumbering knows the importance of this matter. Stealing timber under pretence of settlement has been a popular method of making money in Canada for many years and New Brunswick has had its share of the fake settler. With the experience of the past it should not be difficult for the government if they wish to prevent this injustice to the lumbermen and to the people of the province, to enact a measure which would reduce this evil to a minimum. The principal thing necessary is that the government should be in earnest in its intention to prevent fake settlement, however, seriously the government may intend to stop this business it will always be handicapped by political considerations and for this reason the wisdom of revising the settling laws becomes evident.

The sixth suggestion in the article referred to was that the crown lands should be placed under the management of a non-partisan commission. If this were done it would be possible to put an end to fake settlement and at the same time it would simplify the problem of forest conservation.

The Export of Pulpwood

Probably the most important feature of the forest policy of the government of New Brunswick to-day is the regulation which requires all pulp wood cut in the province from crown lands to be manufactured within the province. In other words, spruce cut from crown lands cannot be exported in the rough, but must be further manufactured, i.e., turned into pulp or paper. Spruce cut on privately owned lands is not subject to this restriction. The writer whose views were set forth in the Canada Lumberman of October 1st, in a further letter presents in a forcible manner the argument against this restriction. "New Brunswick," he says, "has but little water power in that portion of the province sloping toward the St. Lawrence which contains a very large portion of the crown lands. On account of this lack of water power it is particularly important to develop the pulp industry in this province. Secondly the pulp wood from this eastern slope must eventually either go to waste, or to be largely shipped either to the States or to some other provinces where they have abundance of water power. The most practical advisers that I have found so far," he continues, "have been among the pulp wood men. They have so much money invested in mill plants that it is necessary to guard a long future, and therefore, they have been giving the subject practical consideration for a considerable number of years, realizing that deforesting or wasteful

methods of cutting meant a rapid depreciation of their plants, which perhaps have cost millions.

"The building of so many pulp mills in the state of Maine would at first thought give the impression that it would only be a few years before the forests would be exhausted—while as a matter of fact the improved methods of cutting and the saving of so much wood that heretofore has gone to waste, warrant me in asserting that if all the forests of Maine were available to the different mills, the growth would supply the entire demand for an indefinite period. That some of these mills go to Canada for a considerable supply of wood rather than obtain it in the State of Maine, is not because the supply is exhausted, but because they can obtain it more cheaply on account of railroad connection than they can obtain it from northern Maine. If you will glance at the map you will note that the Allegash and the St. John Rivers, with their northern branches, drain a considerable portion of the forest area of that state and in order to make any of the wood from this large area available to Maine mills it would be necessary to float to some gathering point on the St. John River adjacent to some railroad whence the logs would be shipped to the mills by cars. No such gathering point can be found nearer than the extreme northern border (say between Fort Kent and St. Francis) and the cost of cutting this wood together with stumpage, floating it to St. Francis and then shipping it back to the mills by cars has thus far been greater than to take the wood from Canada. As a result, not a single pulp wood log of any kind, shape or description has thus far been taken from this area and used for making pulp and paper."

The point which the writer desires to make in the above letter is that the restriction of the export of pulpwood from New Brunswick crown lands will not bring about an extensive increase in the manufacture of pulp and paper in the province of New Brunswick. If these facts are correct it becomes likely on the other hand that the pulp manufacturers of the State of Maine will be obliged to operate in the pulp wood areas of their own state which have not been cut as yet and that the owners of standing pulp wood in the province of New Brunswick will not only lose their good market but will be unable to thin out their own timber in such a manner as to bring about a good annual growth.

Conditions Rapidly Changing

The same writer dealing with the question of the growth of spruce in New Brunswick says, "Spruce in this north-western region is our best forest product and the species of tree that appeals to the average timber land owner. as the one requiring the most study. In the olden times nothing but the largest and best of this species of wood was regarded as merchantable, the large tracts having a small growth being regarded almost as waste land. The advent of the paper mill has demonstrated that where available these large tracts of undersize growth, formerly regarded as waste land, have large commercial value and the forest owner after considering the matter from a financial standpoint naturally concludes that he does not care a picayune for the sentimental features of forestry; but is willing to sell his spruce beam pole size, or from 6, 10 and 12 in. or larger, as will yield him the best revenue through a series of years.

"Scientists tell us that spruce seeds will germinate and grow only in a mineral soil except in rare cases not worth considering. On the other hand fir seeds will germinate and grow as a general rule only in moss soil. The result is that in a thick growth particularly on land inclined to be mossy the spruce is supplanted by the fir for the reason above indicated.

"Query:—Cannot governments and individuals adopt some cheap method by which the mineral soil may be exposed in order to allow the spruce to germinate and thus do away with the preponderance of fir found on mossy soils—the fir being a much more desirable wood.

"Again, scientistc have determined that a spruce tree takes its food very largely from the air, the roots absorbing and bringing up only the necessary moisture together with what earthy matters are required to enable the tree to make rapid growth. Every spruce tree growing in a forest grows very slowly, indeed, until such time as the top gets up above the surrounding growth where it can get plenty of light and air, when it takes on wood and grows very rapidly. This demonstrates the fact that where a thinning process can be followed thus allowing more air and light to the tree, the amount of actual growth or new wood produced annually will be actually greater than it would be on the total stand without any thinning.

"This leads to a second problem namely: On forest territories where there is a good sprinkling of spruce seedlings, is it practical for the government or individual to adopt any policy by which, at a very modest cost, the undesirable tree growth that simply cumbers the ground, can be destroyed, either by girdling or some other cheap method of destruction, thus affording the spruce a chance to make very rapid growth instead of a very slow growth as under the natural process.

"By actual calculation it is found that spruce trees, either wholly or largely shaded, increase in volume less than 1 per cent. annually, while those more favorably situated, where light and air are abundant, will increase as much as 6 per cent. and sometimes even more. This suggests that the problem is worth considering, how we can best increase the volume of growth at the smallest possible cost, and whether or not this work can be made financially successful."

Encouraging Careful Operation

A great deal of misconception exists in the public mind about the operations of the lumberman. The ordinary citizen considers that when a tree is cut down it is simply destroyed and that so much of the forest is obliterated. He does not bear in mind the fact that lumbering operations are carried on upon scientific lines and that the removal of these in a closely growing forest enables those which remain to grow more rapidly and attain a much greater size than they could have otherwise. The Rev. Edward Everett Hale in an address once referred to this question in forcible language. It seemed to him like sacrilege that the noble pines, the handiwork of the Almighty, requiring His great power through a period of four hundred long years, should be destroyed by greedy man in a single day. To the average audience this sort of thing sounded alright. They did not bear in mind however, that "The greedy man" with his money invested in these noble forest pines was not anxious to destroy Nature's good looks. It so happened that those who were operating upon the land which the Rev. Edward Everett Hale referred to, astonished both him and his associates by causing so slight a blemish to the natural scenery by following the thinning process that they hardly knew that any cutting had been done, judging by the distant view, although a very large amount of timber had been removed.

It is becoming more and more apparent every day, in connection with timberlands in Canada, and particularly those in the eastern provinces, that it is necessary to regulate the timber cutting operations and carry them on under a plan in which the thinning process is one of the principal features. Two very dangerous extremes are to be guarded against. One of these is the complete dstruction of the forest. The other is its complete neglect, the latter would be as dangerous as the former. Between the two extremes lies the only sane policy of timberland exploitation for any country. Sentiment is a valuable factor in bringing the public to a proper appreciation of the value of its timber resources and of the necessity for protecting them against complete destruction either by fire or by the axe. In the preparation of a timberland policy however, there is little or no room for sentiment. Practical economics alone must be considered. Fortunately, it will be found that along the line of practical economics it is possible to foster the sentimental interest in our forest growth. Practical economics in connection with a timberland policy will involve stumpage dues regulated with careful consideration of the value of the product secured and the profits to be made, a system of tenure which will guarantee to the operator that he will not have to be worried by the fake settler and a system of cutting regulated by wise consideration of the maximum known annual growth and based upon the wisdom of destroying the useless forest growths or those which, when removed, will permit of more rapid development of the remaining stand.

Problems Peculiar to Spruce

Lumbering in the forests of New Brunswick is in some respects quite distinct from the operations in other parts of Canada. The preponderance of spruce makes it necessary for lumbermen to devote much of their time to the study of this tree. The various uses of the spruce tree complicate the problem considerably. If the spruce were used simply as a lumber, the questions involved would be largely those involved in other lumbering operations. Great quantities of spruce however, are used for pulpwood and it becomes necessary on this account to look at the situation from an entirely different point of view. A prominent operator in referring to this subject writes to the Canada Lumberman as follows:—"In estimating the stand of spruce, we estimate the total amount from the small pulpwood size to mature trees. The quantity it is practical to cut, or advisable to cut, varies very materially on large areas. For instance on some tracts 75 per cent. of the logs may be saw-mill size, while on other tracts, from 75 per cent. to 90 per cent. is only pulpwood size. In order to prepare for the future, it is necessary to take into consideration the character of the growth you are operating in when limiting the size to cut. In growth where the size is largely saw-mill logs, it is usually the case that the trees are somewhat scattered, and it seems advisable in such growth never to allow a single spruce tree to cut less than 14 in. in diameter, breast high, but where the growth is of smaller size, provided we can have a thinning process followed, so as to leave a goodly stand of undersized trees, sufficient perhaps to occupy the entire ground when they mature, it is wise to let them cut quite small. The trouble in such instances is to prevent what we might call stripping or mowing the ground. This means

cutting so clean on the territory that there is not sufficient stand left for the next crop."

An interesting method of guarding against undesirable cutting as outlined above, has been adopted in connection with some stands of timber in New Brunswick. The owner, having leased the land to others for operation, charges the same stumpage for the small trees as for the larger ones, but knowing that they are of much less value and that the operator cannot afford to pay this full price, and at the same time to guard against the ruinous cutting for the future, he tells the operators that he will give them anywhere from 1000 ft. to 2000 ft. at the price of 1000 ft., according to the perfection of their work. If the operator is careful to leave a sufficient stand for the next crop, and the ground is cut as it should be, the owner is perfectly willing to give him 2000 ft. for every one thousand that he pays for. If however, the operator is careless and indifferent in his cutting—stripping the timber in some places and leaving stumps in others—the owner gives him a less number of feet for a thousand feet. Thus, when the operator's work is all wrong, he is obliged to pay the full price for every thousand feet he cuts. Not much timber has been cut under this policy, but it is presumable that some such plan could be worked out in connection with the increasing demand for pulpwood and that it would provide an excellent incentive for careful and profitable work.

The Hardwoods a Distinct Problem

The hardwoods of New Brunswick present a series of difficult problems which are coming more and more to the front every day. As yet, hardwoods have been practically worthless in any territory in New Brunswick located more than six miles from a railroad and even on territory within the six mile limit, the demand has been restricted and the quantity cut has been small. The demand for hardwood however, is certain to increase constantly and to warrant the building of cheap railroads or the use of steam log haulers for a much greater distance. This process will eventually give value to hardwood timber which to-day is unsaleable. The use of native hardwoods in New Brunswick to-day is, comparatively speaking, limited and as a result only that portion of the tree is merchantable which is comparatively free from knots. When a sound tree is cut therefore, only that portion of the trunk below the large limb is of value, in many cases.

In the present article, and the one which preceded it in the issue of October 1st, no attempt has been made either to offer unpleasant criticism or to outline an infallible remedy for the unsatisfactory conditions of the present day. Our effort has been purely to present the views of some of those who have written us upon this subject and to pave the way for a general discussion of the subject on the part of those of our readers who may be sufficiently interested in the welfare of the lumbering industry of New Brunswick to send us their own views for publication. As already noted, we believe that the present is a critical time in connection with this matter and that the people of New Brunswick should not let it pass without doing their utmost to assist the government in bringing forth a forest policy which will be acceptable to all parties and which will encourage the development and the conservation of the forest wealth of the province. We hope to receive further letters upon this subject and to give them as much prominence as possible in our columns. We therefore, ask our readers to give the matter close study and to write to the editor of the Canada Lumberman, discussing the problems from their own point of view in as thorough a manner as possible, so that we may be able to have the discussion cover every aspect of the case.

C. P. R. Will Reforest Waste Lands

Mr. L. O. Armstrong, of the Colonization and Natural Resources Department, of the C.P.R. while on a visit to St. John, N.B., recently, outlined the plans of the C.P.R. for assisting in the work of colonization and reforesting in the province of New Brunswick. "The C.P.R.," he said, "has recently decided to give its attention to the problem of colonizing the districts in the four eastern provinces served by its lines, and to take up the work of reforesting lands unsuitable for farming and now unproductive because of the destruction of forest fires. The company has recognized the importance to it of the proper conservation of the of the natural resources of the country. A natural resources department has recently been organized and the company has recognized its importance to such an extent that it has agreed to place its financial resources behind it. Huge sums have been spent on irrigation and forestry in the west and now we propose to do something in Ontario, Quebec, New Brunswick and Nova Scotia.

"We will take up the matter of reforesting waste areas, if we can make arrangements with the municipalities to place a fixed and small tax upon such lands as we may acquire. If we are not held up for high prices we will buy any waste lands along our lines in New Brunswick and Nova Scotia, not suitable for farming, put the best foresters in the country in charge of them and start raising trees. The foresters will, of course, select trees best suited to each district, but our idea is to specialize in raising trees suitable for railway ties, and pulpwood. Our foresters will have instructions to cooperate with the Government officials in the work of preventing and fighting forest fires.

"The company feels that though the returns from the work of reforesting may be slow, it is worth its while to go into it and we believe the municipalities will agree to a taxation system that will permit us to go ahead, as there are many acres of land unfit for farming, where the forests have been burnt off and now no not bring the municipalities or anybody any returns."

Next Winter's St. John River Operations

Reports from Fredericton, N.B., state that the lumber cut on the upper St. John River for this season is estimated at 110,000,000 feet, over half of which will be manufactured at the mills at Van Buren and Grand Isle, above Grand Falls. It is expected that the total amount of logs rafted at the booms at Fredericton next season will be about the average. The following figures are reported as being close to the probable operations:

Stetson-Cutler Co., St. John, 20,000,000 feet made up as follows: 5,000,000 feet from Frank Currier of Seven Islands; 5,000,000 feet from W. J. Noble above Seven Islands, and 10,000,000 feet from W. H. Cunliffe's & Sons of Fort Kent, to be cut on the Allagash waters.

Randolph & Baker, St. John, 10,000,000 feet from Maine. John E. Dickey, St. Alexander, will cut 5,000,000 feet for Randolph & Baker on the Little Black River. Another operator will cut from 3,500,000 to 4,000,000 feet on the Green River and, James Hallett will cut 2,500,000 feet for them on the Quidisis.

Murray & Gregory, St. John, will have about 15,000,000 feet of Maine logs. John Kilburn, Fredericton, will take out over 10,000,000 feet for Murray & Gregory on the Big Black River and the head waters of the St. John. F. Chouinard, St. Pamphile, will take out 5,000,000 feet on the Big Black River for Murray & Gregory.

The St. John Lumber Co. will cut 40,000,000 feet of logs in Maine for its mills at Van Buren. Mr. John A. Morrison, Fredericton, will take out 11,000,000 feet on the Baker branch for the St. John Lumber Co. F. Chouinard will take out 10,000,000 feet on the north western branch of the St. John for the St. John Lumber Co.

Mr. C. E. Jones, St. Francis, will take out 2,000,000 feet on the St. John near the mouth of the St. Francis.

Robert F. Potts, Hartland, N.B., will take out 5,000,000 feet on the Big Black and Allagash Rivers. Jos. T. Michaud, Holton, will cut 6,000,000 feet on the Allagash.

S. W. Collins & Sons, Caribou, have taken a contract with the Van Buren Lumber Co. to furnish all the company's logs this winter. They will take out 16,000,000 feet on the Grand River in northern New Brunswick which will be transported by rail to St. Leonards.

The Grand Lake Lumber Co. whose plant is at Grand Isle, sixteen miles above Van Buren, will use about 8,000,000 feet of Canadian logs from Temiscouata Lake.

Lumber operations along the Miramichi River in New Brunswick during the coming winter will probably be considerably reduced on account of the high freight rates which still continue upon shipments of lumber to trans-Atlantic points.

Death of Richard A. Estey

Richard A. Estey, one of the best known lumbermen on the St. John river, died at Victoria Hospital, Fredericton, N.B., recently after a paralytic stroke. Mr. Estey was born in Fredericton 63 years ago and had lived there all his life, with the exception of about a year and a half which he spent recently in British Columbia. For over 30 years he was engaged in the milling business at Fredericton and also conducted lumbering operations on the St. John river and its tributaries, on an extensive scale. The late Mr. Estey was one of the oldest members of the Masonic order in Fredericton. He was a widower and is survived by one son, Frederick, in B. C., 2 daughters and 3 sisters.

A suit between Mr. John Lash and the Canada Shingle Co. was recently heard in the Supreme Court at Vancouver. According to an agreement with the plaintiff, the Canada Shingle Co. were given the right to cut cedar on plaintiff's limits at Sechelt, except where cedar was situated in blocks of fir. The plaintiff claims that the company has not kept this clause of the agreement and is suing for an injunction to restrain the company from cutting in what Mr. Lash terms his fir preserves. The amount involved is in the neighborhood of $10,000.

Judgment for the plaintiffs for $20,932.45 and costs was recently given by Mr. Justice Britton in the case of the Quebec Bank against the Sovereign bank, an action for the price of certain spruce delivered to the Imperial Mills, Ltd., during 1907 for which it was alleged that the defendants agreed to pay.

Belting Pioneer Called by Death

George Foster Cleveland, President of J. L. Goodhue & Co., Danville, Quebec, Closes Long and Successful Career

The Late G. F. Cleveland, Danville, P. Q.

The death occurred on October 7th, at Danville, Que., of Mr. George Foster Cleveland, a man who had been known for the past forty years as one of the most successful and at the same time genial and kindly business men in the province of Quebec. As a member of the firm of J. L. Goodhue & Co., Ltd., Mr. Cleveland had established a business reputation of the highest standard, with every one who had the good fortune to have business dealings with him. The late Mr. Cleveland was president of the firm of the J. L. Goodhue & Co., manufacturers of leather belting and lace leather.

Mr. Cleveland was born in Danville, sixty-one years ago being the son of the late Chester B. Cleveland, Jr. He was one of the first traders in the village of Danville, conducting a general store for a number of years in company with his brother, the late C. C. Cleveland. After he had obtained an excellent business education in this manner, he went upon the road as a traveller for Mr. Goodhue, handling leather belting. Subsequently he was taken into partnership and the firm became J. L. Goodhue & Co. Upon the death of Mr. Goodhue, Mr. G. F. Cleveland and Mr. C. C. Cleveland took over the business by purchase in 1883, still continuing under the former name. In 1910 the business was incorporated and since then it has made wonderful progress, its belting being known from one side of Canada to the other.

The late Mr. Cleveland always took an active interest in municipal affairs. He was a councillor of the village of Danville, continuously from January 1895 to December 1903, and was elected again and held office from January 1907 until 1909. He was mayor of Danville for the year 1901 and pro-mayor during 1908 and 1909. He also took an active part in church matters and for a number of years was warden of St. Augustine's church.

The late Mr. Cleveland leaves a widow and two daughters. The funeral took place on Wednesday, October 9th, and was attended by a great number of friends of the deceased.

Prolonging Life of Crossties

The United States Department of Agriculture has issued a bulletin on "Prolonging the Life of Crossties," in the course of which it says:

The removal of bark hastens seasoning and permits uniform drying. Where an oil like creosote is used as a preservative the presence of bark on the ties may result in such erratic penetration and absorption as to make the efficiency of the preservative practically zero.

Ties peeled in summer sometimes dry too rapidly and so case-harden, which increases the difficulty of securing penetration of the preservative. The best time to peel ties, however, is an economic question which must be determined for each particular case. As a general rule, it is good practice to remove the bark as soon as possible after the ties are cut, and regulate the rate of seasoning by methods of piling. In this way, peeling will be easier, there will be less danger from insects, and seasoning will be more rapid.

Of the three common methods of seasoning; namely, by air, by steam, and by oil, the first is best, if conditions will permit its use. Often, however, a treating plant is called upon to fill a rush order when its stock on hand is insufficiently seasoned for treatment, or the plant may be so located that it can not keep a large stock of air-seasoned material on hand. In such cases artificial seasoning must be practiced.

Seasoning by steam is not as common as it was a decade ago. Perhaps the chief reason for this is the better knewledge that now exists as to the cause of decay and the effect of steaming on the strength of wood. While steam seasoning increases the weight of ties and necessitates the drawing of a vacuum to get the sap and water out of them, seasoning in oil produces the opposite effect, and no vacuum is required. Tests made on 2 by 2 inch by 24 inch specimens showed that this method of drying is likely to cause internal checking.

Progress of the National Hardwood Lumber Association

The National Hardwood Lumber Association whose rules for the grading of hardwood have been very generally adopted by the trade of Ontario and also to a large extent to the trade of Quebec province, have issued a new directory for buyers and sellers. The directory contains a list of members of the association. For this reason it is a practical and most useful list of individuals, firms and corporations engaged in the manufacture and wholesale distribution of hardwood lumber. The present membership comprises eight hundred hardwood manufacturers and wholesale dealers. The increase in membership of late years has been remarkable. During the last fiscal year, one hundred and eighty-five applications for membership were received and one hundred and seventy-two were passed and admitted. The inspection department issued its official certificate for 132,844,156 feet of lumber which had been inspected by members of its staff during the year. It is expected that the total for the present year will be nearly 200,000,000 feet.

The Canadian hardwood trade will be especially interested in the latest issue of the directory because it shows that the association is making a decided effort to secure members in Canada. Recently Mr. Frank F. Fish, secretary of the association visited Toronto and the result is that the new directory contains the names of no less than fourteen members in Toronto. It also includes one member from Montreal and one from Meaford, Ont. The address of the association is McCormick Building, Chicago, and those who wish to avail themselves of its valuable services should write to the secretary, Mr. Frank F. Fish.

The National Hardwood Lumber Association report that during the month of September 1912 their inspection bureau broke all records by inspecting 20,639,850 feet. The previous high record had been in August of the present year which was behind September by 2,598,298 feet. It is interesting to note that among the salary inspectors of the association Mr. J. J. Miller, who was recently appointer inspector at Toronto, stands second in the list with 495,237 feet, the first place being secured by W. E. Robinson, St. Louis, Mo., with 640,864 feet.

Lack of Grading Rules Demoralizes Trade

Montreal, Que., October 17th, 1912.

Editor Canada Lumberman:—

The selling and buying of hardwood here is conducted with little or no system. Our best hardwoods come from the United States, where you can have guaranteed grading, and they should be sold here by such grading, but there is no supervisor of grading here, and it is, in many cases, doctored up to suit the price the customer wants to pay. He may think he is getting 1sts and 2nds cheaper than a "straight" dealer will or can offer, but as a fact he gets a mixture of 1sts, 2nds and No. 1 common, and often times there is a "kick," that is got over by a deduction, leaving still a good profit to the seller, who has anticipated the kick, and the buyer is left with inferior lumber, which often the architects turn down.

Just what its the best remedy is something that has to be thought out.

Yours truly,

QUEBEC LUMBERMAN

Cement Barrel Market in England

The class of material used in the United Kingdom for Portland cement barrel stock, writes United States Commercial Agent E. P. Secker, is fir, which comes chiefly from the Baltic region. The sizes for staves are ½ inch thick by 3, 3½ and 4 inches wide, and 26, 27 and 28 inches long. The grade is good No. 2 common, but the stock must be free from large and unsound knots; small knots if sound are not considered a defect. The price for this stock is $40 per St. Petersburg standard of 165 cubic feet, or about $20 per thousand feet delivered f.o.b. London. The raw material from which the stave and heading stock is made is chiefly trimmings; and the stock is considered a by-product of the mills furnishing it, only a minimum charge being made for the slabs, etc., going into it.

A Growing Lumber Concern

The Forest Lumber Company of Hamilton, Ont., with head office at 24-26 Main street, have just completed their first year in the wholesale lumber business, during which time they have spread out through the country finding customers in nearly every province. The company is fortunate in having as its manager Mr. J. P. Eastman who has been identified with the lumber business for a number of years in its different branches and latterly with the R. G. Kinsman Co. of Hamilton. All kinds of hardwoods and soft woods are handled by the company.

Hemlock Manufacturers Hold Meeting

Demand for Hemlock Reported Brisk and Supply Scarce—No Further Advance in Prices Until Spring—Manufacturers' Views on Trade Conditions

A meeting of Ontario hemlock manufacturers was held at the Queens Hotel Toronto, on Oct. 16th. Those present were: Mr. N. Hocken of the Hocken Lumber Co., Otter Lake, who occupied the chair; Chas. McGibbon of the McGibbon Lumber Co., Penetanguishene; J. D. Shier and Kenneth Shier, of the J. D. Shier Lumber Co., Bracebridge; W. W. Carter of the Fesserton Timber Co., Toronto; R. J. Hutcheson of the Muskoka Wood Manufacturing Co., Huntsville; J. A. MacLean, Wingham; Wynn Lloyd, of the Quincy-Adams Lumber Co., Toronto; W. P. T. Ross of Knight Bros. & Co., Ltd., Burke's Falls; and W. J. MacBeth of the Parry Sound Lumber Co., Toronto. Mr. John W. Long, editor of the New York Lumber Trade Journal, who was visiting Toronto at the time was also present.

Mr. Hocken in opening the meeting expressed his pleasure at seeing so good an attendance. The chief trouble with the trade, he said, was that there was not a sufficient supply of hemlock to meet the demand. Under the present circumstances he was not in favor of asking more than $18.00 for ten to sixteen foot lengths. Although there was no doubt in his mind that higher prices could be obtained, he feared that if more money was asked it would antagonize the building trade, which would be impolitic. More particularly would this be so, as there was very little hemlock to offer and the small amount of extra money obtained would not in any way counteract the bad impression which would be created. Speaking of the high cost of production, Mr. Hocken stated that the chief reasons for this were the high rate of wages and the high cost of provisions. Although the hay crop was good and the price normal, straw was a very bad crop, and oats to-day could hardly be secured on account of the car shortage. Naturally, this considerably raised the cost of keeping horses. Referring to tanbark, Mr. Hocken said that the tanneries had not their usual supply and he believed the mills might expect $9.00 for it.

Mr. McGibbon agreed With Mr. Hocken as to the wisdom of not asking higher prices. Just at present he thought it best to "Go steady." One of the reasons why it would be unwise to ask higher prices was that it would unduly enhance stumpage. He also advised manufacturers not to get out all their stock before next March, but to keep a little on hand. Comparing the situation with 1908, he noted that although prices obtained then were the same as at present, viz., $18, yet in 1907 hemlock cost the manufacturer $1.00 less to produce. Mr. McGibbon did not think that business conditions were really too healthy.

Low Stocks a Certainty

Mr. J. D. Shier stated that shipping was going ahead faster than cutting and consequently there would very soon be no surplus stock on hand. In his opinion $9.00 should be ample for the manufacturers to pay all round for logs. He also thought that the prices should remain as they are, at any rate until the spring.

Mr. Carter was in accord with the former speakers as to prices, but thought they should agree as to the prices they were willing to pay for logs. He was under the impression that those who had logs to sell were playing the manufacturers one against the other, stating that such a one had offered so much more than the man to whom he was speaking. Mr. Carter also touched on the point of the disappearance of hemlock in Ontario and drew attention to the fact that the standing timber available was continually getting farther away from the railway lines.

Mr. MacLean of Wingham, who was attending a meeting for the first time, reported that he does mostly a local trade. He is getting $22 for 10, 12 and 14 feet, and $24 for 16 feet, but at the same time he is paying $15 for logs.

Mr. Lloyd of the Quincy-Adams Co., Toronto, was the first speaker to come out strongly in favor of higher prices. He said that no mercy was shown to the manufacturers when they were in a hard position, and he did not think that the manufacturers should show any mercy now that they had the upper hand.

Mr. Hutcheson pointed out that although $18 was a very satisfactory price to obtain, yet it was not nearly so large proportionately for the manufacturer as in 1907. He also fell into line on the question of not asking higher prices at present for the simple reason that manufacturers had hardly anything to sell. He was quite firm in his opinion however, that at least $20 should be asked in the spring.

Mr. Hocken in addressing the meeting again, stated that his company had manufactured 6,000,000 feet this year and he did not think that they would have a quarter of a million left when they shut down. Talking of future possibilities, he said that there was an immigration this year of over half a million people and yet manufacturers were unable to obtain sufficient labor. Undoubtedly, next year, immigration would be even greater and this would create a still further demand for all classes of lumber. He mentioned that very little hemlock had been manufactured before ten years ago and to-day hemlock was almost depleted, close to the railways. In his opinion prices would never drop to those of former years.

Mr. MacBeth, drew a comparison between the years 1907 and 1912. In the former, the yards were all loaded to their full capacity and the rivers were full of logs. To-day quite the opposite was the case. The yards were practically empty and there was nothing to be seen on the rivers. He sounded a note of warning as to raising prices too high. It was his firm conviction that trade to-day was not abnormal, but the shortage of cars made it appear so. He differed from Mr. Hocken on the point that prices would never drop back to their former level. He thought it quite possible that spruce might be more continually substituted for hemlock. At present 2 x 4 spruce was not a competitor with hemlock, but 2 x 6 and the larger sizes were. Perhaps it might be alright to ask $20 in the spring, but certainly no more.

In talking of the pine situation, Mr. MacBeth stated that pine from New Brunswick was competing with Ontario pine. Referring to the recent purchase of the Jocko limits, he hoped that Mr. McFadden would see a reasonable return on his money, but most of those present seemed to think that $13.26 was too much to have paid for these limits.

Touching again upon tanbark, Mr. Hocken said that $7 a cord could be got at the mill and in a few cases $8 to $8.50.

Conditions in the United States

Mr. John W. Long, editor of the New Work Lumber Trade Journal, was called upon to address the meeting and to discuss trade conditions in the United States.

Mr. Long's first remarks dealt with the value of associations of lumbermen. One of the best associations he knew of in the United States had an order of business exactly similar to that which the hemlock men in Ontario had adopted. They laid great stress upon a heart to heart discussion of actual trade conditions. Sometimes he had really been surprised at the frankness with which they related their business affairs to one another. "I think this heart to heart talk idea is the very best feature of association effort," said Mr. Long.

"As to conditions in United States we have an election on hand shortly. In spite of that it seems to me that whoever may be elected, it is noticeable that the campaign has had less effect upon business than ever before. Business conditions to-day are a little peculiar. One of these conditions I have noticed once before in about twenty years. At the consuming end of the business in the big markets like New York, Philadelphia, Baltimore, Pittsburg and Cincinnati stocks seem to be low. Orders are given as a rule marked "rush" and if they are not marked rush a letter generally follows the next day, asking for immediate shipment. I suppose you all have experienced that sort of thing in this country. I think that in view of the current situation however, some people have a wrong idea as to the actual volume of going business in some cases. In some lines the yard man or a man who is making out big schedules and who would customarily send out the list of requirements to half a dozzen firms, is now finding difficulty in getting supplies quickly and is doubling the number of firms to whom he writes. With the larger number of enquiries, some people have got the idea that the demand is greater than it actually is. However, in such a case one order would wipe out a large number of enquiries. I am fairly convinced however, that business is up to normal to-day and I look for an excess of business in the coming year."

Present indications, Mr. Long said, were that stocks in many lines would be nearly wiped out during the winter. For instance the yellow pine men were very short of stock. September had been the lowest month in their business in a decade. All this meant a strong market, but the volume of business was not there.

Referring to the question of substitution Mr. Long agreed with other speakers upon the point. The price on a given class of lumber could be raised only to a certain point, above which the buyer would substitute. This would send trade to a different part of the country and even to a different class of material in the place of wood.

This had already become strongly noticeable in connection with the substitution of concrete and steel.

Speaking of hemlock Mr. Long said that evidently there was a scarcity both of hemlock and tanbark in the United States to-day and the man who had them for sale was a prince in the lumber business. Hemlock in the United States was pretty high to-day.

Some years ago he had stated in the Lumber Trade Journal that hemlock would go to a $14 basis. He was then told by a hemlock man that he was very foolish to make such a prediction. He had lived however, to see this man take back all he said. He believed that to-day hemlock was at least on a $23 basis and that it would probably go higher.

Before officially closing the meeting, Mr. McGibbon proposed and Mr. J. D. Shier seconded that Mr. Carter be the president for the next meeting.

Copies of the rules for grading hemlock timber which had been adopted at a previous meeting, were distributed to those present by Mr. W. W. Carter. This question of grading has long been in a very unsatisfactory state and it is hoped that the rules laid down on these cards will in future be rigidly adhered to. These cards were distributed to the members, and similar ones have been mailed to about seven hundred others.

Lumber Production of the Soo District

United States Consul, George W. Shotts, Sault Ste. Marie, Ont., in a recent report to his department says:—

"The lumber cut of this district for 1911 was 265,000,000 feet, against 292,000,000 feet for 1910. The value of the lumber declared for shipment through this office to the United States for 1911 was $4,288,021, compared with $5,033,960 for the previous year. This decrease was due principally to the unsatisfactory prices, and large quantities were piled on the various docks for shipment during the present year. It is stated that the lumber cut this season will be considerably less than last season. At least one, and probably two, mills in this district will not operate, and others will have but one shift. Most of the large bodies of pine timber have been pretty well cut, and those remaining are generally in the hands of people who are able to hold for a future rise in valuations. Lumbermen are careful about waste, and they claim that they will clear $15,000 this year on what has heretofore been thrown aside and burned as waste.

Output of Wood Pulp—Construction of Paper Mills

"The output of the pulp mills of the district during 1911 was 51,719 tons of ground wood pulp, against 66,998 tons for 1910. The pulp invoiced at this office for shipment to the United States for 1911 was valued at $719,591, compared with $1,220,883 for 1910. This decrease is accounted for by the closing down of both mills for a long period during the year for improvements and new construction.

"A paper mill with a daily capacity of 100 tons has been built in this city at an approximate cost of $2,000,000. Another paper mill with a capacity of 37,000 tons per annum and costing $1,250,000, has been completed. The latter company purchased the pulp and paper mills located at Sturgeon Falls.

"Natural facilities for water power are among the most important assets of this district. There are 15 rivers having their rise in a height of land in a vast wilderness, with numerous little lakes and plateaus forming natural water reserves, and all having falls and rapids aggregating hundreds of feet, making it possible to use the water a number of times in many cases.

Northern Ontario Timber Resources Exhibited

An interesting travelling exhibition of the products of northern Ontario is being shown by the Ontario government in a special demonstration car. Among the exhibits is one which gives striking illustration of the fact that there is timber of excellent quality and size to be secured in northern Ontario. A section of a pine tree measuring 36 inches across is shown. This was taken from the tree at a height of 14 ft. from the point where it was cut. A similar section taken at a height of 75 ft. is 18 inches across. Eight cross-cuts of a single spruce tree are also shown, the first, taken 14 feet above the stump is 20 in. across. The section at 28 feet above the stump measures 18 in. across. The section 38 feet above the stump is 16 in. across. The section 49 feet above the stump is 14 in. across. The section 60 feet above the stump is 12 in. across. The section 72 feet above the stump is 9 in. across. The section 82 feet above the stump is 8 in. across, and the section 92 feet above the stump is 6 in. across. The height of the tree was 104 feet. Similar samples are also shown of balsam, elm and tamarack.

The Reading Camp Association has recently been closing its night schools at railway construction camps in Ontario and opening those in the lumber camps for the coming winter.

George Gordon Appointed a Senator

Prominent Ontario Lumberman and Politican Called to Assist in Deliberations of the Upper House

George Gordon, Cache Bay, Ont., Appointed to vacancy in Canadian Senate

The report from Ottawa that Mr. Geo. Gordon, President and General Manager of George Gordon & Co., Ltd., Cache Bay, Ont., has been appointed to fill one of the vacancies in the Canadian Senate, was received with interest by lumbermen in Canada. Mr. Gordon is one of the best known and most widely esteemed lumbermen in the province of Ontario and has taken a prominent part in politics for many years. Recently he resigned his seat in the Dominion Parliament in order to provide a seat for the Honorable Frank Cochrane, who had been appointed Minister of Railways and Canals in the Dominion Cabinet. Mr. Gordon was born at Packenham in 1865, and a few years later moved with his father to Pembroke where he was educated in the public and high schools. He selected lumbering as his life's occupation and at the early age of sixteen, started on his career. During the next ten years he was to be found with Messrs. Booth & Gordon on the Kippewa. He next became a logging contractor for Mr. John R. Booth and Robert Booth, and during the subsequent four years he was with the late J. W. Munro, of Pembroke. Two of these latter years were spent in Bay City, Mich., superintending the cutting of the logs. After this Mr. Gordon associated himself with Messrs. Robert Booth and R. W. Gordon in the firm of George Gordon & Co., at Cache Bay, Ont., with which business he has ever since been identified.

In the Dominion election contest of 1904, Mr. Gordon represented the conservative interests in Nipissing, but was defeated by Mr. C. A. McCool. In 1908 however, Mr. Gordon was again unanimously selected to contest the riding in the conservative interest, and was successful in being elected to Parliament, defeating Mr. McCool in a spirited contest.

In addition to his large interests at Cache Bay, Mr. Gordon is director of the following companies: Cache Bay Lumber Co., Ltd.; The Lovering Lumber Co., Ltd., of Toronto; The Temagami Lumber Co., Ltd., of Orillia; The Strong Lumber Co., Ltd., of Orillia; The A. J. Young Co., Ltd., wholesale grocers and provision merchants of North Bay and Sudbury. The Cochrane Hardware Co., Ltd., Sudbury; The Gordon Development Co., Ltd., of British Columbia; and a stockholder in the Cavendish Lumber Co., Ltd., of Lakefield, Ont.

A Pioneer of the Paper Industry

The recent sale of the plants of the Canada Coating Mills and the Georgetown Paper Mills at Georgetown, Ont., in which John R. Barber, ex-M.P.P. was the largest shareholder, to the Barber Paper & Coating Mills Company, which was lately organized, recalls several incidents in the career of Canada's veteran paper manufacturer. Mr. Barber, who will soon celebrate his seventy-first birthday, has had a long and active record, having been continuously identified with the trade for over half a century. William Barber, who was his uncle, established the Georgetown mill in 1855 and at that time there were only three news plants in the Dominion, the Don mill near Toronto, operated by the Taylors, being one of them. James Barber, a brother of the founder of the mill, and father of John R., was the first man in Canada to learn the paper making trade. This was away back in 1830. Paper was made by hand in those days, and with his sieve, vat and blanket, James Barber was an expert in its production. In 1888, an electrical plant on the Credit River was installed for driving part of the machinery of the mill and was the first hydro-electric concern started in Canada for the transmission of power for transportation and industrial purposes. In the early sixties news print and book paper were made at Georgetown from wheat, oat and rye straw, instead of the ground wood and sulphite pulp that we have to-day. Corn stalks were also used for a time but the supply locally being limited, they had to be abandoned. Later on news print was made of rags and was better in grade and texture than much of the

book paper of the present time. What would Canadian newspaper publishers think to-day if, instead of paying about two and a quarter cents for their supply, they had to buy it at eleven and twelve cents per pound. Yet many years ago dailies were furnished with news print from the Barber plant at this figure. The Grand Trunk Railway was just being completed between Toronto and Georgetown in the middle of the fifties when the Barber mill began business, and the first shipment to Toronto was three carloads of wrapping paper, drawn by a wood burning locomotive. Mr. Barber and several men from the mill rode on the flat cars, having several buckets of water close at hand to prevent the paper from taking fire.

Interesting Legal Decision Regarding Driving Costs

A decision in the case of the Harris Tie and Timber Company, Ottawa, vs. Gillies Bros., Limited, Braeside, Ont., has just been handed down by the board of arbitrators consisting of His Honor Justice Gunn, Mr. Burwash, of Arnprior, and Mr. A. E. Corrigan, of Ottawa, which is of much interest to those engaged in lumbering operations. During the season of 1910-1911 both the parties were engaged in lumbering operations on the Madawaska River, the bulk of the Gillies Brothers drive being behind that of the Harris Tie & Timber Company. The latter drive being made up mainly of telegraph poles was slower moving than the other, and in consequence the timber of Gillies Brothers became mixed with the telegraph poles and all were brought down together by the men of the Harris Tie & Timber Company, and the latter company made a claim for a proportion of the cost of the drive. Messrs. Gillies Brothers resisted this on the ground chiefly that the whole trouble was due to the slow rate at which the poles were moving and claimed that they were entitled to damages for delay.

The claim of the Harris Tie & Timber Company for the proportionate cost of the drive amounted to $3,295 and the amount claimed by Gillies Brothers was $2,268. The case was tried in July last and judgment reserved. A decision has now been given in favor of the Harris Tie & Timber Company fixing the amount payable by Gillies Brothers for their share of the drive at $2,100 and dismissing Gillies Brothers claim excepting as to some small items aggregating $130.

Government Withdraws from Customs Appeal

A somewhat peculiar and unexpected development occurred recently in the progress of the Foss Lumber Company case, which is being heard on appeal before the Supreme Court, at Ottawa, and which involves the right of the Department of Customs to collect duty on rough lumber coming into Canada. At the conclusion of the case for the company by W. D. Hogg, K.C., who maintained that the lumber in question conformed with the requirements for free entry, Travers Lewis, K.C., counsel for the Attorney-General of Canada, rose and intimated to their Lordships that as the issue of the case more directly concerned the Foss Lumber Company, appellants, and the British Columbia Lumber & Shingle Manufacturers, intervenants, it would be unnecessary for the Crown to do more than submit the case.

The hearing of the case was concluded on October 15th. and judgment was reserved.

It is announced that the second mill of the Shevlin-Clarke Lumber Co., at Fort Francis, western Ontario, will be made larger than was at first contemplated. It will be constructed with sufficient capacity to bring the total yearly output of the company's two mills at that point up to 100,000,000 feet. The timber from the limits at Banning will be brought down to Fort Frances by rail. Work is now under way on the new plant.

During their recent visit to Victoria, B.C., the Duchess of Connaught and Princess Patricia visited a logging camp about thirty miles from that city. They had dinner at the camp, eating the same food as the loggers and professed to enjoy it hugely.

Tariff Decision on Lumber Reversed

Ottawa, Oct. 29.—The Supreme Court to-day reversed the judgment given last summer by the Exchequer Court, declaring that lumber dressed on one side or edge and roughed on a second side or edge after planing was subject to duty under the wording of the tariff. Until recently this class of lumber was admitted free, the Minister of Customs holding that it was entitled to free entry. The Customs department recently ruled that duty must be collected. This interpretation was challenged by western importers. The Exchequer Court upheld the decision of the Customs Department, that duty should be collected. On appeal to the Supreme Court this latter decision has now been upset, Justices Duff and Anglin dissenting. The case will now probably go to the Privy Council for final decision, unless Parliament takes action this session to remove the doubt by amending the wording of the tariff act.

Eastern Canada's Vicegerent Snark

Ross Allan Rastall of Toronto, a Lumberman of Wide Experence and One with Reputation for Thoroughness

R. A. Rastall, Vicegerent Snark for Eastern Canada

Ross Allan Rastall, Vicegerent Snark of the Concatenated Order of Hoo-Hoo for Eastern Ontario, although still a young man, has had a wide experience in the lumber business. He was born in Kincardine, Bruce County, Ont., on March 1st, 1862. His parents were both Scotch and owned a farm on which R. A. Rastall was born.

At the age of 13, young Rastall left school and commenced to work on the farm, remaining there till he was 19 years of age. Then he decided to strike out into business and chose the lumber trade as the one in which he thought he would be able to get along best. His first position was with the firm of Mickle, Dyment & Son as tally-boy at their Kincardine yard. It was not many years before he found himself occupying the important position of yard-foreman. After being in Kincardine for about six years the firm moved their yard to Goderich and Mr. Rastall was appointed manager. Several years were spent at Goderich in this position and then Mr. Rastall went on the road for a few years, as a traveller for the firm, representing them in Western Ontario.

The next step was to leave the road and take a position at Brantford as manager for the same firm, in connection with their planing mill and lumber business at that city. Mr. Rastall remained in Brantford for eleven years and while there had the honor of representing ward five for four years as Alderman. Last year the people of Brantford thought so well of him that they elected him to the position of Mayor.

Last Spring Mr. Rastall formed a partnership with Mr. W. Boake, of Toronto, under the firm name of R. A. Rastall & Company, and moved to Toronto, to take over the old-established business of Martin McKee & Sons, which had been in existence in the eastern section of Toronto for about thirty-five years. This move has proved to be a most successful one and Mr. Rastall now declares that he is only sorry he did not take such a step long ago. Mr. Rastall was a little over twenty-five years with the firm of Mickle, Dyment & Son and during that time secured an excellent all-round education in the lumber business, which is bringing him well-merited success and which will be certain to assist him in making a success of his efforts in behalf of the Concatenated Order of Hoo-Hoo.

Concatenation at Toronto in December

Mr. R. A. Rastall, Vicegerent Snark, of the Concatenated order of Hoo-Hoo for Eastern Canada, is arranging to hold a concatenation at Toronto during the early part of December. Hoo-Hoo matters are quite lively in Ontario at present and it is believed that a record class of kittens will be ready to have their eyes opened upon this occasion. All members are requested to stir things up as much as possible and to send to Mr. Rastall, 1072 Queen street east, as big a list of candidates as they can secure. W. M. Stephenson, Supreme Scrivenoter, paid a hurried visit to Toronto recently and it is expected that he will be on hand for the concatenation there in December.

United States Imports of Ground Woods

In the seven months ended July 30, 1911, the United States imported ground wood to the value of $2,151,488, of which $1,740,393 worth entered duty free. In the seven months ended July 30, 1912, they imported ground wood to the value of $2,362,395, of which $1,152,598 worth entered duty free. In the seven months ended July 30, 1911, they imported from Canada 24,745,213 pounds of unbleached chemical fibre, valued at $395,287, and 7,106,100 pounds of bleached chemical fibre valued at $182,101, all of which came in duty free. In addition to this chemical fibre from Canada they imported from other countries in the seven months ended July 30, 1912, 278,456,327 pounds of unbleached, valued at $4,197,333, and 84,235,674 pounds of bleached, valued at $1,790,712, all of which paid duty. It is apparent from the above figures that imports of ground wood, the logs for

which came from Crown lands, increased, and that from private lands decreased; the indication being that the prohibition of the export of unmanufactured pulpwood from Crown lands is encouraging the manufacture of much pulpwood into pulp in Canada.

A New Winnipeg Industry

The Acme Sash & Door Co. Ltd., which was recently incorporated, with headquarters at Winnipeg, Man., has made rapid progress in the erection of its plant at Norwood, Man. The company expected that they would be able to have their plant in operation by November 1st. The building is 107 ft. x 72 ft., two storeys, of mill construction with rock face metal ceiling on the outside and mounted on cement piers. The construction is being carried out in a very substantial manner, as the company expect at a later date to add a third storey, and are making provisions to do so with as little alteration as possible. The plant fronts on Des Murion street, and at the rear are located the tracks of the Canadian Northern Railway Co. The site contains 2½ acres, practically all of which will be occupied by the buildings, as it is also the intention of the company to add to the length of the present building. The boiler room and machine shop are located at the rear, the machine shop having a shaving vault on the upper floor, to which shavings from the mill will be carried automatically. This building will be 30 ft. x 50 ft.

Early next year the company will erect a warehouse in which to stock the product of the factory. They will also erect a large dry kiln. The machinery for the factory was all in hand ready to be installed upon the completion of the building. The buildings which have now been erected, will cost about $20,000. When the plant is in operation, about 100 men will be given employment. The firm is handling all its own construction work with the exception of the heating plant. The officers of the Acme Sash & Door Co. Ltd., are T. D. Robinson, president; F. Hinds, vice-president; A. T. Wilson, managing director, and E. M. Counsell, W. P. Alsip, A. B. Anderson, G. W. Ford, J. Sutherland and W. W. Cross, directors.

Report on Timber in Northern British Columbia

The forest branch of the lands department of British Columbia fully realize that there are immense timber areas in the province of which they know very little, and the chief object of the forest surveys which Hon. W. R. Ross, Minister of Lands, is having carried out is the acquisition of information as to the kind and quantity of timber in the province. The latest information on the subject is contained in a letter received at the forest branch from Mr. F. Stephens, a fire warden at Stuart Lake. Mr. Stephens writes in part as follows:—"I have just come across fine timber up in this country. The best timber is in the Driftwood river country, that flows into the upper end of Tacla lake, all government owned. It will all come down to Stuart lake. There are about forty-five or fifty sections, averaging from ten to fifteen million feet to the section. There is some of it that will easily go thirty-five to forty thousand feet to the acre, chiefly spruce, a little fir and black pine.

Reorganization of Dominion Saw Mills Progressing

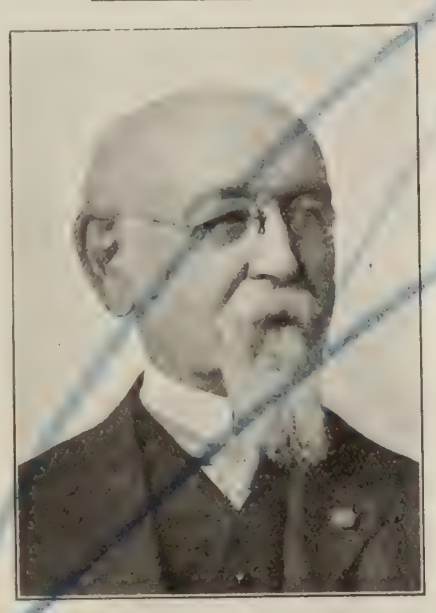
The scheme for the re-organization of Dominion Saw-mills and Lumber Ltd., Revelstoke, B.C., has been approved by the security holders in England and will shortly become operative. Arrangements are in progress for the formation of a new company to take over the assets of the old company. When this has occurred a strong board of directors will be in control. Until then the properties will remain in the control of the receivers appointed by the court for the protection of the interests of the debenture holders, and will be operated under the supervision of the receivers who are acting under the direct instructions of the court. In a letter to the Canada Lumberman the receiver states that the lumber situation so far as he can judge is a very promising one, and that barring unforseen occurrences it is the universal opinion among lumber manufacturers that the season of 1913 will prove to be most satisfactory to the whole of the trade.

Trained Foresters in Great Demand

Dean Fernow, of the Faculty of Forestry of the University of Toronto, has been deluged recently with requests for trained foresters. The twelve men who left the school last year have all found positions of responsibility with the various governments and the railroads. The great majority of the recent graduates have been taken by the Dominion Government, but the institution of a remarkably progressive forest policy in the Province of British Columbia has brought about an unprecedented demand, and large salaries are being offered to the technically trained men. Dean Fernow foresees a shortage which will to a certain extent cripple the forest services. He is therefore allowing men of the other natural and applied science courses to enter the forestry faculty under special regulations and complete their four years so as to secure the degree of B.Sc.F.

Seventy-Four Years and Still Young

G. H. Millen, Joint Manager of E. B. Eddy Co. Celebrates Birthday by His Usual Hard Day's Work



G. H. Millen, seventy-four years young

Ottawa, October 24th, (Special correspondence of the Canada Lumberman and Woodworker).—Mr. George Henry Millen, joint manager with Mr. W. H. Rowley, of the E. B. Eddy Company, of Hull, Que., celebrated his 74th birthday yesterday by working hard, the same as he has celebrated the forty-six birthdays he has had since he joined the company. All day long a steady stream of telegraph boys and letter carriers called at Mr. Millen's office with messages of congratulation from every conceivable person of prominence in the manufacturing world on the continent.

Although Mr. Millen is 74 years of age he is as healthy and active as a young man of twenty-five. According to his custom he was on the works yesterday before eight o'clock in the morning, giving his personal attention to the extensive alterations and improvements that are being made to every department of the Eddy plant.

George Henry Millen was born in Glen Falls, N.Y., October 23rd, 1838. He went to school there and started work there, too. His first notable experience in life was when he joined the Northern Army and fought in the American Civil War in the '60's. To-day he proudly wears the medal given to those who fought in that campaign. Forty-six years ago he joined the staff of the E. B. Eddy Company, in a less responsible position than he has to-day, and he has, through his own energy, risen to be joint manager of one of the largest manufacturing concerns of its kind in the world. He says that the reason he is enjoying such good health is because he has worked hard. He maintains that work is the best of all rejuvenators. He loves work, advocates it as a care and worry scarer, and claims that it makes doctor's bills an impossibility. Although he loves work so much, he loves healthy sports none the less. Motoring is his chief enjoyment. He was one of the first men in the Ottawa district to own a motor car and to-day he has one of the best in either Ottawa or Hull, which he drives every day himself.

Since Mr. Millen came to Eddy's he has invented a number of useful machines for the woodworking and papermaking trade. These machines are time and labor saving. He is a practical man in his business. He positively hates a theorist, avows that a theorist is the most impracticable soul imaginable around a paper making or woodworking plant.

Mr. Millen looks forward to many more years of useful work, for he says he feels equally as fit as he did forty years ago. His life has been a long period of service to the lumber, woodworking and papermaking trade and the community at large.

St. Lawrence Insurance Rates Unfair

We have on previous occasions referred to the vexed question of insurance rates imposed by underwriters upon shipments from the St. Lawrence, says the Timber Trades Journal, of London, Eng. More than seven and a half million sterling have been spent during the last decade in improving the waterway, but we understand that the insurance rates remain on the basis established in 1900. In these circumstances, Canadian shippers feel that they have a grievance against London underwriters, seeing that the objections raised against the route have, so far as is physically possible, been overcome. Advices which have just reached London show that a movement has been set on foot to form a Canadian insurance institution somewhat on the lines of the Scandinavian offices, whose policies the timber trade is fairly familiar with. The movement is what to us seems chiefly a question of financial backing, and if convinced of the stability of the underwriting concern, we have no doubt buyers on this side would be quite prepared to accept equitably worded policies emanating from Canadian institutions.

Something like 4,850,000,000 feet of new timber supply is being opened up on Vancouver Island, through the construction of new railroads.

THE WOODWORKER

Electric Drive for a Woodworking Factory

Electric drive is now so generally recognized as an efficient method of furnishing power for woodworking machinery that many of the most important plants in Canada and the United States have been equipped to take advantage of its benefits. Several plants in Canada which are equipped with electric drive have already been described in the Canada Lumberman, and we are now fortunate enough to be able to publish a description of the machinery and electrical equipment of an important planing mill and hardwood flooring plant at Louisville, Kentucky, U.S.A.

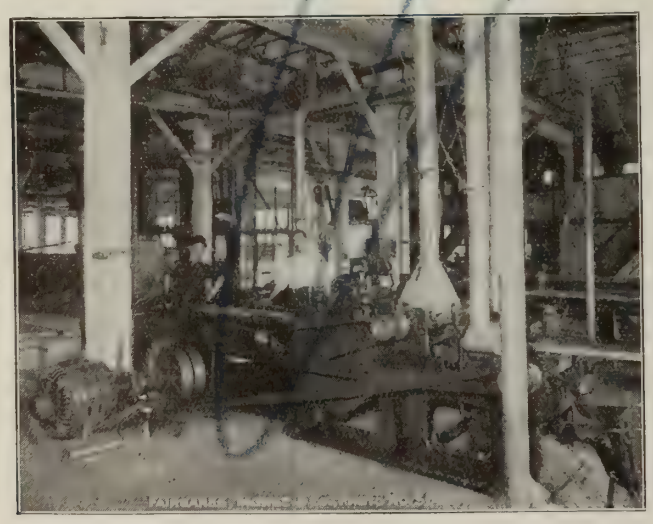
The Louisville Planing Mill & Hard Wood Flooring Co. is incorporated under the State laws of Kentucky, for the purpose of

Fig. 1—30 x 12 Double Surfacer, driven by 20 H. P. and 7½ H. P. Fairbanks Morse Motor

manufacturing interior and exterior millwork, sash, doors and high class stair work. The plant covers approximately 75,000 sq. ft., employs 90 men and uses about 500,000 ft. of lumber annually, which is manufactured into various kinds of interior and exterior finish.

This plant formerly operated its own power plant, but after being destroyed by fire, installed entire new wood working machinery, operated by motors in the most up-to-date style of drive. Practically all the machines are direct connected as shown in the schedule following.

All motors are of the Fairbanks-Morse manufacture, and are 3-



No. 2—S. A. Wood Inside Moulder, Driven by 25 H. P. Fairbanks-Morse Motor

phase, 440-volt, 60-cycle. The total horse-power of motors installed is 294 of which 246 h.p. operates on individual drive, and 48 h.p. on group drive as shown in schedule.

The principal point of interest in connection with the electrical equipment of this plant, is the extreme limit of speed, which is rather unusual for this class of motor. The planers have the motors directly attached to the cylinders, motors operating cylinders at a speed of 3,600 r.p.m., motors being directly connected through flexible couplings.

The double surfacer shown in the illustration, is operated by a 20 h.p. motor at a speed of 3,600 r.p.m., direct connected to the upper cylinder through flexible coupling. The lower cylinder of this machine is belted to a 7½ h.p. 1,750 r.p.m. motor.

While there are some few cases where the planer cylinders are operated by induction motors direct connected to cylinders, the direct connecting to the cylinder of the double surfacer is entirely new in this territory, and is proving successful and giving excellent satisfaction.

The triple drum sander is driven by a 20 h.p. 570 r.p.m. motor, direct connected through flexible coupling to the countershaft on machine.

The 70 in. Sturtevant low power blower is operated by a 40 h.p. double end motor at 475 r.p.m., the shaft of motor being extended sufficiently for the fan blades to be directly mounted on each end of shaft. This blower serves readily all the machines given in the following schedule:

1-40 h.p. 1,150 r.p.m. motor, belted to Fig. 501 American 54 in. band resaw, with

1-3 h.p. 1,750 r.p.m. motor, operating Fig. 511 double jointing attachment, which is direct connected to the cylinders by belt.

1-40 h.p. 475 r.p.m. double end motor, operating a double 70 in. Sturtevant low power blower.

1-25 h.p. 850 r.p.m. motor, direct connected through flexible coupling to countershaft of S. A. Wood No. 107 inside moulder. This is a general purpose machine, combined planer, matcher and moulder for manufacturing flooring, interior finish, moulding, etc. The chief

Fig. 3—70" Sturtevant Blower, driven by 40 H.P. Fairbanks-Morse Double End Motor

characteristics are ease of adjustment, large range in capacity, and quickness of operation.

1-20 h.p. 3,600 r.p.m. motor direct connected through flexible coupling to the cylinder of a 30 x 12 double surfacer, having

1-7½ h.p. 1,750 r.p.m. motor belted to the lower cylinder of this double surfacer.

1-20 h.p. 570 r.p.m. motor, direct connected through flexible coupling to countershaft of Fig. 1073 Columbia 48 in. x 10 in. triple drum sander.

1-15 h.p. 850 r.p.m. motor direct connected through flexible coupling to countershaft of Fig. 8441 No. 22, 10 in. four side moulder.

1-15 h.p. 1,750 r.p.m. motor belted direct to mandrel on one figure 5701 No. 2 self feed circular rip saw.

1-10 h.p. 3,600 r.p.m. motor direct connected through Grundy patent flexible coupling to the cylinder of one Fig. 783 No. 4½, 24 in. x 7 in. single furniture planer with sectional feed rolls.

1-7½ h.p. 3,600 r.p.m. motor direct connected through Grundy patent flexible coupling to the cylinder of one Fig. 7651 No. 5, 24 in. x 8 in. single surfacer.

1-7½ h.p. 850 r.p.m. motor direct connected through a flexible coupling to the countershaft of one Fig. 8601 No. 1, 6 in. four side moulder.

3-5 h.p. 1,750 r.p.m. motors, each motor belted to the mandrel of a No. 11 John T. Towsley Mfg. Co. hand feed rip saw.

1-5 h.p. 1,750 r.p.m. motor belted direct to the mandrel of one Fig. 633 No. 1 variety saw with boring attachment.

3-3 h.p. 1,750 r.p.m. motors, each motor belted to a new pattern swing cut off saw, and each motor is belted to the iron frame of the swing which eliminates all counter shafting.

2-3 h.p. 1,750 r.p.m. motors, each motor belted to the cylinders of one Fig. 801 No. 1, 12 in. hand jointer and 1 figure 802 No. 1, 16 in. hand jointer.

1-15 h.p. 850 r.p.m. motor direct connected through flexible coupling to:

1 15/16 x 20 ft. line shaft running at the speed of the motor, having ring oiling bearings. To this shaft are belted the following machines:

1 Smith & Phillips window frame machine.
1 Figure 801 No. 1, 12 in. hand jointer.
1 Figure 616 No. 7½ combination saw.
1 Figure 7651 No. 5, 24 in. x 8 in. single surfacer.
1 Figure 633 No. 1 variety saw with boring attachment.

1-15 h.p. 850 r.p.m. motor direct connected through flexible coupling to:

1 15/16 x 28 ft. line shaft running at the speed of motor, having Sells' patent roller bearings. To this shaft are belted the following machines:

1 Figure 9421 No. 1 tenoner with double heads and two copes.
1 Figure 907 No. 1 mortises with boring attachment.
1 Figure 8848 No. 3 hand feed panel raiser.
1 New Britain No. 2 standard chain saw mortiser.
1 Figure 8842 No. 5 blind stile mortising and boring machine.
1 Figure 929 No. 2½ two spindle shaper.
1 Figure 1095 No. 9 column sander, Nicholas pattern.
1 J. A. Fay & Egan No. 88552, 24 in. drum sander.

1-10 h.p. 850 r.p.m. motor direct connected to 1 15/16 x 28 ft. line shaft running at the speed of motor, having Sells' patent roller bearings. To this shaft are belted the following machines:

1 Figure 878 No. 2½, four side sash sticker.
1 Figure 1104 No. 2 universal sander.
1 Figure 978 No. 9 post borer.
1 Figure 898 No. 10 sash relisher and mortiser.
1 Fay & Egan double end emery wheel stand.

1-5 h.p. 850 r.p.m. motor direct connected through flexible coupling to

1 11/16 x 20 ft. line shaft running at speed of motor, having ring oiling bearings. To this shaft are belted the following machines:

1 Figure 510, 38 in. band saw.
1 Black Bros. No. 1 pioneer 8 in. moulding sander.
1 Figure 3231 stationary double scroll saw.
1 Figure 1054, 10 in. x 24 in. pattern makers lathe.

1-3 h.p. 850 r.p.m. motor direct connected through flexible coupling to:

1 3/16 x 12 ft. line shaft running at speed of motor, having ring oiling bearings. To this shaft are belted the following machines:

1 S. A. Wood's automatic knife grinder.
1 Hanchett automatic circular saw grinder.
1 Samuel J. Shimer double end emery wheel stand.

Management of a Planing Mill

First of a Series of Articles Contributed by N. J. MILLETTE

The planing mill business looks very profitable to the enthusiastic manager until the inventory statement reduces the amount of the expected profit. The poor fellow who has worked hard and steadily then feels amazed and suspects that the system is leaky.

This trouble is frequently witnessed and appears to be the burden of millmen in general, even those having the best system of management will meet endless new difficulties and repetitions of old troubles very often under a new appearance, as a result of the varied nature of the materials used and of the factory equipment and its employees.

A successful factory built and equipped without special attention or knowledge of the trade would be a marvel and could be held up for the admiration of all millmen, especially those who are suffering from faulty installations.

We cannot take too much care in figuring out the location of mill machinery to assure proper handling of lumber at the various operations. The necessary space is a prime factor, but the most important point is to install the machines so as to form a continual flow of the stock in such a way that one operation will not interfere with another. We should also provide for increased production. Many factories are fairly well equipped with machines, but in a rush season, when it is necessary to increase help, the efficiency of the plant is lowered. Then, instead of extra business giving a greater proportion of profit, the surplus stock carried through will cause unnecessary labor which will consume the benefit.

Quotations and Contracts

An old saying in business is that stock well bought is half sold. We might say with no less accuracy in regard to factory work, that a contract well taken is half made.

A poor step in business is to take a job at a low figure in the hope of making a customer. We could spend a lifetime making customers in this way and die very poor, and the trade established would not be worth a row of pins. If there is not an apparent profit to be made on each contract, it should not be taken; no more from a friend than from a person who is expected to be a large customer.

If we have taken the responsibility of a contract, however, we should carry it out with all the knowledge and ability of the staff. and this is the point where a factory will prove itself. Accurate work, prompt shipments, and obligations fulfilled are powerful advertisements.

Never let the shop be crowded with unprofitable jobs, which, after starting, are completed to get rid of them. We can always pick up more of these than we really care to handle, and unless we fight firmly with the trade with this point in view, we realize some day that we are so crowded with common jobs that we could not handle a large contract in a reasonable time, and we may lose our best customers.

"Be firm in business." The old saying sounds true, and unless we know the exact value of a contract it is impossible to give a figure with confidence.

A person may be an excellent guesser on weights but he will never replace the modern scale. The same reasoning could apply to the value of a contract. A man may have remarkable ability for guessing values, but with the constant changes of design in shop work, the estimator must be familiar with the shop facilities and have up-to-date units of value based on actual cost.

Don't talk high prices. Fulfil your obligations, deliver the stock on time and your customers will have your name at the head of their list.

The cost system of calculating, as a rule, is very imperfectly understood. A manufacturer sometimes gets an idea that handling a cost system is as expensive as the manufacturing. We may certainly carry this system to excess, the same as any other good thing, and spoil it, make it look as bad as a piece of cabinet work overdone. We can spend a great deal more money than is necessary for a cost system, and it will not be worth a continental. It may be done by a staff of good clerks who have been wrongly instructed. This is very often the case, and the values are so inaccurate that we cannot use them with justification.

Some people will say that a good guesser can beat it, and this may seem true, but as two bad points will never make a good one, the only thing to do is to create the good information by the education of the workingman.

This is another point that is very weak in many of our factories and the writer will make an effort to point out what can be done to render the workingman more loyal and interested and to work as if they had a mission to fulfil.

Belt Tighteners—Are They a Help or a Hindrance

London, Eng., October 5, 1912.

To the Editor of the Canada Lumberman and Woodworker:—

Dear Sir,—Many thanks for your Annual Number, of September, which you sent. I found it very interesting reading, especially the mechanical section. While looking over the illustrations and advertisements I could not fail to observe the popularity of the belt tightener, especially on planers, matchers and moulders, etc. Now allow me to ask, are they really necessary? No doubt many will say, certainly they are, otherwise they would not be there. My own opinion is that in many cases they are not essential.

Here in London, Eng., we have practically the same machines

doing the same work, yet we never resort to tighteners. Perhaps it is because the makers here do not fit them on their machines to start with. That may be one good reason. Next, we prefer to have all our countershafts separate from the machines themselves, so that we can have a longer and easier drive. That, in my opinion, is much better practice than having all the pulleys and gearing underneath a matcher or moulder. It is next to impossible to drive such machines at 3,000 to 4,000 r.p.m. with short snappy drives, without resorting to tighteners of some sort. I know from experience that it is a much simpler operation to fix down a moulder or planer with countershaft combined. It saves time there, that is true. But do we not pay dearly for that time later on? Just think it over, ye that have belt troubles, where do they usually come from? Not from your main drives or from the lineshafting, rather is it that the high-speed belts give out and worry us at times.

Another point I notice, many makers put a ridiculously small pulley on many machines. So here we have another trouble aggravating the existing one (short drives plus small pulleys equals trouble). No doubt the self-contained machine works well and more business like than the other type with separate countershaft. I admit that right away. But we are all out for results, not appearances. Again, others may say your method takes up too much floor space. Say the countershaft is fixed 10 ft. behind the machine. That is wasted space which we can ill afford. Such is not the case. Every planer or matcher must have a taking-off table of some sort behind it and all the belts and pulleys are underneath it out of the way. In conclusion let me say that I have charge of a large mill here and have all sorts of machines, Canadian, American, German and English. They are all good, well made machines, yet we have no tighteners. We drive largely with motors, both group and direct, and find it cheaper than one large engine. I hope some of your readers will give their views on the above subject. Yours truly,

T. M. NEASHAM.

Western Canada News of the Trade

William Gordon, recently a pioneer of the north country, when in Edmonton reported the establishment of two sawmills at Fort McMurray, a new town at the confluence of the Clearwater and the Athabasca rivers.

The lumber mills in the Prince Albert (Saskatchewan) district will have upward of 2,000 men in the woods this winter. The camps in that district usually open late in October and a large number have already gathered in the city of Prince Albert. Most of the "jacks," however, do not go into the woods until well on in November.

W. G. Gladwin, supervisor of the provincial forestry protective service for Alberta, reported, on returning to Edmonton, on October 1, from a trip to Prince Rupert and the Skeena country, that the whole district adjoining the Skeena valley is heavily timbered, also that when the lumber is cut, the land will be suitable for agriculture.

Reports from Moose Jaw, Sask., state that a serious lumber famine is one of the possibilities in the near future. Local dealers report that their stocks are getting low and that, on account of the shortage of cars they cannot be replenished. Mountain mills are reported to have large supplies of lumber on hand which they are unable to ship out.

Reports from Seattle, Wash., state that nearly every shingle mill in the State of Washington has been closed, as part of a movement to resist a reduction in the price of shingles. No previous shutdown has ever been so general. It is said that the stoppage of production is supported by the financial interests and that the mills will not re-open until prices are firmly established.

Two Gigantic Boom Sticks

An interesting report from Victoria, B.C., states that two boom sticks of unusual length were recently made at the Canadian Puget Sound lumber mills for use on a stiff-legged derrick of the Canadian Mineral Rubber Co. at its wharf on the upper harbor. The stick of fir from which the lengthy booms were cut was selected with care by a special crew sent into the woods at Jordan river to look for a mighty tree, and the one they selected scaled 8,255 feet when they put it in the water to be towed to Victoria. The massive log was hauled up into the company's mill at Rock Bay and tipped on the sliding carriage which runs the big sticks against the quick-moving saw. It was soon squared, and two booms, one 16 inches by 18 inches thick, with length of 110 feet, and one 12 inches by 16 inches by 106 feet were cut.

Canadian wood piles for wharf construction and blocks for paving purposes have been losing out in British Columbia, but there is a prospect of them coming into their own again. The Canadian Pacific Railway, which is building large wharves, has been importing eucalyptus piles from Australia, since that wood, because of its gummy quality, is better able to resist the teredo. This company has found that creosoted fir lasts even longer than eucalyptus. It also has been found that wood blocks are excellent paving material if properly creosoted. The trouble has been that contractors supplied blocks that were improperly creosoted but the defect could not be noticed unless the blocks were split. The suggestion has been made that the municipalities which have much paving to be done should creosote their own blocks; then it would be known that the work was not skimped.

Hon. W. T. Finlay Retires From Business

Hon. W. T. Finlay has disposed of his lumber business at Medicine Hat, Alta., to the Crown Lumber Company. Hon. Mr. Finlay was one of the earliest business men in Medicine Hat. He opened a lumber yard at that town before the railroad had reached it and has been operating it continuously since June 2nd, 1882. For many years he conducted the only local lumber yard. For several years Mr. Finlay was Mayor of Medicine Hat and was also a member of the Territorial Assembly. When the Autonomy Bill was passed Mr. Finlay was honored with the appointment of Minister of Agriculture, a position which he filled for seven years. Mr. Finlay has been practically retired from business for a few years past, his sons having taken over the active management of the lumber business in which they are partners. In addition to the yard at Medicine Hat, the firm conduct yards at Carlstadt and Seven Persons. The latter two yards they will continue to conduct under the firm name.

Lumbermen Establishing Power Business

The Public Service Corporation is the name under which lumbermen of Vancouver, B.C., are applying to the city for a franchise to enable them to lay conduits for the conveyance of electric power and steam heat both to be generated from waste material of the lumber mills. Interested actively in the scheme are Frank Paterson, W. I. Paterson, John Hanbury, F. L. Buckley and L. G. Robinson. They hope to generate 20,000 horse-power in electricity from the mills at Burrard Inlet and False Creek and an offer will be made to the city at from three-fourths to one cent a kilowatt. Mr. Hanbury told how the steam-heating idea worked out in Brandon where coal was used at a high cost. Mention was made of the success of a mill in Portland in using its wood refuse in the generation of electricity. About three years ago a local syndicate obtained a franchise for the purpose now suggested by the millmen, but nothing was done, and the franchise lapsed.

B. C. Watching Logging Operators Closely

Reports from Victoria, B.C., states that the Forest Branch of the Department of Lands expects, by reason of the closer watch it will be able to keep on logging operations, to be able to meet the cost of its maintenance this year. An instance of the watchfulness of the Forest Branch and of the benefits which may result from its work, is afforded by the recent conviction of a firm of timber and tie contractors who were working in the northern districts of British Columbia last summer. Reports reached the Forest Branch that this firm was operating illegally upon Crown lands. An officer of the Branch was sent to the place and secured evidence upon which the firm were convicted and fined $250 and costs. They had already cut some 200,000 ties which it was their intention to send out of the province without having secured a license to cut, or having paid any ground rent or royalty. The government siezed the timber and sold it at public auction. The firm of contractors bought it in for between $12,000 and $15,000. All of this sum, together with the fine, were therefore clear gain to the province.

It is reported that the traffic in tie timber has been marked in the past by several instances of this sort of work. With the organization of the Forest Branch it is expected that it will be an easy matter to keep track of all the logging in progress and to collect all revenues due. The Forest Branch assert that there is no need for anyone to resort to measures of the above nature. If they wish to buy either timber or ties in any particular locality they only have to make application to the Forest Branch. A man will then be sent out to estimate the quantity and quality of the timber on the area and an upset price will be put upon it. It will then be offered at public auction subject to the upset price and the person wanting it can secure it at a fair price to the province and to himself.

Forest Protection in British Columbia

The close season for setting fires in British Columbia came to an end on October 1st, and the Forest Branch of the Lands Department is greatly pleased with the results which have been secured this year. The work of protection against forest fires has scarcely gone farther than the organization stage, yet with favorable weather, the results have been most encouraging. In order to secure thorough

efficiency however, it is recognized that the force will be greatly increased and the quantity of territory covered by each patrol reduced in corresponding measure.

During the summer which has just closed, fire rangers and divisional fire wardens have been collecting information which will be of value in the prevention of fires in future years. In cases where logging companies have no maps of their limits, the wardens have made rough maps, showing all the logging roads and trains, and similar maps are being made of Crown timber reserves. All possible information is being secured and incorporated in the maps as to sources of danger from nearby settlements, from logging camps or from engines; all of which is being indicated in the maps.

It is expected that when the next close season for setting fires commences on May 1st, 1913, the Forest Branch will be in an excellent position to handle its work. During the winter the permanent men in the employ of the branch will be employed in making roads wherever they are found necessary, on account of the vicinity of danger points and the possibility of fire being difficult of access. Posts of observation are also to be established, from which rangers will be able to keep watch over the forests and detect fires instantly. The rangers will also take their share in the campaign of education, the object of which is to teach the public the importance of exercising the greatest possible care in setting fires and extinguishing them.

Protecting Forests From Locomotive Sparks

An interesting article was printed in the Canadian Forestry Journal for May and June, 1912, translated by Elwood Wilson from the German by Dr. M. Kienitz, royal forester and professor of forestry at the Forestry Academy of Eberswalde. The article is too long to be reprinted in entirety, but the following extracts show the nature of the protective belts through the woodland, which are advocated by this author:

A crown fire can only continue to burn if the ground fire follows it and if the flames can continually rush up the trees. If the ground fire loses combustible material over a wide strip the top fire goes out. On these facts are based our methods of fire-fighting. * * *

In well regulated forests it is not sufficient to make rules for extinguishing fires, but means must be taken to see that no fires start. Police and legal regulations practically prevent fires started by human agency. In countries like Germany, where the knowledge that it is necessary to protect and care for the forests has penetrated to practically every class of the population, it has become possible steadily to decrease the number of fires set through malice and carelessness. Regulations requiring every dweller near a forest to help fight fires without pay are willingly obeyed by the majority, and in countries where conditions are as favorable as they are in Germany the number of fires would yearly diminish were it not that one circumstance increases them.

The Railway Danger

This is the growing number of new railways through the forests and the steadily growing traffic on those already built. Every engine using a fuel which throws off sparks (coal, peat, wood, etc.) is dangerous. In the pamphlet published by the Royal Prussian State Railway Commission in 1901, treating of the Prevention of Forest Fires, it is especially stated that, in spite of all efforts to the contrary, engine-builders have been unable to devise any practical means to prevent sparks being thrown off by locomotives. They have succeeded in making fire-boxes tight, which prevents the dropping of coals, but these latter are not very dangerous, falling, as they do, on the track. It is the glowing sparks whick fly from the smoke stacks which are especially dangerous and can not be held back without interfering with the draft; this is especially the case with fast trains. * * *

Nt is therefore necessary to protect the track on both sides by some arrangement which will automatically prevent sparks, thrown out by an engine, from setting fires. It has been proved by experience that keeping the soil broken up and bare is a certain means of preventing the spread of fire. The danger from sparks is in proportion to the size of the redhot particles, the amount and direction of the wind and the inflammability of the ground-cover.

The larger the sparks the more likely they are to start a fire, but the shorter the distance they are carried, the distance depending on the velocity of the wind; but the danger sparks, thrown out by an engine, from setting fires. * * * It is always greatest near the track. * * *

The conditions are quite different if the railway crosses a wood with highly inflammable ground-cover. There is especial danger for extended stands of pine on poor dry soil.

Protection Strips

If these strips are needed to stop sparks, they must be very wide. A width of 90 feet on either side does not protect, for Burkhard has observed that sparks have set fire 240 feet from the track. But a strip 33 feet wide and a quarter of a mile long contains one acre, therefore a strip 33 feet wide on each side of the track would in some cases increase the danger of fire, as it has been proved that where a railway runs through a forest which lies close to the track there the danger is, on the average, less than when the woods are farther away. If the trees are close the wind is compelled to follow along the narrow lane of the track, while if the trees are farther away the wind can blow from the side and drive the sparks among the trees. To overcome these disadvantages, and to protect the forest from the danger of fire from locomotive sparks, it is necessary to manage the wood near the track, and to prepare a strip on which all fire will die out before it can set fire to the crowns, or kill the trees, and at the same time catch all sparks. The glowing sparks are rather large and fall immediately to the ground as soon as they strike the still air stratum inside the protection stand, just as snowflakes fall behind a hedge or sand-clouds behind fences and grass tufts. The protection strips answer a double purpose. They permit the use of woodland up to the track, even in districts most subject to fires, protect the track from drifting sand, and are relatively cheap to keep up. They consist of strips of trees, 36 to 45 feet wide, which have a bare ditch or path 4.5 feet wide toward the forest, and a strip, 3 feet wide, of bare ground next to the track. The two bare strips are joined by footpaths, kept bare, every 60 or 90 feet.

As mentioned above, every fire starts from a small beginning, which can not harm the trees, and is dangerous only when it has succeeded in spreading. Very often the dry grass or moss on the railway embankment catches, and has quite a large front by the time it reaches the edge of the woods, and that it may not spread over into the wood the edge of the wood is kept bare for three feet. Then the fire goes out. The glowing sparks which fall directly on the strips of wood beyond the first bare place can start only small fires, and if these spread they must die out on reaching the second bare strip of 4.5 feet, or one of the cross lanes.

Wooded Strips to be Narrow

Care must be taken that the fire on the protection strips never reaches the size of a crown fire, and thus spreads over the bare strips. If there is not much fuel on the ground a fire 36 to 45 feet from its origin is not high; height comes only when a fire has reached deeper into a forest, over a larger surface, which much increases the heat. The amount of inflammable material on the protection stand, both on the ground and above it, must be kept down as much as possible; all dry branches, weeds, juniper and other inflammable objects must be removed; suppressed and dry branches of the trees up to breast-height must also be pruned off. Only the green branches on the edges of the stand must be kept as near the ground as possible. The closes the green branches are on the side toward the track, the better the protection fills its second important purpose; i.e., to stop the lighter far-flying sparks.

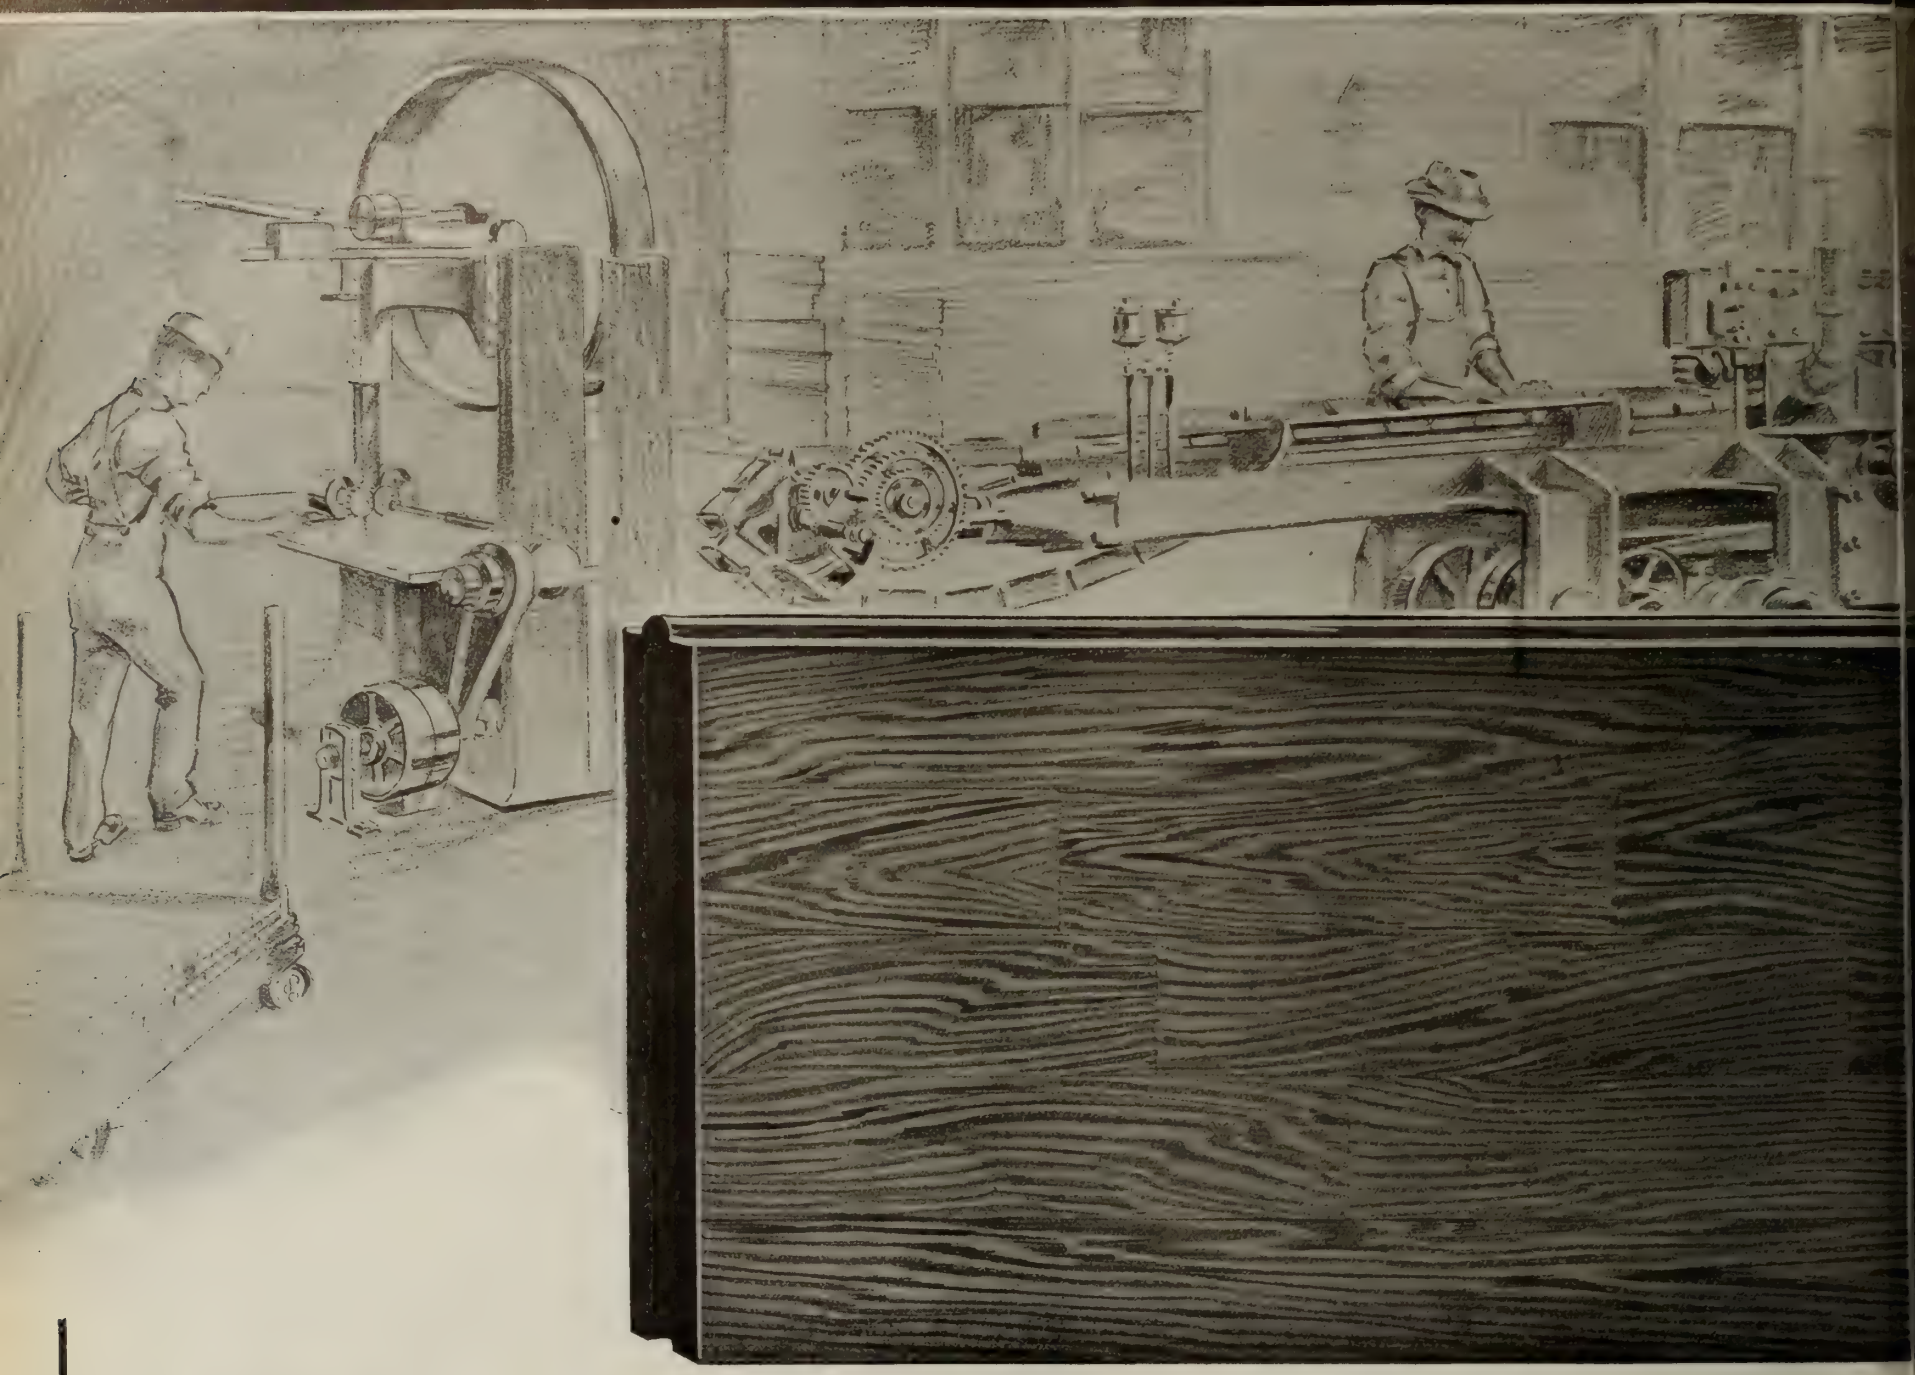
To attain this end, the stand on the protection strips must be closed and without large gaps; a stand which is too thick is not favorable, for between the close standing trunks the flames easily rise higher than where the trees are not so close, and crowded trees do not develop good crowns.

Since very old stands become too thin and the high trees are likely to be thrown on the tracks by storms, or at least may damage the telegraph lines, it is necessary to choose a short rotation for protection strips. In determining this rotation the first consideration is the purpose of the protection stands; the second is the yield. The rotation of strips in pine on sand must be between 60 and 80 years. A too short rotation is to be avoided, for a strip only becomes of use when it reaches a height equal to that of the funnel of the locomotive. * * *

Cuts, Curves and Fills

The danger is especially great on the convex side of curves. Often here the direction of the railway is the same as that of the prevailing wind, while in the curve they do not coincide, with the result that the sparks are thrown in large numbers against the protection stands. It is at such places that the stand must be close, and the trees of ample height, for the number of sparks makes no difference, as even a rapidly passing train can not send out enough to set fire directly to the crowns.

The danger is also that when the line passes along a high fill, where the full force of the wind strikes the funnel. It can not be denied that in such places the sparks can fly farther than in a level section, because they take longer to reach the ground; but the danger is not so great as might appear from a superficial consideration. The wind can throw the sparks into the wood only if it strikes the railway at an angle; and when it reaches the lee side of the embankment it fails, carrying the sparks down with it, and these fall faster and reaching the still air rapidly settle to the ground. Since in railway fills flat slopes are usual, 3 feet rise to 6 feet horizontal, so the protecting strips begin at a considerable distance from the track and run back with every 3 feet rise of fill 6 feet farther from the track.



LONG and WIDE STOCK MADE UP FI

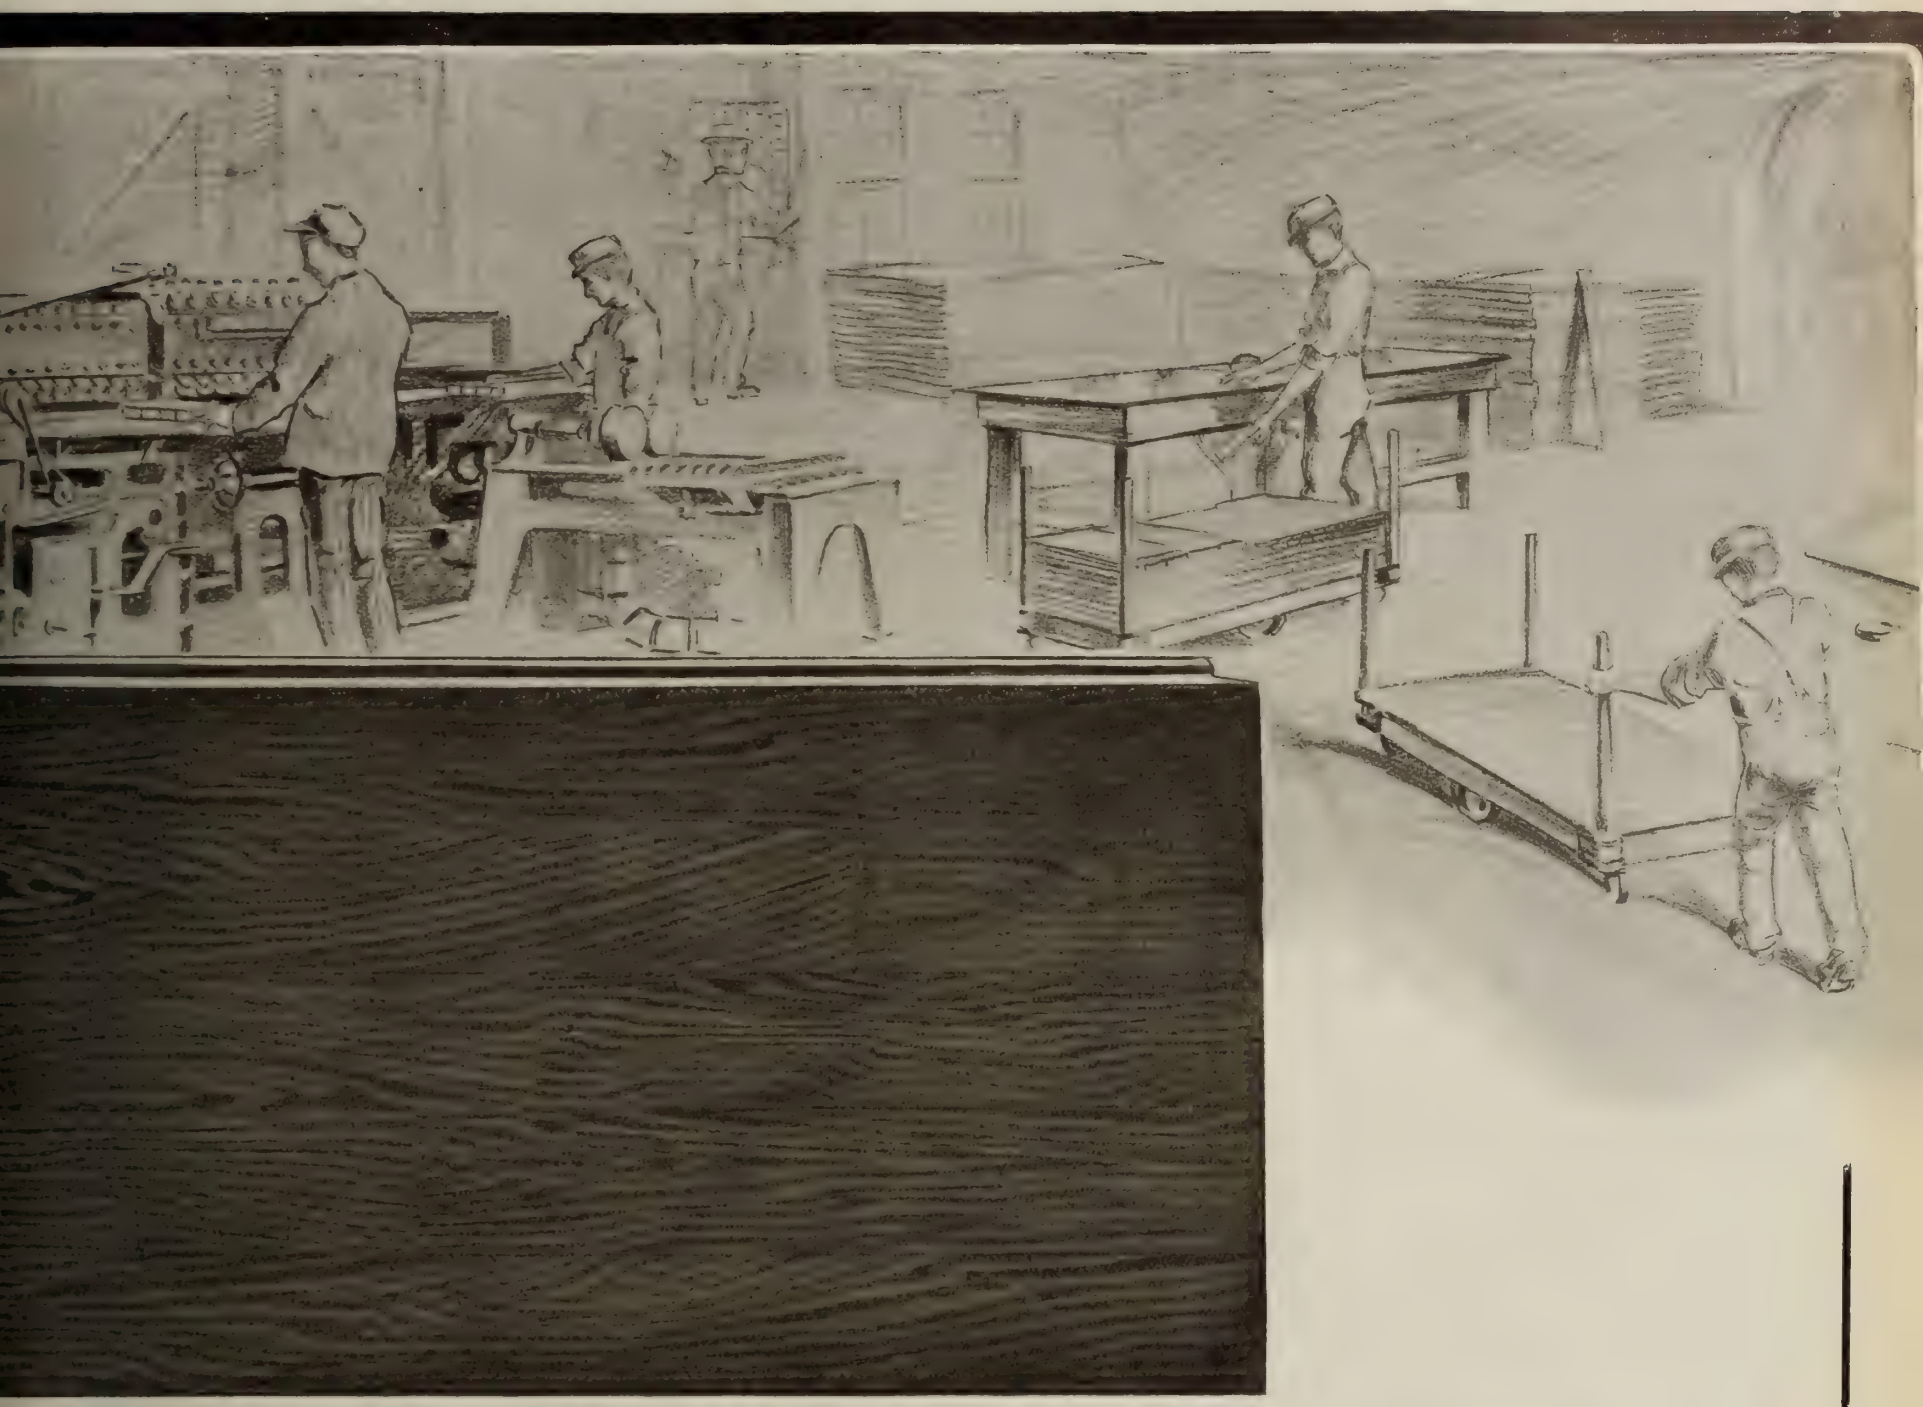
Primarily, the original object of the Linderman Automatic Dovetail Glue Jointer was the building up of wide stock from narrow material, but due to the improvements made in the machine during the past few years, we are now able not only to make wide stock from narrow but to build up a composite board from short narrow lengths, making it as strong or stronger than the long, wide one piece stock.

In most flooring plants throughout the country, there is a large percentage of waste due to defects in the lumber or to defects developed in milling the stock. From 75 per cent. to 80 per cent. of this waste can be utilized by installing a Linderman Machine. If the long stock which has a defective tongue or groove, is laid to one side and not cut up, and the short pieces, after the knots or other defects are cut out, are also saved until you have accumulated from 5,000 to 10,000 feet, this stock can then be run through a Linderman machine. A boy places a number of these short lengths together until they make a strip of any desired length up to 16 feet, the butt ends having been trimmed true when the defects were removed at the butting or swing saw. When a truck of this stock sixteen foot in length is ready, it is moved to one end of the machine. The operator from the other end feeds in the defective 16-foot strip, while from the opposite end is fed a series of the short lengths whose total equals sixteen feet. These two strips are then joined and glued in the machine, the gauge being set to clean off the tongue or the groove as the case may be. To this can be added, either another row of short flooring strips or another one of the long defective lengths. After the binding strip is added, it makes a solid, compact board that will not twist or warp and yet have the same, if not greater strength than though it were wide stock.

This operation has not spoiled the face of the flooring, although at various points it may show a glue line so that it will probably be necessary either to run this stock through a sander, or to send it through a surfacer and clean up with a 1/64-in. cut.

The next problem is the sale of the article. Throughout Canada there are many cheap houses being built and there is no

CANADIAN LINDERMAN CO



M SHORT AND NARROW MATERIAL

reason why such a product as this cannot be sold at $1.00 to $2.00 less per thousand than though it were the longer stock. There cannot be any objection to using the shorter lengths of flooring, built up in this manner, in the cheap houses, for the reason that it has been the custom for years in the high grade houses to use hardwood flooring as short as 18 inches. Or, this composite flooring can be sold as a sub-floor in the higher grade houses where they intend to lay the thin hardwood flooring. It can also be used for partition purposes, sheathing and in thicker stock for barn and factory flooring.

The lumber manufacturer having shorts and short shorts and other cuttings no matter of what width lumber, can likewise use a Linderman machine to work up this product into a composite board which may be of any width, 12-in., 16-in. or even wider. This product can either be milled and converted into shiplap or used for sheathing or partition work or as a sub-floor.

The same machine which will do the above work, will also take 2-in. x 4-in., converting them into 4-in. x 4-in., 4-in. x 6-in., 4-in. x 8-in., 4-in. x 10-in., or 4-in. x 12-in., or building up the 2-in. narrow stock into wider widths.

The cost is very small when the results obtained are considered. On the flooring proposition, assuming that the average length of all stock is 30 inches, except that of the binding strips, it is possible in one day to turn out from 8,000 to 10,000 board feet with a pay roll of four men on the machine and one man to lay out the strips to length before they come to the machine, giving an average pay roll in the West of $13.00 a day or of $10.00 a day in the East. This would make the cost $1.00 to $1.25 per thousand board feet.

For this product, most manufacturers are now obtaining but $2.50 to $3.00 a wagon load, which will equal 600 to 800 board feet, while for such a product as this they should obtain within $2.00 of their regular price for flooring.

By sending us samples of your waste, we will show you the results.

How to Cut Hardwood with Rapid Feed

The Problem of Securing Speed and Maintaining Quality—Importance of the Skilled Machinist—Salient Features in Successful Operation

By H. E. Miles.

Instructive Advice for those who are satisfied with nothing but the best results in manufacturing Hardwood Lumber.

WHILE we sometimes feel proud, and rightfully, too, of the wonderful achievements attained in modern saw milling, we must not forget that there are wide fields ahead for improvement. Although we have many well-equipped mills under qualified management, we also have many which are not. The popular idea has never been progressive. The great achievements have been accomplished on the part of a few, and such is as true in saw milling as in any other industry.

The average mill is so poorly equipped, and so poorly manned, that the manufacture of hardwood by such is not a success. This is not only true of small plants, but often of those having several band saws, gang edgers, trimmers, slashers, etc., etc.

It is apparent to all that if one saw can be made to do the work of two, the cost of manufacturing is greatly reduced. Only about half as many men need be employed. This is not only possible but probable. With the modern transfer and conveyor system a single gang of men is able to care for much more lumber than is being produced by the average single mill. In large mills we often see one edger edging the product of two band saws. The chief factor in increasing the product, therefore, is the first or main saw.

People are too often content to do as they see others doing. The average millwright, sawyer, and others employed to operate, learned about all they know during the first few years of their time spent at such work, settling into a certain rut, there to remain, and any progressive idea is received like that received by the one carrying the stone in the bag. However, there are those who will sit up and take notice, being progressive and teachable. With this class of men and a saw properly made, and properly installed, we can saw hardwood, producing perfectly manufactured lumber, faster than is known to the average miller cutting pine. The writer has been an eye witness of this and therefore knows its possibility.

While the band saw has great advantages over the rotary, in that it can be made to cut both ways, beside a great saving in the saw kerf, it has yet to pull off its coat and quicken its step to make hard maple cuts much faster than the well-installed, properly-built, circular saw, as we shall presently see.

This article is written especially for the benefit of those who are yet running the rotary saw, and who may believe that hardwood must be sawn comparatively slow to secure good lumber, since many such have extensive hardwood limits available.

Fine Machinery a Requisite

The first important fact to appreciate is that the saw mill is entitled to as fine a grade of machinery as can be produced. While this statement may need qualifying in a sense, when comparison is made with the mechanism of a watch, it is, in a sense, very true.

The scientific principles on which a circular saw works provide an intricate study which has not yet been exhausted. A mandrel of sufficient size to stand the strain should be set in large bearings, babbitted with the best metal obtainable. Such bearings should be fitted by one who is skilled in the art, to secure fine work. However, any one can be so skilled if possessed of a little tact, who will make a careful study of the principles of fitting heavy fast running journals.

It would involve too much space to give detailed instruction how to do such work. The millwright or machinist must be able to do that, and should exercise more care than is usually done on mill machinery. Many machinists have the idea that any old way will do for a saw mill. This idea must be discarded.

The saw collars must be shown to be flat by responding to a machinist's straight edge, except that the one on the board side should be slightly relieved within about an inch of the rim to the centre. Then if the foundation of the mill is solid, and the track properly lined with the frame, the owner may expect wonderful results in his favor. A saw which may be made to special instructions should be lined nearly straight with the carriage. When things are right, a very little lead is required. When using imperfectly built machinery a large amount of lead is needed to hold the saw in the cut. A saw with improper tension, and not in proper condition, requires two sets of guides. This is not in keeping with modern milling.

The saw makers have made a study of producing saws adapted to all conditions, but these are of necessity built upon general principles. The saw makers have mastered their art well. They have published leaflets and books instructing their customers how to utilize the knowledge gained. With such knowledge of general principles, I propose in this article to combine other knowledge gained by practical experience.

Relation of Saw Speed to Feed

It is a well established fact that after a certain speed is obtained, to increase the speed of a saw it is necessary to have a lighter feed. This is owing to the fact that to a great degree the feed which a saw will stand is determined by the stiffness of the plate. Hence when a saw is hammered to run at a higher speed than the normal which is designated by the saw makers as standard speed, it becomes too limber to stand as high a feed. Then it is up to the operator to judge which is the best proposition to adopt; to run a lower speed and maintain a heavier feed or a higher speed and a lower feed. While 9000 feet at the rim is adopted as the standard speed for the circular saw, by most makers, many are the speeds run by the multitude of mills operating. This is quite right, for the work must be regulated according to the power available, but when one is probing to get all that is possible out of a saw, it is taken for granted that there shall be no lack of power. Hence we shall confine ourselves exclusively to the question, How can a saw be made to do more work? Or to express it better; how can the cutting capacity of a saw be increased?

Now, having all parts of machinery in connection with it as perfectly made and installed, as possible, we will be able to depart from the general principles and order a saw to our special liking, having a much greater cutting capacity than can be otherwise produced. Thus we come to the question; what is the most practical speed for a saw cutting hardwood, to accomplish the most, under favorable conditions? This can only be answered by a careful study of the principles governing that particular, simple appearing, piece of steel for which all the other machinery in the saw mill is built.

We first find that while a saw having no tension will run at a slow speed and make straight cuts, to run at a speed sufficient to be of any practical service it must have tension to enable it to stand erect. Or, to more properly express it to one unacquainted with the technical terms, a saw must be loosened near the center by a process of hammering to allow for the rim expansion when running at a very high speed. Each saw must possess an amount of tension adequate to the speed it is required to run, and it follows that after a normal amount has been given, if given more, the plate will be too limber to stand any feed sufficient to enable the saw to do as much work as it might if it contained less.

Normal Speed 9000 feet at the Rim

The saw makers have established the fact that under ordinary circumstances, 9000 feet at the rim is the most practical speed. However, we find that by making slight changes in the construction of the saw, and by exercising more care in its management, it may be made to run at a much higher speed, and stand a heavier feed than has formerly been known, at least by many of those operating large plants. By actual experience the writer has found that it is much easier to make good lumber with such a saw than with one which is only nominally speeded. Many think in running "gun shot" feed that a heavier gauge is required. Well it might be if we were to follow the old idea of sustaining the feed by the stiffness of the plate, and volume of steel; but the saw which we are attempting to describe is not a heavy gauge saw. If we pause to consider, what do we gain after a normal amount is attained, in adding one or more gauges to the thickness of a saw? This only necessitates a wider swedge increasing the strain on the rim, which counterbalances all that might be gained by a greater volume of steel. Never order a saw thicker than standard gauge. Rather order a thinner gauge. Then since each tooth can do only a certain amount of work it should contain as many as can be made without diminishing the throat room necessary for the clearance of the saw dust. Keeping in mind the fact that we are to cut hardwood, having plenty of power available, we find as a rule that about an eighth of an inch is what a tooth can stand to chip when filed thin enough to cut easily. Here is where a saw's cutting capacity is often reduced, in not being filed tapering enough. The teeth are often left too blunt.

Of course in frozen timber the angle on which they are filed must be more obtuse, but not so obtuse as they are many times rendered.

The Best Class of Saw to Use

To obtain the results above mentioned we have found that the 50, or 52 inch saw is a very practical dimension, in that it is large enough to saw the majority of logs in the east, and, should there be larger ones in stock, a top saw should be installed for the purpose of completing such cuts as is necessary in manufacturing the same. A larger saw than 52 inches involves many disadvantages. Hence the order which has won the most success is for these dimensions, although a smaller saw is preferable if the logs to be sawn are not too large. However, the best results known to the writer were obtained by the use of a 52 inch saw, 7 and 8 gauge, containing 60 teeth; 9/32 inch swedge. The reader will note that this is a gauge thinner than standard even, for a saw of that diameter, but such a saw stood perfectly erect running at a speed of 850 revolutions per minute, or 11,571 ft. at the rim; under a feed of seven inches to each revolution, while making ten inch hard maple cuts. We believe no better manufactured lumber was ever taken from a saw. We will see by a bit of reckoning that such cuts were made, twelve feet long, in 1½ seconds of time. The sawyer found no trouble in maintaining an average feed of at least 4½ inches throughout the entire stock of maple, birch, and beech, many of which had lain in the sun becoming very dry and hard.

This saw was hammered to run at a speed of 800 revolutions allowing nothing for slack in the cut, and there should be none. However, owing to the fact that, as a rule saws will stand to run at a higher speed than that for which they are hammered, it was run, as we observe, at a speed of 850. This was planned, when the order was given. The speed should be uniform, and if supplied by a high speed automatic engine of sufficient capacity, there will be practically no slack. A good automatic engine will not vary over 2 per cent. when connected with but one saw, although this is very trying to the governing mechanism. Of course in double or triple mills where much machinery is in constant use rendering the load more even, a throttling engine would be quite satisfactory. Not so however, in a single rapid cutting mill. No matter how large a capacity an engine may have, no throttling, slide valve engine can supply an even speed where the load varies so quickly.

Centrifugal Force an Important Factor

It will be seen that by the methods here described, we are able to maintain the feed more by centrifugal force, than by stiffness of plate and volume of steel. This point is of vital importance. While it is apparent that only a slight change has been made in the construction of such a saw, from that outlined from general principles by the saw makers, it is also apparent that the result is quite marvelous, in that an excessive feed is maintained while running at a very high speed. But in reviewing the many little advantages gained it will be more easily understood.

First the mandrel and saw is in perfect condition, involving no unnecessary friction, second the comparatively thin plate allows the use of narrow swedge bits relieving the saw from excessive strain at the rim, thirdly the teeth are squarely filed and given as much pitch as they will stand, which also relieves the strain on the rim of the saw, and fourthly being relieved from the many encumbrances which attend the average saw, its stiffness is maintained, as we have seen, more by centrifugal force, than by stiffness of plate. Hence it can be run at a much higher speed.

At this juncture we would mention the fact that such a saw requires but one set of guides which may, and should, be placed so close to the plate that the clearance is hardly visible to the naked eye. Not that we would infer that the guides should be used to restrict the saw in its natural course, but to show the proficiency which can be easily attained and as a hint that their use is often abused.

This standard of proficiency is more easily preserved than any other. There is no advantage in plodding along in a haphazard way, thinking that to maintain efficiency requires large capital and closer attention. It only requires a little knowledge, and application of a few principles. When paying out money to a machinist insist that he render fine work. Let him know that you know that a sixty-fourth, or a hundred-and-twentieth part of an inch is altogether too coarse a fraction to be considered in connection with much machinery for even a saw mill.

With such a saw in connection with a good system of live rolls and transfers, we have found it very easy to cut 3000 feet, of one inch hardwood lumber per hour from ordinary twelve foot logs, turning nearly all such logs five times. This is not the fastest record however, but we care nothing for them. We must consider only those which may be practical. Those which may be maintained as an average. Such only has the writer endeavored to give the reader in this article.

Results of Structural Timber Tests

Valuable Information Published by the United States Forest Service—Tentative Grading Rules put Forward

A most interesting and valuable publication has recently been issued by the United States forest service upon "Tests of Structural Timbers," prepared by McGarvey Cline, director of the Forest Products Laboratory of the United States, and A. L. Heim, Engineer in Forest Products. The publication contains a great deal of information for all who make use of structual timbers, exclusive of round timbers and other special forms. The results given will be of definite value in determining working stresses and proper factors of safety in connection with the design of timber structures; in studying the relation of the physical characteristics and defects of timber to its strength and other mechanical properties; and in devising standard specifications and grading rules for different forms of structural timbers.

The species of timbers tested included the following: Longleaf pine, shortleaf pine, loblolly pine, Douglas fir, western hemlock, western larch, redwood, Norway pine, tamarack, red spruce and white spruce.

Generally speaking these timbers are divided into three classes, viz.: The southern yellow pines, including the first three in the above list; timbers of the Pacific coast, including the next four in the above list, and timbers of the New England and Lake States, including the last four in the above list. The bulletin contains a great deal of information regarding the actual results of tests and a number of excellent illustrations in connection with the statistics presented.

In a section devoted to the moisture content and the rate of seasoning the following general conclusions are given:

(1) In general, timber 8 by 16 inches in cross section must season through two summers before it reaches a thoroughly air-dry condition.

(2) The weight of thoroughly air-seasoned timbers will vary appreciably during the year, due to the alternate evaporation and absorption of moisture. This change in moisture content is accompanied by a corresponding shrinking and swelling, which tends to increase the size and number of checks formed through the seasoning process. These changes, however, do not seem to affect the interior of the timbers.

(3) If seasoning is started in the hot summer months the loss of moisture is at first very rapid, even though the timber is protected from the sun and wind. The loss in weight in a stringer 8 by 16 inches in cross section and 16 feet long in three months varies from 40 to 60 pounds, the loss being proportional in a general way to the amount of sapwood the timber contains. Checking is less serious, however, when the timbers contain a considerable amount of sapwood than when they are practically all heartwood.

(4) The best results are obtained when the air seasoning is started in the late fall or early winter months. At this time of the year the air is usually moist enough to prevent rapid drying on the surface, and, in consequence, serious checking.

(5) The absence of shrinkage in redwood timbers is very noticeable, although redwood contains a large amount of moisture when cut. On account of its low-shrinkage factor it can be seasoned without serious checking.

A comparison of the results of tests on air-seasoned material with those on green material shows that, in general, all of the mechanical properties are increased by seasoning. Increase in strength is especially marked on small pieces free from defects.

Increase in strength of wood fiber due to drying is, in the case of large timbers, largely offset by a weakening of the timber due to the formation of checks. If the moisture content of a seasoned timber is increased it loses strength rapidly, and if thoroughly soaked with water will become slightly weaker than when green. On this account it is not safe in practice to depend upon any increase in strength in timbers due to seasoning. When, however, large beams are seasoned with ordinary care, it is safe to assume that they will not at any time be weaker than they were when green.

An interesting section is devoted to the consideration of the relation of mechanical to physical properties in timbers.

Dealing with defects the bulletin says: "Defects differ from the physical characteristics just discussed in that they are not always inherent in the timber, but depend to a large degree upon the part of the tree from which the timber is cut, upon the manner of sawing it from the log, and upon the method of seasoning. They are, therefore, to some extent at least under the control of the manufacturer."

The defects that influence the strength of structural timber may be defined and classified as follows:

Shakes:—a shake is a separation of one annual ring from another, in some cases only a few degrees in length, in others entirely separating two rings. It is thought that shakes are produced in the living tree by stresses caused by winds and changes of temperature. They are most common in woods that split easily. Shakes are difficult to

detect in green timber, and usually do not become visible until the timber is at least partly seasoned. A shake decreases the strength of timber in proportion as a plane tangent to it approaches parallelism with the neutral plane in the beam, since the more nearly parallel the two planes the smaller is the area resisting horizontal shear.

Checks: checks are radial cracks or splits produced, almost without exception, by uneven shrinkage during seasoning. Occasionally, however, they are present in green timber.

Cross grains: cross grain may be divided into three general classes:

Diagonal grain.—In sawing lumber, if the plane of the saw is not approximately parallel to the axis of the log the grain of the lumber cut is not parallel to the edges, and is termed diagonal.

Spiral grain.—In many trees the fibers composing each year's growth are ranged spirally instead of vertically. The greater the pitch of the spiral the greater is the defect. Spiral grain usually can not be detected from a casual inspection of the piece, since it does not show in the so-called visible grain of the wood, which in softwood lumber is nothing but a sectional view of the annual rings cut longitudinally. A careful inspection, however, of the medullary rays on the tangential or bastard section will invariably reveal spiral grain, since the rays necessarily incline with the spiral direction of the fibers around the trunk, and therefore, in section, appear obliquely on the face of a timber. Spiral grain may readily be detected also by splitting a small piece radially.

Burls.—Burls are local disturbances in the grain of timber, usually associated with knots or produced by the healing of wounds during the life of the tree.

Pitch Pockets.—Pitch pockets are cavities between annual rings, usually filled with resin. They are rarely large enough to affect seriously the strength of structural timbers.

Knots.—Knots are the most common and varied of the defects encountered in structural timber. They are caused by growing or dead branches adhering to the trunk during the process of growth of the tree. If the branches along the lower part of the trunk die and drop from the tree while they are small the trunk will contain small knots near the heart. If the branches adhere to the trunk for a number of years and reach large size the log will contain the large knots that weaken structural timber.

Effect of Knots on Strength

Classification of knots by lumber manufacturers and consumers has usually been based upon the effect of the knot on the appearance of the material, or upon the amount of clear wood that could be obtained when the lumber was cut up into pieces of smaller dimensions. None of the classifications yet devised, therefore, is very useful in grading timbers according to their strength. The effect of a knot upon the strength of the timber depends in general upon two things: (1) The position of the knot in the timber with respect to the distribution of stresses; (2) the firmness with which the knot adheres to the surrounding wood.

The effect of knots on the shearing strength of wood was not investigated directly. The tests on air-dry beams, however, in which pieces would frequently fail in horizontal shear, indicate that knots do not decrease the shearing strength of wood, but rather tend to increase it by acting as pins, thus preventing the sliding of one surface over the other. Knots have also practically no influence in decreasing the strength in compression at right angles to grain, since almost invariably the wood of a sound knot is harder than the surrounding wood.

Because the growth of wood is a process of nature and the inherent qualities of the material can not be controlled, the user of structural timber, in framing specifications and grading rules designed to exclude material unsuited to his purposes, must rely entirely upon his knowledge of the general quality of the wood produced by the species under consideration and upon the visible physical characteristics of timber which in most species can be readily determined are:

1. Color of the wood.
2. Relative proportion of heartwood and sapwood.
3. Position of the pith in the cross section.
4. Rate of growth.
5. Weight.
6. Proportion of summerwood.

Color of Wood

The heartwood of each species of timber has a characteristic color, due to the presence of gums, tannins, and other substances resulting from the process of growth. The sapwood, however, is generally free from coloring matter, and so relatively white. Coloration from such causes apparently does not affect the mechanical properties of the cellulose composing the cell walls, nor therefore the strength of the timber. Marked variation from the characteristic color, however, often indicates incipient decay, especially when it produces a streaked or spotted effect. Some fungi which produces stain do not injure the timber, because they live on the organic matter contained in the sap and do not attack the cell walls. Many of the blue stains noticeable in sapwood are from this source. If, however, abnormal color is associated with punkiness or softness, noticeable by pricking the wood with a knife blade or other instrument, it is safe to conclude that there is decay.

Proportion of Heartwood and Sapwood

Sapwood, except that from old, overmature trees, is as strong as heartwood, other things being equal, and so far as the mechanical properties of timber go should not be regarded as a defect.

In discussing the dry weight of timber it is shown that the mechanical properties of wood vary directly with its dry weight, that is, other things being equal, the heavier the timber the greater its strength.

Referring to the proportion of summerwood the bulletin says: "Summerwood is the dark, relatively dense portion of each annual ring, the lighter, porous part being termed springwood." The proportion of summerwood varies so much in the cross section of a large timber, and defects such as knots and irregular grain influence the mechanical properties to a so much greater extent than does the former, that it is difficult to bring out any definite relation between the proportion of summerwood and the strength of long timbers. It is unquestionably true, however, that the proportion of summerwood is an important guide in judging the quality of timber, independent of any defects which it may contain.

The maximum crushing strength and the modulus of elasticity in bending obtained from small clear specimens cut from each of the large timbers tested bring out the following points:

(1) The modulus of elasticity for the large beams and that for the small clear beams cut from them are approximately equal. This would indicate that the modulus of elasticity is not influenced by the presence of defects in the large specimens. In other words, knots do not affect the stiffness of structural timbers, this factor apparently being dependent almost entirely upon the quality of the clear wood.

(2) The fiber stress at elastic limit for large beams does not vary directly with the modulus of rupture, but is, except in the weakest timbers, practically equal to the crushing strength of the small clear specimens. This indicates that the elastic limit of timber beams is affected only by defects of the most serious character.

For large beams the modulus of rupture decreases as the number and seriousness of defects increases.

These facts seem to indicate conclusively that the stiffness and elastic strength of timber beams are more dependent upon the quality of the wood fiber than upon the number and character of defects which the beam contains. The modulus of rupture, however, seems to be very susceptible to the influence of defects. To be more accurate, the property of a timber beam most influenced by defects is the difference between its fiber stress at elastic limit and its modulus of rupture. This difference might be termed the reserve strength of the timber.

A study of the results secured shows that:—

Of green timbers from eighteen to forty-three per cent. fail first in tension, from 50 to 75 per cent. in compression, and from 1 to 17 per cent. in horizontal shear. Of air-seasoned timbers from 11 to 83 per cent. fail first in tension, from 12 to 76 per cent. in compression, and from 5 to 56 per cent. in horizontal shear. By comparing the percentages for the green and air-seasoned timbers of each species it is seen that seasoning increases greatly the liability of failure in tension and horizontal shear.

Grading Timber Beams According to Mechanical Properties

It is only within the last decade that engineers and architects have given much consideration to the grading of structural timbers. Before that time structural timbers practically free from serious defects could readily be obtained. With the depletion of the virgin forests, however, the quality of structural timbers has steadily decreased, and to-day it is necessary to accept timbers containing defects which were formerly excluded. Lumber-manufacturing associations have done much to standardize the grading rules for different species and classes of timber. In general, however, these grading rules are based entirely upon the number and character of defects, and while they have proved fairly satisfactory in grading sawmill products for the woodworking industries, they are not very effective in separating structural timbers according to their strength.

One of the aims of the bulletin is to apply the results presented to the problem of better grading rules, and the purpose in correlating physical characteristics and defects with mechanical properties has been to show which factors are the most indicative of the mechanical properties of structural timbers. In this connection, the results emphasize the following points:

(1) The mechanical properties of timber beams are dependent upon (a) the quality of the wood irrespective of defects; (b) the character and location of defects.

(2) The mechanical properties of wood free from defects vary directly with its dry weight. The relative dry weight of the different pieces of wood of any species can be approximated by comparing the proportion of summerwood in each.

(3) The only defects which materially decrease the breaking strength of timber beams are the more serious ones, such as large knots and cross grains occurring where fibers are subjected to comparatively high stresses.

(4) All the species tested seem to be subject to the same general laws regarding the relation of mechanical to physical properties.

On the basis of these four general conclusions the attempt is made to formulate a set of definitions and rules which can be applied to the grading of structural timbers cut from any of the species discussed in this bulletin. It is too much to hope that these will eliminate entirely the judgment of the grader or inspector, but they should be of assistance in bringing about a simpler and more satisfactory system of grading than now exists.

Definitions

The term "dense wood" used to define the quality of wood which is desirable in timbers subjected to stresses such as occur in frame structures. The term applies to the wood itself, irrespective of defects. Since dry weight, which is the most accurate index to the mechanical properties of wood, can not be determined from a casual inspection of the timber, dense, or in other words, comparatively heavy wood will be defined as:

(1) Wood that shows more than eight rings per inch, or the rings of which contain more than 30 per cent. summerwood.

(2) Wood which is resilient; that is, which when struck with a hammer or similar blunt instrument, gives a sharp, clear sound, while the hammer shows a marked tendency to rebound and, the wood to recover from the effects of the blow.

These properties are to be judged from an inspection of the cross section of the timber.

The Effect of Knots

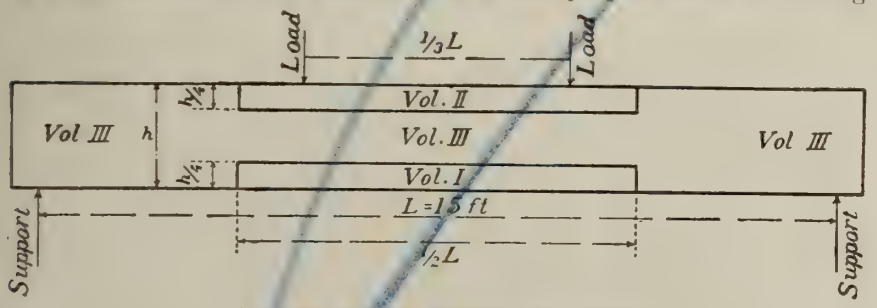
Knots are portions of branches which have been encased in the growing trunk of the tree. In judging their effect upon the strength of a timber it should be borne in mind that the axis of a knot always extends to the centre or pith of the tree, and that the visible part of the knot is a section of a somewhat conical mass of wood, the apex of the cone being at the pith of the tree, and the knot as a whole more or less securely intertwined with the wood surrounding it. A spike knot is a longitudinal section of a whole knot, and a round or elliptical knot is a section, respectively, at right angles or at some oblique angle, to the axis of the knot. Sound knots, as a rule, are stronger and harder than the wood fiber surrounding them. Their effect, therefore, upon the strength of the timber depends to a large extent upon the manner in which they are connected to the surrounding wood and upon the degree of stress to which the connecting fibres are subjected. If knots disturb the grain so that it is decidedly oblique to the edges of the timber the wood will be subjected to stresses in tension at right angles to the grain, the kind to which it offers the least resistance. In such cases early failure in cross-grain tension almost invariably results.

Class 1 knots.—Class 1 knots must be solid, firmly attached to the surrounding wood, and cause no marked irregularity in the grain of the timber. Small spike knots will be included in this class.

Class 2 knots.—Class 2 knots must be solid, but are insecurely attached to the surrounding wood, or associated with burl or other irregularity in the grain.

Class 3 knots.—Class 3 knots are unsound knots; that is, they are softer than the surrounding wood.

Diameter of knots.—The diameter of a knot on the narrow faces of a timber will be its projection on a line perpendicular to an edge



Division of test timbers into volumes

of the timber. On the wide or vertical faces the smallest dimension of a knot is to be taken as its diameter.

Small knots.—Knots less than 1½ inches in diameter.

Large knots.—Knots 1½ inches or more in diameter.

Analytical Study of Failures

To determine the relative importance of defects in different parts of timber beams the beam was theoretically divided into three parts or volumes, as indicated in Fig. 27. Volume 1 includes the middle half of the tension face and extends one-fourth of the height of the beam toward the neutral axis. Volume 2 includes the middle half of the compression face and extends one-fourth of the height toward the neutral axis. Volume 3 includes the remainder of the beam.

Tentative Grading Rules

Grade 1. timbers:—

(a) Must contain only dense wood.

(b) Must not have class 2 or large class 1 knots in volume 1. (See diagram).

(c) Must not have large class 2 knots in volume 2. (See diagram).

(d) The aggregate diameter of knots on any face within the centre half of the length shall not exceed the width of the face.

(e) Must not have shakes or deep checks.

(f) Must not have diagonal grain with a slope greater than 1 inch in 20.

Grade 2. timbers:—

(a) Must contain only dense wood.

(b) Must not have large class 2 knots in volume 1. (See diagram).

(c) The aggregate diameter of knots on any face in the centre half of the length shall not exceed two times the width of the face.

Average strength values of different species by grades. (timbers graded by proposed rules.)

(d) Must not have shakes which extend along an annual ring a distance greater than the width of the piece.

Advantages of Standard Grading Rules for Structural Timbers

Engineers and architects are at present unnecessarily confused by the different grading rules for structural timbers that have been adopted by various lumber manufacturers' associations. Often it is desired to use a new species for structural purposes, but with the present confusion in grading rules it is impossible for the purchaser to select a different species with any definite assurance that the grade of material he selects corresponds in strength with the grade of material he has been using. The tests discussed in this bulletin emphasize that timber beams, irrespective of species, are subject to the same general laws relating to the influence of defects and physical properties on the mechanical properties of the timber, and that all of the species considered in this bulletin can be separated into three fairly definite grades by the tentative rules given. If these or similar rules could be applied universally to the inspection and grading of structural timber it would do away with much of the uncertainty that at present exists regarding the properties of timbers sold for structural purposes, and would to a certain degree stimulate their use. Such rules, therefore, would seem to be to the advantage of both lumber manufacturer and consumer.

Another advantage of a uniform grading rule is that it permits more readily a comparison of timbers of various species and grades on the basis of relative strength. The accompanying table gives the average strength, by grades, of the species studied. These species may be classified in order of strength as follows:

Class 1 timbers.—To include grade 1 timbers for longleaf pine, shortleaf pine, loblolly pine, and Douglas fir. Shortleaf pine and loblolly pine, however, generally contain quite a large proportion of sapwood, which is not nearly so durable as the heartwood. Therefore, unless these species were treated with a preservative they should be excluded from this class and put into class 2.

Class 2 timbers.—To consist of grade 2 longleaf pine, grade 2 Douglas fir, grade 1 western larch and hemlock, and grade 1 tamarack.

Class 3 timbers.—To include grade 1 redwood, grade 1 Norway pine, grade 2 shortleaf pine, grade 2 loblolly pine, grade 2 tamarack, grade 2 western hemlock.

This classification, of course, is based entirely upon the strength developed by the timbers tested, and does not take into consideration other properties which may be desirable for any particular use. For example, the durability of the different species is influenced greatly by the amount of sapwood which the timbers contain. Shortleaf pine, loblolly pine, Norway pine, and tamarack usually contain a considerable proportion of sapwood. All of the other species mentioned in the table can be secured, as a rule, in dimension sizes practically free from sapwood.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Lumber Wanted

Several cars of good 1-inch No. 3 Common Hardwood, Birch preferred. State quantity, average width, and best price. Box 578, Canada Lumberman, Toronto, Ont. 18-21-5

Wanted

100,000 hewn Cedar Ties for delivery during 1913. State what you can supply and quote price or we will make offer. Box 622, Canada Lumberman, Toronto, Ont. 20-23-39

Wanted

Large quantity of Birch, Maple, Elm, Ash and Basswood, 1 inch and thicker, Log Run, Dry or can place orders for spring delivery. Box 636 Canada Lumberman, Toronto, Ont. 21-24-63

Wanted

Five million feet Hemlock and Spruce, 1-in. to 2-in., for delivery next spring or summer. Can use portion now. State what you can supply. Box 640 Canada Lumberman, Toronto, Ont. 21-24-66

Lumber Wanted

Wanted—Stocks of Ash, Elm, Birch and Basswood lumber, all thicknesses, for cash. Send your list and I will look over your stock. Box 632, Canada Lumberman & Woodworker, Toronto, Ont. 21-22-54

Birch Wanted

We desire to buy 100 M. to half million feet 4/4, 5/4, 6/4, and 8/4 log run No. 2 common and better Unselected Birch. For sufficient quantity will send representative to load stock. Terms cash upon inspection. Apply to Louisville Point Lumber Company, Louisville, Ky. 20-23-43

Lumber Wanted

Four, five and six quarter, Spruce, Hemlock and Norway, four, six, eight and ten inches wide, rough, also surfaced. White Pine Mill Culls and Lath. Box 615, Canada Lumberman & Woodworker, Toronto, Ont. 20-1-34

We use yearly five hundred thousand to one million feet of Birch, Basswood and Ash in our business and are open to contract with responsible mill men for same. We would be willing to advance money on the logs and also on lumber as sawn. Write us, Manufacturer, Box 619, Canada Lumberman, Toronto, Ont. 20-37 T.F.

Birch Logs and Hardwood

Wanted from 100 to 300 cars Birch logs, 14-in. and over diameter and 10 ft. and up long, delivery will be accepted up to May, 1913. Desire also to communicate with parties having Hardwood lumber to offer. Box 630, Canada Lumberman, Toronto, Ont. 21-22-50

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

White Pine Wanted

I require large quantities of highest grade White Pine. Can also utilize lengths from 2-in. upwards. Please send offers with lowest quotations to Th. Mannborg, Hof-Harmonium Fabrik, Leipzig-Lindenau, Germany. 21-56

FOR SALE—LUMBER, ETC.

For Sale

Ten cars Telephone Poles. Can be loaded at once. For prices, etc., apply to P. O. Box No. 213, Almonte, Ont. 21-22-57

Lumber For Sale

Two cars dry 5/4 Birch.
Two cars dry 6/4 Maple.
One car dry 4/4 Birch and Maple. Mill cull. S. L. Purdy, Coe Hill, Ont. 21-51

For Sale

For quick shipment, 100 M. ft. 2-in. Birch, December, 1911, cut. No. 2 C. & B. at $20 per M. on cars. Farm Point, Que. Hall Bros., 174 Mutual Street, Toronto, Ont. 16t.f.

For Sale

Five thousand pieces small posts, 3-in. to 4½-in. top, peeled and in good shipping condition. The Baker Lumber Company, Lindsay, Ont. 20-23-30

Cedar Shingles

Four carloads XX 16-in. Cedar Shingles, retailing at $1.75 per M. Price in car lots $1.15 at mill, C. P. R. or G. T. R. Lindsay, Ont., for quick sale. Terms 30 days net. Box 279, Lindsay, Ont. 19-22-24

Lumber For Sale

4 cars 1-in. good cedar for boat building.
100,000 ft. 2 x 6 mill run hemlock.
100,000 ft. 2 x 8 mill run hemlock.
4 cars 2-in. white oak, sound and square edge. Apply to Geo. C. Goodfellow.
C Montreal, Que.

For Sale

200 M. feet Hemlock can be cut to your order. Several carloads telephone poles all sizes. Five to ten carloads square sawed birch, beech and maple, from 5-in. x 5-in. to 12-in. x 12-in.—8 ft. to 16 ft. long.

The above for Winter or early Spring shipment. For immediate shipment 1 car 1½-in., 2-in., 3½-in. hard maple. No. 2 common, 75 per cent. clear cuttings at $12 per M. Hall Bros. Manufacturers, Wholesale Lumber and Timber Merchants, 174 Mutual Street, Toronto, Ont. 21-65

For Quick Sale

1,400 acres standing timber.
100,000 Cedar Ties.
100,000 Cedar Posts.
1,000 cords Pulpwood.
Also some pine. Above is estimate.

Owner must sell at once. Price, Three Thousand Dollars on terms or Twenty-eight Hundred spot cash. Contractor will take out and put on lake shore at following prices:—

Hewn ties, 18c each; cedar posts, 5c each. Pulpwood, $3.50 per cord; cedar logs, $7.00 per M.; pine logs, $6.00 per M.

Apply Box 633, Canada Lumberman, Toronto, Ont. 21-22-55

FOR SALE—MACHINERY, ETC.

For Sale—A Snap

Ten sets Sleighs. Runners 4-in. x 7-ft., 5 ft. wide. Bunks 8 x 9 x 8 ft. Bench 9 x 10 x 6 ft. $15.00 per set. Box 603, Canada Lumberman, Toronto, Ont. 20-23-27

For Sale

Two Steam Engines, Boilers, Saw Mill Machinery and Barkers, all in good condition. Apply The East Canada Power & Pulp Company, Limited, Murray Bay, P.Q. 20-22-38

FOR SALE—Planing Mill, Sash and Door Factory, lumber yard and coal business; this is the best opening in Ontario; will sell stock and lease the mill if preferred; will also sell mill and lumber yard separate from coal business. For particulars, apply to Box 625, Canada Lumberman, Toronto, Ont. 21-45

For Sale

⅝-in. Yellow Poplar saps. One carload 10-in. to 16-in. wide. Also one carload 2-in. panel and No. 1 Poplar 12-in. to 24-in. wide.

21-24-60 Cincinnati, O., U.S.A.

Saw Mill For Sale

Huntsville Lumbed Company, Limited, will in the future only run one of their two double cutting Band Mills, which is now cutting fifty thousand feet per day.

They will sell the same with engine, boilers and all other machinery along with building. Also will sell blacksmith's tools and a number of saw-log sleighs and chains.

Huntsville Lumber Company, Ltd.
20-21-42 Huntsville, Ont.

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

WANTED—Position for coming season as mill foreman. First-class references. A hustler. Sober habits. Apply to Box 635, Canada Lumberman. 21-61

Situation wanted, as office or general man. Sixteen years' experience in lumber. Good references. Box 624, Canada Lumberman, Toronto, Ont. 21-22-44

Wanted position as band saw filer to finish this season cut with the consideration of work next season. Can show first-class references. Reply to Box 620, Canada Lumberman, Toronto, Ont. 20-22-21

Wanted

A position as mill superintendent. Have years of experience handling men in Sash, Door and Planing Mill business, can estimate and handle plans of any kind. Reply Box 612, Canada Lumberman & Woodworker, Toronto, Ont. 20-21-32

Experienced office man wishes position as secretary or accountant in lumber company. Has good knowledge of lumber manufacturing, planing mill work, and selling end. Also capable of keeping books, handling correspondence, etc. Good references. Open for immediate position. Box 631, Canada Lumberman & Woodworker, Toronto, Ont. 21-53

Thoroughly experienced office man, Canadian, age thirty-five, married. Expert bookkeeper and cost accountant, sawmill, wholesale and box factory. Experienced selling yellow pine; also seven years experience white pine, United States and Canada. Desire change to healthy location with good schools. Prefer position as assistant manager or office manager. Haven't lost a day in thirteen years. Reply, Box 613, Canada Lumberman, Toronto, Ont. 20-22-31

WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Salesman with some knowledge of measuring and inspecting lumber, age from twenty-five to thirty-five years. Apply Box 568, Canada Lumberman, Toronto, Ont. 18-21-2

WANTED—First class man as traveller for selling lumber. Apply Box 628, Canada Lumberman, Toronto, Ont. 21-47

WANTED—First class man to look after and take charge of saw mill and camps in Muskoka, Apply Box 629, Canada Lumberman, Toronto, Ont. 21-48

Superintendent Wanted

We desire to engage a competent superintendent for our general Woodworking Factory. He must be fully capable of shouldering the complete responsibility of the technical management of a good-sized sash and door plant and must fully understand the wholesale production of readymade and portable houses. No "desk superintendent" wanted. The plant is just about to be erected in the Canadian Northwest. Excellent opportunity for the right man. Write, stating full particulars, references, and salary expected. Correspondence treated in strict confidence. The Great West Iron, Wood & Chemical Works, Limited, Prince Albert, Saskatchewan, Canada. 21-62

BUSINESS OPPORTUNITIES

Auction Sale of Valuable Timber Limits and Equipment

On Friday, November 15th, at 2 p.m., in Room "G," King Edward Hotel, Toronto, the timber on the following limits, held under license from the Ontario Government, will be disposed of absolutely without reserve, for the purpose of closing out an Estate:—

The N.E. ¼ Township of Mills.
Berth No. 2 Lount.
Berth No. 3 Pringle.
Berth No. 4 Pringle.

At the same time a complete Camp outfit will also be offered without reserve.

The Limits will be sold either separately or en bloc.

For all necessary information apply to

UNION BANK OF CANADA,
Eastern Superintendent's Dept.,
20-21-36 Toronto, Ont.

Important Sale of Valuable Timber Limits

Sealed tenders will be received by the undersigned up to and including the **20th day of December, 1912**, for the purchase of:

Limit No. 194 of 1873-74—River Jean de Terre—tributary to the Gatineau, containing an area of fifty (50) square miles, more or less.

Limit No. 195 of 1873-74—River Jean de Terre—tributary to the Gatineau—Island Lake, containing an area of fifty (50) square miles, more or less.

These limits comprise some of the best pine and pulpwood areas in the Province of Quebec.

Map showing location of these timber limits and report thereon may be inspected at the offices of the undersigned and from whom further information may be obtained.

The highest or any tender not necessarily accepted, and the acceptance of any tender will be subject to the approval of the Court.

Dated Ottawa, Aug. 5, 1912. 16-22-35

For Sale or Trade

Two hundred acres hardwood bush, District of Parry Sound. Small mortgage of $1,000 against it. What will you trade?

B. J. McCORMICK,
21-22-49 Welland, Ont.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

Three hundred acres of good land, well timbered with virgin beech, hard maple, red and yellow birch, ash, elm, hemlock, balsam, spruce, cedar. Largely level. Good main road to Emsdale Station. Two and a quarter miles from station. Price three thousand dollars. Enquire B. Mabee, Box 22, Emsdale, Ont. 21-46

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 115 h.p. boiler, 100 h.p. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

FOR SALE
FULLY EQUIPPED MILL

$8,000 will buy a mill with machinery for the manufacture of common slotted clothespins, easily converted into a factory for hardwood flooring, broom handles, or spoolwood, with 60 h.p. engine and boiler, saw carriage, rotary saw, trimmers, double edger, planer, drying apparatus, lath machine, gang saws, lathes, power drill, emery stands, shafting, belting, pulleys, carriers, haul up, together with buildings, mill yard, mill dam, at the mouth of a drivable stream, a short distance from millions of feet of white birch and spruce timber, alongside the main line of Intercolonial Railway and within two miles of shipment by ocean steamers.

Apply to B. Carr Harris, Bathurst, N.B., Canada. 21-52

PARTNERS WANTED

The advertiser has just built and equipped the best plant in Canada for the manufacture of doors and boxes, and wants one or two good men with capital to join him, either a man to take the financial end and office work, or one with a good knowledge of the manufacturing end of the business. The trade in boxes will be local, but doors will be shipped to all parts of Canada as well as to England. There is not a large specialized door factory like this one in Canada to-day. The demand for doors is increasing rapidly, and car loads are daily being brought from the States which can be filled by a good Canadian plant. All correspondence will be treated confidentially. Address Box 600, Canada Lumberman & Woodworker, Toronto, Ont. 19-21-25

FOR SALE

A Going Lumber Business Steam Saw Mill and Timber Lands

Six and One-Half Miles from Lavant Station, K. & P. Railway, comprising

Mill and 1,100 acres deeded land, Township Lavant, also license for 9-mile government limit in Township Dalhousie, adjoining mill property. All the timber lands are well wooded and all green bush. Has never been destroyed by fire. Ten to twelve million feet of lumber would be a safe estimate, probably five million feet of this original maple of good quality. Besides there is a great quantity of cedar, also five million feet comprising elm, ash, oak, basswood, poplar and second growth pine. Over 300 M. feet lumber now in yard sold for winter delivery, but would give purchaser some idea of qualities. This output could be doubled this year. Have contracted already for this season 200 M. feet to be taken from the stump and sawn and piled in yard for $8.00 per thousand. Can buy also large quantities from farmers in locality. Mill in good repair ready to start. Good stables, barn and three houses, sleighs and all equipment. No encumbrance. Too much other business to attend to. Price $10,000, half cash and half secured. For more particulars apply R. R. Drysdale, General Merchant, Lanark, Ont. 21-22-64

Baughman's Buyer and Seller

The twelfth edition of the handy book for lumbermen just out. Revised, improved; see the new side tables, the metric system, tapering timber, to figure narrow flooring, moulding and box work, etc., five sections each indexed and separate work. Every page worth the price of the book. The book that talks to lumbermen. Not millions but more than seventy-five thousand copies have been sold to lumbermen. Bound in red flexible leather cover, $2.50 per copy prepaid. Orders mailed day received. Address H. R. A. Baughman, Indianaoplis, Ind. 19-22-18

Notes on Erecting Countershafts

In erecting coutershafts or machines they should be fixed, as far as possible, so that the belts pull on the main shaft in opposite directions, as should too many belts be pulling in one direction and the shaft be of insufficient size or not very strongly supported it will cause a good deal of trouble by springing and will soon get out of line, says the Timber Trades Journal. In fixing driving pulleys on the main shaft, those transmitting the greatest power should be fixed as near the bearings as may be practicable. If hangers from the roof are employed they should be mounted on substantial hardwood plates of a sufficient length and width to give an ample bearing surface to the base of the hanger. Countershaft bearings, as well as main shaft bearings, should be made adjustable for wear and alignment.

We may say, wherever possible, we prefer to use belt gearing instead of toothed, as toothed gearing requires more power to transmit the same effective force as belts; it is also noisy and unsuitable for high speeds.

If from the exigencies of the site or other cause it is necessary to run a shaft at an angle to the main shafting, we prefer a belt led over guide pulleys instead of a cross shaft and bevel wheels, as it is less noisy, much cheaper, and, if well arranged, quite as effective. The best plan with which we are acquainted is to mount the idle pulleys on a spindle fixed vertically in a ball and socket seating, which may be fitted in a bracket attached to a hanger or standard by prolonging the end of the spindle and fitting it with a screw safety washer and nut; the spindle and pulley may be set at any desired angle. The spindle carrying bracket should be arranged with a vertical adjustment on the hanger or standard. The ball segment can, of course, be turned round as may be necessary, and with the plan we have described the idle pulleys may be adjusted to suit any position of shaft, thus obviating the construction of a special set of hanger or bracket patterns for each separate case, and at the same time ensuring the correct running of the belts on the main pulleys.

All main shafts and countershafts should be carefully tested for easy running at stated intervals, as should they be allowed to get out of line or level a considerable loss of power may go on for a time undetected.

Instead of the ordinary rigid bearings, ball, roller, and ring self-oiling bearings mave of late been introduced with much success, and when properly designed and applied there is little doubt that they effect a large saving in power.

Creosoting Sleepers

In impregnating hardwood sleepers with creosote, one of the most important essential requirements is that they should be grouped according to their hardness, species, the ratio between heartwood and sapwood, and other factors which determine the extent to which they are susceptible to penetration. There is an extreme variability of penetration in different groups of sleepers, and it stands to reason, therefore, that in the work of creosoting a great deal of time is wasted in continuing the process on such as are easily impregnated when they are mixed with species less easily penetrated. It seems to be a pretty general concensus of opinion among timber preservative experts that it is necessary to treat them to the limit of their absorption. While various characteristics should necessarily be considered in grouping, it seems to be the pretty general American custom to group only according to species. After a wood is thoroughly dried it is certainly more susceptible of penetration than a wood which has been but superficially seasoned, and therefore, according to the "Engineering Review," the second wood should be given longer treatment than the first. Instead, however, as stated, the general practice is to separate merely the various kinds of trees botanically. The question of the ratio between sapwood and heart wood has not commanded the attention it merits. No one seems to have been capable so far of assorting timbers of the same species equally seasoned and having similar proportions of heartwood an dsapwood, as to density of ring growth or physical characteristics of the wood affecting the pentrability. According to one authority, the only practical method of grouping would be according to degree of seasoning, and he argues further that this would require artificial seasoning in all cases. This practice is somewhat common in Europe, in addition to which European railroad companies air-season their sleepers much longer before treatment than in America.

Hemlock and Hardwood

Review of the statistics presented at the recent meeting of the Northern Hemlock & Hardwood Manufacturers' Association in Milwaukee, and of condensed figures selected from a similar report made at Detroit in behalf of the Michigan manufacturers, shows a very material reduction in visible supplies as compared with a year ago. The net result as regards hemlock is that for the first nine months of the year there was a decrease in cut of 7 per cent. in the Wisconsin territory, and an increase in shipments of 34 per cent. Stock on hand, October 1, as compared with a year ago, shows a decrease of 37 per cent. The stock decrease as to all hardwoods for Wisconsin is 48 per cent. While the reduction in stock has been more marked in case of No. 3, No. 1 and No. 2 grades show a materially lighter stock in every wood. Wisconsin shows a total aggregate stock of both hemlock and hardwoods of 181,587,000, as compared with 300,982,000 feet a year ago. Michigan shows, as to hardwoods, a total stock of about 40,000,000 feet, as compared with a total stock of about 70,000,000 last year; and in hemlock, taking boards and piece stuff together, a stock of about 63,000,000, as compared with a stock of about 128,000,000 a year ago.

The expected cut for Michigan is not yet at hand. The logging plans for the coming winter in the territory of the Wisconsin association show a possible increase in output of about 355,000,000 feet of hemlock, as against 335,000,000 last season; and about 238,000,000 feet of hardwoods, as against 200,000,000 last season. The pine production will probably drop from 194,000,000 to 109,000,000, or a net reduction of about 27,000,000 feet, taking all the woods together. In view of the present demand for all kinds of wood the statistical situation for both Michigan and Wisconsin is very strong.

Cooperage of Salt Barrels

The manufacture of cooperage for salt is especially interesting to saw mill men because pine staves may be used and because they may be made from scrap material around the mill. Almost any kind of stave can be used, the narrow one is the favorite because it will not "buckle in" when swollen on the inside from the moisture drawn by the salt. This gives the opportunity to use stock two inches wide. Another interesting relation between the salt industry and its cooperage is in the geographical distribution of the sources of supply. The six leading states in production of salt are Michigan, New York, Ohio, Kansas, Louisiana, and California. Each is in or near the centre of a lumber region. The fact that the salt industry is a regular and stable industry that fluctuates very little is again a point of interest.—St. Louis Lumberman.

Review of Current Trade Conditions

Ontario

During the past fortnight practically nothing of interest has developed in the lumber trade of Ontario. In nearly all lines, both of soft woods and hardwoods, the market is strong with an excellent demand and small stocks. This applies particularly to hemlock and the indications are that the situation in this particular wood will become far more acute between now and the time when fresh stocks can arrive on the market next summer. Hemlock manufacturers report that there was a large reduction in the quantity of tanbark taken out this year. Some manufacturers are inclined to advance prices of hemlock but others have decided that it would not be wise at present, as the advantage to be secured would only be slight, because stocks are light and the quantity of lumber which could be sold at an advance would be very small and it would be unwise to risk encouraging the use of substitutes. Most of the manufacturers in Ontario are of the opinion, however, that prices of hemlock will be advanced considerably in the spring. A recent development of some interest in Ontario is the fact that dealers in the western states have shown an inclination to come to Ontario for supplies, the indication being that there is an unusual shortage in the Western States.

The market for hardwoods continues very firm with an excellent demand and stocks are rather low as a result of the difficulty in securing cars for shipment. This latter trouble continues to effect the whole lumber industry in a most regrettable manner. Many dealers are obliged to refuse orders, being quite unable to make any promise in regard to dates of shipment.

Reports from Ottawa state that an active business continues in lumber and that it is quite easy to get good orders, but that, on the other hand, it is very difficult to secure care upon which to make shipments. This situation applies all through the Ottawa Valley and manufacturers and wholesalers are behind in filling their orders. It is a thought that some improvement in the situation may be expected shortly.

Eastern Canada

No important developments are to be reported from Montreal and one can only reiterate the old story, that much good business is being held up on account of the scarcity of flat cars. In spite of this situation it is believed that the present season will have witnessed the largest trade ever handled by Montreal dealers. Spruce is in good demand and prices are high. Stocks of low grades of spruce and pine are scarce on account of the strong demand from the United States. Clapboards and shingles are moving actively and hardwoods are in good demand. There is a good trade in lath and the demand for hemlock is also strong. The export trade to Great Britain is very active and indications are that the year's shipments of pine will show an increase over 1911.

Ground wood pulp is rather quiet so far as immediate shipments are concerned, and some Canadian mill owners have decided to carry over fair sized stocks, to sell during the low water periods in the winter. Canadian newsprint mills are able to dispose of their product easily at good prices. Sulphite fibre is very firm in the Canadian market and the mills are said to be well sold up. Extensive contracts have been made for 1913 delivery at good prices.

A satisfactory run of orders is reported for eastern spruce at New York, both in car and cargo lots. Cargo shipments however, are not so numerous as usual at this time of year. Mill stocks are reported firm, with manufacturers holding out confidently for higher prices. Wholesalers at New York are commencing to feel that they will have to pay the higher prices which mills are likely to require. Yard stocks are fairly large but the assortments rae not so good as usual at this time of year. The strong demand for hemlock at New York continued unabated. Prices are still high, but retailers are quite willing to pay them if they can secure stocks at once. Mill stocks are reported badly broken. A few mills which are in a position to make prompt shipment of staple sizes are doing a splendid business.

At Boston no great amount of new business in spruce lumber is reported. Manufacturers are still holding firmly and are looking for higher prices after the first of November. Frames have not been selling extensively, but in many instances the price is held more firmly than a month ago. Some of the mills are taking nothing less than $25 although buyers are trying to secure stocks at $24.50. Not much business is done above the latter figure. A fair trade is reported in random but buyers are not quite so keen on securing stocks at current prices, as they were a little while ago. The general price asked for 2 x 4's is $22.50, but very few buyers will pay more than $22. Clipped hemlock boards are held firmly at Boston at $23 and sales at $22.50 have been reported in cases where the lumber had already been sold by the buyer or in which he knew that he could secure a higher price for prompt shipment. A firm market continues at Boston for shingles. The general asking price for cedar extras is from $4 to $4.25, with only a slight amount of business at the higher figure. Manufacturers are showing no anxiety about disposing of their stocks. Clears are held at $3.75 to $3.90 and some brands cannot be had below the top price. A good demand continues for lath, the asking price for 1⅝ in. being $4.50 and for 1½ in. $3.90 to $4.

United States

Reports from various points in the United States indicate rather unanimously that the heavy rush of demand from the retail trade which has been in effect since September, has reached its high point for the year and that a satisfactory level of trade may be expected at least until the winter commences. The most urgent demand is felt in the north-eastern parts of the United States, while in the western parts, retailers are not showing quite so much inclination to stock up. Car shortage continues to be a serious factor in trade conditions although it is not so acute in the north as in the south.

Chicago:—The demand for northern pine continues steady and active. Wholesalers report that they are fairly busy. An extensive box trade is in progress and low grade lumber is scarce. Upper grades are firm and moving actively. The hardwood trade continues in satisfactory condition, with prices firm. Most of the large buyers are in the market and are paying the prevailing prices. Quartered white oak is fairly steady. Ash is not in large supply. Birch is moving steadily at good prices. Soft elm and rock elm are steady. Maple is in fair demand. The strong demand for hemlock continues and stocks have been greatly reduced of late. Fairly large quantities of hemlock are arriving by water. The building demand has continued steadily this season. Prices of hemlock are firm. A fair yard business is reported in southern pine although no increase in the movement is noticeable. Red cedar shingles are only steady and trade is quiet. Clears are selling at $3.47 and stars at $3.14, Chicago basis. White cedar shingles are selling steadily at fair prices. Stocks of the better grades are very broken. Lath continue strong and firm in price.

Buffalo:—The lower grades of northern pine continues strong and stocks are so scarce that in all probability high prices will prevail for some time to come. It is expected that low grade stock will advance during the coming year. The upper grades are in good demand with stocks light. Pattern lumber is moving actively. The hardwood trade is active, but is badly handicapped for want of cars. The principal woods, including oak, ash, maple and birch are selling at about the same level as formerly. Hemlock is growing scarcer all the time and the building trade is calling loudly for good stocks. Prices have continued firm at the recent advance. The mills are having difficulty in filling orders and have been declining business even at an advance above former figures. Shortleaf pine is selling actively but great difficulty is experienced in getting shipments. Southern pine is in good demand and is also scarce on account of the shortage of cars. Higher prices are expected. Shingles are reported 10c lower than formerly. It is expected however, that the conclusion of the rail and lake shipments will strengthen the market shortly.

North Tonawanda:—All kinds of northern pine are in good demand and it is expected that the common grades will be scarcer this winter than they have been for several seasons. No. 2 and No. 3 barn were in large supply last season, but on account of the heavy consumption, it looks as though they will be among the shortest at the close of navigation.

Great Britain

The London spot market continues very active and reports are to the effect that considerable progress is being made in catching up to the requirements of the trade, in spite of the great advance which has already taken place in freight rates. The indications are that there will be no weakening during the balance of the year and that prices in general will be more likely to stiffen than to remain unchanged. The deliveries at London docks for the week ending October 5th, amounted to 10,659 standards as compared with 7750 during the corresponding week of 1911. At Churchill & Sim's recent auction sale, a few 3 x 11 first Montreal pine brought £36 5s. for 12 to 16 ft. Thirds were sold at £16. Some 2 x 7 Quebec spruce 8 to 16 ft. firsts, was sold at £10 10s. A lot of 3 x 10 and 11 dry, first Quebec pine, 15 to 16 ft. was sold at £25 and some 3 x 9 and 10 seconds 9 to 13 ft. brought £21. Dry thirds, Montreal pine, 1¼ x 7 and 8, 12 to 15 ft. sold at £12. Rock elm timber 12 and 14, 16 to 21 was sold at 42s. per cubic foot.

Liverpool reports indicate that consumers of timber are commencing to realize that they must pay prices now which they were refusing to pay a few months ago. It is difficult to get tonnage to-

Partial view of booming ground and lumber yards

For Quick Sale

We have the following stock of lumber piled where it is necessary for us to move it quickly on account of our insurance. We offer it at attractive prices for quick sale.

3,500 ft. 5/4 No. 2 shop.
4,500 ft. 5/4 No. 3 shop.
4,000 ft. 5/4 stained saps.
8,500 ft. 5/4 outs from fine com. and bet.
20,000 ft. 5/4 No. 1 mill lumber.
14,000 ft. 5/4 No. 1 barn.
7,000 ft. 6/4 No. 1 barn.
8,500 ft. 5/4 No. 2 barn.
4,000 ft. 6/4 No. 2 barn.
58,000 ft. 5/4 No. 3 barn.
20,000 ft. 6/4 No. 3 barn.
3,000 ft. 5/4 No. 1 box.
13,500 ft. 5/4 x 5-in mill run.
6,000 ft. 6/4 x 4-in. mill run.

Write or wire for quotations

A. F. Holden, Pres. J. M. Diver, Vice Pres. and Gen'l. Mgr. E. C. Barre, Ass't. Mgr.

day from any of the spruce shipping ports of eastern Canada. Shippers in New Brunswick and Nova Scotia are reported to have only small stocks and therefore not to be eager to engage tonnage. Under these conditions engagements for future delivery are light and owners are apparently playing a waiting game. The situation therefore, is one which logically persuades the consumer in England that if he wants the lumber he must now pay a sufficient price to cover the increased costs of manufacture and transportation. A few consumers of Canadian pine have been coming into the market with orders. They are at last waking up to the fact that prices have advanced as a result of natural conditions and cannot be expected to decline, now that the season is approaching its close.

The demand for timber at Manchester continues about steady, in spite of the fact that prices have a general upward tendency. Spruce deals are reported to be at the highest price they have obtained in the last 20 years and prices "ex stock" at the docks are now given as follows:—

Average lengths 11 x 3, £12 5s. per standard.
Average lengths 9 x 3, £11 15s. per standard.
Average lengths 7 x 3, £10 10s. per standard.

Scantlings are bringing proportionate prices and indications are that by the spring all these prices will be even stiffer.

The timber market at Glasgow shows no alteration, of late, the quantity of business being fairly satisfactory, with indications of continuing the same. Timber merchants are disposed to increase their holdings in the expectation of higher prices.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Strong Trade Conditions Continue at St. John, N.B.

St. John, N.B., Oct. 23rd; (Special correspondence of the Canada Lumberman):—The wholesale and retail lumber trade at St. John holds a very strong position at the present time. All the stocks of deals, boards and plank have been practically sold ahead, and mills will continue sawing right up to the close of navigation, about December 1st, on these contracts. The prices for stocks have been about as good as any year in the history of the trade. Of course, the first part of the season was dull, but as the summer came along, prices began to advance and trade took on a new spurt, which has lasted right up to date, and will undoubtedly continue to do so for some time. The retail trade has never been better, in fact, at the present time mill yards contain very little low grade stock, which has not been sold. At mills where there are any stocks of low grade being carried it is found on inquiry to have been sold and awaiting shipment. The difficulty in making shipment has been the greatest draw back the lumber manufacturer has met with during the season. In fact, at the present time there are practically no vessels for coastwise trade to be had at this port. Vessel owners apparently do not know what freight to ask and are using different means to compel the shippers to pay exhorbitant rates. It is said that as high as $4.62½ has been paid on cargo to New York from this port, but the lowest offer at present is $4.00 with the person offering the same standing a very good chance that his neighbors will not pay more. Large quantities of laths and long lumber are now waiting shipment for Sound ports and New York. Car business is also good, with foreign cars scarce.

Spruce Boards Sold Ahead

Stocks of spruce boards are quoted for 4-in. and up wide, sound, merchantable stock, at $13.50 per M. at mills, and are mostly all sold ahead.

On short random 2 x 4, 2 x 6, the figure is about $16 f.o.b. cars. For 2 x 8 and up, mostly 2 x 8, the price is $17 f.o.b. cars. This stock would not average more than 14½ feet in length, running 8 to 20 feet long, very little of the longer lengths being put in.

The base price at Boston for any assortment of 8-inch and under in width and thickness, 20 ft. and under, is $23.50, with longer lengths and widths at a corresponding advance. Business is good and nearly all stocks of lumber are taken up as fast as shipped in. 2 x 3 and 2 x 4 sized, is selling at $21.50 Boston. Hemlock boards are in good demand at Boston with no stocks offering; in fact, it is said that hemlock never was so scarce there as at present. $23 is being offered for clipped boards, 10-12-14-16 feet long, with random boards at $21.50, all, of course, planed one side.

New York prices for random still continue strong at $24.50 to $25.00, for stock to average 18 feet or thereabouts, say fifty per cent. 2 x 8 and up; this would leave $17.50 f.o.b. St. John for this stock. Of course, an extra specification of widths and lengths demands a corresponding increase. If it were not for the high rate of freight the manufacturer would be doing a very lucrative business, but the freight is really taking off any advance which he may have figured on getting. Both Boston and New York markets are taking largely two inch with a small quantity of three inch and some four inch.

Laths continue firm and anyone having them to sell can get about $2.65 on wharves at St. John.

Shingles still continue firm with extras at $4.25 in New York. They may go higher as practically all 2nd clears and No. 1's have been taken into consumption here.

Box shooks are very firm for all kinds. In fact, mills cannot supply orders, and prices are advancing with seemingly no let up for a time at least.

The booms of the St. John Log Driving Company at Fredericton will finish rafting on Friday, October 25, when all logs will have been cleaned up on booms. In all about ninety-five million feet have been handled. Many of the men have already left for the woods.

Practically all the mill owners in this section, with the exception of Messrs. Hilyard Bros., who, it is said, will not operate in the woods this winter, are or will begin to operate in the woods in a few days. The cut for St. John will amount to about the same as in 1912, viz., about 100,000,000. Of course, on the upper St. John above the Falls, the St. John Lumber Company will get their usual cut, about forty million spruce and five million cedar, but this does not affect St. John except so far as the logs which get by the booms at Van Buren are concerned. These, if any, go to Messrs. Warner & Company, St. John. All operators at St. John carry out about the same policy year in and year out, viz., to stock enough logs to keep their mills going the season through.

The cost of logs will be about the same as in 1912, viz., $13.00 to $13.50 for short provincial logs, and $15.50 to $16.00 for American logs, delivered St. John, the cost of supplies, wages, etc., being about the same as last year.

Messrs. Tapley Bros., freighters of logs, doing business here for many years, are said to be in financial difficulties, but it is hoped that a compromise may be made so that they shall be enabled to carry on their business.

Ottawa Trade Active—Car Shortage Contines

Ottawa, Oct. 22; (Special correspondence of the Canada Lumberman):—The lumber business continues active here. A canvass taken by your correspondent of some of the leading lumbermen brings out the unanimous testimony that it is easy to get orders for lumber, but hard to get cars on which to ship it to customers. Lumbermen all through the Ottawa Valley are clamoring for cars, but cannot get all they require. Consequently they are behind in filling orders. The Board of Trade is doing all that is possible to relieve the situation by appealing to the Railway Commission to use its influence with the railroads. There are prospects that more cars will be supplied immediately.

Messrs. McAuliffe & Davis, the well-known lumber dealers of this city, who recently purchased eighty-one acres of land at the east end of the city near Hurdman's bridge, will commence work early in the new year upon the erection of large planing mills. They will also put the ground in shape for an extensive lumber yard. Over $250,000 will be spent on the buildings and machinery and the layout of the yard. McAuliffe & Davis already have five lumber yards and three planing mills in Ottawa, but these are not sufficient to handle their increasing business. The site of the new yard is touched by four railroads, namely the C. P. R., G. T. R., C. N. R. and the Ottawa and New York. The C. P. R. is already putting a siding into the site in order to provide accommodation for the preliminary work of preparing for the erection of the necessary buildings.

Some time ago Mr. Jackson Booth bought the Bank Street Presbyterian Church and the land on which it stands. It is understood that he has definitely decided to erect a block of stores on the front part of the valuable site. Whether he will build a new theatre at the rear is yet a matter of conjecture. It is very probable that he will, though, because it is generally understood that if the Russell Theatre has not already been sold to the C. P. R., for a site for an uptown station, the lease of that playhouse will be soon bought out and a general transformation of that part of the city is inevitable, if not by the C. P. R., then by the C. N. R., or the Dominion Government. Mr. Booth is also building a large block of modern stores and

offices on Sparks street. He decided last week to make the building eight storeys high instead of five, as originally intended. Mr. Booth is spending probably more than any other one man in Ottawa on building in the city.

Some time ago the Canadian railway companies increased their rates on pulpwood from Ontario, Quebec and New Brunswick to the United States border over one hundred per cent. Through the application of the International Paper Company of New York and a number of Canadian companies the Railway Commission ordered last week that these increased rates be taken off until February 4th, when the Commission will hear further evidence in the case and give judgment accordingly.

The companies opposing the action of the railways told the commission there is no reason for the increase. Mr. N. G. Guthrie, of Ottawa, counsel for the complainants, said the old tariffs had been in force for years and the profits the railroads made on these rates should be sufficient. Prominent railroad men, representing the different roads involved, said that before the advance was made shippers were notified and warned to include the increase when making new contracts. The increased rate approximated 1½ cents per 100 pounds from points in Canada to the American border and not to the mills.

Mr. G. H. Shaw, general traffic manager of the C. N. R., said that as far as he knew shippers of pulpwood had no outstanding contracts and therefore, would not be injured by the new scale of tariffs. Mr. F. A. Summerville, of Watertown, N.Y., quickly contradicted Mr. Shaw by saying that he had a contract with a shipper from a point on the C. N. R., that had three years to run.

Freight Rates From the Pacific

At a meeting of the Dominion Railway Commission held here last week a table of comparative rates was presented showing what lumbermen in the United States and Canada have to pay for shipping lumber to different parts of the continent. The following table shows some of the different rates:—

Shingles—Seattle to Buffalo, 78 cents a hundred pounds, compared with Canadian rate, Vancouver to Toronto, 75 cents. Seattle to Philadelphia, 83 cents, compared with Vancouver to Ottawa, 80 cents. Seattle to New York, 85 cents, and Vancouver to Montreal, 80 cents. Seattle to Boston, 85 cents, and Vancouver to St. John, 90c.

Cedar lumber—Seattle to Buffalo, 78 cents, and Vancouver to Toronto, 67 cents. Seattle to Philadelphia, 83 cents, and Vancouver to Ottawa, 70 cents. Seattle to New York, 85 cents, and Vancouver to Montreal, 70 cents. Seattle to Boston, 85 cents, and Vancouver to St. John, 80 cents.

Fir and pine lumber—Seattle to Buffalo, 68 cents, and Vancouver to Toronto, 67 cents. Seattle to Philadelphia, 73 cents, and Vancouver to Ottawa, 70 cents. Seattle to New York, 75 cents, and Vancouver to Montreal, 70 cents. Seattle to Boston, 75 cents, and Vancouver to St. John, 80 cents.

Long timbers, poles, etc.—Seattle to Buffalo, 78 cents, and Vancouver to Toronto, 67 cents. Seattle to Philadelphia, 83 cents, and Vancouver to Ottawa, 70 cents. Seattle to New York, 85 cents, and Vancouver to Montreal, 70 cents. Seattle to Boston, 85 cents, and Vancouver to St. John, 80 cents. Other companies showed that the Canadian rates are considerably lower than they are in the United States. The figures were put in at the inquiry into the Western Freight rates case.

George McLaurin, of Ottawa, head of the firm that bears his name, E. G. Auger, of Quebec; C. H. Griffin, of the St. Maurice Lumber Company; C. P. Watson, treasurer of the Mountain Lumber Company; C. H. Tiffany, manager of the West Virginia Pulp and Paper Company, Harold Goodhue, of the Eastern Townships Lumber Company, and others, gave evidence on behalf of those affected by the increased rates. The railroad officials say they are justified in their action because of the increased cost of operation of their roads.

A Statue to the Late James Davidson

There is a movement on foot here to start a public subscription to a fund which shall be devoted to securing a statute of the late Mr. James Davidson, founder of the Davidson Lumber & Manufacturing Company. For several years Mr. Davidson was an alderman and controller of Ottawa and it is the concensus of opinion that he rendered perhaps greater service to the city than any other man. It is in honor of his work and to keep his memory green that the erection of the statute on the new Plaza is proposed.

Not until a general policy on fiscal matters is agreed upon will the Dominion Government consider imposing a duty on pulp to be exported. This is learned from careful enquiries made on Parliament Hill

Mr. James Lawler, secretary of the Canadian Forestry Association, returned last week from the convention the association held in Victoria.

The Forestry Branch of the Department of the Interior intends to turn some of the forest reserves into public playgrounds. Last summer the experiment was tried at the Turtle Mountain reserve in Southern Manitoba and the result was so encouraging that the idea is to be extended.

So rapidly is the business of the E. B. Eddy Company increasing that the extensive alterations now being made to the plant and offices are being rushed towards completion with all possible speed.

The Rat Portage Lumber Company, Winnipeg, Man., in a letter to the Canada Lumberman, report that just at present shipments are being greatly delayed as a result of the car shortage. The demand, however, is fairly brisk and prices are ruling steady. They report a recent advance of $1.50 per M. on 2 x 4 and 2 x 6 pine dimension and 10 cents per M. on No. 1 B. C. shingles.

Busy Trade Across the Border

The Tonawandas, Oct. 25th. (Special correspondence of the Canada Lumberman): Shortage of cars and scarcity of lumber to fill what few cars are secured is the same old bugaboo for local handlers of Canadian stocks. A car or two may be had if spoken for three or four days ahead which means that there is a big waiting list for cars all the time. Prices are going up and since orders cannot be filled from Canadian stocks, the upward tendency is affecting other stocks, particularly those cut in the south. But the price doesn't appear to cut any figure. It is not unusual to receive an order with the offer of from of from $1.50 to $2 per thousand more than the current quotation for immediate delivery. But there's the rub. There is scarcely any such thing any more as immediate delivery. The railroads hold out little hope of relief until the crops are all harvested in the west and the coal mines stop sending all the coal they can pile into any kind of rolling stock to lake ports for shipment by boat to upper lake points.

Building shows no let up. Retailers say the demand for lumber from building companies and contractors is as strong as at any time during the summer. The particularly favorable weather of the last few weeks throughout the entire state of New York and Pennsylvania has acted as a tonic to all outdoor work and the builders have made the most of it. Everybody is hustling to get structures under way and enclosed before early winter weather with rain and sleet makes it difficult to work out doors. Not even the fact that a presidential election is only two weeks away appears to have the slightest effect on business in the building trades. This is unusual in a presidential year and but illustrates further the fact that the people of the United States no longer fear a change of administration at Washington as they once were accustomed to.

Large Shipments by Rail

During the second week of October the shipments of lumber east from the Tonawandas by rail amounted to 2,800,118 feet as compared with 1,070,000 feet the corresponding week a year ago. Part of the apparent increase over that of a year ago is accounted for by the break in the canal at Bushnell's basin which blocked canal navigation nearly six weeks. Part of the fleet delayed by the break did not clear from the Tonawandas until last week when the break was finally repaired. Boats been passing through the temporary flume now for a week without difficulty and it is predicted that the repairs are sufficient to continue navigation until officially closed for 1912 which it is hoped will be December 1 at the latest, two weeks longer than the usual season.

In contemplation of increasing the capacity of plant and yard, the Wilson Lumber & Box Company of Tonawanda has leased about 200 feet of dockage on Niagara river at First street. This company is a large manufacturer of wood and paper boxes. Its president, Mr. T. J. Wilson, was recently elected president of the Herschell-Spilman Company, a large local concern making automobile parts.

Capt. Charles K. Little, for 25 years prominent in the lumber trade, was buried Sunday from his home in Christina street. Death was sudden. The funeral was in charge of the Masons and was attended by the Elks, Knights Templar and representatives of the Shipmasters Association of the Great Lakes.

J. R. Taylor, superintendent of the Kelsey Lumber Company plant at Charlestown, S. C., has returned to that city after spending part of his honeymoon with his mother in North Tonawanda.

A stubborn blaze broke out in the yard of the R. T. Jones Lumber Company on Tonawanda Island, Saturday, October 12. A high wind that compelled the stopping of all lumber handling in the yards in the morning helped fan the fire into what was for a time feared would be a serious conflagration. The blaze was confined to several piles of four foot white pine shorts and the loss did not exceed a few hundred dollars.

The Mackenzie-Morden Transit Company of Port Colborne is again the owner of the barge Jeanette which foundered in Georgian Bay last August but was raised by wreckers. The latter paid the insurance company $1,200 for the lumber aboard the Jeanette and when the craft was raised sold the damaged cargo for $3,000.

The week before last was a light one so far as receipts of lumber

Schacht

The Truck with Good disposition — built for Canadians with Canadian money.

Lumber Trucks

Are especially designed and built for the Canadian Lumber field—for Camp duty—for the lumber yard—and for retail delivery.

A Schacht Lumber Truck will cut your conveying and delivery expenses in half, and will turn your present hauling losses into profits.

It Builds Your Business Bigger No Matter How Big it is now

We urgently invite enquiries and will gladly give expert advice as to the saving the Schacht Truck will effect in your business.

Schacht Motor Car Company of Canada

Limited

Hamilton **Ontario**

A Few Specifications—

Motor, 45-50 H.P., four cylinders.

Ignition, magneto, with double system.

Oiling, plunger pump in crank case, separate feeds to all bearings, with splash system.

Clutch, cone, thermoid faced, 15½ in. diameter.

Transmission, selective sliding gear, 3 speeds, forward and reverse.

Emergency Brakes, internal, expanding on rear wheels, 18-in. drum. Service brakes on each end of jackshaft.

Frame, rolled steel channel section, 6-inch side members.

Frame, 217¾ in. long, 38¾ in. wide.

Axles, rear, rectangular, 2¼ in. wide, 4 in. deep, drop forged. Front Timken, I beam with solid section through centre, 2 in. wide, 2¾ in. deep, dropped forged.

Bearings, Timken roller bearings in wheels, jackshaft and steering knuckle, annular bearings in transmission.

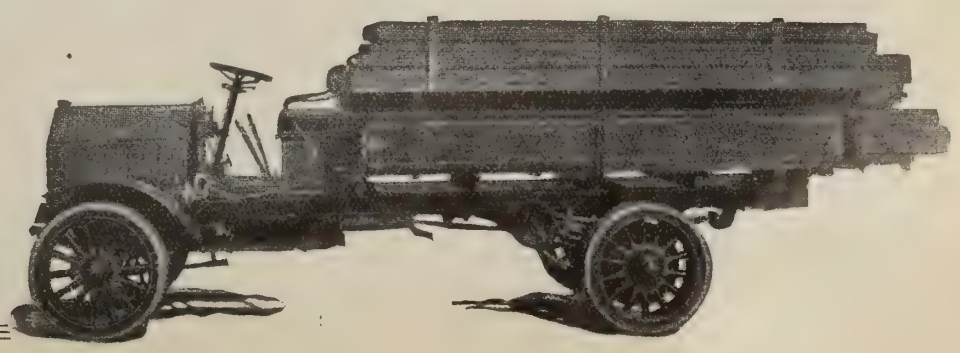
Tires, 36 x 4 in single front, 36 x 5 in. dual rear.

Wheel Base, 144 in.; tread 64 in.

Speed, 10 to 18 miles per hour on direct.

Loading Space, 11 ft. 5 in. back of seat on chassis frame.

Body, to order.



from United States and Canadian ports at upper lake points was concerned. For the first time in the history of the Tonawandas southern pine and cypress receipts exceeded those of white and Norway pine. The month of October as a whole will, however, show a big balance in favor of Canadian, Michigan and Wisconsin cuts. Lumber tonnage is chartered right up to the limit as proven by the fact that rates of as high as $4.50 per thousand are being offered on hardwood cargoes from Duluth.

W. H. Crabb, proprietor of a box shook factory on Tonawanda Island is an applicant in voluntary bankruptcy. His assets are given as $13,584 and liabilities $29,970. The first meeting of creditors resulted in the appointment of J. P. Mackenzie of North Tonawanda, well known as a dealer in Canadian stocks, as receiver. The receiver will continue the business until the election of a trustee in bankruptcy. The petitioner asks that he be permitted to continue, asserting that orders are plentiful enough and the business outlook such as to assure the payment of all indebtedness in a short time.

C. J. Wilkie & Son of Tonawanda are defendants in an action for $3,000 brought by Smith, Davis & Company, insurance brokers, for the recovery of payment on a shipment of lumber. The defendants allege that the shipment was not up to specifications and present a counter claim of $540 for freight and storage charges.

Cars Scarce but Trade Good at Montreal

Montreal, October 25, (Special correspondence of the Canada Lumberman).—The old story continues here, of good business all the way round and a scarcity of cars. Lumbermen state that notwithstanding the small number of cars almost throughout the season, they have done the largest trade in their experience, and that the outlook is distinctly satisfactory. There is a heavy demand for spruce, with prices high. Low grades of spruce and pine are in very short supply, there being a big call for these descriptions for the United States. One wholesaler says that buyers on the other side of the border are so anxious to obtain this lumber that they are willing to have it dressed here and to pay the extra duty. The clapboard and shingle mills report that business was never better; while hardwoods generally, command a very ready market. Lath is also firm, and recently hemlock has been in good request.

Shippers to Great Britain are very busy hurrying forward consignments, present appearances pointing to an increased total of pine exports as compared with last year.

Wood Pulp Market Quiet

With regard to the pulp and paper situation, it is very difficult to sell ground wood pulp for immediate shipment, and the Canadian mill owners have made up their minds to carry over a considerable stock to sell during the low-water periods of the winter months. A contract for about 6,000 tons of Canadian pulp has been made recently, at a low price, and as this amount has been taken off the market, and will go to Great Britain, the market here has been strengthened, but it is still by no means satisfactory. The pulp is the product of a new mill. The flatness of the market is due to the falling off in the demand from the States, where the water powers have lately been very good.

It is reported that newsprint is a little lower in spots in the United States, but in Canada the mills find no difficulty in disposing of their products at good prices. Within five years the production of newsprint in Canada has about doubled.

Price Brothers' new print mill near Jonquiere will start one machine next month, a second in April, and a third in August.

Wayagamack Producing Kraft

The Wayagamack Company are now placing their kraft wrapping paper on the market. The company expect to make fifty tons of this paper per day when fully running.

The Canadian market for sulphite fibre is very firm, and it is said that the mills are sold very heavily. Large tonnage contracts for 1913 have been closed at good prices.

The Laurentide Company, Grand'Mere, P.Q., will start a new pulp digester at the beginning of the year. The production of this digester, thirty tons per day, has been sold for two years ahead.

Mr. John Norris, head of the Newspaper Association of the United States, has been on a visit to Canada in connection with the question of the interchange of pulp and paper between Canada and the United States.

The Bronson Pulp Company, of Ottawa, have started up with three grinders in their new mill. This mill will eventually be of considerably larger capacity, arrangements having been made to manufacture seventy-five tons of ground wood per day in the course of time.

S. P. Musson, Son & Co., Bridgetown, Barbados, report under recent date as follows: Lumberstuffs.—W. pine—the only arrivals during the fortnight is the Schr. "Mersey" from Weymouth, with some 150 m. ft., sold to arrive some time ago. The market is still in a good position, and further receipts should do well. Spruce—The "Mersey" also brought 100 m. ft. which consignees sold at $26 and $21 respectively for shippers and seconds quality. Stocks are light, and further supplies are wanted. Shingles—The market is lightly supplied, and although a few cargoes are known to be on the way, further receipts are needed. Pitch pine—No receipts. Shooks—No arrivals.

London Report from Churchill & Sim

Churchill & Sim in their wood circular dated London, Eng., Oct. 3rd say: Importations from the St. Lawrence during September was—

Pine deals. ..341,000 pieces against 271,000 pieces in 1911
Spruce.. .. ..599,000 pieces against 625,000 pieces in 1911
Birch planks .233,000 pieces against 236,000 pieces in 1911

and from New Brunswick, &c.—

Pine deals. .. 50,000 pieces against 45,000 pieces in 1911
Spruce.. .. ..266,000 pieces against 384,000 pieces in 1911
Birch planks .311,000 pieces against 221,000 pieces in 1911

The importation of Canadian pine deals continues on an ever decreasing scale, and the range of price naturally moves in reverse proportion. The business, however, becomes a very minute one, and it seems to take three buyers now-a-days to buy 150 1st pine deals. Of spruce deals the month's supply has been a small one, and prices have at last responded even in London to the general conditions of cost and freight. In other home markets, more important than London, there has also been a distinct advance of price during the month. Birch timber is short in stock and firm in price, and planks have held nearly up to previous rates. There have been sufficient arrivals of elm and smaller ones of yellow pine timber during the month, which have been chiefly stored in the docks.

The market conditions in London for Oregon timber continue quite satisfactory. The demand has been very insistent during the month, and the fresh arrivals have only added 1,200 loads to the stock. Prices remain at their highest.

Current prices are as follows:

St. Lawrence pine deals, &c., per P.S.H.

Canadian Trade in Liverpool

Farnworth & Jardine in their wood circular dated Liverpool, October 1st, say: The business of the past month has been steady, with some improvement in values in most directions. Imports have been moderate, and deliveries satisfactory. Stocks generally are within moderate compass. Ocean freight rates are very firm, and continue to dominate the situation.

Canadian Woods.—Pine timber—Waney 1st class: Arrived freely during the past month to Manchester. A large proportion of this import will no doubt go direct into consumption. Values remain high. Of 2nd class timber the stock is light; values well maintained. Square pine has not been imported; stock is light, and values remain firm. Red pine—No import; values unchanged. Oak—There has been a considerable import to Manchester, largely on contract; values firm. Elm—There has been a small import to Manchester, where there has been a good consumption; stock is light; values continue high. Pine deals have again been imported freely, and in excess of the demand. Stocks have increased to some extent, but are not excessive; values practically unchanged. Red pine deals—There is not much improvement in the demand; values, however, continue firm.

New Brunswick and Nova Scotia Spruce and Pine Deals.—The

"AMPHIBIA"

(WATERPROOF)

Leather Belting

contains more downright

Service

per dollar invested

than any other kind of belt transmission. This has been proven time and again in mills such as yours. Make your next belting order "Amphibia" and you will be highly satisfied.

Remember "AMPHIBIA" costs less per day of service than any other although the first cost per foot length may be higher. Price per foot is no criterion of belt value.

To insure satisfaction---state where belt is to run

import to the Mersey (including Manchester) amounted to 7,680 compared with 7,530 stds. during the corresponding period last year, the greater portion arriving at Manchester. Deliveries have been satisfactory, amounting to 10,810 stds. as compared with 10,830 stds. last year. Stocks are not excessive, being about 2,000 stds. less than at this time last year. Tonnage remains very scarce, even at present extreme rates. Pine deals continue in fair demand at unchanged prices.

Birch.—Logs have been imported sparingly. There has been a fair consumption; stocks are in moderate compass, values firm. Planks have reached this market in fair quantities; consumption has failed to keep pace and the stock is still heavy, although values have somewhat appreciated.

British Columbia and Oregon Pine.—The small import of 9,000 cu. ft. has consisted of lumber. There has been a fair consumption at firm rates, and the stock on hand is moderate.

Liverpool Stocks of N. B. & N. S. Wood Goods

Stocks of N. B. and N. S. spruce, pine and birch at Liverpool and Manchester at the beginning of October were reported by H. W. Lightburne & Co., Liverpool, and John E. Moore & Co., Ltd., St. John, N.B., as follows.—

Cooperage Stock will be Scarce

Chatham, Ont., October 16, 1912.

Editor Canada Lumberman:—

At the present time the demand for cooperage stock in Canada is greater than the supply and consequently considerable stock has had to be imported from the United States to keep the coopers going. This shortage has been caused by the weather during the past summer, which prevented any summer logging operations. Consequently, after the mills cut out the logs that were put in during the winter they have had to remain idle instead of making a fall run as usual. This year has been the worst year in the memory of the cooperage stock manufacturers in Canada for getting out material. Even after the goods were manufactured the continual rains damaged stock in process of seasoning and consequently there were thousands of dollars lost to the manufacturers by the lowering of their grades of staves.

Staves which would ordinarily go as No. 1 stock had to be put into a lower grade for cement or apples, on account of mildew, thus curtailing the production of high class stock to a very great extent.

On account of the manufacturers not being able to do any summer logging, there will be a tremendous shortage in cooperage stock for delivery the coming winter and next spring, and prices will be very high on this account. In fact, it will be hard for manufacturers to get a price high enough for material, to pay for the loss incurred through the weather damaging their stock and leaving their mills idle for want of raw material.

Yours truly,

The Sutherland-Innes Co., Ltd.,

Maple and Hickory Skewers in England

There is a large market in the United Kingdom for skewers made from hickory or maple wood. The maple skewer is what the trade expect to receive from Canada, and they claim that their importation from the United States of this article is very large; Lancashire alone being able to handle, in the assorted sizes, forty car load lots in a year. This line would be well worth cultivating, and there should be scope in many of our mills for a side line that would be profitable, as most of these skewers are made from plank ends.

The following figures, furnished by the Canadian Trade Commissioner at Manchester, give the sizes required, how packed, and quantities of different sizes in cases or barrels, also prices of several sizes that will give a general idea for all sizes. Prices must be quoted c.i.f. Manchester.

Sizes	Price per M.	Packed in parcels of	Cases or barrels containing
4½ x 5/32	1/-	250 each end	40,000
5½ x 5/32	....	100 "	25,000
5½ x ¼	1/7½	100 "	15,000
6 x ¼	1/10	100 "	10,000

12 x ⅜	5/9	50 "	5,000
14 x ⅜	6/7	50 "	5,000

British Canadian Lumber Corporation's Fine New Mill

British Columbia can claim the distinction of possessing the largest electrically equipped lumber mill on the North American Continent. This was recently inaugurated by the British Canadian Lumber Corporation, Limited, and is situated at Lu-Lu Island, on the Fraser River, New Westminster, fifteen miles from the ocean, a distance which makes the piling foundation immune from the ravages of the teredo worm. The mill has a capacity of 250,000 feet B.M. per day of ten hours. It is operated by the latest type of electrical turbine engines, generating 3,000 horse power. After the first of next year it is proposed to run a double shift.

The mill is situated on a natural harbor, where the largest ships can come alongside the wharf and receive the manufactured lumber direct from the mill without any additional handling. The electrical equipment was furnished by Allis-Chalmers-Bullock, Limited, who state that it is one of the most complete and modern sawmills that can be designed. The equipment includes a complete log haul, steam log deck, carriages, with the latest improved power setworks, a 9-ft. band mill, a 10-ft. band mill, and all other necessary machinery for the successful manufacture of lumber.

Mr. G. S. Mayes, of St. John, N.B., one of the directors, who has recently returned from a visit to the properties, thus sums up his conclusions: "I was more than surprised and pleased to find the three mills and mill sites and other properties far exceeded my anticipations. Naturally I think I look on the pessimistic side, but I went this long distance at my own expense to look at the properties I had put a lot of money into; and I am confident that with a continuation of good management, at fair prices for the output, and especially taking into consideration the large and magnificent timber limits held by the company, it has a splendid future."

The Fort Frances Pulp & Paper Company have well under way a pulp mill with a capacity of 100 to 125 tons of ground wood pulp per day. The wood preparing room is ready for the installation of the machinery, and the grinder room is completed and the grinders installed. The balance of the machinery for the completion of the pulp mill will be installed during the coming winter. This company also contemplates the construction of a two-machine news print paper mill during 1913.

Gordon Grant & Co., Limited, Port-of-Spain, Trinidad, report under recent date as follows: Lumber and cooperage materials—The Schr. Edyth has arrived from Liverpool, N.S., with a cargo of 208,000 feet white pine lumber. As mentioned in our last, stocks of this quality of lumber are ample for present requirements.

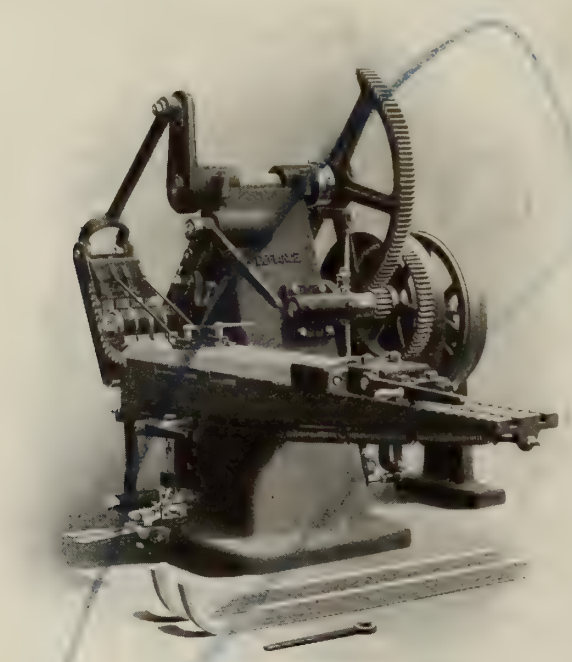
Defiance Patent Plow-Handle Bending Machine

The No. 1 Patent Plow-Handle Bending Machine as shown in the accompanying engraving, is especially designed for the bending of plow handles and other similar work. It contains many new and important features which entirely overcome the difficulties heretofore encountered in performing this particular class of bending. Four handles are bent at each operation, perfectly accurate in circle and free from buckling or breakage.

The main frame is a massive casting in one piece, with cored center, and of great strength to withstand the heaviest class of bending.

The forms over which the handles are bent are made of bronze to prevent corrosion, and they are fitted to a heavy steel shaft which is attached to a sliding head, and by means of a hand lever the forms are brought down upon the handles to hold them in proper position upon the table. A pair of foot treadles, located at the base of the frame, connect with the driving power for running the bending head up and down. The weight of the operator's foot upon one of the treadles instantly starts the machine and bends the handles around the forms. After the bend is completed and the shackles attached to the handles to hold the bend, the operator's foot is applied to the second treadle and the bending head retreats. The forms are then lifted from the handles and held up out of the way by spring balances.



Defiance Patent Plow-Handle Bending Machine

The bent handles can then be quickly removed from the machine without loosening a screw or disconnecting any of its parts.

The bending head is fitted with a tool-steel master strap of link-belt construction, and when down, forms a level table upon which the handles are laid after having been placed into the bender or minor straps. The bender straps are provided at one end with a heel casting and at the other end with a quick-acting screw binder clamp to which the shackles are attached. It requires two straps and two shackles for each batch of timber bent, and they must be left on the bent handles, after they have been taken from the machine, long enough to allow the timber to become cold and thoroughly set, to prevent their springing out of shape. A special spring attachment underneath the bending head insures absolute contact of the bend and the bending head. Automatic safety stops are provided for arresting the bending head on both the upward and downward movements. The motion of the bending head on the upward movement, being automatically arrested, insures uniform bends, as the stop is made at the same point each time, without any attention on the part of the operator. The automatic stop for the downward movement is also of much importance, from the fact that no time is lost in getting the handles off the machine, for the reason that as soon as the bend is completed the operator depresses the left-hand foot treadle when the bending head resumes a horizontal position, thus giving him ample time to remove the bent handles by the time the bending head comes to rest.

The master strap is made of high-carbon steel with interchangeable parts. It should be wiped and oiled frequently. It is also advisable to occasionally remove the same from the machine and place it in oil over night. If the ordinary machine oil fails to lubricate properly, melt a few pounds of tallow and drop the master strap into it, allowing it to remain until cool.

The material to be bent should be equalized to exact length, and the portion which is to form the inside of the bend is rounded or shaped by a special machine to correspond with the shape of the bender forms. The end to be bent should be thoroughly softened, either by steaming or soaking in hot water before being bent. By the use of an ingenious spring device the proper amount of end pressure is applied to each handle individually, which corrects any irregularities that might arise due to the variation in the length of the stock, which often occurs during the process of steaming.

Special strapping device is furnished with which the bending or minor straps are put onto the handles under the desired end pressure before they are placed into the machine. This is a very important feature and is quickly accomplished.

Double attached friction counter instantly starts or stops the machine without shifting the belts, and is free from shock or jar. The operator has complete control over the machine from the working side. Two friction belt pulleys are employed: one 24 inches diameter by 6-inch face, for running the bending head up, which is driven by o straight belt, 50 revolutions per minute; the other pulley is 24 inches diameter by 4-inch face, running 50 revolutions per minute in opposite direction, and driven by a cross belt for running the bending head down.

The counter is furnished as follows: Shaft 1 15/16 inches diameter by 42 inches long; two No. 2 hangers, one pulley 18 inches diameter by 5-inch face, to be driven from line shaft; one pulley 6 inches diameter by 6-inch face, for pulling bending head up; one pulley 6 inches diameter by 4-inch face, for running the bending head down; speed, 200 revolutions per minute; no belt shifter required.

Price and further particulars relative to the advantage of this machine will be gladly furnished by the manufacturers, the Defiance Machine Works, Defiance, Ohio, U.S.A.

An Interesting Stove Exhibit

One of the most prominent exhibits at the Central Canada Exhibition at Ottawa this year was that of Butterworth Foundry Limited, the well-known stove manufacturers of the capital city. Besides a full line of their "Diamond" house ranges, stoves, furnaces, etc., they exhibited their Shanty Steel Range and Heater, which have become so popular with the lumberman from coast to coast. Thirty years of experience has resulted in the perfecting of a range specially adapted to the lumbering needs. Mr. Connor, manager of the company, was in charge of the exhibit.

The Clyde Iron Works, Duluth, Minn., U.S.A., the well-known manufacturers of steam logging machinery, have published an excellent booklet entitled "Cutting the Cost of Clearing Logged-off Lands," which should appeal forcibly to all who have this problem to consider. The booklet is beautifully prepared and is illustrated with many attractive cuts showing the company's machines in operation.

Messrs. Hamilton H. Salmon & Company, of 88 Wall street, New York, are now operating their own gum mill, and advise us that they are in a position to handle large orders of gum from some exceedingly fine stock.

A useful log scale book has been published by the Musson Book Company, Toronto, which should prove popular with all log scalers. The book is bound in strong pliable red cover and contains a simple arrangement of pages providing for the scaling of 10,000 logs. The columns are so arranged as to present the scaling returns in readily available form. The book also includes a copy of a scaler's certificate and a sample contract memorandum. Its price is fifty cents.

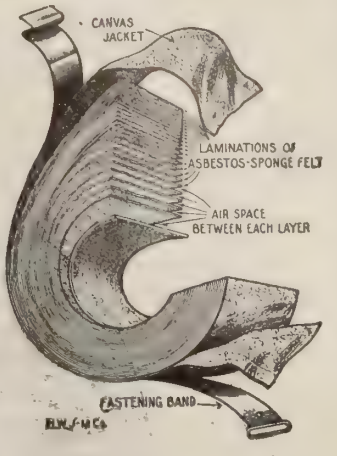
A Sure Way to Reduce Your Coal Bills



If the pipes of your steam plant are covered with only an ordinary covering, or not covered at all, you are wasting hundreds, perhaps thousands of dollars every year. Repeated tests have proved that when pipes are not properly insulated, from one-quarter to three-quarters of the fuel burned is wasted by radiation and condensation.

J-M Asbesto-Sponge Felted Pipe Covering

positively prevents radiation and condensation. It carries steam a mile with practically no loss. It is the most efficient covering on the market, because it confines the greatest amount of dead air—the secret of insulation.

J-M Asbesto-Sponge Felted is also the most indestructible covering on the market. It will not crack, break or lose its insulating value from vibration or rough usage.

What J. D. Shier says about the Barkey Lumber Register

Barkey Bros., Stouffville, Ont.

Dear Sirs,

Yours to hand and noted. We have been using one of the George Lumber Registers for some years past and find it still working well. It gives very accurate measurements and have never known it to make a mistake. When in need of another we will certainly get one of the same kind.

We remain respectfully yours,

Feb. 5, 1908. J. D. SHIER, Orillia, Ont.

Can be used on any moulding or matching machine.
Ensures absolute accuracy and saves one man measuring.
Sent on 30 days' trial, return at our expense if not satisfactory

STOUFFVILLE - ONTARIO

EDGINGS

Ontario

Gill & Fortune, lumber dealers, Trenton, Ont., recently suffered loss by fire.

The Taylor & Green Coal & Lumber Co., Gananoque, Ont., have been succeeded by Jos. Taylor & Son.

The ratepayers of Pembroke, Ont., have passed a by-law granting a bonus of $50000 to the Pembroke box factory.

The Rat Portage Lumber Co., Kenora, Ont., whose mill was destroyed by fire in July last, have commenced work upon rebuilding.

Benson & Bray, Midland, Ont., who are contemplating the erection of a dry kiln are also in the market for a large matcher and edger.

The Laidlaw Bale-Tie Company, Limited, of Hamilton, Ont., have just completed the erection of their new building which they will move into in a couple of weeks.

The Wm. Drader Lumber Co., Thames and Salter streets, Chatham, Ont., recently suffered loss by fire, resulting in the destruction of their planing mill, valued at about $20,000. It is reported that they will rebuild at once.

The Toronto Paper Manufacturing Company, Limited, has secured a license as an extra-provincial company to carry on business in the province of Ontario. Its capital for use in the province of Ontario is restricted by the license to $1,000,000.

The Expanse Lumber Company Limited has bees incorporated with a capital of $100,000 to carry on a general business as dealers in all kinds of lumber, timber, shingles and wood products with head office at North Bay, Ont. The provisional directors are R. M. Rattray, J. R. Moffat, bankers, and J. M. McNamara, barrister, all of North Bay.

The Lakeside Lumber Company Limited has been incorporated with a capital of $100,000 to carry on business as timber and lumber merchants, saw and planing mill proprietors, &c., with head office at Port Arthur, Ont. The provisional directors are Carl Sorenson, lumber merchant, W. F. Langworthy, K.C., and A. J. McComber, barrister, all of Port Arthur.

The Dominion Government Department of Naval Service is calling for tenders until November 12th, for birch, cedar, spruce, pine, oak, fir and teak to be delivered at H.M.G. dock yards at Halifax, N.S., and at Esquimalt, B.C. Tenders should be addressed to the Deputy Minister, G. J. Desbarats. Forms of tender and other information may be secured at the Department at Ottawa or at the naval stores offices at Halifax, N.S., and Esquimalt, B.C.

Messrs. Anson & Ogilvie of Montreal who were the successful tenderers for the Abitibi pulp limit recently offered for sale by the Ontario government, have secured incorporation in the province of Ontario under the name of the Abitibi Pulp & Paper Mills, Limited. The capital stock mentioned in the notice of incorporation is $3,000,000. The company are already sending in material for the foundations of the mill and expect to have them well advanced before the cold weather commences.

The mill recently erected by R. M. Appleby, formerly of Scotia Junction, Ont., at Zebra Siding, on the C. N. O. R. about fifteen miles north of Parry Sound, has been cutting lumber under contract for the Canada Wood Specialty Company. The latter company own limits in that vicinity which will cut out from 16,000,000 to 20,000,000 feet. They count upon cutting about 20,000,000 feet per year. The limits are situated in the township of Ferguson, district of Parry Sound. The mill is equipped with one circular saw and has a capacity of about 20,000 feet per day.

Robert Bruce, of the firm of Alexander Bruce & Company, Fort Frances, Ont., who have a large timber preserving plant at that place, is now in Vancouver, B.C., arranging the location for a large preserving plant which the company intend to erect there as soon as possible. They are also arranging to establish a plant at Edmonton, Alta., and possibly one at Winnipeg, Man. The firm are at present having made at the Polson Iron Works, Toronto, a large cylinder 100 feet long, exclusive of the doors, etc., which they understand is the first of its kind to be constructed in Canada.

A serious fire occurred at Lindsay, Ont., at 11 p.m. on October 20th, resulting in the total destruction of the extensive lumber mill belonging to the Baker Lumber Co. The night watchman who first saw the flames sent in an immediate alarm, but before the firemen could arrive, the flames had secured such a hold upon the building that their efforts were of no avail. The other buildings and a large amount of stock in the vicinity of the yard were saved. It is estimated that the loss will be about $20,000 and the insurance is reported at about $9,000. It is expected that the mill will be rebuilt during the coming winter. The plant gave employment to about 70 workmen and was one of Lindsay's most successful industries. The output of the Baker Lumber Co. during 1911 was 3,536,900 ft.

The Collie & Cockerill Co., 313 Albany avenue, Toronto, manufacturers of office desks, filing devices and cabinets, started business at the above address in May last. They have, however, been so successful since their commencement that the small factory they are now occupying is quite inadequate to turn out the large number of orders which they have on hand. As an example of this, they have sufficient orders from the northwest alone to keep their factory busy until the end of the present year. The firm has just secured incorporation as the Collie-Cockerill Co. Ltd. Mr. J. D. Collie, the former manager of the firm, is president and managing director of the new company. They have purchased two acres of land at Aurora, Ont., and are building a four-storey brick building 150 by 50 feet. The factory has sidings on the Grand Trunk and the Grand Trunk Pacific. It is expected to be finished early in 1913. As soon as the building is ready for occupation, the Collie-Cockerill Co. Ltd. will vacate their Toronto factory and settle permanently in Aurora, shipping their up-to-date machinery from Toronto. The company are at present employing twenty men, but will commence with at least fifty in Aurora.

Eastern Canada

Hubbards Lumber Co., Hubbards Cove, N.S., recently lost their mill by fire.

The Lumber & Construction Co., Limited, Ville St. Pierre, P.Q., has been incorporated.

Billings & Fleming, Debec Junction, N.B., have been registered to carry on a saw mill business.

The D'Israeli Box Co., D'Israeli, P.Q., recently suffered a serious loss by fire when their box factory was totally destroyed. The loss is estimated at $60,000.

The loss on the D'Israeli Company's factory at D'Israeli, P.Q., which was recently destroyed by fire, amounted to $60,000, and the insurance totalled $21,000.

Black & Flaws, Cookshire, P.Q., recently suffered a loss by fire which destroyed their sash and door factory. They will rebuild the plant and will require a complete new outfit. The plant will be of concrete and brick construction with steam power and electric light.

Considerable progress is reported upon the mill which is being erected by John E. Moore at South Bay, N.B. The building has now been roofed. The St. John Iron Works Co. Ltd., St. John, N.B., have the contract for the machinery and the general contractor is E. A. Burns, 341 Main street, St. John.

The mill belonging to Luther B. Smith, at Fredericton, N.B., had a narrow escape from fire recently, but unfortunately the flames destroyed 1,500,000 ft. of sawn lumber valued at upwards of $20,000. The damage to the mill is estimated at $300. The mill was insured, but the lumber only carried $2,000 of insurance.

The large mill belonging to the J. B. Snowball Co. of Chatham, N.B., closed down for the season on Saturday, October 19th, nearly three weeks earlier than usual. More than 16,000,000 ft. of lumber were piled on the wharf at the time. The reason for closing down the mill in advance, was that it had been found impossible to secure steamers for the deal carrying trade. The company's upper mill will continue running for some time yet.

A report from Fredericton, N.B., states that Premier Fleming has signed the deed of transfer of the water power and five acres of land at Grand Falls, N.B., owned by the Provincial Government, to the Grand Falls Co. Ltd., of which Sir William Van Horne is president. The company proposes to erect pulp and paper mills and spend several million dollars in development work at the Falls. It has secured options on extensive areas of timberlands along the upper St. John waters in New Brunswick, Quebec and Maine, from which to secure its raw material .

The Mispec pulp mill is again the subject of considerable discussion among the city commissioners of St. John, N.B. A proposition for selling the mill and property to Stetson, Cutler & Co. has frequently been brought up, but has not as yet come to a conclusion. It is reported that another offer has been received from the company, but that the commissioners consider it too low. Negotiations are now under way with a view to selling it at a slightly higher figure. It is reported that the deal is likely to go through in the near future. It is also reported that another company is considering a proposal to purchase the mill.

Western Canada

The Campbell River Lumber Co., Hazelmere, B.C., recently suffered loss by fire.

L. Robinson and J. Shrive of Sutherland, Saskatchewan, have formed a partnership with the intention of erecting a planing mill next spring.

H. B. Burgess, San Francisco, Cal., is interested in a syndicate which is considering plans for the erection of a sash and door factory at Port Alberni, B.C.

The East Westminster Wood-working Company, Limited, have purchased a site for the erection of a factory at New Westminster. They will manufacture household and hotel fittings.

A large sash and door factory is being erected at Calgary by Mr. Ed. Peterson, contractor. The foundations for the new building are almost completed and within a few weeks the building will be ready for the machinery.

The British Canadian Lumber Co., New Westminster, B.C., have taken out a permit for the construction of a planing mill to cost $11,000. The company's new plant which cost in the neighborhood of $1,000,000 is now operating at full capacity.

The Canadian Western Lumber Co., Fraser Mills, B.C., are reported to be considering the erection of a saw mill costing $100,000 at Comox, B.C. The mill will handle small fir and hemlock logs which might become waterlogged if sent to Fraser Mills.

The new plant of the British Canadian Lumber Company on Lulu Island near New Westminster has begun operations. J. H. McDonald is manager. The mill is a big affair, being 378 x 72 feet, and equipped with the latest machinery. About 250 men are employed.

A United States syndicate is reported to be interested in a proposition for the erection of a pulp and paper mill at Prince Albert, Sask. Mr. H. C. Struction of Minneapolis is reported to be negotiating with the city for a fifteen acre site. Mr. Struction may be addressed, c/o Mr. Davidson, City Clerk, Prince Albert, Sask.

The Vancouver Lumber Co., Vancouver, B.C., recently suffered a serious loss by fire when their dry kiln and 200,000 ft. of lumber were destroyed. The loss amounted to $45,000 and is practically all covered by insurance. The kiln will be rebuilt at once, according to the report of the president of the company, Mr. John E. Tucker.

The Emerson Lumber Company, Vancouver, B.C., recently sold their stock of lumber, logs, etc., at Port Moody, B.C., to the National Finance Company, the firm which bought out the mill and water front some two and a half years ago and gave the Emerson Company a three years' lease, but surrendered it recently and the National Finance Company took over the stocks on hand and also bought two of the Emerson Company's tugs and all of their timber. The National Finance Company have in turn sold the Port Moody business to the Thurston-Flavelle Company who will operate the plant.

SILVER'S NEW JOINTERS

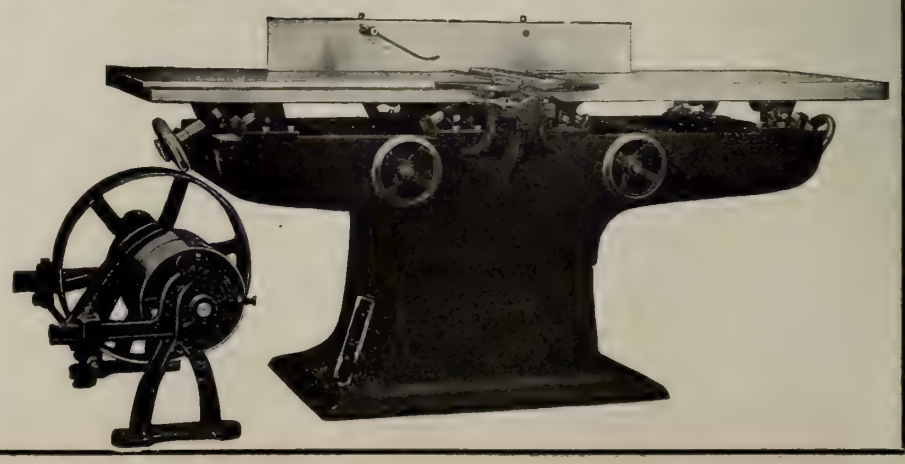
Band Saws, Saw Tables, Swing Saws

Thousands of Silver's Machines are earning big money in all parts of the world. Australia, New Zealand, South Africa and India are heavy buyers.

Silver's machines are designed for convenience and ease of operation and for rapid efficient service. Their moderate price recommends them to all wood workers.

Strong, durable, high pressure machines that will save you time and labor. Made in sizes to suit any need or any purse.

Ask for 1911 Machinery Catalog and special Canadian prices.



THE SILVER MFG. CO.

375 BROADWAY **SALEM, OHIO**

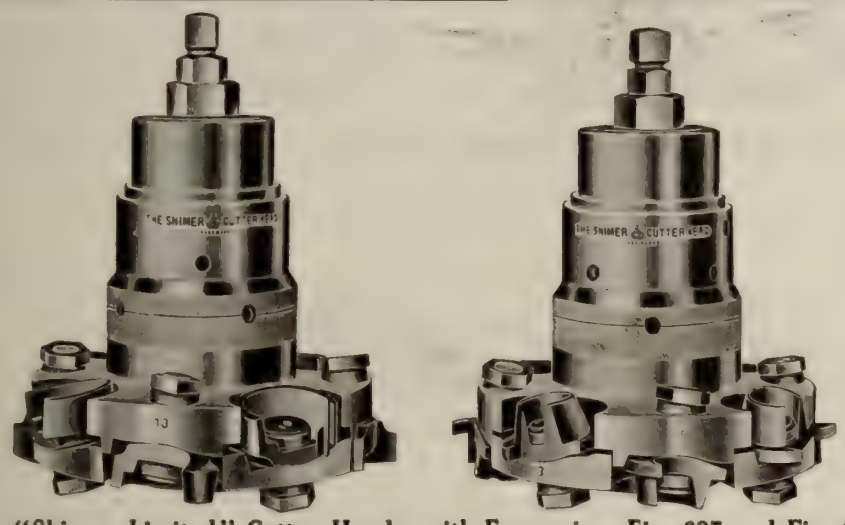
THE SHIMER CUTTER HEADS

Quality Machine Work

The planing mill man, furniture worker or any one who uses machines to finish wood products, will always find in the Shimer System of Tools the remedy for mill troubles, the power to increase output and the facilities to make a superior product.

No matter whether your work is Single Matching, Double Matching, Ship Lap, Jointing, making Glue Joints or Door and Sash patterns, if you desire to turn out quality product get the Shimer System in your mill.

Look over this page and then let us have your specifications.



The "Shimer Limited" Cutter Heads, with Expansion, Fig. 627 and Fig. 628.

For the High Speed Matcher

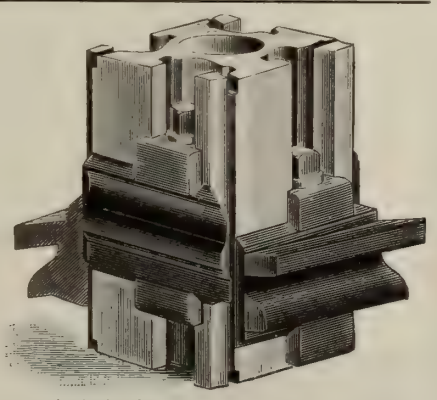
These Heads have a chucking device which self-centers them on the spindle and grips firmly thereto when the device is drawn up, overcoming the objectionable set screw as a means of fastening the Head to the spindle. It is reliable and practically perfect in results.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to the parts coming into contact with the lumber.

They are simple and strong throughout, have no delicate parts to break down or get out of order, and are safe and efficient tools for matching flooring, etc., at high speeds.

Price, net, for Flooring, $72.46 the set complete.

The Shimer Combination Head for Door, Sash, Blinds and Mouldings



The Head illustrated herewith is intended more particularly for the mills which make only a few mouldings or Door and Sash patterns and change work several times a day. Where a mill runs on stock or has much work to do we advise running the Shimer Heads with Circular Bits on account of the greater wear and the fact that the Heads are always ready to be slipped on the spindle.

This particular outfit consists of one Combination Head with one set of Sash Bits, one set of Door Bits, one set of Cope Heads with Door Cope Bits and two Sash Cope Bits for the lower Door Cope Head. The outfit is sent complete for the low price of $47.31.

The Bits are quickly changed and set to the gauge, when the Door and Cope moulds or the Sash and Cope moulds will match to a nicety. There are no complications to puzzle or annoy operators. As the Bits are moulded on the back at an angle, they work with perfect clearance and maintain standard patterns. Bits can also be adjusted for different thicknesses of Door and Sash mould.

This Head is very strong and durable and with its combinations is applicable to every class of work. It will take Bits to make Door, Sash and various other mouldings and these Bits are quickly and accurately changed and adjusted by the use of a gauge.

We guarantee these tools to be of the best material and workmanship, and will send them on 30 days trial to any responsible lumberman returnable if not satisfactory.

Send measurements at once.

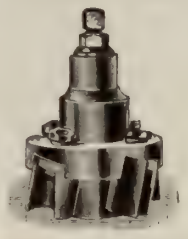
Our Popular Cutter Heads

Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13/16 to 1½-in. in thickness with tongue and groove proportions expanded to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench $40.95
Extra Bits for Flooring 11.44
Extra Bits for Ceiling 10.40

With 4 Bits to Each Head

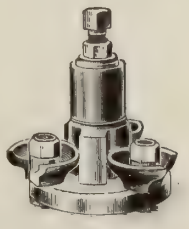
Jointer Heads



Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

Price, Heads, complete with Bits for 15/16 to 1¼-in., net only $31.20
Extra Bits 1½-in. face, the set 10.40
Extra Bits, 2-in. face, the set 12.48

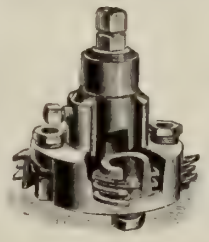
O. G. Batten Heads



Figs. 48 and 49 represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads, complete with Bits, net only $31.98
Extra Bits, each, net 2.08

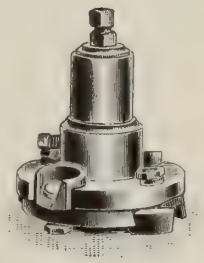
Double Ceiling Heads



Figs. 45 and 46, are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, net $40.94
Extra Bits, per set of (8) 16.64

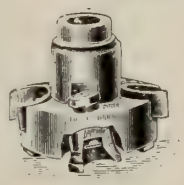
Ship Lap Heads



Figs. 38 and 39 are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices:

Heads with one set of Bits to work 15/16 to 1½-in. thick, net $34.84
Extra set of Bits 11.96

Door, Sash and Coping Tools



That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

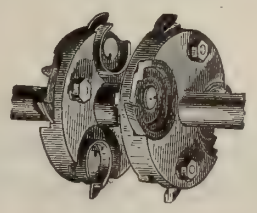
DOOR AND SASH HEADS

Fig. 82, solid flange, Door Head $10.75
Fig. 84, Expansion Door Head 13.35
Fig. 86, solid flange, Sash Head 9.75
Fig. 206, Expansion Sash Head 12.35
Bits to work 1-in. to 1¼-in. Doors, 4.. 7.28
Bits extra to work 1 to 1¼-in. Sash (2 Moulded Bits, $4.30; 2 Rabbeting Bits, $2.86) 7.16

COPE HEADS

Fig. 83, Cope Heads (2) $12.90
Coping Bits, each 1.43

The Shimer Box Board Matching Heads



make a uniform cut and close fit, as well after years of use as when new, with no friction upon the Bits. For thicker material the Bits can be expanded.

Price for two Cutter Heads to match ⅜ to ½ inch, $29.15.

We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, $11.05.

Bain Sleighs for Logging Operations

Famous for their great Capacity and Light Draft

LOGGING is a severe test of a sleigh.

The best is none too good, even though you may pay considerably more than for one which possibly may appear to be just as good.

It is only by actual test—the test of time and hard usage—that the difference is apparent, and the increased first cost is forgotten. **The quality is remembered long after the price is forgotten.**

The cross chain couplings allow great flexibility and the hind bob follows in the tracks of the front when turning. Some prefer the short reach for well broken roads as a sleigh so fitted can be backed same as a wagon.

Swing bunks are an advantage in the bush, as they can be swung parallel with the runners when driving without a load.

Any of these sleighs except the heavy sloop can be fitted with 38, 40 or 42 inch bolsters for general work.

Our new catalogue No. 30 tells all about it and is yours for the asking.

The Bain One-Beam North Shore Sleigh

Steel Shoes; Swing Bunks or Bolsters; Cross Chain Coupling; 2 ft. 10 in. or 3 ft. Track. Clearance under Beam 9½ inches

The Bain North Shore Sloop Sleigh

Steel Shoes; Cross Chain Coupling; 2 ft. 10 in. or 3 ft. Track. Clearance under Beam 7 inches

The Bain Heavy Sloop Sleigh

Steel Shoes; Cross Chain Coupling; Furnished without Bolsters but with king bolts front and rear; 3 ft. 4 in., 4 ft. 4 in. or 4 ft. 8 in. Track. Clearance under Beam 7 inches.

The Bain Heavy Sloop Sleigh

With Short Reach Coupling

The Bain Double Beam Manitoba Sleigh

Steel Shoes, Short Reach Coupling, 3 ft. track. Clearance under Beam 9½ inches

The New FAY-EGAN "LIGHTNING" 333-335 Matcher-Resaw

will produce twice as much on certain lumber stocks at one-half your present labor cost—

—You now use two men on the Matcher and two men on the Resaw to manufacture bevel siding, ship-lap, flooring, ceiling, box shooks, etc., at 75 to 100 ft. per minute. On the new 333-335 Matcher-Resaw you can do this same work at 150 to 200 ft. and upward per minute, with only two men—and you save the cost of trucking and handling between the machines.

—in addition to doubling capacity and cutting labor costs one-half or more, this machine will manufacture lumber without tearing out on knotty and cross grained stock, raising grades 10 to 30%—wherever it is possible to plane and match double thick and resaw after, this new machine will effect a wonderful saving—just figure it out for yourself.

—this new machine is a combination of our "333", the greatest Matcher ever built, and our No. 335 Horizontal Band Resaw—**placed below the bedline of the Matcher,** eliminating dangerous overhead rigging and giving a steadier and more accessible mechanism. Blade is easily slipped off the wheels when Matcher only is to be used.

Write today for details of this new method of manufacturing lumber on a 333-335 Matcher-Resaw.

"With the Resaw Below the Bedline of the Matcher."

72 Years of Disston Control

In these times when new firms are born every year and old ones are changing from one control to another; when many are endeavoring to ***build*** reputations by clever advertising, it is significant to learn of a firm with a record such as that of Henry Disston & Sons.

Aside from those sentimental feelings that naturally attach to it is the importance of this record to the users of DISSTON goods. It conveys the assurance that DISSTON Saws, Tools and Files are made to-day in the same thorough manner as for nearly four-score years, and that the efforts expended to ***build*** the high reputation achieved are still being made to maintain and enhance it.

When the statement is made that the ownership, operation and management of Henry Disston & Sons has not left the DISSTON family since the foundation of the business in 1840, it presents the products of this firm in a new light.

A man starting with the high ideals that Henry Disston did must surely impress his personality upon his sons and grandsons, and while they continue to manage and extend the business, as they are doing to-day, the same high aims and broad policies that were his will never cease to pervade the entire organization.

No man knew better the value of a reputation and he strove to establish one that could never be surpassed. This reputation he built with his unmatchable saws as a secure and lasting foundation. The business has grown to its present huge proportions because the reputation established by its founder has been greatly broadened by his descendants.

The same policies, the same spirit of advancement, the same aspirations, prevail to-day, and those who purchase DISSTON products hold in higher esteem the reputation behind them than the guarantee that goes with them, for a guarantee can be earned by ***anyone,*** while a reputation must be earned.

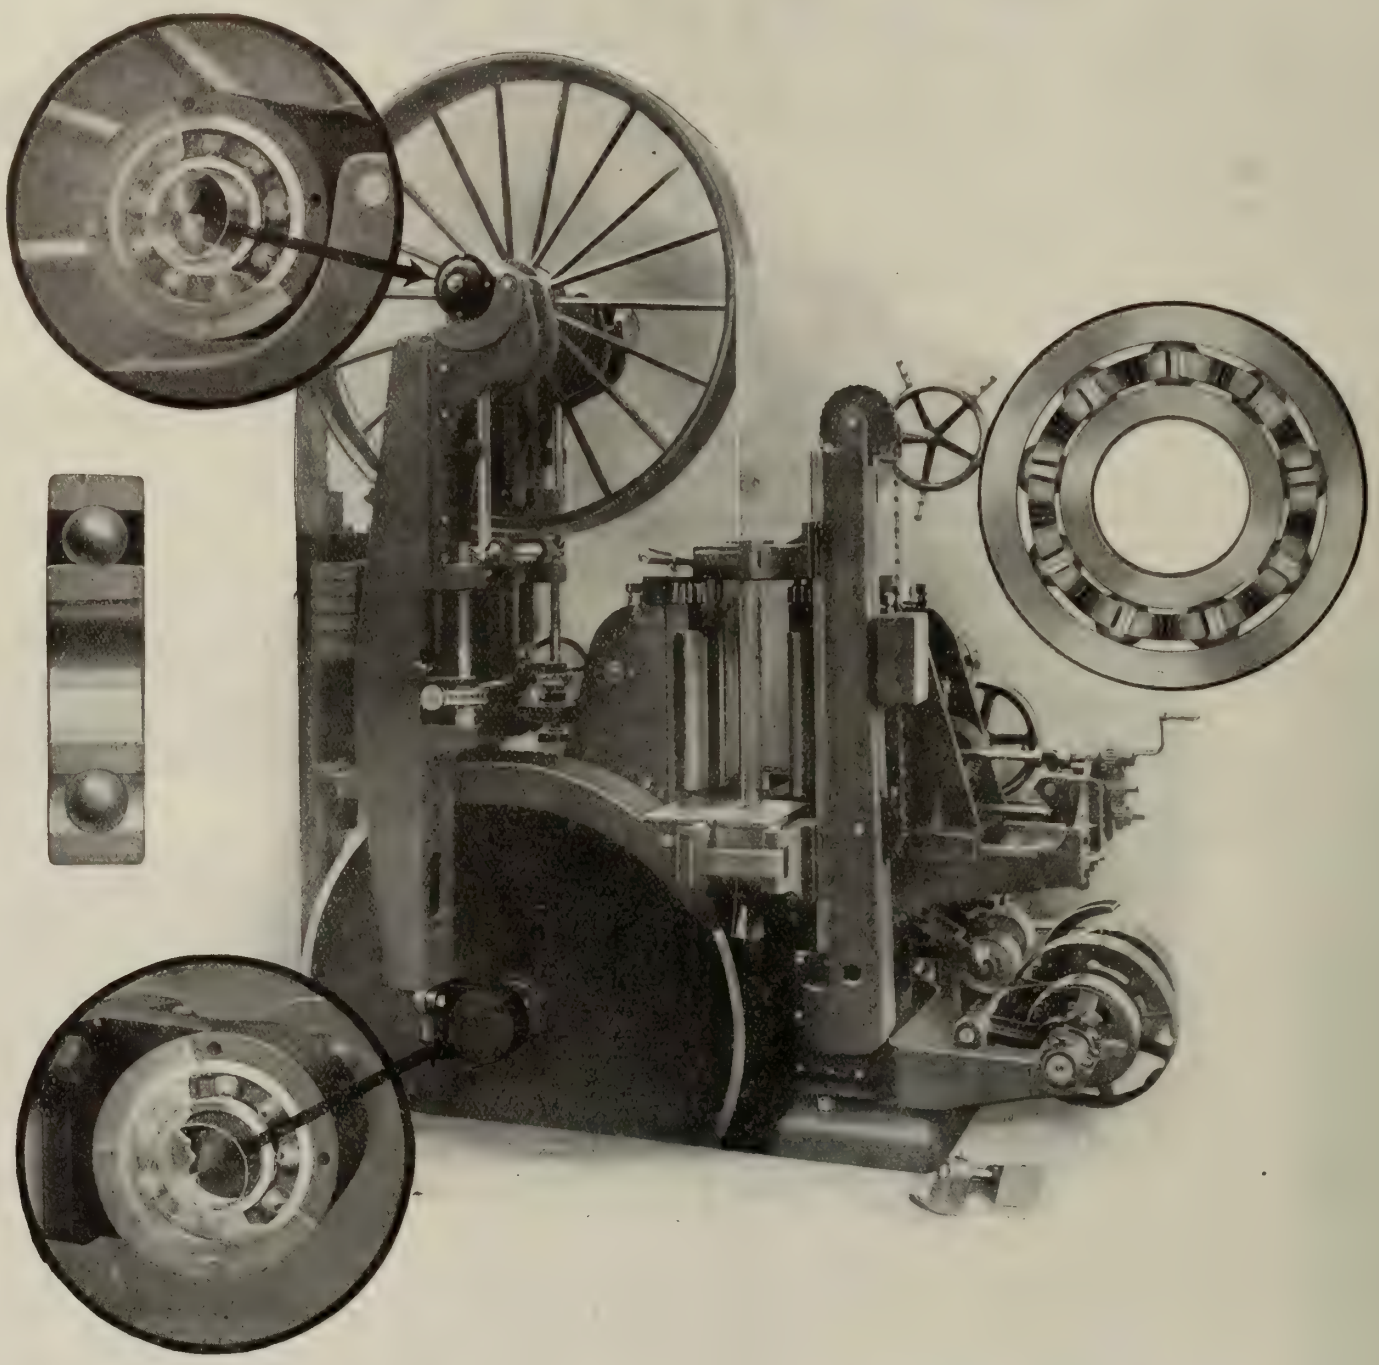
Douglas & Co., Limited

Victoria Street, AMHERST, N. S.



The American No. 111 Band Resaw

was designed for the application of Ball-Bearings—that's the reason why it is a thorough success The adjustment is perfect, the alignment of the wheels is a thing you can depend upon. Some manufacturers have tried Ball-Bearings on their machines, and abandoned them—simply because the mechanical construction—(all right for ordinary babbitted boxes, perhaps)—would not do for Ball-Bearings.

Let us send you a large illustration of the best BALL-BEARING BAND RESAW on the market.

"Dolphin" Waterproof Belting

is the answer for belting troubles in wet places.

Leather belting is acknowledged to be better and cheaper than any other kind of belting for wet places, providing it is waterproof and that the laps will not come apart.

Dolphin Waterproof Belting is guaranteed to meet all these requirements.

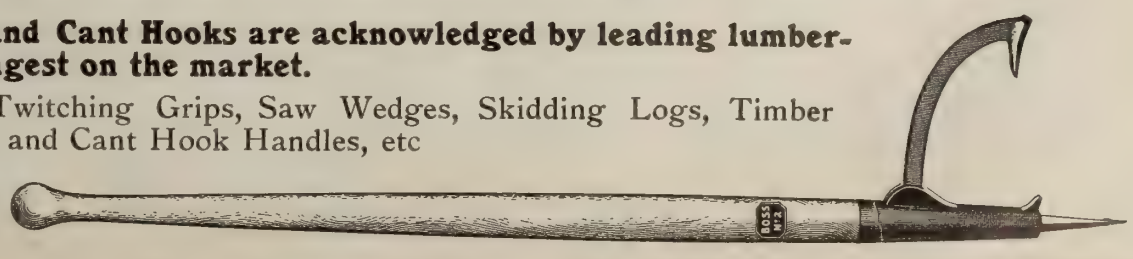
Catalogues furnished and prices quoted on application



PROFIT by the Experience of Others

Thousands of firms throughout the continent testify the efficiency and economy of Beardmore Belting.

The price of their experience was the cost of a cheap belting, resulting in stretching and consequent loss of power.

Beardmore Belting has made enormous savings of power in power plants all over the country.

The maximum value is put into every piece of belting we manufacture.

The old fashioned oak tanning of No. 1 Packer Steer Hides produces a leather unequalled for solidity and tensile strength.

The utmost stretch is taken from the leather by improved methods which without injuring its life give the greatest belt efficiency possible.

Get information about Beardmore Belting.

It may mean much help to you in the long run to send for catalogues now.

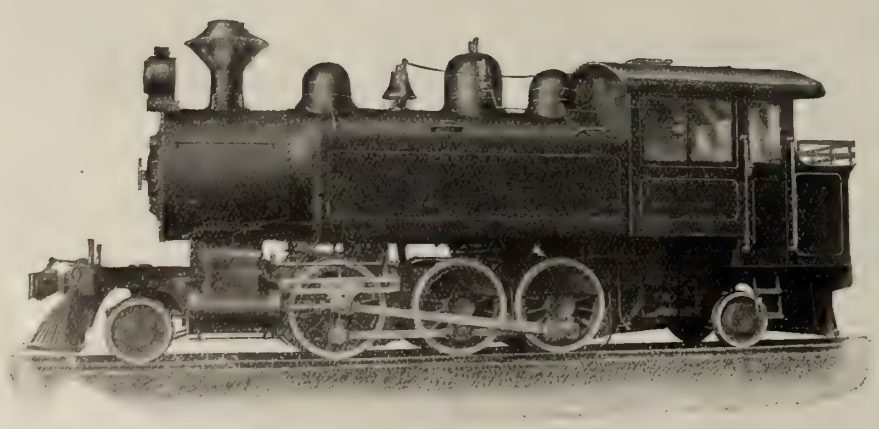
SELECTION OF LOCOMOTIVES

WHAT SHOULD BE KNOWN BEFORE YOU PURCHASE LOCOMOTIVES:—



Nature of the service.
Capacity of the cars and weight of train.
Character of track—is it new or old.
Length of haul.
Is time an important factor.
Do you want a quick locomotive or a big puller.
Distance from base of supplies and quarters for the men.
Water and coal carrying capacity.
All these items and more should be considered.
A careful study of conditions may mean larger profits.
Our experience may be valuable in considering them.
A dollar saved is more than a dollar earned.

Write or wire us, or better still, come to see us.

MONTREAL LOCOMOTIVE WORKS, LTD.

Dominion Express Building, MONTREAL, CANADA

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

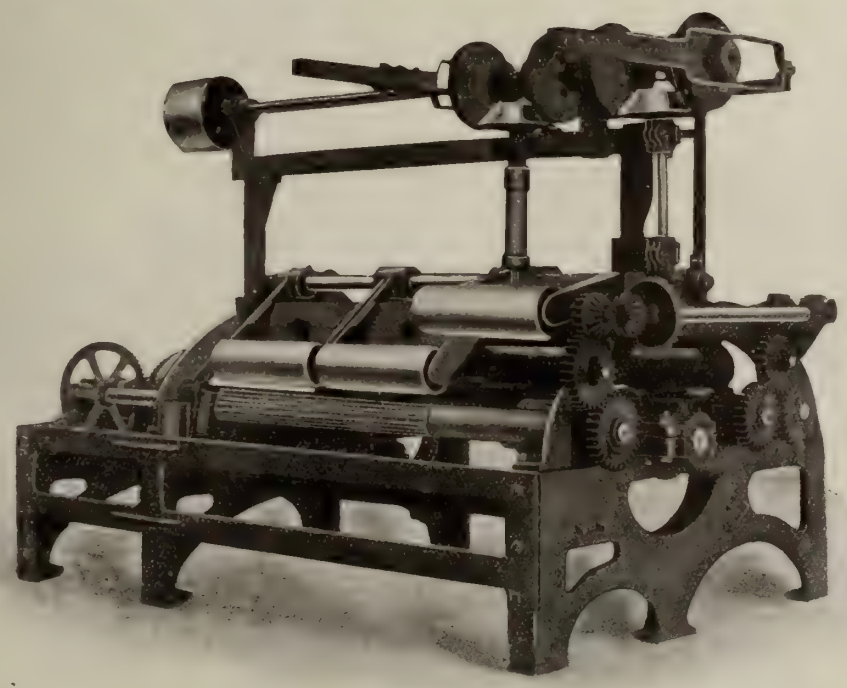
Mowry's Jumbo Edger



Our latest model is an improvement on the one illustrated here

Mowry's "Jumbo" Combined Gang and Edger is the most useful mill machine on the market to-day.

It embodies every detail of construction essential to an adequate gang edger. ¶ We have some very flattering testimonials for our "JUMBO."

Mandrel: 4½ inches by 10 feet 6 inches long.

Drive Pulley: 20 inches, 20 inches.

Saws: 2 movable saws on edger side (more if desired) 8 stationary saws on gang side, 2 water boxes.

Let us quote you when you are in the market for Saw, Lath or Shingle Mill Machinery or Repairs.

MOWRY & SONS, Gravenhurst, Ontario

ROSSING MILL EQUIPMENT

THE WITHAM JR. AUTOMATIC BARKING ATTACHMENT

A steam operated barking attachment capable of turning out 30 cords of perfectly barked wood per day. **How much are you barking with your equipment?** We are the only Canadian builders of this machine.

Bulletin No. 201

THE building of Rossing and Pulpmill equipment is not a new line with us. For over 30 years our machines have been cutting and handling pulp wood in many of the largest mills in this country.

If you are erecting a new Rossing Mill or are re-building or adding to your present equipment you should have our catalogues. An investigation of our line will certainly repay you.

We manufacture:

Pulp Log Haul Ups
Cutting Up Rigs
Slasher Tables
Barker Attachments
Barkers
Pulp Wood Splitters
Conveyors and Elevators
Engine and Boilers

These machines are the last word in up-to-date Rossing Mill equipment. They are turned out in a separate department—not as a side line—by an engineering staff and skilled mechanics who have specialized in this work.

We have records in this office of some of the most successful Rossing Mill installations operating in Canada to-day. These are at your disposal. Write us and let us show you how to build "The Rossing Mill Up-to-date."

When You Get Ready to Buy—

Suppose you want a sawyer, or a setter, or a filer, or some other man for your mill, right at the start don't you usually ask every applicant,

"What experience have you had?"

And if one has been a filer or a sawyer say for ten or fifteen years, and has specialized in his trade, aren't you inclined to take him on?

You're making strong play on experience in this case.

Now, buying sawmill machinery is simply employing some one to work for you,

And experience in this case is far more important.

Because it is only as a result of experience that a manufacturer can design and build his machines properly.

And because you have to depend on your machines to keep down your sawing cost and at the same time cut good lumber, and if they're not correctly designed and well built, how can they do the work they ought to and that you pay for?

Our experience has been long enough—over fifty years, but

We've had the right kind of experience, too. We've always built machinery for stationary mills only. We have never built any other kind, so you see, **we're specialists of more than fifty years' standing in heavy sawmill machinery.**

You can get all this experience for nothing, because our prices are no higher than you will pay anywhere for good machinery.

When you are placing your orders for new equipment this winter, give this question of experience the consideration it deserves.

Timber Limits for Sale
on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

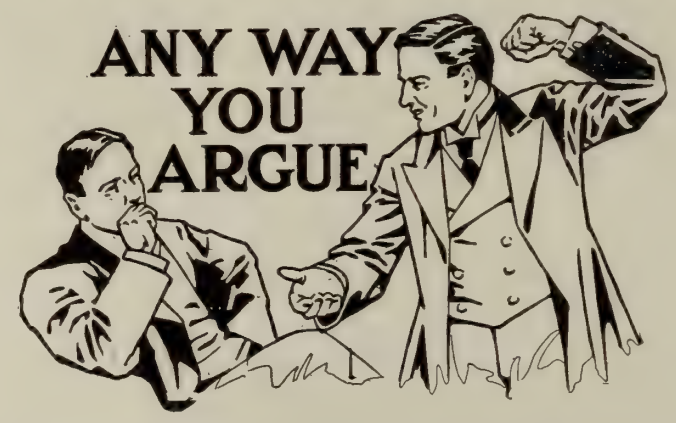
Don't Hesitate



You know the old proverb "He who hesitates is lost"—Well, of course, we know that that is contradicted by the just as old proverb "Look before you leap"—The logical conclusion therefore is—"you can't do both." But that is just the trouble with many business men. They take a good look and then they hesitate. There is no need to hesitate in deciding where to purchase

Hemlock, Pine and Hardwood

You are quite safe in coming to us—we will give you the best on the market at the right price.

Write us for quotations—take a good look at our proposition then send us your order at once..Don't Hesitate.

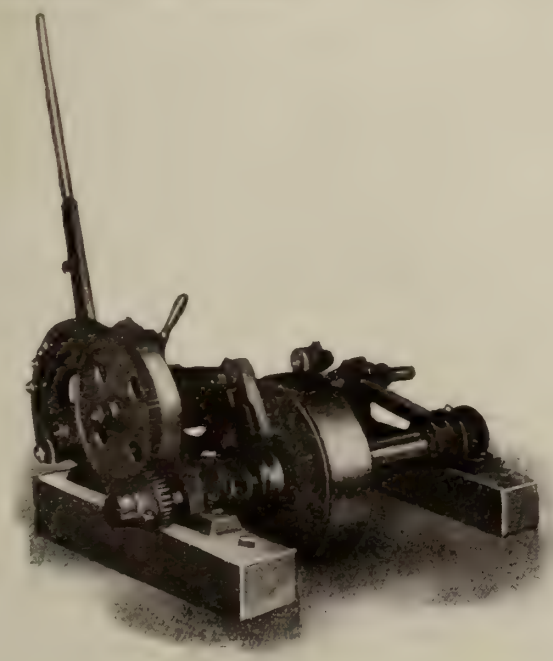
The Importance of Efficient Mill Machinery

In Millwork, where every portion of the equipment has to undergo the severest treatment with unusually hard conditions only the best machinery will serve. No mill can be run at a profit with inferior equipment. This is an expression of the opinion of men of wide and varied experience in the business.



P. Payette's Improved Mill Machinery, is built to stand all the strain and hard usage of mill work. This machinery is of the special Payette design and embodies many improvements, which add considerably to the efficiency of mill equipment.

The New Patent Saw Mill Dog which operates in soft or hardwood timber of any kind will do good even work in summer or winter with perfect safety.

Payette's Improved Set Works will set even thickness of lumber in all class of timber and will set any size log with perfect ease, Can be changed instantly so as to make either thick or thin lumber and can be put on any make of carriage.

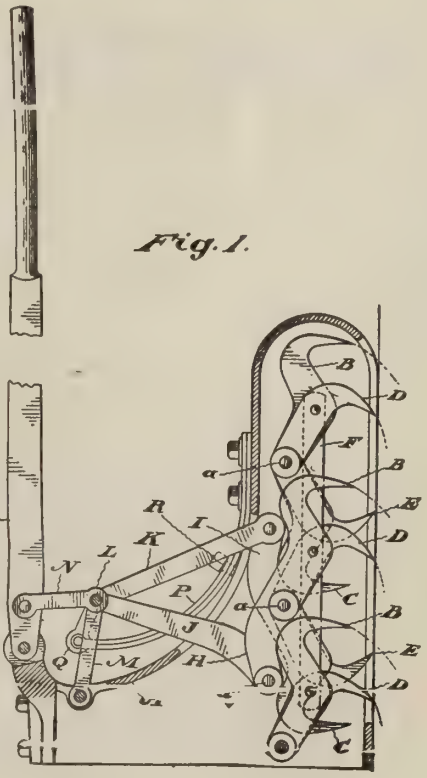


Fig. 1.

We want to prove to you the advantage of this set works in your mill and we are prepared to demonstrate its efficiency and superiority. Full information sent on application. Ask for our booklet on set works.

P. Payette & Co. Engineers & Machinists **Penetanguishene, Ont.**

Cross - Cuts for Good Hard Work

The "SAW KING" Cross-Cut Saws have won exceptional favor throughout the trade by the good work they do, the hard wear they stand and their general reliability. These saws have stood the test of Camp and Mill and have proved their worth—their high quality steel and perfect tempering and grinding sets them far above the average and places them in a class by themselves.

THE "SAW KING" CROSS-CUT

The "Saw King" Cross-Cut Saws have merits possessed by no other saws. By looking at the above cut you will see that the chip spaces are wider and deeper in the centre than they are in any other part of the saw, thereby giving a capacity for the accommodation of the largest accumulation of sawdust, which is always in the centre of the saw. The chip spaces decrease in size from this point of the saw, as also does the quantity of sawdust. All users of saws know that the teeth at the centre wear much faster than they do at the ends, as the teeth are longest at the centre, it gives greater wearing capacity to the saw, and as the teeth are smaller at the ends of the saw and leaves the saw blades wider between the teeth and at the back. Where the blade is narrowest, it gives more strength and stiffness at the point where it is most required. The saws are tempered by our new improved process, giving them a keener cutting edge than any other Cross-Cut Saw made. They are thoroughly warranted. Any defective saws will be replaced by the seller.

Prompt Delivery a Specialty. **Send for Particulars and Prices.**

A Belt which Conveys ALL the Power

Practical men know the drainage of power from a slipping belt, ***and because they know,*** they are buying

GOODYEAR RUBBER BELTING

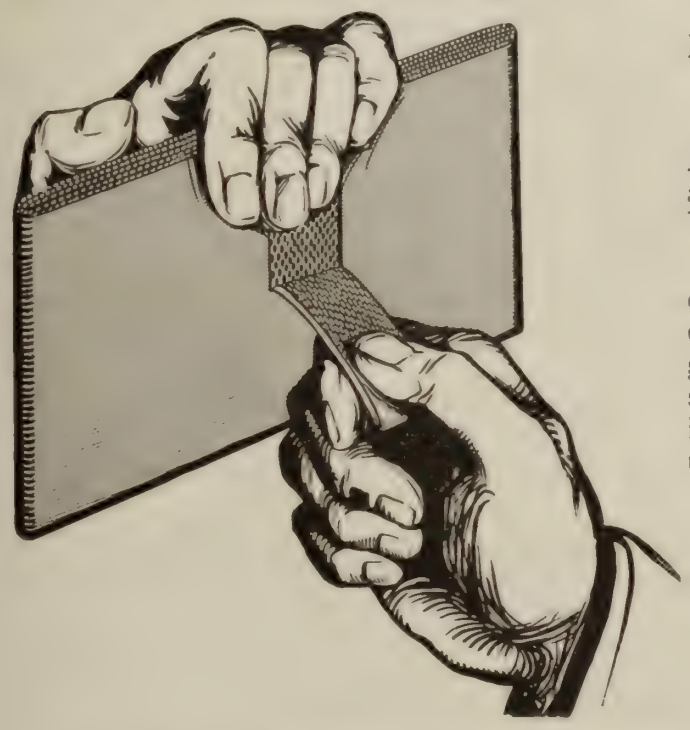
Which Neither Slips Nor Stretches

It is built up, layer upon layer, of close-woven, long-fibre, cotton fabric, rubberized and cured under Goodyear processes. And every Goodyear belt has in it the lowest possible minimum of stretch, because the belt is "cured" whilst stretched to the limit of safety in a special machine.

That is the Goodyear Method of Belt Manufacture

And the result is entirely satisfactory to belt users—a fact to which our enormously increased sales testify. What is the significance of this CONTINUED SALES INCREASE — 50% over last year? Simply that Goodyear Belting more than fulfills the claims made for it by the Goodyear people—who know what a belt should do, and make a belt to do it.

It has cost us less than $200.00 for claims or adjustment of every kind in connection with our total output for the past two years—a remarkable tribute to Goodyear reliability.



Look into the Belt for Yourself—Try to Tear It Apart.

Make a cut in the top layer—and then try to pull it apart. You will get a faint idea of its strength.

That is the result of forcing rubber at tremendous pressure through the fine cotton fabric—separating every strand—thus abolishing all internal friction or grinding. Whilst these layers of fabric are afterwards so compressed as to be almost homogeneous, the finished belt bends easily, the "duck" being so woven as to retain complete pliability in the finished belt.

For Main Drives and High Speed Pulleys GOODYEAR Belting is the Best

It has all the tensile strength necessary to absorb tremendous strain without slip, stretch or rent. The grip of rubber and the prodigious strength of hard-twist cotton fabric are united, and prove equal to every emergency.

Where the power transmitted is high, and great tensile strength is essential, Goodyear Rubber Belting proves its worth.

EVERY GOODYEAR BELT IS SUBJECTED TO A STRINGENT TEST BEFORE LEAVING THE FACTORY, and what is more, the materials used in the manufacture are also tested in the Goodyear laboratory before using.

IF YOU USE A BELT AT ALL IT WILL PAY YOU TO USE A GOODYEAR

Loss of power is loss of profit—and an inferior belt is dropping power all the time. Goodyear belting quickly earns its cost in power saved and trouble avoided.

TWO HUNDRED AND FORTY ROLLS—A TOTAL OF 72,000 FEET

We have just received an order for this quantity of GOODYEAR RUBBER BELTING from one business concern in the west, for the equipment of interior elevators. Such an order shows supreme confidence in the quality of GOODYEAR Belting.
If we have not just the belt you require we will make it for you.
In the choosing of belts our booklet would be of great assistance to you. We supply it free. Write to our nearest Branch for one.

Mr. T. H. E. Retailer,
Canada and United States,
North America.

Dear Sir:—THE SAW-MILL OWNERS SALES COMPANY is a collection of lumber manufacturers of the Provinces of Quebec and New Brunswick, representing an annual output of over Forty Million Feet B.M. of Spruce lumber (apart from the Lath and Shingles), united under one Board of Management, having supervision over the sawing of the lumber and manufacturing in general of all the Mills interested, with the sole aim of creating uniform grading and uniform manufacturing. Therefore, avoiding the great trouble experienced by wholesalers in general, which is to supply their customers with stock of all kinds of manufacture and grade, caused by the individual management of each mill, where the wholesaler buys his supplies. A state of affairs entirely beyond the control of the wholesaler. Our organization in this instance naturally gives the Retailer better satisfaction. All our individual shipments are samples of the whole output.

Then again, the millmen have organized an experienced staff of salesmen, under the supervision of a sales manager, condensing in each and every salesman these three great points, so important for the continuance of the retailer's patronage—Quality, Quantity and Responsibility. Three points known to very few of the trade.

At present our stock is very low, but we have Five Million Feet in our different yards. Some of this ready to ship, notably some merchantable spruce: 2 x 4, 2 x 5, 2 x 6, 2 x 7, 2 x 8, 2 x 9, 1 x 4, and up, also 1 x 4 Mill Cull Pine.

We remain, Dear Mr. Retailer,

Yours respectfully,

THE SAW-MILL OWNERS SALES COMPANY.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, November 15, 1912 No. 22

What is the Situation in Hemlock?

In view of the high prices at present prevailing for hemlock, it would be interesting to ascertain how much spruce and other lumber is being substituted for hemlock. In an interview with a well-known and old established wholesale lumber dealer in Toronto recently, a representative of the Canada Lumberman had a case mentioned to him in which a contractor, who last year had bought a large quantity of hemlock No. 2, was this year substituting spruce for a similar job. The chief reasons given by the contractor for this substitution were: 1st, waste in hemlock No. 2, which does not occur in spruce; 2nd, a thinner size in spruce than in hemlock could be used and yet the same strength be obtained. This contractor had figured out that for the reasons given above, he was considerably in pocket in spite of the higher price which he had to pay for good spruce. Although this is an isolated instance, it tends to show what may occur should the price of hemlock make a still further advance, and it would be well for manufacturers of hemlock to give this close consideration. The substitution of spruce and other lumber for hemlock has taken a long time to develop, and it may be taken for granted that a similar length of time would obtain before consumers would revert to hemlock, conditions being equal. At the present time when hemlock manufacturers are refusing orders and have practically no stock to dispose of, the matter is not one to give them much immediate worry, but should conditions alter, owing to a poorer demand or for other causes, the question might be one of considerable anxiety.

The wholesale dealer above referred to mentioned in course of conversation that he was finding the manufacturers were competing with the wholesalers by selling direct to the consumer. He instanced one or two cases in his own business where consumers with whom he had tried to do business, had told him that the manufacturer had offered him the same lumber at a considerably lower price. This price, the dealer stated, was the same as that at which he, the dealer, could buy from the manufacturer.

This dealer had also just received a quotation stating that the order would be filled in three lots at thirty, sixty and ninety days. At the price quoted, the dealer said he could buy from a local yard and have the lumber delivered in two or three days. If this state of affairs is general, no reliability can be placed on any quoted prices and requests for quotations on insignificant lots are likely to be sent out broadcast to manufacturers and wholesalers alike. These are simply samples of a class of story which one hears daily in lumber offices and they reflect no credit upon those in the trade who conduct their affairs in such a manner as to give rise to them.

Wood Consumption and Production

The United States Forest Service has published an extensive bulletin upon the wood-using industries of Michigan, which has been prepared by H. Maxwell. The investigation was undertaken by the Forest Service in co-operation with the State of Michigan. The statistics were compiled from data collected during 1911 covering a period of one year from January 1 to December 31, 1910. The saw-mills in the State of Michigan are reported to have cut during the year 1910, 1,681,081 ft. of lumber and the factories of the State required 1,282,561,200 ft. for the commodities which they produced. In addition to this, the factories bought nearly half a billion feet outside of Michigan. The reason for the excess of manufacture of lumber above the quantity used by factories is that a large part of the output is demanded for other purposes being used both in the State and out of it as rough lumber for framing, bridges, fences etc. Another reason is that much of the wood required by the factories does not grow in Michigan, or not in sufficient quantity.

Michigan mills cut during 1910, 48,000,000 feet of white pine, 60,000,000 feet of beech, 210,000,000 feet of sugar maple and 460,000,000 feet of hemlock which never found their way to factories within the State.

The yearly output of the saw-mills of Michigan is declining. It was 200,000,000 feet less in 1910 than in 1909. This decline may be expected to continue. Some species, once abundant in the State are now scarce, notably, white pine and Norway pine. With the probable exception of birch and popple—both of small comparative economic value—it is doubtful if there is a single timber tree in Michigan which is not becoming scarcer. Michigan factories are now sending to Arkansas for oak, Tenneesee for yellow poplar, Pennsylvania and West Virginia for cherry, Louisiana for cypress, California for redwood, Oregan and Washington for fir and cedar, Mississippi, North Carolina, Canada and Idaho for pine and to nearly all foreign countries for costly cabinet woods.

There will be timber in Michigan for a long time, but the bulk of what was once there is now a thing of the past. Wide-awake lumbermen understand that in fifteen years it will be about over. Up to the present time practically no planting has been done. The Michigan forest fire problem is a hard one to solve, and until it is solved, re-forestation is impossible.

Michigan manufacturers reported the use of 99 kinds of wood in that state. Of these, white pine was used to the extent of 210,136,308 feet, being 16.38 per cent. of the total wood consumption. The average cost per thousand feet was $21.57. The total cost f.o.b factory was $4,532,296. The quantity of this grown in Michigan was 34.5 per cent. and the quantity used was 151,758,450 ft., being 11.83 per cent. of the total wood consumption. The average cost per thousand feet was $13.31 and the total cost F.O.B. factory $2,019,305. Of this, 98.91 per cent. was grown in Michigan and 1.11 per cent. outside of Michigan. White oak was used to the extent of 46,230,272 ft., being 3.60 per cent. of the total wood consumption. The average cost per thousand feet was $47.63 and the total cost F.O.B. factory was $2,202,171. Of this quantity 11.1 per cent. was grown in Michigan and 88.99 per cent. outside of Michigan. Red oak was used to the extent of 29,278,234 ft., being 2.28 per cent. of the total wood consumption. The average cost per thousand feet

was $40.25 and the total cost F.O.B. factory was $1,178,581. Of this, 90.55 per cent. was grown in Michigan and 9.5 per cent. outside of Michigan. Longleaf pine was used to the extent of 24,901,539 ft., being 2.72 per cent. of the total wood consumption. The average cost was $25.29, and the total cost f.o.b. factory $882,576. All of this was grown outside of the state of Michigan. Shortleaf pine was used to the extent of 22,382,626 ft., being 1.74 per cent. of the total wood consumption. The average cost was $27.20 per thousand and the total cost F.O.B. factory $608,742. All of this was grown outside of the state of Michigan.

The wood used by the factories of the state of Michigan for manufacturing purposes cost $29,650,823. Sugar maple, white pine and hemlock, taken together, supplied more than half of all the wood consumed by the factories. Sugar maple heads the list, making more than one-quarter of all. It was consumed to the extent of 333,724,944 ft., being exactly 26.02 per cent. of the total wood consumption. The average cost was $17.53 per thousand feet and the total cost F.O.B. factory $5,849,472. Of this 91.22 per cent. was grown in the state of Michigan and 8.88 per cent. outside of the state of Michigan.

Referring to white pine the report says: "The Northern two-thirds of Michigan were once covered with white pine, but very little remains now. In a few localities the remnants of the original stand are being cut; and here and there straggling trees which escaped when the forests were felled, are coming to the mills, loaded on log cars with hemlock, Norway pine, and the hardwoods. Logging operations began in Michigan on a large scale soon after the civil war, and white pine was cut in enormous quantities. It was not unusual to sell good lumber at the mills below the cost of mediocre stumpage now. The entire State, north of the southern tiers of counties where little pine grew, was cut over. To-day it is difficult to find plots of even a few acres of the original pine; but over the whole region, with scarcely any exception, are to be seen the stumps in all stages of decay. Probably a scene like it can be found nowhere else; a forest so vast removed in so short a time that the stumps of the first cuttings have not had time to disappear through decay."

After a lengthy consideration of the situation, the report says:

"Reforestation is the remedy. Much of the region will never grow farm crops. It once produced the finest pine forest in the world and though the soil is plainly deteriorated, it would still grow pine, if given the chance. The young trees would fix the drifting sand and slowly the forest would come back. It is much easier however, to discuss the matter as a theory than to tell how to do it in practice. The regions needing re-forestation are so extensive, conditions so adverse, and the cost of planting large tracts so great, that practical work commensurate with the needs can be got under way but slowly. On the other hand, the recollection of the high place Michigan once held as a producer of pine is a strong and constant encouragement to the people of the State to get the sand land back into pine again.

It is admitted by all who have given the matter serious thought, that the hardest part of the whole proposition is the control of fires.

The aggregate cost of the wood consumed by the thirty-three chief wood-using industries in Michigan during 1910 was $29,650,823 and the average cost was $23.12 per M. feet, the following figures show the average cost of a thousand feet in several other states: Kentucky $23.07, Wisconsin $21.81, Massachusetts $21.29, Maryland $20.67, Oregon $15.87, North Carolina $14.13, Louisiana $11.63. The average price of the wood grown in the State of Michigan was $13.00 per M feet less than for wood brought in from outside. The most extensive consumer of wood products in the State during 1910 was the planing mill business which utilized 432,526,195 feet, or 33.72 per cent. of the total consumption. For this they paid on an average $18.94 per M. The automobile industry paid the highest average price for its wood, viz., $57.62 per M. The cheapest class of wood was used by the excelsior manufacturers and cost them only $10.42 per thousand feet. The planing mill industry is the largest listed in the State of Michigan, both as to quantity and value of the material used.

The report deals in detail with the quantities and classes of wood consumed by each of the important wood-using industries of the State and contains a great quantity of most interesting and valuable information. Excellent statistical tables are also included together with a list of the wood-using industries of the State with the classes of wood required and a directory of Michigan wood-using firms. The bulletin is one of the most thorough and valuable that the forest service have every brought out.

Inspection and Grading of Lumber

A letter which was recently received from a large firm of paper manufacturers in New York city is typical of many of the enquiries upon this subject. In the course of the letter the writer says: "It is of course very desirable that there should be some definite and known rules for the grading of hardwood lumber, and as you no doubt know, the National Hardwood Lumber Association of the United States has compiled and had printed complete and definite rules for grading in the United States market. If there are any definite rules for grading of hardwood lumber in the domestic market of Quebec and Ontario, I would be glad if you would advise me where a copy of such rules may be obtained."

The Canada Lumberman would be pleased to receive letters or articles upon this subject, so that the situation may be brought home forcibly to the whole trade.

The Canada Lumberman receives many letters from its readers regarding the question of inspection and grading of lumber. The number of letters received has increased considerably of late, showing that the interest in this important subject is becoming more wide-spread. Frequent enquiries are received from the United States and when information is given in reply, to the effect that there is very little in Canada in the form of grading rules, officially adopted by representative bodies of lumber manufacturers or dealers, the information is received with surprise.

This is a subject in which practically every lumberman whether he be a manufacturer, wholesaler or retailer is vitally interested. It is also a question which will undoubtedly continue to create a great deal of trouble to the trade until it has been settled by the adoption of grading rules for the various classes of lumber.

Two Scarcities Which Affect the Lumber Trade

In an article dealing with the scarcity of lumber tonnage on the Great Lakes and the scarcity of skilled labor, which is at present hindering to a great extent operations in the woods, the American Lumberman recently published the following interesting reflections:

"Complaint is made by wholesalers, from Duluth to the Tonawandas, that there is a scarcity of vessel tonnage for the carrying of lumber from the head of the lakes, and from mill points down the chain of Great Lakes to the different destinations. At first blush this seems like an unaccountable condition, since it might be supposed that since the decline of white and Norway pine production craft to transport the remnant of lumber produced in the waterfront parts of Michigan, Wisconsin and Minnesota would be plentiful. Yet there is a reason for the comparative scarcity of lake boats adapted to the shipment of lumber.

"In the old white pine days, when several billion feet of mill product were annually piled at numerous ports on Lakes Huron, Michigan and Superior, a lumber fleet grew up, composed of schoon-

ers and steam barges, each carrying 250,000 to 1,000,000 feet, that throughout the season of navigation did nothing but transport lumber. In fact, they were built for that purpose and were not adapted to the grain and merchandise trade. When lumber manufacture declined, the declension becoming rapid in the decade between 1895 and 1905, the old lumber schooners and steam barges generally fell into disuse, while few were built. As the lumber trade declined the ore business increased, and steamships were built at Lake Erie ports in rapid succession for the transportation of iron ore. With the passing of the greater share of the lake lumber trade comparatively few vessels and barges remained, and these were retained to provide transport for the remnants of pine, for a developing hemlock business, and to provide for the hardwoods produced contiguous to the lake ports. Now when demand for boats is anything extraordinary, such as usually occurs in the fall, there is not enough to provide for the exigency, and a scarcity is the result. It is now said that at the Tonawandas, at Cleveland and at other points wholesalers fear that they will be unable to get all the lumber that will be needed to stock their yards before the close of navigation.

"Another scarcity felt in northern Michigan and Wisconsin, as well as in Minnesota, is that of men to do the season's logging. There was such a scarcity last winter, and it threatens to be worse during the season now beginning. If reason for such a lack of woodsmen is sought it will be found in the passing of the old generation of skilled woodsmen, who made that employment the principal means of livelihood. Many of them were bred to their business in Maine, northern New York and in the Canadian provinces. As the lumber industry declined in the old pine states the once dependable force, that was employed in the woods during the logging and driving seasons and about the mills in the summer, scattered, some to the south, others to the intermountain and coastal west, while many abandoned lumbering entirely. Not only has the old woods army been thus dissolved and scattered, but the very art of the axeman, the skidder and the woods teamster has been lost. The mass of the operators' forces has disappeared, and to a large extent they have to depend on green hands—and they are scarce, at that. This season the cry goes up for more men, and they must be taken when found, such as they are.

"The foregoing two instances of scarcities in the lumber line show that in respect to both material and human agencies, adaptabilities and utilities grow up on the basis of demand for them. In the decline of any industry the remaining operators are handicapped by dissolving facilities and the dispersion and desuetude of skilled workmanship."

Timber Growth in Lac LaBiche Region

The Forestry Branch of the Department of the Interior has had a number of parties out during the past season continuing the examination of the unexplored districts to find out the supply of timber on Dominion lands and determine the lands which should be reserved permanently for timber purposes. These parties are generally in charge of graduates of the Forest School of the University of Toronto. The work for the season is almost completed and the parties are now returning from the field. Two of the parties have already reported.

Mr. S. H. Clark examined during the past season the district lying north of Lac LaBiche and east of the Athabaska River in Northern Alberta, which is along the route which was proposed for the Alberta Great Waterways Railway. The season was wet, and, as the district was found to be covered largely by muskeg, the examination of it was difficult. The muskegs were almost impassable and the few trails that were found are in poor condition. In spite of the condition of the trails quite a large number of people were going in to Fort McMurray to locate.

It had been reported that there was some large timber north of Lac LaBiche, but the examination brought out the fact, which has too frequently been the case, that the quantity of large timber is small and only in a few scattered areas. There is, however, a large quantity of immature spruce and jack pine which needs only protection from fire to be a valuable crop for pulpwood or lumber. The land is generally covered with muskeg, and the soil, nowhere first-class, becomes lighter and sandy towards the east, where it consists of sandy jack pine ridges with muskeg between. The undrained muskeg make the timber growth slow, but the whole district is more suited for timber growth than for agriculture.

Editorial Short Lengths for Busy Readers

There is a very good demand for lumber in practically all parts of western and central Canada. In the rural districts many of the farmers are busy on new buildings and repairs and the country lumber yards are doing a satisfactory volume of trade. In some parts it is reported that the well-to-do farmers are building granaries on their farms. This is a step that has been urged in western Canada for some years. There is still considerable activity in building operations in the cities and towns. Contractors are rushing work as much as possible before the winter sets in. Collections are still slow as the crop movement is a little later than the average but the outlook in that respect is encouraging.

The judgment given by the Supreme Court of Canada to the effect that lumber which has been planed or dressed on two sides and then passed through a roughing machine which gives one of the dressed sides or edges the appearance of being rough or undressed, shall be admitted to Canada free of duty, is a serious blow to the lumber manufacturing industry of Canada, particularly to that of British Columbia. At the present time the situation is not serious because the manufacturers of the United States are able to dispose of their stocks easily in their regular markets. When a time comes, however, such as that which prevailed until about a year ago, when home markets are depressed in the United States, large quantities of this class of lumber will unquestionably be dumped on the markets of Canada as they have in the past. It will be a pleasant thing for the consumer to secure his lumber at less than it costs to manufacture, but it is not just that the manufacturer in Canada should be made the goat of politics and of commerce in such a manner. The decision of the Supreme Court ought to be appealed to the Privy Council and an effort should also be made to have Parliament alter the wording of the tariff act so as to make its meaning unquestionable.

The report of the Census and Statistics department upon manufacturing industries in Canada during the year 1911 shows that 3499 lumber manufacturing establishments employed capital to the extent of $146,395,438. In these establishments there were 76,424 employees, whose salaries and wages amounted to $25,822,383. The value of the products of these plants was $105,506,190. The above values refer to plants turning out log products. A separate schedule is given in the statistics for plants manufacturing lumber products of which there were 859 with a total capital of $52,547,261. These plants employed 17,225 employees whose salaries and wages amounted to $9,615,046. The value of the products of these plants was $39,805,615. Some of the statistics in regard to the total production of manufactured products in Canada are of much interest. Compared with the census for the year 1900 an increase is shown of 4559 in the number of working establishments, of $798,829,009 in the value of capital, of 175,108 in the number of persons employed, of $127,274,301 in the earnings of salaries and wages and of $683,722,157 in the value of products.

Notable Pulp, Paper and Lumber Firm

Riordon Mills at Hawkesbury, Calumet and Merriton—Description of Methods and Equipment Used by a Company with Extensive Output

One of the most notable features of the industrial development of Canada has been the rise of the paper and pulp trades, particularly in the Province of Quebec, the magnificent water powers of which have been vital factors in this connection. Both in Quebec and in Ontario many new plants have been started, while the established companies have found it imperative to extend their facilities.

One of the oldest concerns in the Dominion is the Riordon Pulp & Paper Company, with mills in Ontario and Quebec. The business was founded about fifty years ago for the manufacture of paper, but went into pulp production. In 1910 the lumber business of G. H. Perley & Company, of Ottawa (established in 1899) was added, the name being lately altered from the Riordon Paper Company to its present title. For fifty years the management of the company has been controlled by Riordon interests.

The company are the owners of six mills, two in Ontario and four in Quebec, the former for the manufacture of pulp wood and paper. The sulphite mill at Hawkesbury, Ontario, is the largest in Canada or the Empire, and the second largest on the North American Continent, the capacity being 47,000 tons per annum. It is supplied with both steam and electrical power. Recently a new cut up mill was completed, which takes the logs in sideways and has a capacity of 25,000 logs per day. The sticks are taken from the mill by a cableway running on a steel trestle sixty feet high, 1,600 feet long with 120-foot spans, delivering on to a pile of a capacity of about 60,000 cords. The company are now erecting two digesters each of 12½ tons capacity, and in addition to the digester house a new boiler house with three 600 horse power Babcock & Wilcox boilers, equipped to burn wood or coal and with induced draft, an extension to the wood room, three more acid towers and an extension to the shipping room.

The mill at Merritton, Ont., has a capacity of 7,500 tons of sulphite pulp, 6,000 tons of ground wood pulp and 6,000 tons of wall paper and building paper. Very little of the ground wood pulp is sold, as most of it is used by the company in the manufacture of paper. The mill is located on the old Welland Canal and is served by spurs of the Grand Trunk and Niagara, St. Catharines and Toronto (Canadian Northern) railroads. There are several paper mills in the locality which purchases practically all their pulp from the Merritton mill. The company control the water power for five levels on the Welland Canal with a total head of sixty-five feet. During last spring a new unloading plant was erected. It consists of a travelling revolving crane which unloads wood from ships in the new canal at the rate of about thirty cords per hour, and discharges into a pond between the new canal and the old canal which has a capacity of about 2,000 cords. The wood is taken from this pond by carrier, and discharges into barges on the old canal, of which there are four, each of about 100 cords capacity. These take the wood down the old canal about four miles to the mill, where it is unloaded by carrier and partly goes into the wood room direct and partly to the storage trestle of about 6,000 cords capacity.

The mills in the province of Quebec are for the manufacture of lumber and have a total capacity of fifteen million feet (B.M.) per annum. At Calumet, clapboards, ties and shingles are turned out. The saw mill has recently been rebuilt and is of steel frame construction throughout, sheathed in concrete with concrete basement floor and plank first floor and galvanized iron siding and roofing. All the principal line shafts are carried on concrete piers and all fast running shafts are in ring oiling bearings. The mill is protected from fire by sprinkler and hydrant systems. It is equipped with one double cutting band saw, with slash, etc., three shingle machines, and four clapboard machines, and it turns out about 1,700 ties, or 40,000 feet of lumber, and 75,000 shingles and 20,000 clapboards per day. The yard is equipped with several lines of industrial track connecting the mill with the drying grounds, storage sheds and with the siding on the Canadian Pacific Railway. Hardwood lumber is manufactured at L'Annonciation, and at the Boule and the Queenouville mills; the two latter mills are situated near St. Faustin.

About fifty million feet of lumber is consumed every year, and

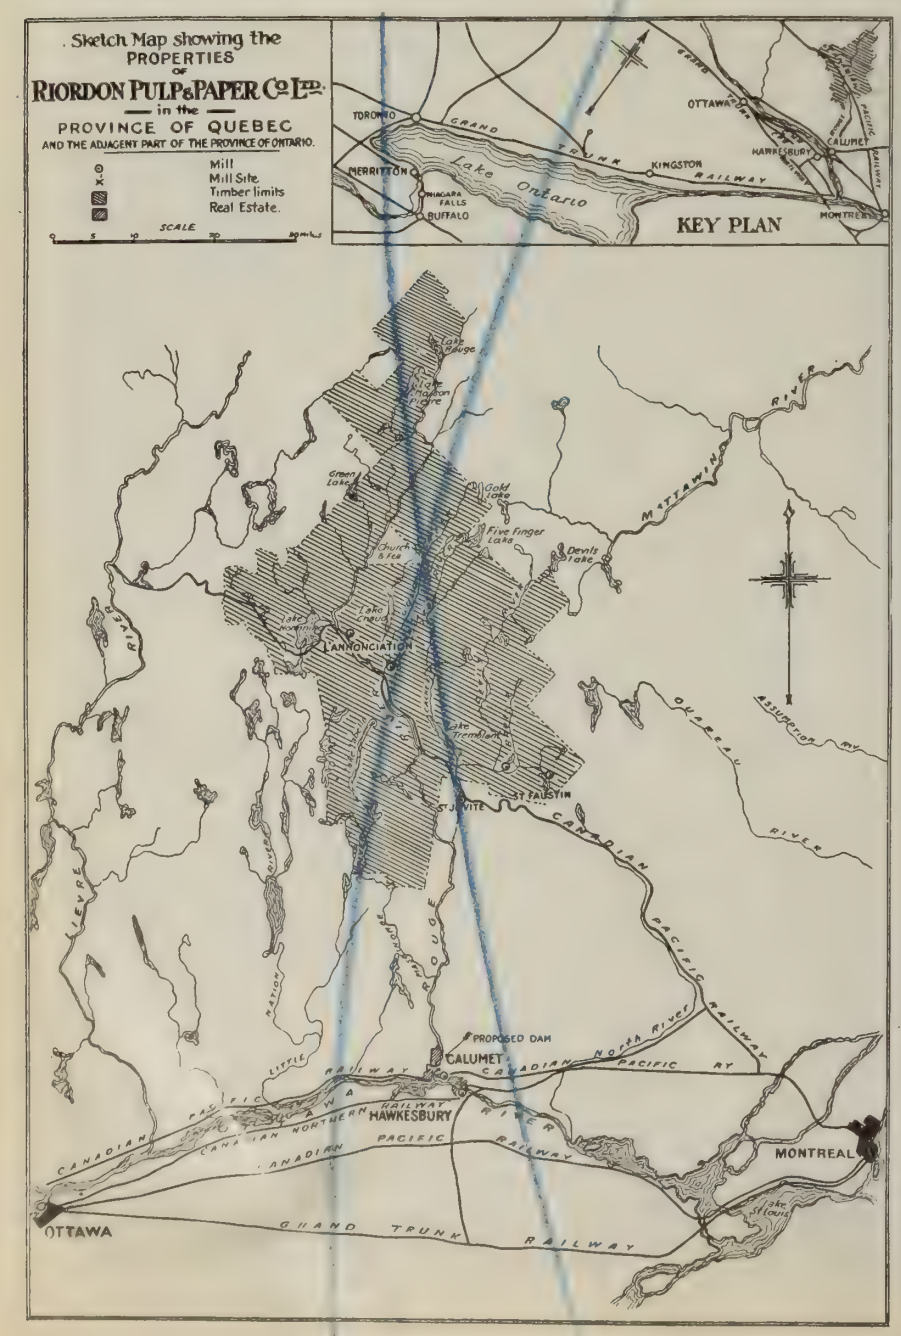
the company owns and controls 1,184 square miles of limits on the Rouge River, P.Q., comprising about seventy-five per cent. of the limits on that river. The limits are held under licenses from the provincial government, which confer the right to cut all the lumber (subject to the government regulations) consisting of spruce, pine, balsam, hemlock, cedar and hardwoods. The ground rent payable is $5 per square mile in addition to the regular stumpage dues. It is estimated that there is sufficient timber on the limits for the needs of the company for the next hundred years. The company have been exceedingly careful in their policy of lumber conservation, and have regulated the cut, as far as possible, to the annual growth.

The company is capitalized at $8,500,000, of which $7,000,000 has been issued. The assets are valued at $5,789,500. Of this the timber and timber limits are assessed at $2,056,000, the real estate and water powers at $808,900, and the buildings, machinery, etc., at $1,419,000. The average net earnings of the company from 1909 to 1911 inclusive were $226,410. The following are the directors: Messrs. Chas. Riordon, J. G. Riordon, F. W. Avery, Chas. E. Read, Walter G. White, and Carl Riordon, managing director.



Letters to the Editor

The Grading Problems—Some of the Obstacles

Editor Canada Lumberman:—

We think it would be a good idea to have a general inspection rule for the grading of hardwoods, but think it is impossible to establish such a rule in Quebec province on account of the way people buy their hardwoods—and then, besides, there is so much shipped to England, which is bought and sold on a grade all by itself—so that we think that the man who undertakes to get up a set of rules for the inspection of hardwoods will find a lot of trouble in trying to establish the same—and are afraid it will be turned down the same way as rules for grading pine were, at last meeting of the Canadian Lumbermen's Association.

Yours very truly,
FASSETT LUMBER COMPANY, LIMITED,
J. R. Collins.

Grading Rules Needed in our Foreign Trade

Editor Canada Lumberman:—

We have read with a good deal of interest the two articles published in your issue of the 15th inst., one entitled "A Ship Without a Compass," and the other, "How is Hardwood Graded in Quebec"? the latter written by Mr. H. E. Miles. We believe that it is very desirable to have proper grading rules for both softwoods and hardwoods, and the only way to accomplish their adoption is to agitate the question and get the big men in the trade interested.

You cannot expect the trade to jump at adopting rules that they know little or nothing about. It will also be necessary to show quite plainly to the trade the many advantages to be derived if such rules existed from one end of the country to the other. The Tonawanda, N.Y., rules for softwoods and the National Hardwood Association Rules of the United States would answer for all our purposes in Canada with very few modifications.

A large part of our output is shipped to the United States, and it would be a distinct advantage if our lumber could be graded at shipping points, and shipped to that great market under their well-known grades.

The British markets will also accept lumber shipped under these rules as they have used them for some years and are becoming familiar with them.

If you could get some of the leading manufacturers and dealers to meet and appoint practical men to go carefully over these rules, make any desirable changes, then adopt them, have them printed and start using them in their own operations, you would very soon find the trade fall in line and in four or five years they would be used almost entirely.

Yours truly,
ANGUS McLEAN.

Power Lost in Transmission

We have had some interesting reading and figures on the above subject lately. We have been shown that engineers reckon on 3 to 6 per cent. for shafting losses, while there are cases on record of 60.9 per cent. h.p. being lost. Why is that? some may say. The engineer's allowance of 3 to 6 per cent. must be totally inadequate. No doubt it would have been considered a very small percentage some few years ago, when plain bearings and heavy iron shafts were in universal use. To-day it is to my mind quite ample, providing care has been exercised in the purchase choice of power transmission materials—steel shafts, roller or ball bearings, etc., etc., and what is even more important is having a capable man to instal or erect your power equipment. Any handy man can rig up a line of shafting, but a practical and experienced millwright should be employed if you want a good job and want to run your plant economically.

The most important point of all, however, is the placing of machines or tools. This is an expert's work, while there are a few consulting engineers who have made wood-working machinery plants their specialty.

Now my point is simply this. Power can be transmitted in any factory at 5 per cent. loss if expert advice is obtained and acted upon—direct drives, group drives, step loose pulleys, friction clutches, roller and or ball bearings, solid foundations, good belts, etc. All those items help toward the economical transmission of power, but it wants a capable man to arrange the plant properly.

A great artist was once asked how he produced such beautiful pictures. He replied "Simply get the right color and put it in the right place."—J. M. N. in Mill & Works Practice.

Ontario Sash and Door Association

A meeting of the Ontario Sash and Door Association was held at the King Edward Hotel, Toronto, on the 8th November. The members of the Association present were:

Mr. W. D. Cargill, H. Cargill & Son, Cargill.
Mr. F. W. Brennen, M. Brennen & Sons Mfg. Co., Ltd., Hamilton.
Mr. H. A. Currie, Wilson Bros., Ltd., Collingwood.
Mr. F. Buchanan, C. Lloyd & Son, Wingham.
Mr. R. R. Gardiner, P. W. Gardiner & Son, Galt.
Mr. G. S. Siebert, Georgian Bay Shook Mills, Midland.
Mr. M. J. Emmett, Georgian Bay Shook Mills, Toronto representative.
Mr. S. M. Knechtel, Northern Planing Mills, North Bay.
Mr. G. P. Davidson, Estate of James Davidson, Ottawa.
Mr. O. W. Rhyness, Mickle Dyment & Son, Brantford.
Mr. R. A. Rastall, R. A. Rastall & Co., Toronto.
Mr. J. F. Houston, The Houston Co., Ltd., Tweed.
Mr. R. A. Laidlaw, Laidlaw Lumber Co., Toronto.

Mr. Cargill, as president of the Association, occupied the chair and was supported by Mr. Brennen, the secretary, at the chairman's table.

Mr. Cargill opened the meeting by welcoming those present, and then called upon the secretary to read a number of letters and telegrams of regret from some absent members.

The subject first under discussion and which was, in fact, by far the most important one before the meeting, was the question of the importation of United States doors into Ontario. The word importation was considered too mild by the members present, the majority of them using the term "dumping."

Mr. Buchanan stated that the situation was a very serious one and was rapidly becoming worse. He was of the opinion that the Association should take definite steps at once to place the matter before the Government.

Mr. Gardiner, who had evidently made a thorough study of the situation, stated that he had visited the United States and had obtained his information at first hand from the manufacturers there. He laid before the Association indisputable facts and figures to show that labor for the manufacture of doors could be obtained cheaper in the United States than in Ontario, and that the methods employed by the Americans were superior to ours. He gave particulars of doors imported into the Windsor district, and also details and prices of some laid down in Toronto. In spite of the duty and freight paid by the Americans, it was impossible for Canadian manufacturers to compete with them, nor could business be done at the prices which were in vogue by the Association at the present time. Mr. Gardiner gave the Americans credit for the appearance of the No. 1 doors sent to Toronto. He had carefully examined a number of them, and in no case did he find a flaw in the material, and the workmanship and finish was perfect.

He had also been told by American manufacturers that they were prepared to sell in Canada at a loss, and he and other members made calculations which amply proved that they were actually doing so at the present time.

Mr. Rastall confirmed Mr. Gardiner's statements as to the doors which were imported into Toronto, and said that he himself had been dealing in them. While he very much preferred to sell Canadian doors and was, in fact, prepared to sacrifice a considerable profit to do so, yet the prices at which American doors were now selling made it altogether impossible for him to make a bare living profit from the Canadian article. Mr. Rastall thought that the lumbermen were charging the manufacturers too much for pine, but the general opinion of the meeting was that not much relief was to be expected from this quarter.

The Secretary had stated that it was very difficult to obtain accurate statistics as to the number of doors imported into Canada from the United States, as they were not specially classified in the Customs' reports, being combined with many other manufactured articles under the terms "n.o.p." (not otherwise provided for), and although he had applied to several Government Departments in the United States, he had not been able to obtain figures which could be taken as in any way accurate. Mr. Currie, who was attending a meeting of the Association for the first time, thought that the members should ask their Parliamentary representatives to assist them in getting reliable information on this subject.

Mr. Brennen said it was very noticeable that architects were favoring American doors when making out their specifications, and he had a strong conviction that American door manufacturers were coming into Canada and offering architects considerable inducements for doing so.

A general discussion then took place. Mr. Davidson was of the opinion that the prices quoted for No. 1 doors were too cheap. Mr. Siebert knew of one firm in Montreal which had imported twenty car loads of fir doors from the U. S. Mr. Knechtel thought that the Government should be approached, accurate statistics and actual factory costs to be submitted to them, and adequate protection asked for.

The following motion was then put to the meeting and carried unanimously:—

"Moved by Mr. F. Buchanan and seconded by Mr. G. S. Siebert, that the present committee, with the addition of Messrs. R. R. Gardiner and H. A. Currie, be authorized to consider the question of American doors coming into Canada and, if they deem wise, to interview the Government with regard to a more equitable protection. Also that the same committee take into consideration the revision of our present price list and submit their report to a meeting of the Association to be called by the Chairman at a suitable date. That the committee be authorized to secure the co-operation of other manufacturers, either as individuals or as associations, in other parts of Canada, and also of the Canadian Manufacturers' Association."

It was then moved by Mr. G. S. Siebert and seconded by Mr. O. W. Rhyness, that Mr. Gardiner be the Chairman of this Committee. This was also carried unanimously.

A letter was then read by the Secretary in which Mr. W. D. Cargill, the President of the Association, placed his resignation in the hands of the meeting. Mr. Cargill stated in his letter that he thought a more practical man than himself should hold the responsible position of President of such an Association. General regret was expressed by the members at Mr. Cargill's determination, and upon the earnest solicitation of those present, he was prevailed on to remain at President until the end of the year.

The Secretary then spoke on matters of general interest to the Association. He stated that the membership was about fifty. The work done by the Association was more valuable than appeared on the surface and he augured great things from the enthusiasm of the members then present at the meeting. He thought that the Association did not meet often enough and that a little more energy put into it would be beneficial. He was of the opinion that an occasional social festive gathering should be held, and in this manner the members would become more intimately acquainted with one another.

It was decided to hold the next meeting of the Ontario Sash and Door Association on Friday, December 13th, at 11.30 a.m. in the King Edward Hotel, Toronto.

Specializing in Woods

Almost throughout the history of the lumber industry, lumber has been treated as a crude commodity, and many manufacturers to this date make little attempt to specialize and push their products into uses where they will be preferred to other woods, says the American Lumberman. Specializing is possible and is practiced to a large extent in those woods that go through further processes of manufacture after leaving the sawmill. Woodworkers are inclined to make very fine distinctions in the use of woods, and when they have once acquired the habit of using a certain wood for a particular purpose they are able to turn out a more satisfactory product and therefore hesitate to change from that wood to others.

Certainly a study of the various woods will develop important differences in structure and other qualities that determine their value for various uses. If the manufacturer of these woods and the retailer through whose hands they are sold is thoroughly familiar with the special qualities possessed by the wood he handles he will be able to emphasize these points to increase the sale of the particular wood. Not only that, but when a wood is used for the purpose to which it is specially adapted the user is more likely to be satisfied with his purchase, and lumber in general will be in greater favor than it would be if a wood were pushed into a use to which it is not adapted.

Many of the substitutes that have taken the place of lumber in many uses for which lumber formerly was preferred have won their present position by the kind of specializing that is here considered. In some cases, however, the manufacturers of substitutes have made a mistake in recommending their materials for uses to which they are not adapted, and some of the most serious setbacks they have received have resulted from mistaken zeal of that kind.

Wood is the best material in the world for thousands of purposes, and when each variety of wood is applied to the purposes for which it is best adapted the purchaser and user will be perfectly satisfied, the manufacturer will have a steady demand for his product, and lumber will maintain its supreme position in its legitimate field.

Forest fire loss in British Columbia has been practically nil this year, owing to three reasons, first, frequent wet spells checked the fed fires that got started; second, the force of fire wardens was greater, and third, oil-burning locomotives have replaced the spark-scattering engines over a considerable portion of the C. P. R. in the interior timber belt.

Importance of Uniform Lumber Grading

What Is To Be Our Future?

(Written specially for the Canada Lumberman and Woodworker by H. E. Miles

Mr. H. E. Miles

While the writer has been a reader of the Canada Lumberman as well as other trade journals, to his mind, nothing of greater significance to the lumber industry has appeared in print than the editorial published in the October 15th number of this journal entitled: "A Ship Without a Compass." It has a progressive ring; an ideal to attain.

That some standard to determine the quality and fitness of lumber for the various requirements of the trade is necessary is self evident. And that such a standard to be practical must, not only be adapted to such requirements, but be universally adopted is also self evident. For if the standard employed by one man, or a body of men, is adverse to that held by others with whom they are to deal only confusion and dissatisfaction can prevail. However, despite the existing evils caused by the absence of such a standard in many places, we hear whispers of protest. Although, at present, we are unable to know the reason for such we will lend a listening ear for we are ever out to learn.

We note the editor of this journal states that letters asking for information regarding the inspection of lumber are often received from members of the trade throughout the country. Surely such is only natural in view of the fact that no specific rules are known except by a few, and any man who is at all practical would naturally, on entering the trade, endeavor to acquaint himself with the standard by which he is to manufacture or deal out his goods.

If the grain trade needs a standard by which the various quantities of wheat, oats, etc., are to be measured how much more does that of lumber.

To the writer's mind there is no one industry that calls for so many different grades of its products as that of lumber. However, there are many, as has been before stated in the columns of this journal, who have been shipping lumber for years trusting to the condition of the market and to the honor of the buyer. This is evident from a remark made by one of the most extensive exporters in the Dominion to the effect that when the market is dull pieces of cutting will be rejected that would pass inspection all right at other times. This statement was made to the writer during the panic of 1907 and the shipper further stated that his concern was having a very sorry time of it in the English markets over the matter of inspection although they had previously been very successful in satisfying that trade and at the time was more careful about culling than ever. While it is quite natural that during a depressed market only the better grades find a ready sale, if such markets were controlled by an accepted, written standard by which the grade of lumber to be shipped could be compared, those that were ordered would of necessity, be accepted without a comment, and the experience of the writer is such that when one has sold a shipment of lumber naming some particular rules for its inspection the fellow who kicks is only breeding trouble for himself and without a compromise too if you please. Not that we would infer, for a minute, that he is clever but when one makes his shipments well up to the grade, as he should, and measures and tallies it properly what show has the kicker? He has absolutely none. Such shipper can advise his opponent that he is quite willing to make a reinspection, and in case he does not know it, he soon finds out that the shipper can get top of that shipment and tell why, and back it by a set of printed rules. The only thing for him to do is to pay the fellow for his time and trouble together with travelling and hotel expenses and learn a lesson, or do worse by heaping up more cost for himself by applying to a court.

By virtue of such a course the writer has had, on the whole, only pleasant experiences with the matter of satisfying his customers, and is convinced that as a rule those to whom the manufacturer ships his stock are men of honor who only require what they order and the worth of their money.

Of course there are a few whose nature seems to be to kick without a cause and thus effect a compromise, but if one is properly armed, such tactics are only amusing and affords a bit of recreation that would otherwise have been missed, hence such may be a blessing in disguise.

Thus far we have mentioned only one of the advantages of having a guide, but now we will consider a few relative to the importance of having one that is at home whether in a state, province, or kingdom. While there seems to be a difference in the requirements, we can see no reason why one set of rules cannot be made to cover all the requirements of the entire earth and some of the planets, so far as we know, despite the fact that it is alleged that arbitrary rules can be adopted with satisfaction.

Of course it would be quite as impossible to define every minute detail as it is for a legislature to name all the conditions and circumstances involved in a civil statute, but no judge would contend that the law wasn't applicable because it did not specify every such condition. Neither should any inspector find any trouble to determine the requirement of a set of rules because they might read, "one or more standard defects," as the case might be, "or its equivalent." From personal observations and inquiries into the matter the writer is convinced that nearly all the differences which arise in the trade are due to misunderstandings owing to a lack in not having a definite, universal set of definitions of what constituted the grade of lumber to be shipped.

We understand that it has been objected that, to establish such a system it would involve a staff of inspectors. Well, what of that. There was nothing ever accomplished worth mentioning that didn't require some effort. "A faint heart never won a fair hand" or anything else worth of note, and that matter may prove to be more of a mole hill than a mountain in the end.

When once a set of practical rules are established, printed, and circulated, the culler that holds his job will be required to know something about them and will find himself backed by something more tangible than a rumor from some dead ancestor. And the greater part of the differences that now exist will vanish. However, to adjust the few difficulties by way of disputes that would naturally arise, a few practical men can easily be chosen at different points who can make reinspections and demonstrate their ability by, thus sayeth the pocket volume, that should be in the possession of every dealer and culler in the country. To show the practical workings of these principles we only need to turn to the work of the National Lumber Association in this respect. The matter of uniform grading has been one of the chief objects of this association, if not the chiefest, since its existence and the results of its efforts is felt with high appreciation in all the markets where American lumber is handled. Having a desire to probe to the bottom of this matter, the writer wrote letters of inquiry to many of the prominent concerns as well as different lumber associations and individuals in the trade throughout this country from ocean to ocean. In every instance those responding gave the movement a hearty welcome, and not a desenting note was sounded.

The system as practiced by the National Hardwood Association is lauded everywhere, not only by those belonging to the association but all, so far as we can learn, who have to do with it. Such is also the writer's personal experience. Although never belonging to the association, by the use of their rules he was brought in unison with the hardwood markets of that country, and when hearing people talk unfavorably about shipping to the American markets, complaining that the dealers over there were fussy, and would take advantage, it is apparent that such shippers have never properly learned their definitions or perhaps have had none to learn.

Among many of the letters received, we will here mention the advice contained in one, the writer of which is not a member, for he says: "Although I do not happen to be a member of the National Hardwood Lumber Association, I can, however, endorse their rules, regulations, and practices, as being satisfactory and acceptable all over the United States." And calling attention to their methods of supplying a certificate with each shipment, he remarks, that such is usually accepted by the buyers without any question. This man is well known to the writer and stands at the head of a very large concern who is a heavy buyer of hardwood for the Eastern trade. Such show how their work is regarded by those buying as well as the shippers, and is a sample of the sentiment expressed of the methods employed by that association. And what is true of the inspec-

tion of hardwood is also true of the soft. Take for instance cypress and pine; we know of no market in the United States that is not governed by uniform rules for these particular woods.

It would seem to the writer that the work of the Canadian Lumbermen's Association would be incomplete without adopting the same attitude to the lumber industry and establish uniform grading among its members with a qualified staff of inspectors which would also be appreciated and employed throughout the trade. Or will the dealers be under the necessity of organizing a distinct body for that purpose?

We see by the last report of the National Hardwood Lumber Association that its membership has greatly increased in this country, and why should it not? Its workings are practical and the progressive man, who wishes to avail himself of every advantage, would naturally join just such a body. Hence, unless the Canadian association keeps tab with such matters what can they hope for their future?

It is a very practical proposition for the small manufacturer to sell his stock, "log run dead culls out," or "log run mill culls out," especially that of hardwood, since it requires a large stock to make it profitable to sell in grades, for such involves many disadvantages too well known to need mentioning here. However, there being no definite printed rules to go by, there is perhaps as much or more dissatisfaction over that class of stock as any other, simple as it ought to be. Hence we return to the plea for a system of uniform rules to be universally adopted; not to be uniform for one province, or even one country, but as far as the trade might extend.

To illustrate the practical working of the plan, to secure suitable stock for the many purposes, one only need to look over the rules as adopted by the leading associations in the United States who have established such, to determine just what grades to order. Take for instance those adopted by the National Hardwood people as above referred to; they are so broad and yet definite that no one need to mistake their requirements, and they cover grades enough to enable any wood worker to select a stock especially adapted to his business.

And we would not discriminate against those of the Manufacturers Association for they are perhaps equally as good or better. There is, we believe, but a slight difference, and the writer is not prepared to argue the superiority of either, for having chanced to arm himself first with those of the National, and finding them sufficient for every emergency, so long as being mentioned when selling, he may be biased in their favor. However that may be, it would be ungrateful to discriminate against the bridge that has carried him safely over. And while those of the other association may be superior he has never found any trouble in finding sale for more lumber than he could handle on such rules, although, many times, in the local trade as well as in foreign markets, it was found necessary to first supply the customer with a copy that he might understand exactly what he was buying. In every instance they found favor, even with one of the largest concerns in Liverpool.

If, however, such are not adopted to the English or any other trade the proposed universal rules may have a section that will specify the requirements for that particular market and let that be universal for such market. As to the English market the writer is led to believe that the English dealers have quite uniform ideas regarding the stock they desire from this country but as yet have established no printed rules which would be a great advantage to the trade if they would.

The same principle applies to all soft timber and we find that the several associations who have compiled the rules for the various kinds of wood have done their work so completely that they are inscribed on the statutes of Massachusetts although many of them had their origin in the West and South.

Despite these advantages and many more which would require too much space here to relate, there has ever been an adverse element, so we are instructed by those who have baffled for the cause from its infancy. Nevertheless it has advanced until the principles have become so popular in the United States that a movement is now on foot to try and persuade the two associations holding the most popular rules, for the grading of hardwood, to slightly modify one or both so they may read alike, thus establishing uniform grading to the fullest extent, for, as we have seen, they are so universally adopted that in case of a dispute, where no rules have been mentioned in contract, it would be very rare that any other could be applied from Maine to California.

A Glimpse of the History of the Rise and Progress of the Movement

When the National Wholesale Lumber Association was launched in 1894 it appears that conditions in the States were worse than at the present time here, for there was practically no rules available. And referring to advice rendered by the secretary of said association, they found it at first very hard to get their members interested in such a project, but after some effort on the part of its leaders a separate association was organized having for its aim, not only to establish some rules, but uniform grading for hardwood throughout the land. Although it required some time to get sufficiently established to command recognition it finally succeeded and a few years later some of the manufacturers of the Middle West appreciating the necessity of such a system, but believing those outlined by the former organizations was not quite to their liking, started another organization for the purpose, and they were soon joined by still another who set about to accomplish the same end but to found rules a little more to their liking, each of which have made great progress. Although such placed three set of rules before the public three set was far better than one and at present the popular sentiment seems to be in favor of having but one. Soon two of these became very popular and the movement to have them modified to read alike is in the hands of a committee composed of some of the most practical and influential members of the trade who are evidently in earnest about the matter and expect to get these two associations to see eye to eye, thus establishing uniform grading throughout.

If it is alleged that the adoption of such would mean a cater in favor of any one class of dealers, it will be noticed that, those who compose the membership of those organizations who have been the most instrumental in advocating it is composed of men in every sphere of the trade, in almost equal numbers.

The principles are certainly as beneficial to one class as to another. In fact they are of no use to one unless adopted by the others.

We note that some have objected to universal grading on the grounds that they have been to great expense and much effort to established rules of their own and now to throw them all up and adapt themselves to others would not be agreeable, besides, such would likely effect their business, temporarily at least.

We have some sympathy with this class of people since it is evident that they are possessed with more originality and ideality than some who have not even gone so far as to employ any rules. However, we trust they will not spoil the good impression given, by becoming narrowed or unwilling to sacrifice a bit of apparent good fortune for the sake of others. Who knows that if such an one has established proper definitions that his may not be the ones to be universally adopted? If they are not ideal he should certainly be willing to exchange them for something better. This is no age to build castles, feudal days have gone by, and the man to be progressive must be broad minded or get out of the ring.

This subject means something to the people of Canada when we come to realize that much of the civilized world is looking to us to supply them with lumber for future generations. If we are to keep pace with the times and become really progressive can we confine ourselves to a class of rules only applicable to a portion of the trade; or retain so many that those placing orders cannot know what to expect owing to such a babylon of voices?

Should we not rather become of one mind and unite in attempting to place the lumber industry on a solid commercial basis by establishing a system of grading that will command respect the world over?

There are many dealers in this country handling millions of feet of lumber each year that never saw a copy of any rules and there are a few who have, some of which, however, have a marked tendency to try and keep others as ignorant as possible. The writer has observed this many times and when first entering business he asked one inspector, who chanced to have a copy, why the people he represented did not advise those of whom they bought lumber concerning the rules on which it was to be inspected also telling them where they could secure copies of the same. Whereupon he replied that it was poor policy to do that; that the public already knew too much about them. However, after enjoining great secrecy he consented to make a loan of that certain copy during noon hour. This was the first copy of any rules for the inspection of lumber that the writer had ever seen. After perusing its contents, copying a portion of it, and making note of where copies of it were kept for sale, it was returned. Such was the door that led to that for which the writer had been seeking.

There may be more of this class running at large but such people cut but little figure either way, hence we look forward to the time when the Canadian Lumberman Association will get hold of this thing in earnest and push it to its finish. However, should they neglect the privilege we are sure that others will rise from this cosmopolitan population and do the work.

We are looking forward to expansion of trade, are we not? Then why should we not broaden our minds and study the world's requirements which will enable us to supply them. Can this be done by withering all up and be content to grade our lumber according to the ideas of the operators of a few dressing mills or retail dealers located in one part of the country.

If we are to be at all progressive we must win the trade of the Latin States of South America, and we are glad to know that the Canadian Lumbermen's Association have contemplated sending a

representative there to study their requirements and to cast an influence for us. Now suppose he is to start soon, can you see any disadvantage that he is up against? He can tell of the great trees of British Columbia and of our well equipped mills and facilities for prompt shipment, etc., but to the writer's mind he would still be lacking something. Some practical man might wish to see a copy of the rules we employed for the grading of our output. Perhaps some of the more clever members of our commonwealth would manage to get over the matter without embarrassment but the writer would prefer to be excused when approaching that point. On the other hand our representative would more likely carry an influence if he were able to immediately present the inquirier with a nicely bound copy of practical grading from which he might easily select just the stock he was looking for. In such an event he would likely be impressed that we as a people were systematic and technical; that we had cullers that knew their business and had a standard whereby any dispute might be settled.

Are we to hold the largest timber wealth in the western hemisphere and not know how to classify the product? Are our dealers to be groping in darkness, while our cousins over the line march on to victory in the foreign trade singing the harmonious notes of uniform grading? This question is up to the dealers of Canada. How will they act upon it?

Utilization of Hardwoods

Without much noise, blowing of trumpets, or brass band parading of any kind, the hardwood door is making more progress to-day than any other one article manufactured from wood. It is increasing in volume steadily and continuously at such a rate that it is doubtful if anyone can keep up with it, even to the point of making a correct record of its progress.

It is not merely the hardwood door turned out by the conspicuous and well-known door manufacturers who specialize in this work, but all over the country, planing mills are continually turning out increased quantities of hardwood doors. The output of each mill perhaps is insignificant as compared to the output of the door factory proper, but the output from all planing mills all over the country makes an enormous volume.

The hardwood door of to-day is usually a veneered door. Now and then may be found a solid door, but these are exceptions and are made to order to satisfy a sentimental rather than a structural requirement. There are doors with thin hardwood veneer, some with thick hardwood veneer, doors with plain hardwood veneer and doors with extremely fancy veneer very carefully matched and artistically finished.

The standard door is veneered with hardwood veneer one-eighth of an inch thick. In the fancy door, taking mahogany and other figured woods, thin veneer is used, because it is not practical to get it in the standard thickness of the door stock. Also, there is a disposition now in building doors for outside, to use a heavy veneer. Some of it is made as thick as one-fourth of an inch on the theory that it will resist the moisture better and there will not be any likelihood of veneer peeling when thin veneer is used and the door is exposed to weather on the outside.

In the veneer door manufacturing world proper, birch is the first wood that became conspicuous in the making of the hardwood door. Then came oak, and now we have gum, and the rivalry among these three popular native woods promises to be quite lively in the future.

Already the exclusive makers of birch doors have found themselves compelled to include a line of oak doors and a fair quantity of gum, and those who began making oak doors exclusively at first have found themselves compelled to add a line of birch doors, and following right on the heels of this comes the gum door clamoring for recognition in the front ranks, too. This is among the door factories proper. In the planing mills there is the same rivalry as to choice, but the planing mill men themselves do not take much hand in it. They simply make the doors to order and supply whichever of the native woods is wanted, or when required make the extra fancy doors with mahogany, Circassian walnut, or whatever is specified.

The explanation of the remarkable progress made lately is to be found in the fact that the builders of modest homes have taken to hardwood doors. They cost a little more than the high-grade solid pine doors. When a prospective home builder goes into some newly finished home and sees hardwood doors, the pine doors are no longer attractive and he wants hardwood doors immediately.

The only people objecting to hardwood doors are the carpenters who find it a little more tedious to put up a hardwood door. So, they are inclined to charge a little more for them, but when the house builder gets them he feels like he has had his money's worth even though the doors cost a little more and the carpenter sticks him a little extra for the hanging.—Hardwood Record.

Woods Used in Saw Handles

Although one is not apt to think of the apple tree as a source of timber, as a matter of fact at least 2,000,000 board feet of apple lumber is manufactured annually into saw handles, says the Hardwood Record. This, too, is about the only important use to which it is put, though small amounts are made into smoking pipes, and miscellaneous articles of turnery. The wood was formerly used for shuttles and gave excellent satisfaction, but has been entirely superseded by persimmon and dogwood. As a fuel wood apple has few superiors.

Apple wood is usually the product of old orchards which are removed on account of age. Owing to the inroads of pests of various kinds during the last few years, a comparatively large amount of apple timber has been offered for sale, especially in the Middle West, where old trees are being replaced by new. The supply of this timber comes from Kentucky, Ohio, Indiana, Illinois, Michigan, Pennsylvania, New York, Delaware, New Jersey and Maryland.

Small lots are occasionally imported from Canada. It is interesting to note that when the collectors inspected the shipments they assessed it as "cabinet wood not further manufactured than by sawing." The importers were dissatisfied with this classification and succeeded in convincing the collectors that apple wood is never used for cabinet purposes, but almost exclusively for saw handles. The Board of General Appraisers sustained the importers' contention and the wood enters as plain lumber.

Apple lumber is sawed from butts which run two feet or more in length, occasionally reaching eight feet long. Bolts less than thirteen inches in diameter are ordinarily not used, "for the reason," as a manufacturer explains it, "if the butt is smaller than that the wood is worthless for making saw handles, since a certain width clear of heart is required."

Sometimes logs are shipped to the factories and sawed there. More often the manufacturer buys the material sawed into lumber from 6 to 6½ inches wide and 1⅛ to 1 3/16 inches thick. The length of piece required for a saw handle is nine inches.

When the timber is first cut it has a reddish yellow color. It is customary to subject it to a steaming process, which reddens and deepens the color and renders it more uniform. To secure the best results the steaming must be done after the timber is cut and before the sap is dried out. This is accomplished by placing the green wood in a tightly closed box or room and subjecting it to the action of live steam for a period varying from thirty-six to seventy-two hours, depending on the length of time the timber has been cut; the greener the material the less time required in the steam box to get good results.

Following is a brief description of the processes of manufacture of Disston hardsaw handles: "The thoroughly seasoned lumber is planed down to an even thickness and then sawed into small pieces, generally of such size that two handles may be made from each of them. The makers then trace the shape of the handles with lead pencils around sheet steel patterns. They are then cut out by the band saws, after which a hole is bored in the center through which the jig saw enters and cuts out the center piece. They are now sent to the 'nosing' machine, where the nose is shaped. 'Jimping' is the next operation. In this the roughly cut handles are brought into contact with swiftly revolving cutters, and the edges are rounded. The handles now pass on to the filers, who work them into the finished shape. This is followed by sand-papering on belt machines. The next step is varnishing, after which comes 'slitting,' as it is termed, or the process of sawing the slot in the handle in which the blade rests.

Apple wood, being hard, of very fine and uniform texture, capable of receiving a high polish though of little lustre, is very well adapted for handsaw handles. The deep, uniform color makes it attractive and the trade has become so used to the wood for the better grades of handles that none other is considered satisfactory. The price of the material is so high, however, that for the cheaper saws beech is a common substitute. What beech lacks is natural beauty and high polish is offset for general utility by its greater strength, toughness and vitality. Other woods used for handsaw handles are black cherry, red gum and maple and, where specially ordered, black walnut and mahogany. Handles for long or cross-cut saws are made principally of beech and maple, though some few are of hickory.

H. Morton Jones, of the R. T. Jones Lumber Company, of North Tonawanda, has been appointed a first lieutenant in Company K, the local company of state militia, attached to the 74th Regiment of Buffalo.

Mr. H. J. Hoadley, recently retired from wholesale lumber business in North Tonawanda, is moving to Buffalo. Mr. W. H. Griffin, of Silverthorne & Company, of North Tonawanda, has bought the Hoadley home on Christiana street.

Why do Lumbermen not apply Forestry?

Little Cause as Yet for Congratulation—Few Timberland Owners Using Successful Methods for Ensuring a Continuous Crop

By Dr. B. E. Fernow*

It is precisely thirty years, a generation, since the forestry movement was publicly started in the United States by the Forestry Congress meeting in Cincinnati.

What success has it had in persuading timberland owners to apply forestry methods to their holdings? Outside the Federal Government, which has actually and on a large scale begun to introduce forest management on its timberlands, outside of a few half-hearted and small beginnings of some of the States to bring their few acres of timberland under some systematic treatment, how many private owners and on how many acres have they made even such beginnings in changing their attitude towards their timber properties and cut-over lands, such as forestry implies?

When it is realized that the private ownership represents about three-quarters of the total timber supply and forest area of the country, the importance of the attitude of the owners becomes apparent.

Whatever some hopeful enthusiasts may think of the situation, to the cold-blooded reasoner from facts, there is as yet little cause for congratulation visible. There is, to be sure, little information published on the subject, but we may be quite sure that everything worth noting is on record regarding private endeavor in introducing forest management, and in what is on record the most comprehensive construction has been given as to what includes forest management.

The result of an inquiry reported in the second volume of the Report of the Commission of Conservation show that out of around 600 firms, representing not as much as three per cent. of the total privately owned acreage, hardly one-fifth in number uses some conservative methods, one-quarter is held for a future crop, and only a little over one-third in acreage reports even measures taken for protection against fires! In another inquiry, the acreage reported protected against fire rises to as much as 50 per cent. of the reported ownership. If these reported conditions were at all representative, they would show, that still most owners of timberland do not even take precaution to protect their property against fire. In this respect, however, great strides for the better have been made lately, and, if a new inquiry should develop that really effective measures are in operation on half the acreage of cut-over lands—the most important part for the future—our hopes for the eventual application of forestry would rise one hundred per cent.

This leads us to the question: is protection against fire, forestry? Is the surveying and mapping, and more careful estimating and locating of timber, and systematic arrangement of logging operations, forestry? Is even, holding for a future crop forestry? Indeed, what is forestry?

It seems rather late in the day to raise this question, and yet even professional foresters have hazy notions as to how to answer the question; the incidents of forest management appear to them principal issues! Of course, protection against fire is necessary in order to carry on forest management. So in any other business protection of the property is a first essential; it is merely a general, not a specific, measure, belonging to any one business.

Of course, it is wisdom to base logging operations on systematic plans based on accurate information, as in any other business. This also is merely a general management not specific to forestry except in the method of ascertainment. It is, to be sure, also an incident to forest management, but not an essential. Lumbermen have done similar things without any thought or knowledge of forestry, in a cruder manner, and may now find that the foresters do it better and cheaper than the old cruisers, hence may be inclined to employ foresters.

Lumbermen who will make plans to protect their property will map and plan the operations on their holdings systematically, they will adopt measures to reduce waste in the logging, to utilize more closely, etc., merely because they find that it pays in the present. The cutting to a diameter limit, which is advocated as a forestry measure, is also commendable to the lumberman only when he has figured out that his present business of exploiting the forest pays better if he delays for some years the cutting of smaller sizes until they have increased in diameter and value; it is a short time financial calculation that induces him which has not necessarily anything to do with forestry. Even the "holding for future crop" will, we suspect, be found in most cases to reduce itself to the same position, namely, a waiting for increase in size and value of the present immature crop which Nature had provided.

* Dean of the Faculty of Forestry, University of Toronto—Reprinted from American Forestry.

Finally, we must declare, that leaving mature timber standing is no more forestry than storing and keeping locked up goods in trade!

Some of my professional friends will take issue with these declarations, since all these measures are incidents or may be turned into useful adjuncts to forestry management. But I take the position that from the broad standpoint of political economy the idea of forestry involves an attitude of the owner towards his property, which either makes these measures a part of a forestry program or excludes them from such designation.

The forest can be looked upon either as a mine, the stored material of preceding ages, which the lumberman exploits, or else it may be conceived as a crop, which the forester harvests and reproduces. Reproduction is the key-note of forestry; it denotes the difference between the exploiter, the converter of material into serviceable form, and the forester, the crop producer.

How many of the timberland owners, even those who adopt the measures enumerated above for improving their business conduct, look at their property as a means for continuous crop production, for sustained yield? I do not mean the strict economic sustained yield, i.e., the deliberate, intentional devotion of the soil to the production of wood crops. I venture to assert that there are as yet not as many as can be counted on the fingers of two hands who would affirm that they had deliberately started into the business of wood production—which is forestry!

Even those, who have started planting their waste places—and we are glad to see their number growing rapidly—will be found often dubious as to their purpose.

At any rate, we come back to the original statement that attempts on the part of corporations and individuals to start in the forestry business are so sporadic and few that it is worth while to inquire for the cause of the failure to follow our advice.

There is one simple answer, the one condition by which forest cropping differs from all other business: the time element and the many uncertainties which that involves!

It takes 60 to 100 years and more to grow saw timber from the seed—as a rule, varying with locality and species, 1 inch in 5 to 10 years in diameter may be secured on the average; the sower rarely is the reaper. During all this time there is the fire risk, and the risk from wind and insects; there is the capital invested without a chance of changing the investment. Will, so long hence, wood, or this particular kind of wood be wanted in the market? Will substitutes have replaced wood? What will be the wood prices? Will our present outlay be returned to us with proper interest earnings?

We may point to Europe and show that forest property after all is on the whole not necessarily so hazardous as with us at present—with us it is still more hazardous than any other and for reasons must remain so for some time; that, in spite of substitutes, wood consumption has continuously increased; that wood prices have continuously increased; that excellent returns have come from persistent forest management.

All this occurred under other conditions of civilization, and in the past, who can assure us of the future? Forestry deals in futures, and if it is hazardous to deal in futures in Wall street, so the forester owner thinks it is wiser to secure the present dollar instead of waiting for the possible two. The disposition of all our people is to live for the present, and the timberland owner is naturally not an exception.

This sounds altogether pessimistic. It is not intended to be so, but is to bring home the fact that forestry as defined above is a business sui generis, that it can be successfully carried on only under special conditions, and that private, present interest is not likely to enter it with ardor and persistency. One of the important conditions for its successful conduct—we leave out of consideration the farmer's wood lot—is size.

Some twenty years ago I was asked whether I thought that forestry could be profitably practised in the United States at that time. I did not hesitate to state the conditions under which, in my opinion, it could be practised. Give me two million acres of southern pine and three million dollars of capital, and it would not be difficult to demonstrate that a real forestry practice, i.e., deliberate, systematic reproduction of the cut areas will pay in the long run.

Altogether, forestry is a business for the long run, hence persistent corporations, municipalities, States who live into the future are the proper persons to engage in it. Until we wake up to this realization much energy to induce small forest owners to go into the business will be wasted.

St. Lawrence Insurance Rates Unfair

High Premiums a Relic of Former Days Before Improvements to Navigation—Heavy Freight Rates the Result

A recent speech delivered by Mr. J. D. Hazen, Minister of Marine & Fisheries, at Montreal, has again directed attention to the discrimination in insurance rates against British North American ports. The subject is a very old one, and many representations have been made to British underwriters on behalf of Canadian merchants and shipowners, but unfortunately those on this side can obtain no relief. Montreal, as the national port, naturally feels the injustice more than any other, and lumbermen, who ship the bulk of their products from that port, share in the burdens which the excessive rates of insurance on hulls and cargo impose on the exporting firms. The city of Quebec and the ports in the Maritime Provinces are also more or less affected. Canadian lumber has enough to do to hold its own in the British markets, owing to the keen competition of other woods, and the chances of our keeping and improving business are distinctly handicapped by insurance rates, which, in their operation, prevent the entry of tramp vessels into the St. Lawrence trade, thus enabling the regular steamship lines to keep up freight rates to a high level. There are many complaints to-day of shortage of tonnage, but not until the rates of insurance on hulls are lowered is there any likelihood of permanent relief. Then we should get a number of tramp vessels at Canadian ports, and the resultant competition with the present Conference steamers would make freights more favorable for importers and exporters. Insurance rates for cargoes would, no doubt, also be lowered, and merchants would be benefited in a double sense.

The St. Lawrence rates of insurance are about as high as those for Boston, New York, Portland, etc. The extra premiums are prohibitive to all vessels save the regular lines. It is not contended that the rates for the St. Lawrence should be the same as for New York or Boston, but it is asserted that they are unduly high, and that they drive away business to competing United States ports. Previous to 1900, outside tonnage was allowed unrestricted navigation in Canadian waters between April 1st and October 31st without extra charge, but from that date the obnoxious B. N. A. clauses have been added to all policies on hulls. This clause is as follows: "Warranted not to enter or sail from any port or ports, place or places, in British North America, except Halifax for purposes of coaling. On payment of an additional premium of per cent. it is agreed to cancel above warranty—except British North America between September 1st and April 1st." The clauses mean the imposition of at least ten per cent. on ocean freights, and have resulted in tramps being practically excluded from Canadian waters.

The clauses referred to, were inserted with the object of providing for unusual risks, especially in the St. Lawrence. Since that date, however, a great deal has been spent in buoying, deepening, lighting, and improving the St. Lawrence, until to-day there is probably no river in the world which is better lighted and buoyed. Rates have no doubt gone down since 1900 but not to the extent they ought to have and the obnoxious clauses still stand, shipowners and merchants thus being penalised. The extent to which the latter are handicapped may be judged from the fact that 2½ per cent. per annum is charged to owners to the United States, while it costs from four to six per cent. for regular lines to Canada.

To quote the words of Major G. W. Stephens, former head of the Harbor Board: "These high rates on cargoes and hulls to Canada are maintained, and the restrictions on outside tonnage adhered to—in spite of the fact that marine insurance companies and underwriters through the improvements carried out, and through the higher class risk resulting from the bigger and better ships now employed in the trade, are admittedly making large profits; in spite of the fact that the last few years have seen a marked reduction in the number of accidents in Canadian waters; in spite of the fact that the aids to navigation provided by the Canadian Government have been carried out without the addition of a single cent to underwriters or ship owners; and in spite of the fact that the size of steamers navigating Canadian waters has almost doubled during the period under consideration."

So far the London underwriters have refused to give way to the representations from this side. It is asserted that the risks in the St. Lawrence are unduly hazardous, but the underwriters have been challenged in vain to prove this assertion by the production of their books. As a matter of fact, it is known that the business is very profitable, and out of the two and a half to three million dollars annually paid in premiums on vessels and cargoes it is probable that, even in the worst years, one-half of this sum is profit. It is also asserted that fogs are very prevalent and result in big losses. No one can deny that fogs occur in the St. Lawrence and the Gulf; but vessels to New York run equal risks with fogs, and yet the premiums are substantially lower than those to the St. Lawrence. The fact appears to be that years ago, before the improvements were made, the St. Lawrence received a bad name, and that, despite the enormous sum spent on the river, the bad name still remains. The underwriters are not inclined to recede from their position, and it may be that there will be no relief until Canadian shippers formulate an insurance plan of their own, backed by government aid.

May Follow Ontario's Experiment

The experiment of the Ontario Government in calling for tenders for the Abitibi pulp limit in northern Ontario, and stipulating in the contract made with the successful tenderers that in addition to the bonus of $5,000 a year to be paid to the Government, a paper mill of 100 tons capacity must be erected, and $50,000 spent in erecting buildings and preparing land for settlers, is being watched with much interest in Government circles in Quebec. The Quebec Provincial Government, like that of Ontario, has vast areas of timber country in the neighborhood of Abitibi, and thence eastward sheer to the Atlantic coast, and it is stated that a scheme is now under consideration for securing the establishment of a series of pulp and paper mills throughout the country, on lines similar to the experiment of Ontario. The National Transcontinental Railway will afford an easy outlet for the products.

Forestry as Taught at Laval

There is a larger enrollment than ever this season in the Forestry School established by the Government of Quebec in connection with Laval University. This is consequent on the greatly increased interest in the paper making, pulp wood and lumber industries of the province, and the promising careers offered by the Government to expert forestry men. It was only in June last that the first students of the school graduated. There were seven of them, and on getting their diplomas they were at once employed by the Government to take places in the parties sent out on the work of exploring and classifying the land and timber right across the northern part of the province, from Abitibi, on the Ontario border, to the Gaspe coast.

B. C. Exhibit Wins First Prize

Some exceptionally fine British Columbia coast timber samples attracted wide and favorable attention at a recent inter-provincial competition at Toronto. A display of British Columbia fir, spruce, cedar and hemlock won first prize. The first sample of each was a four-foot length from the butt of a log. The second sample consisted of a four-foot length squared. The third consisted of a piece of log sawn into a plank and dressed and finished to bring out the natural beauty of the grain. With the exception of the spruce the logs were all more than ten feet in diameter. Planks ten feet wide without a defect of any description could not help but attract attention in the East.

Quebec, Oct. 31; (Special correspondence of the Canada Lumberman).—A deputation of paper manufacturers in the Province of Quebec to-day waited on the Provincial Cabinet with a request that the government abolish the restriction on the export of pulp wood from Crown lands to the United States. The companies represented were the Laurentide, the Belgo, Wayagamack, and Price Bros.

On behalf of the deputation it was stated that the restrictions handicapped the news print companies in entering the United States market to the south, as the United States Government imposed a duty of $5.75 per ton on newsprint manufactured from pulpwood grown on Crown lands, paper from free limits wood being admitted free.

The Bateman Manufacturing Company, Grenlock, N. J., have purchased the plants of the Wilkinson Plough Company, Limited, and the Toronto Pressed Steel Company, Limited. The new company will be known as the Bateman-Wilkinson Company, Limited, and will manufacture the same lines as the two companies they have purchased, and also their own lines, viz.: potato planting and digging machinery, spraying machinery, riding cultivators, horse hoes, and small garden tools.

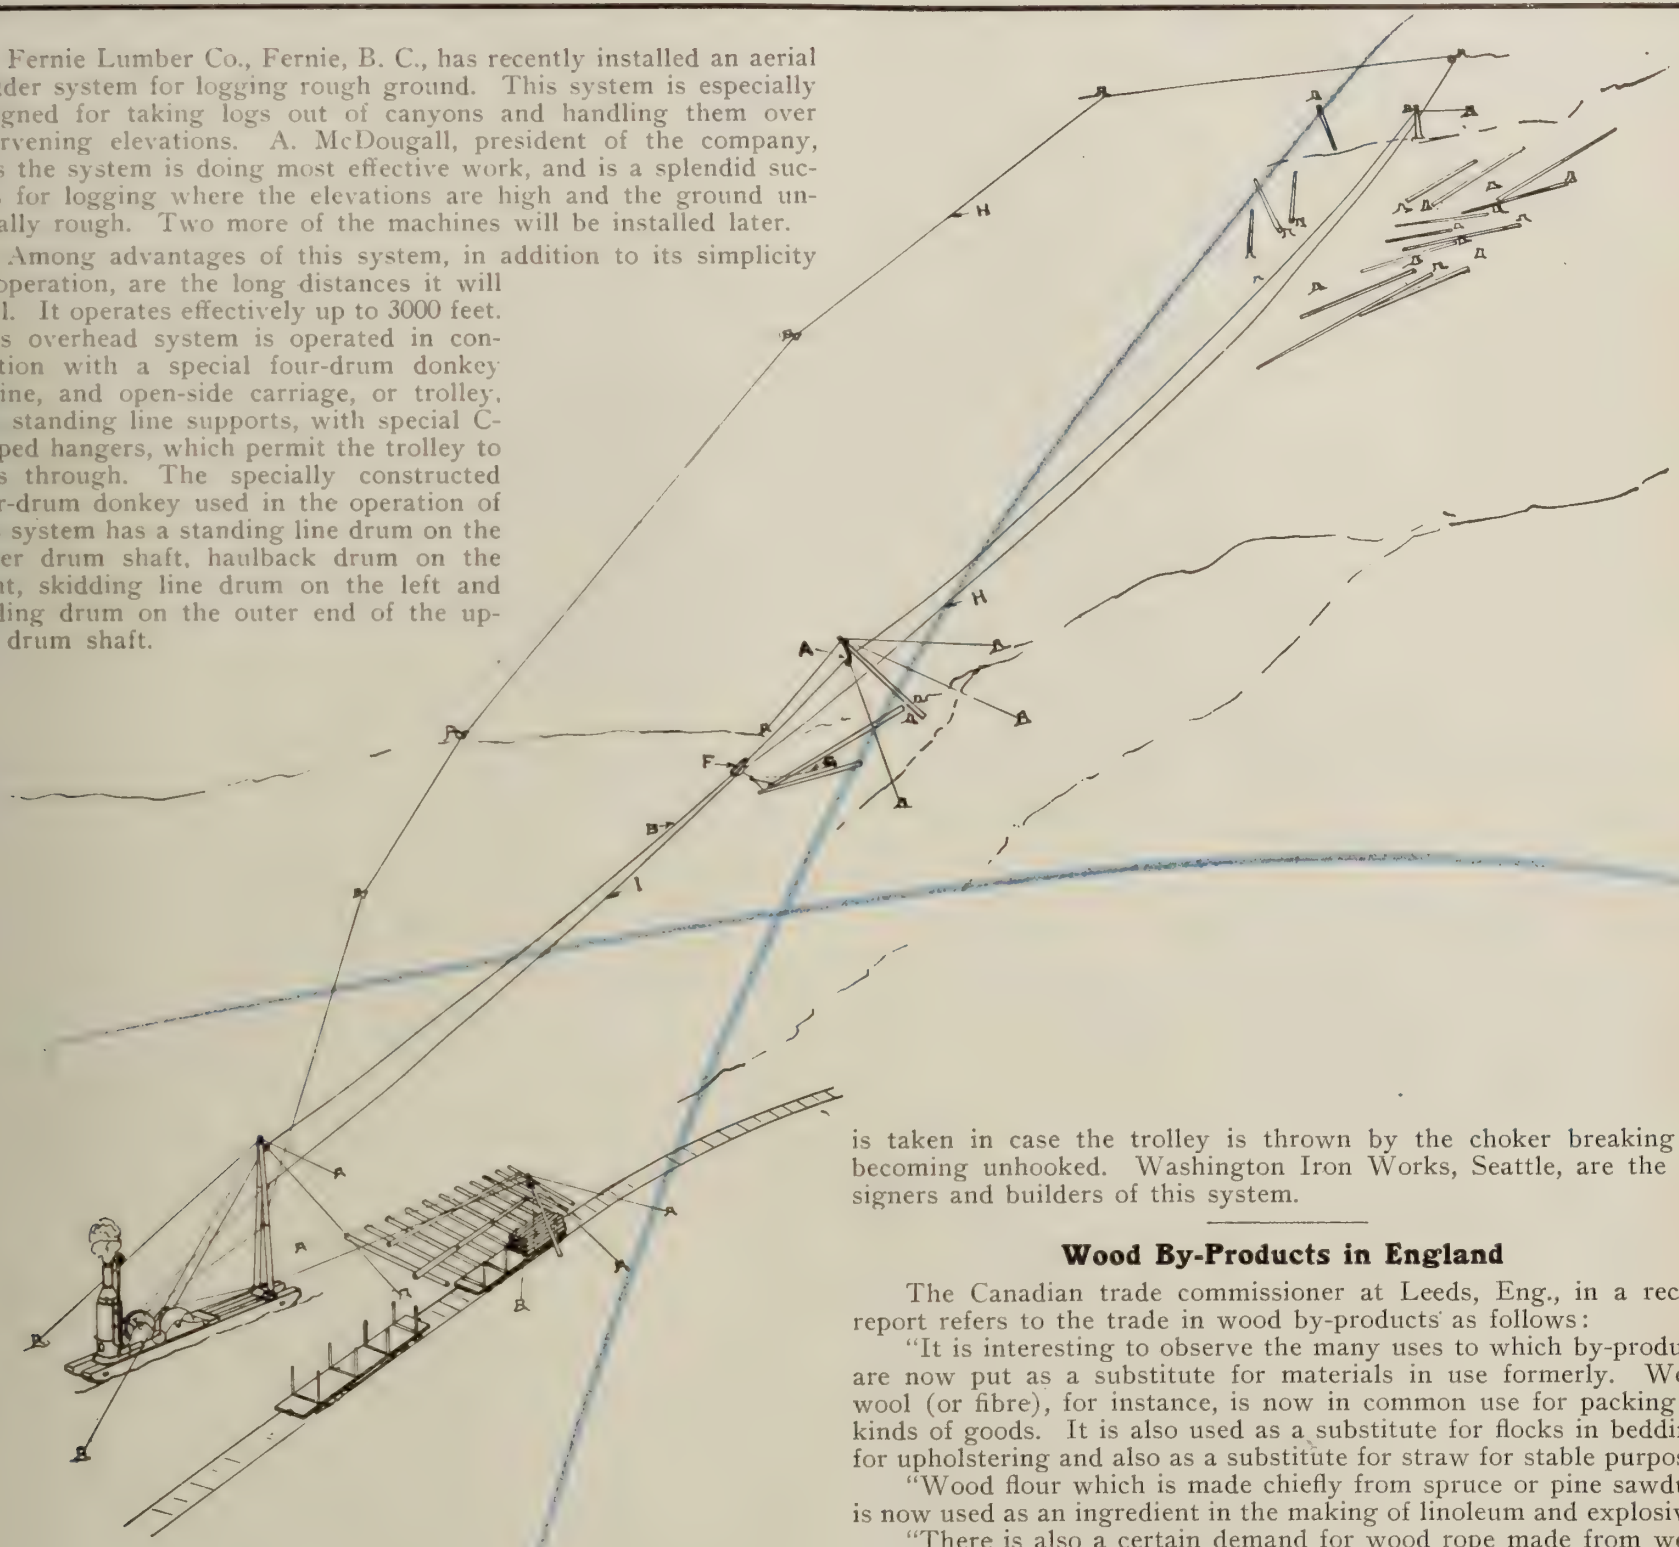
L. G. Dennis, hydro-electric engineer for the Conservation Commission, who has just returned from an extensive trip of investigation of the rivers draining the northern portions of Saskatchewan and Alberta, reports that they contain splendid water powers which will be of great value in the development of the extensive pulpwood and lumber resources of the northwest.

October receipts of lumber at the Tonawandas showed a considerable decrease from those of the same month a year ago. Very little Canadian stock is represented in the following total: 42,303,429 feet. October last year showed receipts 46,754,706 feet.

Cableway System Utilized in Interior British Columbia

Fernie Lumber Co., Fernie, B. C., has recently installed an aerial skidder system for logging rough ground. This system is especially designed for taking logs out of canyons and handling them over intervening elevations. A. McDougall, president of the company, says the system is doing most effective work, and is a splendid success for logging where the elevations are high and the ground unusually rough. Two more of the machines will be installed later.

Among advantages of this system, in addition to its simplicity of operation, are the long distances it will haul. It operates effectively up to 3000 feet. This overhead system is operated in connection with a special four-drum donkey engine, and open-side carriage, or trolley, and standing line supports, with special C-shaped hangers, which permit the trolley to pass through. The specially constructed four-drum donkey used in the operation of this system has a standing line drum on the lower drum shaft, haulback drum on the right, skidding line drum on the left and loading drum on the outer end of the upper drum shaft.



The slack is taken up by means of a chain hook, which is attached by about three feet of three-eights inch chain, to a swamp hook, which is hooked to any convenient stump. From the bull hook a chain about thirty feet long trails, and when the trolley is brought back to the proper position the chain hook is fastened on the tag chain, and as the trolley goes back to the woods the slack is absorbed. By this means any amount of slack can be successfully overcome. For average yarding conditions 125 feet to 150 feet would be the most it is advisable to work. Operating at 1000 feet the rig goes out in about one and a half minutes, pulls slack in one-half minute and comes in with the load in two minutes.

The hangers are provided where long-distance hauls are made, or where hauling over ridges is necessary, and are special C-shaped, used to support the line, where it would otherwise sag too low. These hangers are suspended on gin poles, the standing line resting on a steel sheave.

A special trolley, constructed with open side, is used in order to pass over these supports. To prevent the trolley from jumping off the standing line, two hinged bars of sufficient weight, drop and thus keep the gap in the side of the trolley closed. This precaution is taken in case the trolley is thrown by the choker breaking or becoming unhooked. Washington Iron Works, Seattle, are the designers and builders of this system.

Wood By-Products in England

The Canadian trade commissioner at Leeds, Eng., in a recent report refers to the trade in wood by-products as follows:

"It is interesting to observe the many uses to which by-products are now put as a substitute for materials in use formerly. Wood wool (or fibre), for instance, is now in common use for packing all kinds of goods. It is also used as a substitute for flocks in bedding; for upholstering and also as a substitute for straw for stable purposes.

"Wood flour which is made chiefly from spruce or pine sawdust, is now used as an ingredient in the making of linoleum and explosives.

"There is also a certain demand for wood rope made from wood fibre which is used by engineers and iron founders and also by furniture and other packers.

"Supplies of these products are obtainable in England and are imported from Norway, Sweden, Belgium and Germany. From inquiries made as to the prospects for Canadian manufacturers some doubt is expressed as to whether the cost of freight from Canada would not prove an obstacle to the trade."

The shipment of timber to Manchester, Eng., is one of the chief branches of traffic showing an increase. During the seven months ended July 31, 1912, 270,942 loads of sawn and hewn timber arrived there as compared with 225,666 loads during the same period of 1911, showing an increase of 51,276 loads.

British Columbia's timber revenue for the month of September amounted to $255,681.93, made up as follows: Licenses, west of Cascades, $889; revenue, $133,853.81; licenses, east of Cascades, $434; revenue, $58,590; transfer fees, $600; penalties, $1,725; royalties, $55,781.77; scaling fees, $3,378.15; fees for registering timber marks, $58; hand loggers' licenses, $225; rentals, $1,469.70. The amount paid to the forest protection fund during the month was $7,002.80.

The Question of Cost Accounting

Need of a Uniform System—The Experience of a Leading Box Manufacturer

That the box manufacturer is still greatly interested in the subject of cost accounting in the box factory and uniform accounting, is evident from the letters that have been received on this always interesting subject, says Barrel and Box.

One of the main features that has been brought out by these letters is the fact that there is a great variety of ways in which the box man is to-day arriving at his cost. Every system in use has considerable merit attached to it and almost to a man at the box factory, indicates that while they have a good system, they are constantly seeking to improve it and make it more satisfactory and to produce better results than they are obtaining from their present plan.

This only serves to emphasize the need of a uniform system of cost accounting. On the other hand there seems to be a great difficulty in the way of this from the fact that nearly every plant has a line of business peculiarly its own. This fact has often been stated and yet expert cost accountants look upon this as rather an antiquated idea in the minds of the box manufacturers, for they contend: "A box factory is a box factory and in the main the operations must be more or less alike." This is a broad statement, and inasmuch as it is a broad statement, it is true. It is only upon investigating the individual cases that the fact that every box factory has a problem peculiarly its own, is a fact that can not be denied. To bring out this point more clearly, the following letter from a leading box manufacturer will be of interest. Speaking of cost systems in the box factory, this manufacturer says:

"Such systems will depend entirely upon the class of trade and style of boxes produced and can only give you my ideas and opinions as it relates to our own business.

"What we are all after is that difference between the net selling price and the cost of material, manufacturing expense and selling expense and to burden any business with detailed reports, cost systems and all that will accomplish nothing in the end. What is necessary is the manufacturing cost of the different styles of work, and this can only be obtained by running it for a period of six months or a year and from these figures we can arrive at a basis of figuring future orders. It is not necessary to test this out upon individual orders, but strike an average upon the different styles of boxes, and by styles I mean also small boxes—such as drug and jewelry boxes —medium-sized boxes containing from two to six feet and the larger boxes.

"We are exclusive manufacturers of shooks in gum and cottonwood and the greater percent. of our shooks are a combination of veneer sides, tops and bottoms and sawed ends. Our principal output is egg cases, cracker boxes, can boxes, macaroni and starch box shooks. We are operating our own saw and veneer mills. Payrolls for the different departments are kept separate. That is to say, lumber is charged with the timber and operating expenses of the saw mill and 'veneer' with the timber and operating expenses of the veneer mill. Then, to carry it further, shooks are charged with the agreed price for the lumber and the veneer and with the operating expenses of the box factories, which expenses put the shooks on board cars for shipment.

"The amount of feet of lumber and veneer is kept and then the net feetage of the shooks produced by the box factories and the difference between these two amounts, together with the inventory of whatever is in the process of manufacture through the box factories, gives us our wasteage for any given length of time and we are thus able to arrive at a percentage of wasteage to figure shooks of this class.

"As regards forms kept, would say that in addition to the lumber and veneer being measured into the factories and these records kept, we also tally the finished products as it is delivered to the warehouses, from which we figure the net feetage.

"In other words, every morning I receive reports from both of our factories showing the gross feetage of lumber and veneer delivered to the box factories, the number of bundles produced and kind of shooks, the net feetage of lumber worked and kind, the net feetage of veneer worked and kind, and the total of both veneer and lumber. These reports are tabulated for comparison and weekly and monthly reports made from same. In addition to this in the case of standard stock, such as egg cases and can boxes, I keep a perpetual inventory so that I may know from day to day just the condition of the stock. Weekly inventories are also taken of our box lumber and veneer, both dry and green, so that I am kept in full information of the conditions of our stocks and can tell what we can produce and what orders we can accept and time of shipments.

"As stated before I do not feel that a detailed cost system, which covers every individual order, is of any use to a shook plant, for it adds to the expense and a lot of reports which are cumbersome and mean nothing when it comes to figuring profits. This is especially so in a plant making the class of shooks we are here. By taking inventories four times a year and closing up your books sufficiently to know the losses and gains one cannot go so very far wrong."

That some system is needed, and in fact wanted badly by the smaller manufacturers, is shown by the following letter from a well-known box manufacturer, which explains itself:

"We have no blanks nor forms at present that we use in our factory for keeping track of the workings in the mill. We have tried to get up forms, but could never determine on anything that was satisfactory. Our superintendent, who is at present away on his vacation, usually writes some form out or has the sawyers submit to him each evening the result of the day's work, as more or less of the work done by the sawyers is piece work. Bear in mind that our plant as compared with most others is a small one, and it is not so necessary to have a 'system' in the workings of our mill as it is in the larger ones, as our foreman or superintendent can usually keep track of these things himself.

"I am sorry that I am not able to give you any information along these lines that would be of value to you or to the trade in general. We have given considerable thought to this subject, but have never been able to determine upon a plan that we thought would be adaptable to our purpose without entailing too much expense to justify us in adopting it."

Valuable Advice to Retailers

President of the Indiana Retailers Makes Some Good Suggestions

The Retail Lumber Dealers' Association of Indiana recently commenced the publication of a monthly bulletin, and to the second number, the president of the association, E. J. McErlain, contributes a letter addressed particularly to members of his own organization, but which contains suggestions and advice of value to all retail lumbermen. We take pleasure in reproducing it as follows:

"I believe the Bulletin affords an excellent medium for the members of the Retail Lumber Dealers' Association of Indiana to study and understand the business. A lively interest and a hearty co-operation will undoubtedly redound to the mutual advantage of all concerned.

"Keen competition and the increased costs of doing business makes it imperative that the dealer avail himself of the most up-to-date business methods. It stands to reason that one man cannot know it all. Out of the experiences of the many may come wisdom that will be valuable to you. A man's success depends very largely upon the judgment and enterprise that he puts forth. You cannot afford to ignore a means of increasing your business efficiency and consequently your success.

"You will bear with me if I give a few business principles that bring good returns. The first duty of the retail dealer is to give service to his customer. Sell him good goods and give him a square deal. Dependable promises and business courtesy are worth while. Go out of your way to give a customer what he wants and you have gained his trade and better still his friendship. If at any time you find yourself puzzled how to meet the requirements of your trade, remember that you can secure this information through the Bulletin.

"A second valuable bit of advice is to be zealous in collections. It means work and it spells success.

"Last of all, be progressive. Keep abreast of the times. Don't neglect this golden opportunity through indifference.

"Our association has been productive of much good. Dealers have learned much about conducting their business. They have learned how to avoid the sink holes and how to stop the holes. To-day the retail dealers would not consider for one minute the abandonment of the association. This is proof of the underlying good and open helpfulness of this organization.

"There are some dealers who have not as yet comprehended the advantages that would come to them by becoming members of this association. There are none so blind as those who will not see. Or is it a case of being penny wise and pound foolish. There is no way to bring this element into the organization except the light or reason. It seems self evident that a man who is in business to succeed would gladly accept every honorable means to advance his interests and welfare.

"To the dealer who is not a member, we invite your careful consideration of this matter and extend to you a cordial invitation to come with us. We want you, but you need us far more.

"As president of the association I wish to say that I am well pleased with the progress that has been made this year. Members are showing great interest and the spirit of co-operation prevails. Let the good work go on."

Cultivate the Contractors

Establishing and maintaining equitable and friendly relations with contractors and carpenters, especially in the rural districts, is a problem which is and will continue to test the ingenuity of the retail lumbermen, says the Mississippi Valley Lumberman. Because of the varying conditions in each locality and the large element of personality involved no set policy or fixed rule can apply. Unfortunately, these so-called contractors and builders are not, as a rule, high class business men, while many of them are not even ordinary mechanics. In very many cases these un-skilled artisans endeavored to shift the responsibilty for errors of commission or omission upon the retail lumberman.

When based upon equitable relations, there are many ways in which the contractor, builder or even the carpenter, and the retail lumberman can co-operate to their mutual advantage. We have known some instances where the local lumber dealer has considered it good business to give a commission or a gratuity to the contractor who is building some structure in which the dealer was furnishing the material. Such a policy has almost invariably proven to be detrimental to the interests of the lumbermen. Nothing so thoroughly arouses the indignation of the average individual as to find out that some person has been able to secure a gratuity simply because of the patronage he has given some merchant. It is almost impossible for a business man in a small community to have any trade secrets without his neighbors very soon becoming familiar with the details. The class of individuals who accept a gratuitous commission under such circumstances are not of a high character either intellectually or morally, and it is a foregone conclusion that in a short time they will be confiding their good fortune to some intimate friend, who would in turn spread the news broadcast, with the result that the local lumberman finds that he has prejudiced his interests in some case irreparably.

The catalog houses and other concerns, either large or small, who seek to sell building material direct to the consumer, seem to consider the contractor, carpenter or builder in the rural districts as an especially favorable medium through whom to secure the trade of the consumer. Many of these local contractors are friendly to the retail lumbermen and turn over to them such correspondences as they received from these concerns. Others, however, either openly or secretly actively co-operated with these competitors of the local retail lumbermen.

In some instances these contractors are now resorting to very questionable, if not dishonest methods to further their own interests. An instance of this kind was called to our attention just recently. A contractor, who is well known to the retail lumberman, submitted a bill of lumber for an estimate, the material to be used in the construction of a substantial residence for a prominent citizen. The dealer at the time was impressed with the fact that the material asked for was of much better quality than usually called for and that the quantity was in excess of the amount required for the size of the structure. He mentioned this fact to the contractor, who, however, insisted that he wanted simply a rough estimate what the material would cost. With the tacit understanding that he would be given an opportunity later to revise and go over the bill, the dealer named a lump sum price. Within a week or so a car of lumber and other building material was delivered at that station, taken away by the contractor, and used in the building of the residence. A salesman for a well-known lumber manufacturing company happened to be in town the day the car arrived, and he checked over the material carefully. Instead of being the high grade stock which the original estimate called for, it consisted almost exclusively of the very poorest stock which could possibly be used. A careful investigation by the retail lumberman disclosed the fact that this contractor, after securing his figures for the material, had gone to the prospective builder and offered to construct the building for a very small sum in excess of the cost of the lumber and building material, as estimated by the local lumberman.

The retail lumberman was so indignant and incensed at the trickery and deception which had been practiced that he proceeded to retaliate against the contractor in a most effective manner. A contractor and builder who thoroughly understood his business was imported from a neighboring city, and the local lumberman has been erecting numerous barns, houses or any other structures in that territory. This very effectually put the dishonest contractor out of business and he now is trying to injure the business of the retail lumberman by acting as agent for a catalog house and soliciting orders for all kinds of building material to be shipped direct to the consumer.

Naturally, there is a very animated contest carried on in that locality. While up to the present time the local lumberman has been able to more than hold his own, all parties involved are contributing very liberally of their time and resources without any reasonable compensation. This incident teaches the moral that every dealer should be very careful about giving to any middleman, off-hand quotations, especially on material which is not suitable for the structure proposed or to the advantage of the builder to utilize. It would be a part of wisdom, too, in our judgment, for the retail lumberman to get in touch with the individual who is to pay for the lumber, and not take it for granted that simply because some contractor or carpenter asked for prices, that his interests were being looked after. The friendship of the contractor and carpenter is desirable. While cultivating their good will and friendship, however, the dealer will do well to keep thoroughly posted on all that is going on in the community and keep one eye on these contractors, builders and carpenters.

Preparing Core Stock for Veneers

The preparation of core stock for veneers is a job that has caused considerable discussion among veneer men. This is not because it is a difficult piece of work, but rather because every veneer man is constantly trying to find the best and cheapest method of doing it.

I have seen, as perhaps a good many others have, cabinet makers working on core stock with tooth planes fitting it to receive the glue, so as to hold veneer firmly over every inch of surface. There never has been any doubt in my mind that they prepared a good surface; but think of the expense.

I have tried out a way that has given the very best of results and want to pass it on. As a sander man I had an idea sometime ago that this veneer core stock could very well be put through the sander to good advantage and the idea proved correct.

I put No. 3 Garnet paper on the first or cutting drum, and lowered the other two drums so that they couldn't come in contact with the stock in going through the sander. I found there was no need of taking a real heavy cut, as the coarse paper on the hard cutting drum left the stock sufficiently rough for the glue to lay in the scratch marks. It is best to use the Garnet paper as there is no danger of burning the stock with it.

The dust brush should be raised up so that it will take off all of the dust and loosened sand before the stock leaves the machine. If this brushing is thoroughly done, users of this sanding method will have no trouble with their glueing.

Of course, the stock must all be of the same thickness before it goes to the sander, but that is up to the planers. If the sander is compelled to take anything but a light cut the sharp Garnet paper will be worn down so that it loses the effectiveness it should have for the purpose. One paper will last a long time if the matter of light cut is held to.

Many may already be using some such scheme as this, but whoever is not, once they have tried it out will not go back to the old style tooth plane method. I believe they will find it reduces the cost of the job 50 per cent. and does better work by far.—R. M. N. in Berlin Quality.

"Nordfarer"

The accompanying illustration gives an excellent idea of the size of the sailing vessel "Nordfarer," which came into the Miramichi River during the summer which has just passed. The "Nordfarer" was the largest sailing vessel that ever came into the Miramichi. She carried away no less than 2,342,000 superficial feet of spruce deals, scantlings and boards, valued at over $30,000 and consigned to Newport, Monmouthshire, Eng.

Mr. W. C. Oille, of Oille & McKeen, large wholesalers in lumber at the Tonawandas, and a native of Canada, will in all probability be the new postmaster to be appointed at North Tonawanda by President-elect Woodrow Wilson. Mr. Oille has for several years been the Democratic leader in North Tonawanda.

Following the Changes in the Wholesale Market

With the rise in the wholesale prices this fall, comes that which is dreaded by all retail lumbermen; the necessity for an advance in the prices to the consumer, for it means to him an almost endless tale of the causes and the reasons for his charging more for a certain item than he did a month ago, perhaps for the same article. As far back as I had anything to do with running a retail yard the price of lumber has always been too high with the farmers. During the periods when they went down, the farmer had naught to say in commendation, but assumed that they might be lower and still enrich the lumberman. And when prices have gone up again, it was the "trust" that was the cause of it.

It used to be amusing to me to hear even good sensible men talk of the inevitable rise in the prices of everything they bought when their farm produce was bringing them better returns in the market. They seemed to think that lumbermen, especially when they saw the prices of grain advancing, would raise their prices to correspond, and thus help to keep the profit from the farmer that he ought to have. It is curious how such fool notions will be entertained by otherwise sensible people, but the soil of prejudice is harder to deal with than a New England stone farm where it was once alleged they had to shoot the seed grain in with a musket.

But, what can we expect, when we consider that the opinions of the present day farmer are formed from what he reads in the numerous farm papers that are controlled by the great mail order concerns in this country and the millions of catalogs they send broadcast over the land? From the time you first raised your prices this year, you have had a continual fight on your hands in combating this prejudice of the farmer against the lumbermen. A good many dealers, no doubt, have been more or less timid in advancing their prices at the same time they went up in the wholesale market. They have let their old stock, bought at lower prices, absorb that which came in later on the advance and still kept on selling at the old prices. But the time came when they could do this no longer, and they were forced to spring the surprise on their customers that they should have done a month or so before. They have in this way lost just that much extra profit they could have had as well as not. Considerable stuff will have to be sold out of the yards as extras of bills that were sold before the last advance in the market, and this will have to be sold at the prevailing prices when the bill was sold; not necessarily so, of course, but most dealers will do it to avoid the "kicking" customer who would object to have prices raised on him before he got through his job.

City Retailers Follow the Market

I find that the retailers here are very much more responsive to the changes in the market prices than dealers in the country. As soon as any advance becomes general, a new yard list is at once issued to the trade, and likewise also, where there is a general drop in prices. There is not the selling at the same old list for very long when the prices go down, as is the practice with a good many dealers in the country. And another thing they do, which the country dealers would do well to follow, is the following of the different prices for the different sizes and lengths of dimension as they are shown on the wholesale list, as for instance, the 16-foot lengths of nearly all sizes of piece stuff. They don't sell 2 x 4, 12, 14 and 16 feet all at the same price as is common in many country yards. If a customer wants all 16-foot lengths in anything, he is told that it will cost him extra. In almost every instance he will change his mind and conclude he can get along with the shorter lengths. I've often thought how much more I could have made if I had followed the same practice when running a country yard.

There is no good reason why country dealers cannot do this as well as the city dealers. It is not a question of one getting the advantage of the other, for all are in the same boat, so to speak. Each has to pay the same distinctive prices for his stock that the other does, and it is therefore only a matter of breaking away from the old custom of a blanket price for several lengths that cost them different prices. With the close competition that is now pressing the retailer it behooves him to take advantage of every little thing that he is legitimately entitled to. As we buy, so should we sell, as regarding the things I have spoken of, and by so doing, the country dealer can make a few more dollars in the aggregate, and besides keep his stock in a better balanced condition at all times.

I know some won't agree with me about a country yard following the fluctuations of the wholesale market, and the argument against it is based on the supposition of the ignorance of the buying public concerning the wholesale prices of lumber. This was largely true years ago, but the avenues of information are far more numerous now than they were in those times. And the dealer who maintains practically a stereotyped price list through all the seasons of the year, is running a good chance of getting a hard "jolt" when a comparison of prices is shown him by some well informed party who is figuring on building. I am aware how strong the temptation is to keep on selling at the same old list when prices have gone down in the market. But, as I say, this naturally gives rise to dissatisfaction and often to more serious action on the part of those who are buyers of lumber.

A "Standpatter" On Prices

There are too many eyes open now to make it safe for the dealer to have the one price the year round, as we once could have. It was always my policy to make out a price list in the latter part of the winter that I thought would do for the rest of the year, sometimes, of course, I had to change it in the fall if the wholesale went up, but I never thought of lowering them unless I was compelled to by competition. I was a real sure-enough "standpatter" on the question of stability in the yard list, and many an inquiring mind have I answered with "prices are about the same." In later years though, I changed somewhat in this policy, and when I saw the probability of prices going up in the market I would try to stimulate building by telling my trade they had better buy before the rise. On the whole, I have found this to be the better policy, because it showed I had a regard for their interests and was trying to do them a favor. In fact, I think what success I had as a retailer, was largely due to the personal interest I took in the general welfare of the individuals of may trade. I was educated up to doing this through finding out that, even as a business proposition only, it paid better than to cut prices to get their business.

The law of supply and demand we know to be the primary cause of lumber going up in the wholesale market, but, to my knowledge, it has been in operation so far as the retail yards are concerned. It don't seem to work in a local way, for, no matter if half the dunnage is bare in a yard, the prices continue to be the same. I have seen the time when, for several weeks I had the only supply of shingles in the town, and still I knew that if I advanced the prices, as I was entitled to do, there would have been a cry of complaint and charges of extortion, that would no doubt have injured my general trade. Yet, no one gave me any credit for sacrificing what I could have gotten in a perfectly legitimate way.

Lumber and coal yards seem to be considered by the public as in a class by themselves, and different from other lines of business that are continually affected by this law of supply and demand. I suppose this is the principal reason for the stereotyped character of the country yard price lists in general. There are many queer things about the retail lumber business that really do put it in a class by itself. Dealers do things in a way that those in other lines could not do, and keep out of the sheriff's hands, and still for all that, it has its compensations. I have at times thought that perhaps the government in its efforts to fasten a "trust" on the lumbermen of the country was finding its principal difficulty in this feature of the distinctive nature of the lumber business, and probably this fact is one of the reasons why the case has been dragging along the time it has. It is difficult for buyers to realize that our whole business system has been built up on the basis of the legitimate protection of the retailer by the producing manufacturer.

Railroad Rules Enforced

This is the time of year, more than any other, when the rules of the railroads regarding demurrage become a matter of more than ordinary concern to the lumber dealer. The consumer is rushing him for stock and he is rushing the mill men to fill his orders. And they in turn are rushing the railroads for cars. In order to fill these requirements, the railroads are hammering away at the dealers and other retailers, to unload them at once or pay the penalty according to their rules made and provided for these emergencies. So you see, the rush comes all back again to the retailer and makes him the key to the whole complicated problem. Of course, there are other things, such as inadequate facilities at the various railroad terminals, that enter into the problem, but, in the main, the question of keeping the supply of cars moving to meet the demand depends largely on the promptness with which they are unloaded at the point of destination. Engaged as we are, with our own troubles in unloading them, we are not apt to realize fully our share in the responsibility for the unequal distribution of cars and the alleviation of their shortage at the sources of stock supply.

I have put it in this way—and I think fairly—that those who read it may have their attention drawn to a phase of the question that naturally they are blinded to, because of their own particular interests that distract their attention from it. I know the assumption is, that the retailers are just as much concerned about the getting their orders delivered as the transportation companies are of getting the cars to their destination, but when once they are set in on the side track, it is natural for them to lose interest and consideration for the needs of others, who are waiting for their orders to be filled as they have been. The railroads know this, and therefore, in order to make the dealer who has just got in his car, realize his obligation to others, they say to him, "you must unload that car in a certain time according to our rules, or pay us the stipulated charge for the use of the car." The dealer says to Mr. Railroad, I'll unload that car as quickly

as I can, but remember, old man, you have been a week longer than you should have in delivering it to me and therefore you should be a little easy on me if I don't happen to get it unloaded in the time you say I must." The railroad man, however, is inexorable in his demands for the compliance with the rule, because of the same nature of the necessity which is pressing in on him from every quarter of the business world, and as, "needs must when the devil drives" his only recourse is to press in turn the consignee who has the car for unloading. All movements in human action are made in the same way. One thing is pressing behind another, and that pushes the other in front and so on in the whole moving drama on the stage of life.

He Hates to Pay It

There is probably no more aggravating thing to a retailer than the matter of demurrage when it comes to him in the acute form of a bill for payment and he pays for nothing else with so much ill grace and so grudgingly. To the average dealer it is a piece of extortion that he bitterly resents because of its apparent unfairness to him, as perhaps he has been annoyed and suffered loss from the car that has been long delayed on the road. Then another thing. When several cars are set in on him at the same time, it looks absurd and totally unreasonable to expect him to get them empty in the time thus arbitrarily allotted him. As a rule, the dealers are only too glad to get the stuff at such times as these, and they waste no time in getting at work on the car containing the items they are most in need of but where they have to haul it by team into the yard, they are doing pretty well if they unload one of the big carloads in a day. And if busy in the yard, and depending only on their own teams, they have got to work late into the night to do it.

I have known of instances where the lumber was taken from the car and piled down by the side of the track to be afterwards hauled to the yard. I did this myself, as one of the instances, but only once. I hired some green hands to do it and I lost more from breakage than the demurrage would have been. There is considerable risk in doing this when the lumber is mostly of the upper grades, because of the liability of damage from rain, but it won't hurt a car of timber or heavy piece stuff. It frequently happens that the train crew are not particular in setting a car where the dealer can get at it to unload. In that case, he may be paid to wait till the next day to have it changed. It "riles" him therefore to have this time charged against him. Of course, the agent is not going to report it because it is his duty to see that cars are placed conveniently for their prompt unloading. To avoid this, I used to send a man or go myself, and see that no such mistake was made. Station agents have a good deal to do in the busy days of the fall months and they can't look after the placing of cars as closely as at other times. The grain men are very insistent for "empties" in these times, and they are often responsible for some of the "prods" that are given the lumbermen to hurry up and let them have that car. Some wrangling is apt to be indulged in when one or more cars of lumber get on the grain stock. Frequently it is the case that a partly unloaded car of lumber will be shoved in a position when nothing more can be done till the next train pulls out the loaded grain cars. Everything these days is subservient to the necessity of getting the grain on wheels and rolled away to its destination, and all other interests have to suffer in consequence. But this is a part or the penalty which the dealer has to pay, who has waited too long before ordering his stock.

When the Cars Are Bunched

One great difficulty the dealer has to contend with when several cars are "bunched" on him is the hiring of sufficient extra help to get them unloaded in time to avoid the demurrage. This used to be one of my greatest worries in the rush times and many a time have I worked all night unloading with the men I could pick up and those of my own, in order to get the stuff out that was needed for the next day's business. Of course I had to pay extra wages, but I've found, when confronted with such difficulties, that the best way is to go right through them, no matter what the cost. It is just as economical to hire four or five men to do one day's work as it is one man for four or five days' work. I don't know but it is the cheapest, in the case when you have several loaded cars on track that you badly need. Go at it and bid up for help you need and put two shifts of men on them till they are empty. This is often done here in the city where sometimes a dozen cars are set in one yard at the same time. This is where I learned the value of having an extra wagon when unloading in a hurry. Two men at the car will keep another two men busy unloading at the yard and in this way much time is saved. The extra wagon also comes in mighty handy at other times, when you are busy delivering about town, and in loading up for going out the first thing in the morning.

The great trouble with all these small country towns is that they are not fixed for handling the ordinary rush of trade that comes in the fall months. The average lumber yard has the same equqipment of men and teams that it has at other times of the year, and they are called on to do—as often happens—two months' work in one month, and all this until snow flies. Consequently, some part of the work has to suffer more or less as the case may be, and no matter what else intervenes the process of making sales must not be interfered with. Loaded cars on track must stay there till time can be had to unload them. Overworked managers get calloused concerning them, and the result is that hundreds of cars are tied up that are badly needed elsewhere. If it were not for the charge of demurrage it would be a good deal worse than it is for those needing the "empties." We penalize—or try to—those to whom we give credit, by charging them interest on the account after 30 or 60 days. This is done to spur them up to pay us promptly when due. They have got the money we need in our business. Likewise, when we have the loaded cars sent in to us the railroads give us a certain time in which to empty them and failing to do it, is it unreasonable for them to charge for the continued use of their property?—C. H. Ketridge, in the Mississippi Valley Lumberman.

B. C. and West Coast Lumber Shipments

Shipments of forest products from British Columbia to the Yukon Territory from January 1st to June 30, 1912, amounted to 48,180 ft.

Foreign shipments were as follows:—

Australia	9,604,352	737,490	532,245
West Coast—South America	3,077,627	.....	.....
Mexico	280,833	.....	.....
Japan	1,584,834	.....	.....
U. K. and Continent	5,464,474	.....	.....
Total	20,012,120	737,490	532,245

Total shipments from the Pacific Coast were as follows:—

British Columbia	20,012,120	737,490	532,245
Washington	120,839,071	1,880,254	773,195
Oregon	64,972,813	466,840	293,145
Total	205,824,004	3,084,584	1,598,585
Total Domestic	640,827,673	18,828,049	29,766
Total Foreign	205,824,004	3,084,584	1,598,585
Total	846,651,677	21,912,633	1,628,351

Lumber—feet	846,651,677
Lath—feet	21,912,633
Pickets—feet	1,628,351
Grand Total	870,192,661
Total Domestic—Lumber, Lath and Pickets—feet	659,685,488
Total Foreign—Lumber, Lath and Pickets—feet	210,507,173
Grand Total	870,192,661

Timber Culled at Quebec

We publish below a statement which has just been received at this office from the Supervisor of Cullers,' Quebec, giving the number of feet of timber, masts, bowsprits, spars, staves, etc., measured and culled to the 6th of November, 1912, and comparative figures for 1910 and 1911.

	1910 Cubic Feet	1911 Cubic Feet	1912 Cubic Feet
Waney White Pine	479,280	757,840	1,055,200
White Pine	10,720	10,680	1,760
Red Pine	21,920	27,720	12,200
Oak	256,680	92,080	109,400
Elm	246,920	221,680	276,640
Ash	1,360	120	520
Basswood			
Butternut			
Tamarac			
Birch and Maple	43,120	62,320	38,640

From what we hear, Quebec deals and timber—in fact, all kinds of wood for shipment—will prove a record, so far as shortness of stocks are concerned, says the Timber Trades Journal of London, Eng. While the higher class pine deals are increasing in value daily, there is a demand springing up, both at home and abroad, for the lower qualities, and it now appears certain that very little wood will be sent over on consignment, even if freight room could be obtained. The scarcity of tonnage and the lowness of stocks will tend to keep consignments to the smallest possible limit, and as we are so near the end of the season, those who have stocks of Quebec goods of any description should hold out for full prices. Spruce deals have been sold recently at higher prices than we can remember; we understand that £11 c.i.f. has been paid for unsorted 3 x 9.

Care of Small Band Saws

In small plants, where there is no regular filer, and where it is up to the operator to look after his saws, it is quite a task to take care of his saws, especially if he has not had any experience in that line, says R. B. in the Wood-Worker of Indianapolis.

Judged upon general principles, such as are common to all saws, there is a probability of the band saw supplanting every other method. Consisting of a thinner blade than can otherwise be used, capable of any degree of tension, and moving at a higher speed than it is possible to run other saws, its advantages are too obvious to warrant any other conclusion. Besides, it cuts squarely through the wood, which is of very important advantage, and is operated by rotary shafts and wheels running at a moderate speed.

The fear of breaking blades, or the inability to manufacture them, seems to have, for forty years or more, deterred operators from using band saws. This trouble has been overcome, and band saws of good quality will do as much cutting as other saws, measured by their value or cost. Joining the blades, formerly regarded as the next thing to impossible, has become so simple a matter as to be performed in every shop, and almost by any person.

The first thing in order is the blades. They should have a high spring temper; if harder, they become more liable to fracture, are difficult to sharpen, and will be broken in setting. A saw that has a good, lively temper is comparatively worthless. It is quite impossible, after a saw is finished, to tell whether it is properly tempered throughout; if 1-in., even, of its length has not been tempered, or is drawn by polishing or grinding, it is as bad as though the whole saw were wrong, for such spots cannot be found; and, if they were found, there is no remedy but to cut them out. We have to trust mainly to the skill and good faith of the sawmakers, and should patronize those of known skill.

In selecting saws, a good plan is to test the temper. If the saw is not joined, roll up the ends and see if it will spring back straight or remain bent. If it springs back nearly to its first shape, the temper is good. The texture or grain of the steel, which is the only clue to quality, can be determined by breaking a short piece from the end of a blade. By unrolling the blade on the floor it can be tested as to straightness. The ends, if laid together, will show if it is parallel and of the same width throughout.

The processes of joining now in use can be divided into brazing and soldering, the distinction relating mainly to how the joining is done, rather than to any difference in the processes. In what is termed soldering, the melting or heating is effected with hot irons; in brazing, the saw itself is put into the fire.

Brass, spelter, german silver and other alloys can be used for joining, any of which makes a joint which, if well made, will be as strong as other parts of the blade; that is, will stand an equal tension, for the tendency to fracture is greatest alongside the joints, where the union takes place between the tempered steel and the portion that is annealed in making the joint.

For solder joints, silver solder is convenient; it is strong, and melts at a low heat. The most convenient form is to have it rolled in thin strips, so that pieces the size of the lap can be cut off and laid between. To make joints of this kind there is required a strong, heavy pair of wrought iron tongs and some kind of a frame to hold the saw straight, leaving the joint free at the ends, to be clasped with the tongs.

For soldering the smaller blades the saw should be scarfed or tapered at the ends for a length corresponding to one or two teeth, as the pitch may determine. This scarfing must be done true and level, or the joint will not be a close one. The joint should be cleaned with acid, to remove all grease, the solder placed between, and the saw clasped with the tongs, which should have a full red heat. As soon as the solder runs, the tongs should be removed and a wet sponge or cloth applied, to restore the temper in part. The joint can then be filed parallel by using a wire gage or a pair of calipers to determine the thickness, being careful to file the proper amount from each side. This last is the most difficult part and requires great care to have the saw parallel and straight, without making it thinner at the joint than at other places.

One of the main points in operating band saws is to avoid bending the blades edgewise, which is more easily and frequently done than would be imagined. The wheels require to be so adjusted that the saw will only touch, and not bear against the back guides when not at work; and as different saws and different positions of the guides as to height will vary this back thrust, it requires constant attention.

The amount of back pressure is easily determined by placing a piece of wood behind the saw while it is running, and pressing it forward and noting the amount of force required, then setting the wheels until it bears lightly on the back. This edge strain, as we call it, is generally provided for by an adjustment of the axis of the top wheel, which every machine should have. The different forms of teeth, the pitch, angle, and manner of setting, are questions of much importance with large saws that run with power feed, but for scroll sawing, with narrow blades generally, the matter of teeth has not such importance, a fact that is sufficiently proved by most of both opinion and practice met with.

In respect to sawing logs with band saws, the present limits will not admit of going into the subject, which is a wide one.

A Plea for Sharp Tools

By Herbert

One of the hardest lessons for some men to learn is to keep their working tools in good trim. No matter how often the importance of this subject is impressed upon their minds, somehow or other they still continue as lax as ever, much to their own disadvantage and the detriment of the work they turn out, says the Wood-Worker of Indianapolis. Why they persist in being so slack is hard to comprehend, unless it be due to their having fallen into a slovenly habit, from which it is difficult to break away. Whatever the true reason may be, this matter is of sufficient importance to merit serious attention on the part of every skilled workman. Neglect to do so lays him open to severe criticism.

Tools well sharpened do better and cleaner work. This statement applies to every kind of a tool, whether a saw, a turning chisel, or the knife of a planer. A keen, sharp edge always does cleaner work than a dull one. The fact of the matter is, if the edge lack sharpness, it does not cut at all, but merely scrapes the wood. This is a result to be avoided as far as possible, and, indeed, may be obviated by following the hints here suggested. I regret to say that more than once have I seen planks coming out of a planer not much smoother than before they passed through. I have seen pieces taken out of the lathe, supposed to be finished turning, the surface of which was so rough as to be a disgrace to any man pretending to be a skilled turner. And all this due to a lack of keeping a proper edge on the tools in use. Surely it would have taken but few moments to attend to the sharpening, while the results would have proved much more satisfactory.

The same sensible advice is applicable to the saw, whether band or circular. To insure the best results in the way of a clean, smooth cut, nothing is so essential as sharp teeth. They never scrape or burn their way through the wood, as does a dull saw, leaving behind either a frayed or singed surface. Many a time have I seen a saw virtually made to burn its way through a piece of lumber, with smoke rising in so dense a cloud as to attract general attention. All this is unnecessary and open to severe censure. There is no need of such a thing, when a little application of the file now and then will do away with it altogether. A sharp tooth always cuts, and cuts cleanly, while a dull one scrapes and burns the wood.

Besides, a keen-edged tool does quicker work. As a rule, it means the saving of much precious time. Other things being equal, the man with a sharp tool is able to accomplish anywhere from one-third to one-half more work than the other fellow who is deficient in this regard. In fact, the main reason why some mechanics are accounted superior to others, by being able to produce more and better work, is their habit of always keeping their tools in good working order. The real secret of many a workman's success is due not altogether to superior skill or closer application, but fully as much to the quality just mentioned. He is considered a quick worker because he appreciates the real value of a sharp blade or a well-filed saw.

A sharp edge means, also, far less strain on the tool itself. Have you ever watched a piece of lumber pass through a planer when the knives were dull? If you have, you must have observed with what strained effort and increased noise the machine worked. It seemed like an uphill effort, as indeed it was. Grudgingly, so to speak, does the machine do its task. Have you ever noticed a man using a dull band saw? If this privilege has been yours, you could not fail to be impressed with the fact that the workman, in feeding the saw, had fairly to push the wood against the teeth, while the saw itself, acting as if reluctant to work so hard, showed an erratic disposition to run away from the cutting line. Indeed, your scribe is inclined to the belief that this unnatural strain put upon the saw blade is often the direct cause of breakage. A sharp knife or a well-filed saw passes through a piece of wood as easily as through cheese; there is no strained effort and the machine works with a will.

For the reasons just advanced, it behooves every wood-worker to appreciate more fully the great value of those dumb instruments so helpful to him in his daily toil. He ought to treat them well, and they, in return, will gladly repay him for his trouble. Never let him for a moment think that time spent at the oilstone or grindstone, or in handling the file, is wasted. Nothing of the sort. These apparently trivial accessories have a most important part to play in the economy of true workmanship, and the sooner this lesson is learned the better it will be.

Planing Mill Management

A pertinent question for mill owners is whether their men are working with interest and loyalty, or giving as much attention to their work, when the manager is away, as when he is present. Do they use the necessary judgment in their work to make it profitable? The question is simple, but upon the answer depends in a great measure the success of the company.

To these questions some would reply: "I hire my men without any responsibility, pay them the price agreed upon, and insist on getting the work done the way I want it. I am personally responsible and in charge of what is done here, and it is only right to have everything carried out according to my personal ideas."

It seems quite reasonable to hold this opinion. It is the shortest way to end investigations and discussions and the responsibility is easily located if something goes wrong. But there is no greater cause of lack of that personal interest which should exist in each individual employed in the various branches of a manufacturing concern.

The Workman and the Employer

As a rule our best workmen are real strangers to us. They are not tied by friendships nor by relationship. They accept a share of our labor or burden, and carry it to its destination for a remuneration which becomes their daily support. It is as important for the employee to hold his position as it is for the employer to depend on the labor and loyalty of his men.

What could be termed the "perfect workman"? We might expect to find perfection in a workman who would never make a mistake and do to a nicety what he agrees to do. He may do the whole of that and be of no importance, when we consider the real requirements of factory help.

To make a good workman in the shop, an employee must have natural aptitude, steady habits and mechanical ingenuity. He must expect a profitable future in the trade, and think so much of the older employees' jobs as to envy their situation. He must be ready to make daily sacrifices to acquire knowledge in the hope that some day he may be able to supply a little brain work instead of labor, and get better remuneration, thus reaching the point called success.

The Employer as Seen by the Workman

What reputation should a mill have to create such a feeling in a a stranger's mind? When a man looks for a job: (If he is not a globe trotter), he inquires about the standing of the firm; if there is any future in the business and if an employee who has spent a few years of his time there will have a better reputation. Relying on favorable conditions, the man gets a situation, but he will still investigate and size up the place from its system and from gossip. If he hears old employees talk dissatisfaction or criticize the management and their salaries, the stranger is ready to move on to another factory.

If such conditions exist in a factory remedy them at once. Weed out criticism, make the condition such that a man will believe he is being as well treated as he would be in any other place, and that the class of work he is doing is equal to the best. Let him feel that if he succeeds in learning the trade in this factory he will be in a position to compete with workmen in any similar factory in existence.

When there is much good said about the factory's standing and management, the advantage of being employed with a progressive firm will soon create an ambition in the employee's mind. With proper factory rules we can soon get employers under a system that will show clearly what each man is doing in every hour of the day. If the men know that proper records are made of their doings and that the good work they turn out will bring them credit, they will acquire careful habits of work

Helping Employees to Improve

What else can be done to render the men careful? There are men who are so careless that they can spoil enough work to cut off the profit of a whole department. The best remedy for this disease is to record all defective work done by the men. Put down the date, the operation, the value of the stock and the amount lost. Make a regular charge against that man. If we find that the charge is coming too often on the same account, advise him to change his trade.

When the time comes to consider an increase of salary, the man who has a few charges against him is not so proud of his ability. On the other hand, if you find that a man is always making good work, encourage him. This is the right man to encourage and to help.

There are some employees who are really not responsible for accidents or bad work. They never cause accidents themselves, as they are not in a position to, but they are very unfortunate. There are always in the corner where an accident will happen. They don't make the trouble but they cannot prevent it. Such men are not profitable around machines of any kind. It is dangerous for the man and not profitable for the firm.

When it is understood that by the system carried out every individual has to account for his good or defective work, his steady attendance on duty, as well as the maintenance of his tools, an employee will soon find that he has to do some thinking to get around and that it is the mechanical skill that counts. He will cultivate his mind and develop his ingenuity.

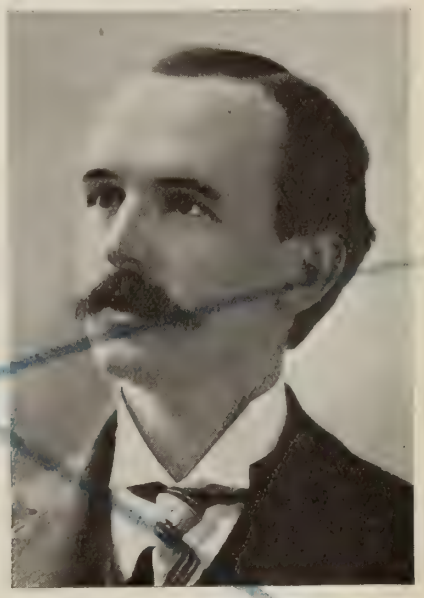
If the men find that practical knowledge gets them jobs, and that there are good chances for improvement in their position, and if you help them along by filtering into their minds an appreciation of the fact that an employee is supposed to possess aptitude and skill to make his services indispensible, you will do much for your employees and for yourself.

Changes in S. A. Woods Machine Company

Owing to ill health, Mr. Frank F. Woods, of S. A. Woods Machine Company, Boston, Mass., has retired as president and treasurer of the company. On account of Mr. Woods' retirement, a change has taken place in the personnel of the company, Mr. H. C. Dodge becoming president and Mr. C. W. H. Blood vice-president and treasurer. Mr. Dodge also retains his position as secretary. Mr. Dodge and Mr. Blood have acquired the stock formerly held by Mr. S. A. Woods. The mechanical and executive ends of this business will remain practically the same as formerly; in other words, the high standard of machine construction, in the way of workmanship, quality and capacity, will be maintained.

Mr. Dodge has been connected with the Woods Company for about ten years. Since leaving Harvard College, he has devoted all his time to studying the lumber and wood-working business. During his connection with the S. A. Woods Co. he has had charge

Mr. H. C. Dodge



Mr. C. W. H. Blood

at different times of their business in several States. For the past two years he has been general sales manager and has also held the office of secretary for the last year. Mr. Dodge is well known in the lumber trade and has done much towards the revolution which has taken place in the dressing of lumber in all parts of the world.

Mr. Blood has spent about twenty-one years in the company as head designer and engineer. His mechanical training was obtained at Cornell University from which he graduated in 1892. Mr. Blood has a fine record as an inventor, the government having issued to him no less than forty patents covering wood-working and planing mill machinery. During his connection with the company he has personally supervised the designing and construction of every machine which the S. A. Woods Company has put upon the market.

The S. A. Woods Machine Co. was established in 1854 and incorporated in 1873.

The Niagara White Pine Association, which includes all the prominent local dealers and a few Buffalo firms, is again holding regular monthly session for the discussion of matters pertaining to the trade. Monthly dinners have been held at the Hotel Sheldon, followed by informal after dinner discussions.

In a government report on the wood-using industries of Michigan, is stated that 50,000 board feet of apple wood is used annually for handles. "The only wood in the whole industry (handle) costing an average of $50 a thousand feet was apple, obtained in old orchards where the trees are no longer profitable for fruit. Apple wood is peculiarly fitted for saw handles and most of it is put to that use. Black cherry is employed for the same purpose, but in Michigan it costs $14 a thousand feet board measure and is much cheaper than apple wood."

Electrical Notes for Woodworkers

Although electricity has been introduced as the motive power in large numbers of sawmills and wood-working factories during recent years, there is still a great uncertainty as to what power is really required to run certain machines. We cannot wonder at this unfortunate state of affairs when we find that we have no definite basis to work from. There is too much guess work to be done before one can decide. I have before me an "Electrical Pocket-book," which contains a table of the horse-power required for various machines. Here are a few examples:—

34 in. bandsaw .. .. .. requires 0.96 h.p.
35 in. circular saw .. .. " 5.64 "
14½ in. x 4¾ in. fourcutter " 6.91 "

If we were to take a 34 in. bandsaw and fix a 1 h.p. motor to it, it may drive it slowly, providing the motor is of good make and has a 100 per cent. overload up its sleeve. But do not attempt to cut with it, or it will be "Good-bye, motor." I have also a well-known machinery maker's catalogue before me, which states that in their experience—

a 30 in. to 40 in. circular saw requires 8 to 12 h.p.
a 12 in. x 5 in. fourcutter saw requires 15 to 25 h.p.

Now, where are we? Is it to be wondered that there are instances of burnt-out motors and dissatisfied purchasers when we have such conflicting evidence laid down for our guidance? This is what really does happen in the mill when driving a heavy type 12 in. by 5 in. fourcutter (by W. Haigh & Company, Limited) (with a 20 brake-h.p. direct-current motor by E.C.C.). The motor is belted direct to countershaft. The cutter-blocks are speeded to 4,000 revs. per min.; to drive this machine light takes exactly 14 amps., or 7 2/3 h.p. Little is lost in vibration, as countershaft and machine are securely fixed on a solid concrete foundation. The belts are all in one piece, and as wide as pulleys will allow. When running hard oak (imported) the following readings were taken:—

10½	in.x1	in. on four sides at	12	feet per min.,	21	ampr.=	11.54 h.p.
7	in.x¾	in. "	24	"	22	" =	12.09 "
7	in.x¾	in. "	12	"	19	" =	10.44 "
6	in.x⅞	in. "	24	"	23	" =	12.64 "
1½	in.x1	in. "	12	"	18	" =	9.89 "
5	in.x1⅜	in. "	12	"	22	" =	12.09 "
14	in.x1¼	in. "	12	"	26	" =	14.28 "

Voltage at 410

The above figures may be useful to those who have had trouble with under-powered motors. One more point. Allow a bit beyond its fullest load. The motor in question takes 46 amps. to get speed up (starting light), that is, 25.28 h.p. Of course, it is only momentary, but it has to be allowed for just the same, unless you are looking for trouble. Don't place too much reliance on what the juice man may say. Figure it out and be on the safe side, then you will have no cause to grumble about electric motors.

"J. M. N." in Mill & Works Practice.

With the Woodworker

A prominent knife manufacturer was talking shop recently, and made the following remark: "When a man orders a knife, he should not only order a knife, but should order a knife to do a certain work."

This is good advice, and coming as it does from a man of considerable experience, it should be heeded by the stave man. The reason for this is plain. If an order is sent for a knife to do a certain work, the knife man will know the needs of the manufacturer and will give him a knife of the proper temper, etc.

Manufacturing knives is much more of a science than it ever was. For example, to cut the staves properly the knife must not only have a certain temper, but must be shaped on a true and accurate basis. The inside edge of a stave knife must be the exact segment of a 20-in. circle, or a circle described on a radius of 10 inches. If this varies in the least the knife will not do good work, making hard work for the cutter, and reducing the daily output to a large degree, thus increasing the cost of production.

It is more important to have a good stave knife to-day than ever before, because stave men are cutting timber that is harder to cut. Good clear logs used to be the rule, but to-day very nearly everything must be cut. Some stave men are going over ground to-day that had been cut over years ago and clearing up all the timber, the bad with the good, and it is mostly bad in some sections. Necessity has brought this about. Because of this condition, because of the rougher usage of stave knives, some stave men have been led to believe that stave knives are not made to-day as good as they used to be. This is a great mistake, for stave knives have to be made better than ever before.

It is easier to spoil or ruin a good knife than it is to spoil a poor one. Take it in the matter of razors, with which nearly every one has some practical experience. A razor made of poor steel and only a fairly good edge will stand a lot of rough usage; but a razor with a keen edge and made of a high quality of tempered steel is easily nicked and gotten out of good condition. The same holds true with reference to stave knives. The better the knife, the better work it will do, and the more care should be exercised in its use.

While it is essential to use a great deal of care in working the knife on the stave machine—especially instructing the machinist not to drop his wrench in the machine, but to keep it in the tool box, where it belongs when not in use, as a wrench won't work well on the edge of a good knife—it is in the grinding that most knives receive their rough usage. Take, for example, the speed at which knife grinders should be run when grinding stave knives. Of course, the speed will vary according to the kind or make of a wheel that is used; a hard wheel must be run slower than a soft one. Every manufacturer of wheels ought to supply the information of just the speed to use for his wheels, if he knows the kind of work to be done on them. Here is a chance for the operator to use a little common sense. Should the wheel be hard, run it a little slower, and if soft the speed can be increased. When run at the proper speed a wheel won't glaze, unless you get oil or grease on the surface.

It seems to be the impression among some that the faster you run a wheel the better it will cut the steel, but this is not the case. In fact, an emery wheel can be run at such a high speed that it will not cut at all. Not only will it not cut or sharpen the knife, but it will, if run at too high speed, burn the steel. The edge of knives burnt in this way will either turn over or break out. If after grinding the knife small cracks appear, it is certain that there is something wrong with the grinding. Either the wheel has been run too fast or the emery wheel dresser had not been used often enough. Frequent use of the dresser will save a lot of trouble with stave knives.

Some men in the grinding room, not familiar with the fine points of the proper speed for a knife grinder, will increase the speed of the wheel, thinking that in this way they can save time and sharpen the knife quicker. This is a false deduction, and as shown above will result in either burning the steel or in taking a considerably longer time to do the work of putting on a good edge, depending entirely upon how much the speed is increased, and if the speed is increased beyond a certain point, the wheel ceases to cut.

It is possible to crowd a grinder, and it should be avoided both from the standpoint of the grinder and the knife. Of course, if a wheel is run on too slow a speed it wears the wheel away too quickly with no gain to the knife. There is only one way to save time, labor, trouble and expense, and that is to run the wheel at the proper speed, as this will produce the best results for the knife as well as for the wheel, thereby reducing the expense of the grinding room.

If a disc wheel is being used on the grinder, it is necessary to increase the speed as the wheel wears down. If this is not done the wheel will appear to be soft in the centre; it will cut slow and waste both the wheel and the time of the man doing the grinding. Good stave knives and good knife grinders are like anything else—they must be well cared for and properly handled to produce the maximum of efficiency.—The Barrel & Box.

Fire Risk in Woodworking Plants

The great inflammability of materials and products in the woodworking plant, together with the inevitable collection of dust and sawdust liable to flash into flames from spontaneous combustion, or the careless use of matches, makes this type of property an extremely hazardous one from the fire point of view. Insurance rates of 8 per cent. per annum are not at all uncommon, and a rate as high as this is justified in many of these properties.

Elimination of fire risk is of extreme importance, as it would result not only in absence of danger from fire but a very material decrease in the cost of insurance. The placing of an engine and boiler room close to the plant increases the fire risk, particularly as inflammable dust is always carried from the plant into the engine room by the heavy belt and is liable to cause an explosive fire. Electric drive does away with this inflammable dust, and if induction motors are used also eliminates danger of sparking. The savings effected in insurance premiums alone is sometimes sufficient to warrant the erection, and electric equipment of new fireproof buildings.

This is so, however, only if the buildings are adequately protected by a complete system of automatic sprinklers. Recent figures on the cost of cheap wooden buildings with engine drive as compared with the best fireproof construction driven electrically and protected by automatic sprinklers, show that for a certain plant the cost of the former including all machinery will represent $28,800 as against $38,300 for the latter. The difference in insurance premiums, however, amounts to more than $2,000 a year in favor of the more expensive plant. It is seen that this difference is more than 20 per cent. dividend upon the difference in cost, and that the additional expenditure or first cost is more than justified on every ground.

Addition to Fay & Egan Matcher

A logical development in the economical manufacture of lumber recently brought out by J. A. Fay & Egan Co. of Cincinnati, is a horizontal band resaw built on the end of their highly successful 333 Matcher so that bevel siding, ceiling, ship lap, etc., may be matched double thick and then resawed without further handling.

By the old method this class of work was put through the matcher at 75 feet per minute, then trucked to the resaw and put through at the same rate. This required the service of two feeders and two off-bearers. By the new method the same work can be done at 200 feet per minute with one feeder and one off-bearer.

The resaw is entirely below the bed line of the matcher, eliminating dangerous overhead rigging entirely and making it very easy to change blades or take off blade when matcher only is to be used—in fact, this arrangement gives easy accessibility to the entire mechanism.

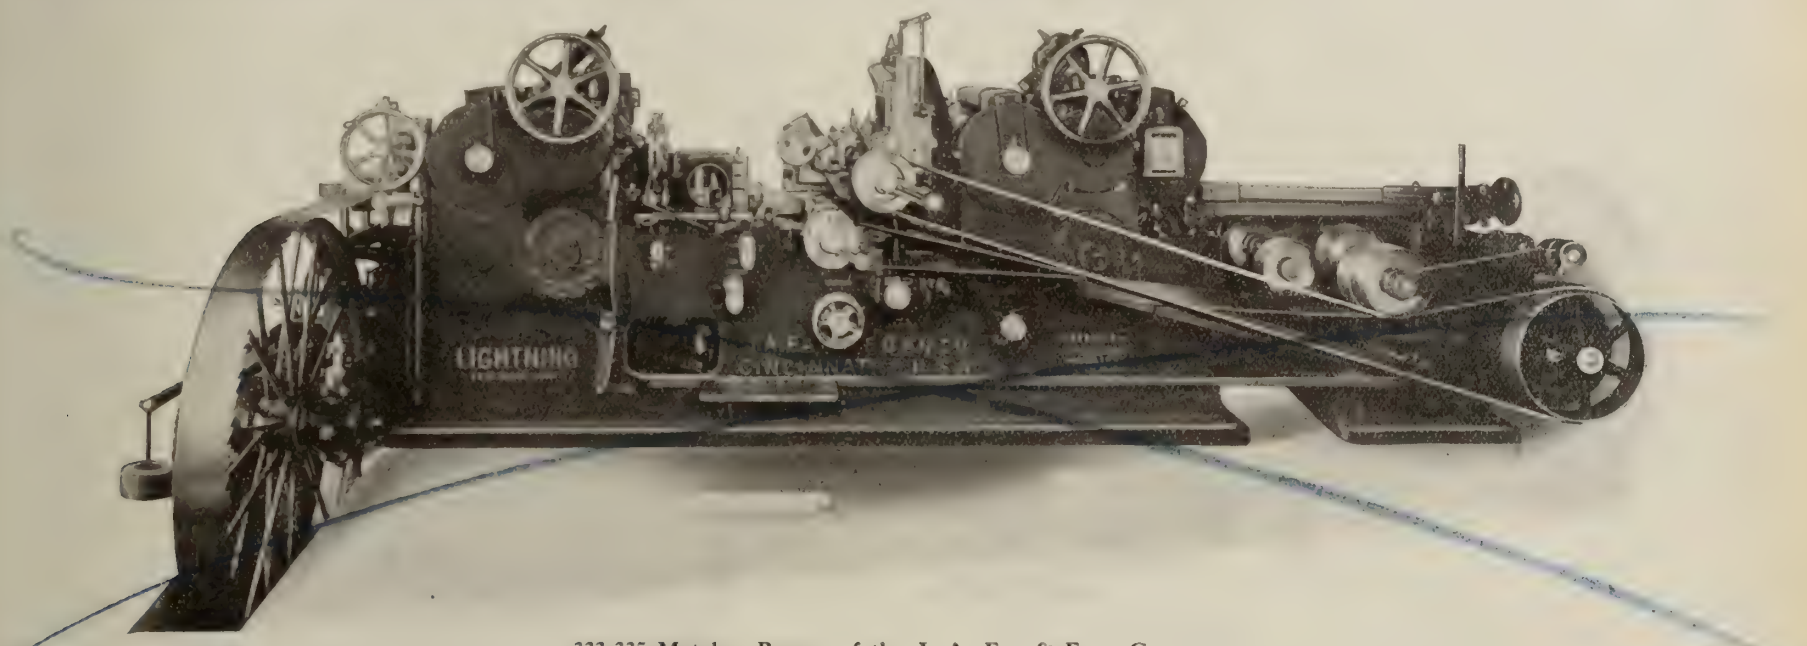
Compared with the old methods this new matcher-resaw will reduce manufacturing costs to a wonderfully low figure.

The installation can be used as a single unit, or the matcher may be used without the resaw.

This installation is exciting not a little comment where it is already running. Mill men who desire further details may obtain same upon application to J. A. Fay & Egan Co., 465-485 West Front street, Cincinnati, Ohio.

Modern Sanding

When you say "modern sanders," there is a vast difference in the makes, construction, adjustments and quality of work produced over the old type machines so commonly used a few years ago.



333-335 Matcher Resaw of the J. A. Fay & Egan Company

Up-to-date manufacturers are beginning to realize the vast strides with which the modern machines are overcoming the difficulties experienced in the past, and grasping the new ideas of to-day, thereby increasing their output as to quantity and quality, with a satisfied confidence in their product.

If a sceptical old timer could once visit a plant where modern machines are born and made, and see the solidity, simplicity, exactness and accurateness in the early and final stages of construction, and last of all, the testing of the qualities of the "giants" of the day, of whom so much is expected and must be realized, his scepticism must vanish and new-born astonishment take its place.

Now, the importance of the testing of these modern machines in their birth-place, can be realized when you consider they have to go to the mills of the country, and are to produce the results expected of them; no little detail is left unfinished, everything must be just right, carefulness in construction and alignment cannot be slighted, cylinders must run true and in balance, and the forty and one things that make the sander of to-day the realization of the strides of modern advancement.

When the new machine arrives at its destination, it will stand up to its work, and the thrill of expectancy is a fact. The adjustment of the cylinders simplified and convenient; new oscillation with take up for wear by end thrust; perfect alignment; and tension on springs in feed rolls; three changes of feed; operated at a moment's notice; stop, start, and reverse controlled by one lever; and the power hoist with hand-wheel for fine adjustments, are a few of the modern ideas not found on old-type machines.

Now, in the alignment of feed and pressure rolls, many of the difficulties of good sanding depends. A firm grasp of the pressure roll, thereby stopping the rotation, is enough pressure on the top chain of rolls for good work. Few operators pay enough attention to these facts, and continually adjust rolls to the disadvantage of good work. With an even tension on springs, and a perfect alignment, with a graduated adjustment of rolls, to allow for the cut which the sand paper takes off, on modern machines produces the best results. Much depends on the coverings of the cylinders, as a loose felt is a bad proposition. Sand-paper must be put on exact and careful to produce the best work. All oil wells and grease cups must do their duty. Bearing these pointers in mind and carefully operating an up-to-date sander with the adjustments and improvements possible to-day, you have a product unequalled and satisfied consumers of the production.

Sanding machines are built to-day to cover almost every condition called for in the sanding world, taking in material from 31-in. to 103-in. wide.

The endless bed sander—one of the modern achievements—with its enormous capacity on short stock, is filling a long felt want in wood-working plants handling short length material. The stock can be cut to the desired length, moulded and worked on any other machine before being presented to the sander, thus saving all labor formerly done, and delivering a piece of work ready for the finish room.

When you realize that this material, whatever it may be, is delivered 500 per cent. faster than on roll feed machines, it don't take long to see the advantages. O. E. S., in Berlin Quality.

It is reported that the Spanish River Pulp and Paper Company will have two additional machines, recently ordered, in operation by the beginning of February, making the total output 200 tons a day. The company have contracts signed for the sale of their entire output, including that of the new machines, for the next five years. The contracts have been made on the basis of the recent good prices. It is also understood that the Ontario Pulp and Paper Company, now part of the Spanish River Company, have nearly as long a contract signed for the output of 100 tons of manilla. In addition to their paper production both the Spanish River and Ontario companies will have a certain surplus of pulp, mechanical from the Spanish River plant, and sulphite from the Ontario plant, to dispose of.

National Wholesale Lumber Dealers Association

The National Wholesale Lumber Dealers Association recently sent a circular to their members, calling attention to the lack of uniformity which exists, as regards terms of sales, and requesting them all to endeavor to remedy this defect. These conditions are as follows:

The terms hereon are those agreed on by both buyer and seller and are a part of the sale agreement. Settlement to be made promptly on receipt of each car. Freight, net cash. Balance by note at 60 days from date of invoice or less 1½ per cent. discount for cash if paid within 15 days from date of invoice; or 1 per cent. for cash if paid within 30 days from date of invoice. No discount allowed after 30 days. If car is not received within the above discount times, and discount is desired, prepayment on account will not be held as acceptance of the shipment and the right to make corrections and complaint will not be forfeited thereby. In making delivered prices, cost of goods delivered at destination is guaranteed, but not against delay in transit. Claims for count or quality must be reported as soon as car is unloaded and tally proven. No claims allowed if not reported within 10 days after unloading. General Conditions—All accounts and agreements are made contingent upon strikes, fires, floods, inability to secure cars, delays of carriers and other delays unavoidable and beyond our control. In making delivered prices we simply guarantee the cost of goods at your place, but are in no way responsible for their safe delivery.

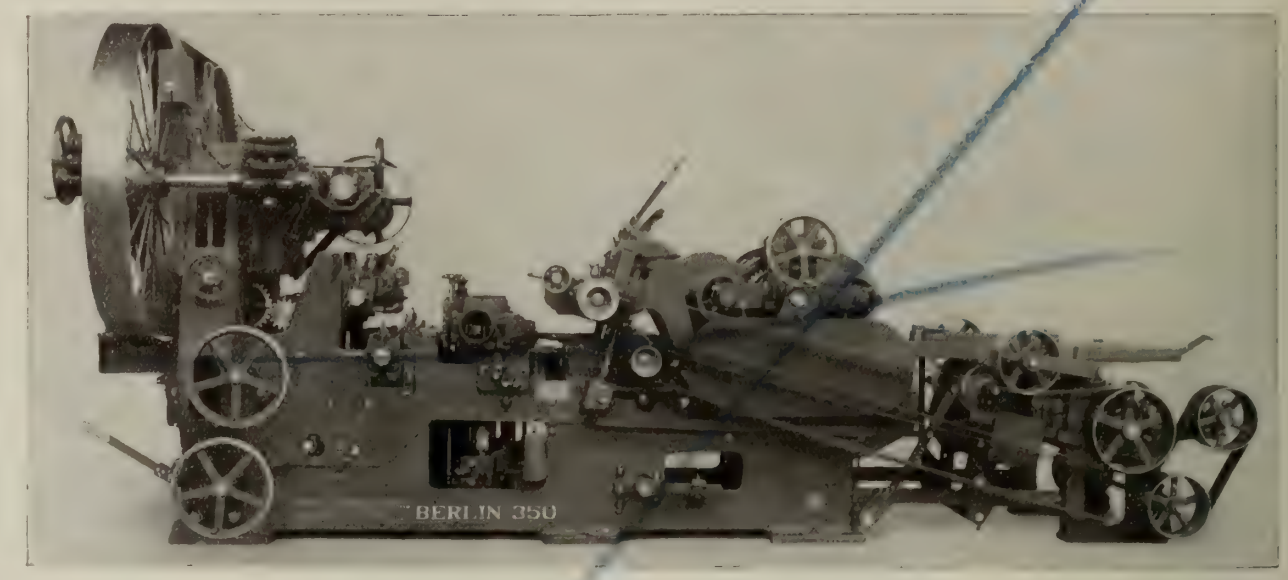
Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Berlin Combines Resaw with Matcher

The Berlin Machine Works have, during the past few years, given to the lumber industry a number of machines that have made it more than profitable, for their users, to remain in the lumber business. Such machines as their new fast feed matchers with profiling device have almost revolutionized the production of the class of product which they manufacture.

The Berlin horizontal resaws also, have had a wonderful effect on certain systems of manufacture, for the most part in the box factory. The twin horizontal No. 345 is a wonderful producer with its hopper feed running a constant stream of stock through two saws.



Berlin Resaw with Matcher

The latest combination machine put on the market by the Berlin people is more interesting in itself perhaps, than either of these, because it makes everything in double thickness. This machine requires in effect one operation to finish two pieces of either flooring, shiplap, novelty siding, ceiling and bevel siding. This is the new Berlin Combination Matcher-Resaw No. 350. It combines in one machine a late Berlin Matcher Profiler with the horizontal resaw.

Probably the most interesting thing about this machine is that it makes perfect bevel and novelty siding at the same speed given the fast-feed matcher in making matched, beaded and profiled stock in single thickness.

This is an entirely new method of manufacture. An output of beveled siding for instance has heretofore depended on two machines and four men. Two men take full care of the No. 350. The manufacture of bevel siding until now has meant a lot of extra trucking and double handling, a large proportionate expense on low priced lumber. The one-operation machine simplifies the system and lowers the cost. Beaded and profile stock is as well made in double thickness with the combined machine as the regular matcher-Profiler makes it single. This in itself shows a 50 per cent. saving in manufacturing costs of these stocks as the speeds of the two machines are identical.

A Berlin Engineer speaking of the new machine said, "With the necessity of making good bevel siding before them, and the high cost involved, manufacturers have been demanding a cheaper method of production. So we took our fast feed matcher, equipped with 6-bitted round heads, 12-bitted side heads, the improved belt tighteners and the profiling device, in fact every feature of our high speed machine, and simply added the saw equipment."

The outfeed rolls of the matcher take the place of the feed rolls of the resaw. The resawing attachment is mounted on extra heavy cast-iron columns securely bolted to the one-piece matcher frame. Gibbed to the upper ends of these columns a heavy cross head carries the wheels. This cross head is provided with a hoisting arrangement to adjust the saw for varying thickness of work. It is also provided with a tilting mechanism for sawing at an angle as for bevel siding.

There is nothing complicated about the machine, nothing difficult to understand. No new problems are introduced to bungle any present system. It is simply a matcher with a band saw at the outfeeding end to resaw anything worked double or to make bevel siding without further handling.

The Berlin Machine Works, Hamilton, Ont., will send full information to those desiring it. Kindly mention the Canada Lumberman and Woodworker when writing.

Henry Disston & Sons, Inc. have published an excellent illustrated booklet describing their various types of machine knives. In addition to a large number of splendid illustrations, the booklet contains a most interesting article upon the making of Disston machine knives. The article is one which will repay reading by anyone who has to use machine knives as it is exceptionally informing and interesting. At the same time, it gives one a capital idea of the excellent quality of material used by Disstons and the care and attention exercised in the manufacturing of their goods. The booklet is prepared in a very attractive manner and should be in the hands of all users of machine knives. A copy may be secured by writing to Henry Disston & Sons, Inc., Philadelphia, Pa., and mentioning the Canada Lumberman.

The "Cyclone" Saw Mill Blower

The "Cyclone" Saw Mill Blower which is shown in this illustration in action on a portable saw mill, is manufactured by the Ramey Company, Chillicothe, Ohio. Several thousand of these machines are in use at the present time in American mills.

The "Cyclone" Blower is built especially for saw mills, particular attention having been given to its strength and durability, and

it is not injured by bark or hard knots passing through it. The Ramey Company claim that the "Cyclone" is a great saver in time and labor in that it does away with the necessity for having a man to shovel and wheel dust. The Ramey Company have recently opened an office at 10 Wellington street east, Toronto, where they are prepared to give their careful attention to Canadian business.

Changes in the Officers and Directors of the Joseph Dixon Crucible Company

At the regular monthly meeting of the board of directors of the Joseph Dixon Crucible Company, held on October 21st, the following changes in the officers and board of directors were made on account of the death of Vice-President William H. Corbin; Mr. George E. Long, former treasurer was elected vice-president to succeed Mr. Corbin; Mr. J. H. Schermerhorn, former assistant secretary and assistant treasurer was elected to membership in the board of directors and treasurer of the company. Mr. Albert Norris was elected to the office of assistant secretary and assistant treasurer.

The Retail Dealer and His Problems

Starting in the Retail Business

When a man starts in to sell lumber to the people of a rural community with the notion cinched up in his hat band that all he has to do is to pile up a few loads of boards, planks, scantling, lath and shingle, and then sit back and see them grow into money, he will be dead sure to find the basement of his overalls getting thin enough to need half-soling before the dollars begin to drop. The opening of a lumber yard is viewed by some people, who never have tried it, as a proceeding that calls for nothing beyond putting in the stock and letting the people come and get it as they happen to think they want it. Those who have tried it know better, and many of them know that even in the best of times and in the best of places it is necessary constantly to look alive and "toot their horn" to keep the people awake in the fact that they are in business for something besides their health.

There is some difference, of course, in the keeping of a city yard and one in a small country town, but the necessity for a wide-awake business policy exists alike in both. The city yardman has to keep on hand a larger assortment of stocks, and to supply the carpenter-and-jobber trade he must have constantly on hand and in convenient place the materials most likely to be called for on short notice. When it becomes known that he has the stuff handy and can give quick service, he gets the trade and can, if he will, hold it. He must first get the attention of the people—advertise, "toot his horn," and when he gets them coming, they come a-running.

This is a reminder of an ease-loving retailer who was well "set-up" in a growing grain town. He had the field all to himself; and while he was not so well fixed that he could turn up his nose at an order for a jag of rough stuff for a pig pen or a machine shelter, he was strong enough financially to take his own time about doing things generally. Among other self-indulgences he had acquired the habit of strolling up-street to a neighboring drug store in the rear room of which he and the druggist waged a see-saw battle for the checker championship of the town. While thus engaged his office and yard were left wide open and unattended for hours at a time, and if a customer came along the chances were that he would have to go up to the drug store to buy lumber.

This habit of the lumber dealer became a source of much annoyance to some of his out-of-town customers, for it was sometimes a labor that took time and patience to get him away from the game long enough to sell a bill of lumber. When called for to attend to business his invariable reply would be: "All right, pard, wait till I finish this game. Won't take more'n a minute now, I've got this chap cornered." Half an hour later, perhaps, "Dick" would disentangle himself from the druggist's furniture and stroll down-street to his office and his waiting and impatient customer.

"Throwing a Scare"

One day a peppery old citizen, who was well known for his vitriolic temper, wanted some fencing and material for a board walk. He drove his team into "Dick's" yard and, seeing no sign of life, he went into the office and sat down to wait for the only lumberman in town to come along and take his order. And then he waited some more. When he had waited away his limited stock of patience he snorted a few, hammered his knee and said—a bad word. Then he said some more, a good deal worse, all of which gave him a good start and he went out on a still hunt for the lumberman. He found him at the druggist's just setting out the men for "one more game."

"Hey, you," he roared, " your yard's on fire!"

The lumberman, intent upon the game, scratched his head and made his move. Then, looking up at the angry man in the doorway, he said, "Hello, John, what's the noise?"

"Your yard's on fire, dad burn ye! Come on out here an' git a hustle on or the' hull dad-gummed place 'll go up in smoke!"

For once "Dick" gave signs of being something other than a wooden man. He jumped up and ran out of the drug store and streaked it down the street toward his yard. He had not gone far before it occurred to him that there were no signs of a conflagration and he slowed down and stopped. Turning around he saw the old man, the druggist and several others laughing at him. Then the old man let a yell out of him that brought forth all the people in the adjacent stores and houses: "Run, you son of a gun! Your yard's on fire!" he yelled.

The lumber dealer went on his way, slowly, head hanging, and did not pause until he reached his office. He went out into the yard and going among the piles came upon a social function of a very interesting nature. Chris, the hustler, was seated upon a lumber pile with a "scuttle of suds" in hand, orating in his Moscow brogue to Adam, the teamster, who was waiting patiently on his load, which they had just brought from the cars, for his turn at the "scuttle," his fearful glance glued upon the seductive foam of that vessel.

The lumberman did not interrupt them. He seemed to have awakened to the fact that there had not been anything in his example to inspire his help with ambition or action. He returned to the office, peeled off his coat and went to work loading out his peppery customer, who was still grinning ghoulishly over the scare he had "thrown into" the dealer.

Elements of Success in Retailing Lumber

It seems to me that the biggest asset possessed by the retail man is confidence. Confidence in his stock, confidence in the people and confidence in himself, says W. B. M. in the Lumber World Review. Get a man's confidence, and it is ten to one that you will get his business. There are more mind readers abroad than is generally suspected, and if you can not look a man square in the eye while you are telling him a few of the reasons why he had better buy of you, you had better wear smoked glasses.

Don't be afraid to accept Farmer Jordan's invitation to go quail hunting some fine day, and take dinner with the family. If you can wing a bird without killing half the stock on the place, he will come to the office some day and talk it over with you. You will not only get more invitations, but you will get better acquainted. It may not be a quail hunt, it may be a game of checkers. In either case you have found a common point of interest.

Be public spirited. If you can help out on any local enterprise, do it. Just about a year ago the young men of our town got up a football team to play a neighboring town. I used to play the game while at college and like it yet, so I got out and limbered up some of the muscles that I had forgotten I had. All business closed for that afternoon, and everyone went to the game. It was a representative team, for it was made up of merchants, barbers, preachers and others who thought they could stand it. Well, we beat the visitors 39 to 0, and I do not think any of the men who played for the honor of the home team lost anything by it, except the customary skin, though some of had hard work persuading ourselves to get up the next morning.

If you can toot a horn, get out and blow the street lights out. The boys will appreciate it, and you will get to furnish the stuff for that new bandstand. In other words, be a mixer, and if you have any talents, put them out on interest in your community.

Get familiar with your stock, so you will not have to show your ignorance by hunting all over the yard for the 2 x 4-16's if your yardman does not happen to be there. The best way to do this is to help pile it, and the yardman will not think any the less of you.

Nothing is made by running down your competitor's stock. A good business man will see by this that you are as liable to skin him as you are to help him.

Never make a special price, and tell your customer not to say anything about it. It is too good to keep, and his neighbor will be in soon, and that is the first thing that you will hear, and, the first thing you know, your prices are all special, while your profits suffer from it. It does not pay to get a bill in this way.

When you think your business is doing fine advertise in the home paper. It helps, if no one but the editor buys of you, and he might speak a good word for you. Get him to help you out in your campaign against the mail order houses, for here is a factor that must be met. I have yet to find a man who has bought a second bill of one of these concerns, but the loss of the initial bill is enough, and if you get the first, there is no reason why you should not get the next.

A good memory for names and faces is indispensable to the small retail dealer. Any customer dislikes to be treated as a stranger. Even in settling up his account with you, he dislikes being asked his name. Getting hold of a man's "front" name make him feel at home in your office. If you have not the time to get on intimate terms with your customers you had better quit. This I say is for the dealer in a small town. It may not be possible in a city, although the more a person cultivates this faculty, in either case, he will find that his business will stand for more of it.

It is a good asset in any line and one that helps in any department in building up a business; it is one of the most important elements of success.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted

1,000 cars ordinary Sawmill Sawdust. Will accept now or later. State what you have. Box 639, Canada Lumberman, Toronto, Ont.
22-1-68

Wanted

Large quantity of Birch, Maple, Elm, Ash and Basswood, 1 inch and thicker, Log Run Dry or can place orders for spring delivery. Box 636 Canada Lumberman, Toronto, Ont.
21-24-63

Wanted

Five million feet Hemlock and Spruce, 1-in. to 2-in., for delivery next spring or summer. Can use portion now. State what you can supply. Box 640 Canada Lumberman, Toronto, Ont.
21-24-66

Lumber Wanted

Wanted—Stocks of Ash, Elm, Birch and Basswood lumber, all thicknesses, for cash. Send your list and I will look over your stock. Box 632, Canada Lumberman & Woodworker, Toronto, Ont.
21-22-54

Wanted

One million feet 4 x 4 to 8 x 8 Maple, Beech, Birch or Elm Squares. Will accept hearts of knotty stock, for rough work. Delivery now or during 1913. Box 638, Canada Lumberman, Toronto, Ont.
22-1-67

Soft Elm Wanted

We require for prompt shipment few cars 1¼-in. Soft Elm, No. 1 Common and Better, also 1-in. Winter sawn White Basswood.

Robert Bury & Company,
79 Spadina Avenue,
22-74 Toronto, Ont.

Birch Wanted

We desire to buy 100 M. to half million feet 4/4, 5/4, 6/4, and 8/4 log run No. 2 common and better Unselected Birch. For sufficient quantity will send representative to load stock. Terms cash upon inspection. Apply to Louisville Point Lumber Company, Louisville, Ky.
20-23-43

We use yearly five hundred thousand to one million feet of Birch, Basswood and Ash in our business and are open to contract with responsible mill men for same. We would be willing to advance money on the logs and also on lumber as sawn. Write us, Manufacturer, Box 619, Canada Lumberman, Toronto, Ont.
20-37 T.F.

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont.
14 T.F.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont.
7-tf

Birch Logs and Hardwood

Wanted from 100 to 300 cars Birch logs, 14-in. and over diameter and 10 ft. and up long, delivery will be accepted up to May, 1913. Desire also to communicate with parties having Hardwood lumber to offer. Box 630, Canada Lumberman, Toronto, Ont.
21-22-50

Lumber Wanted

Four, five and six quarter, Spruce, Hemlock and Norway, four, six, eight and ten inches wide, rough, also surfaced. White Pine Mill Culls and Lath. Box 615, Canada Lumberman & Woodworker, Toronto, Ont.
20-1-34

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

FOR SALE—LUMBER, ETC.

For Sale

For quick shipment, 100 M. ft. 2-in. Birch, December, 1911, cut. No. 2 C. & B. at $20 per M. on cars. Farm Point, Que. Hall Bros., 174 Mutual Street, Toronto, Ont. 16t.f.

For Sale

Five thousand pieces small posts, 3-in. to 4½-in. top, peeled and in good shipping condition. The Baker Lumber Company, Lindsay, Ont.
20-23-30

Timber For Sale

One million two hundred and fifty thousand feet of standing timber; fifty-three miles east of Toronto. Price and full particulars on application to E. Todd, 336 Main east, Hamilton, Ont.
22-23-72

Cedar Shingles

Four carloads XX 16-in. Cedar Shingles, retailing at $1.75 per M. Price in car lots $1.15 at mill, C. P. R. or G. T. R. Lindsay, Ont., for quick sale. Terms 30 days net. Box 279, Lindsay, Ont.
19-22-24

Pine For Sale

For sale by tender on the stump or loaded on cars at Waterdown Station, G. T. R., about 200 pine suitable for piles, from 40 to 70 feet long, 6 to 8 inch tops. N. H. Howard, Aldershot P. O., Ont.
22-69

For Sale

50,000 ft. 4-in. Hard Maple, No. 1 Common and Better, 75 per cent. 1sts and 2nds.
20,000 ft. 4-in. Soft Elm, No. 1 Common and Better, 75 per cent. 1sts and 2nds.
25,000 ft. 4-in. Basswood, No. 1 Common and Better.
35,000 ft. 1-in. Basswood, No. 1 Common and Better.

Apply ROBERT BURY & CO.,
79 Spadina Avenue,
22-73 Toronto, Ont.

For Sale

30,000 ft. 4-in. Hard Maple 6/16 ft.
30,000 ft. 2-in. Hard Maple 6/16 ft.
30,000 ft. 1-in. Hard Maple 6/16 ft.
Log Run (culls out); also
Square Cedar 8 in. x 8 in. to 12 in. x 12in.
Address H, Canada Lumberman, Montreal.
22-70

Lumber For Sale

400,000 ft. 3 x 7 and up Merchantable White Pine.
200,000 ft. 2 in. Merchantable White Pine.
200,000 ft. 1¼ in. Basswood, Log Run.
500,000 ft. Hard Maple, 1 in. to 4 in.
Apply to

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale

Ten cars Telephone Poles. Can be loaded at once. For prices, etc., apply to P. O. Box No. 213, Almonte, Ont.
21-22-57

For Quick Sale

1,400 acres standing timber.
100,000 Cedar Ties.
100,000 Cedar Posts.
1,000 cords Pulpwood.
Also some pine. Above is estimate.

Owner must sell at once. Price, Three Thousand Dollars on terms or Twenty-eight Hundred spot cash. Contractor will take out and put on lake shore at following prices:

Hewn ties, 18c each; cedar posts, 5c each. Pulpwood, $3.50 per cord; cedar logs, $7.00 per M.; pine logs, $6.00 per M.

Apply Box 633, Canada Lumberman, Toronto, Ont.
21-22-55

FOR SALE—MACHINERY, ETC.

For Sale—A Snap

Ten sets Sleighs. Runners 4-in. x 7-ft., 5 ft. wide. Bunks 8 x 9 x 8 ft. Bench 9 x 10 x 6 ft. $15.00 per set. Box 603, Canada Lumberman, Toronto, Ont.
20-23-27

For Sale

Two Steam Engines, Boilers, Saw Mill Machinery and Barkers, all in good condition. Apply The East Canada Power & Pulp Company, Limited, Murray Bay, P.Q.
20-22-38

For Sale

5/4-in. Yellow Poplar saps. One carload 10-in. to 16-in. wide. Also one carload 2-in. panel and No. 1 Poplar 12-in. to 24-in. wide.

CHARLES F. SHIELS & CO.,
21-24-60 Cincinnati, O., U.S.A.

Saw Mill For Sale

Huntsville Lumber Company, Limited, will in the future only run one of their two double cutting Band Mills, which is now cutting fifty thousand feet per day.

They will sell the same with engine, boilers and all other machinery along with building. Also will sell blacksmith's tools and a number of saw-log sleighs and chains.

Huntsville Lumber Company, Ltd.,
22-42 T.F. Huntsville, Ont.

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Situation wanted, as office or general man. Sixteen years' experience in lumber. Good references. Box 624, Canada Lumberman, Toronto, Ont.
21-22-44

Wanted position as band saw filer to finish this season cut with the consideration of work next season. Can show first-class references. Reply to Box 620, Canada Lumberman, Toronto, Ont.
20-22-21

Thoroughly experienced office man, Canadian, age thirty-five, married. Expert bookkeeper and cost accountant, sawmill, wholesale and box factory. Experienced selling yellow pine; also seven years experience white pine, United States and Canada. Desire change to healthy location with good schools. Prefer position as assistant manager or office manager. Haven't lost a day in thirteen years. Reply, Box 613, Canada Lumberman, Toronto, Ont.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont.
tf.

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont.
19-22-t.f.

FOR SALE

A Going Lumber Business Steam Saw Mill and Timber Lands

Six and One-Half Miles from Lavant Station, K. & P. Railway, comprising Mill and 1,100 acres deeded land. Township Lavant, also license for 9-mile government limit in Township Dalhousie, adjoining mill property. All the timber lands are well wooded and all green bush. Has never been destroyed by fire. Ten to twelve million feet of lumber would be a safe estimate, probably five million feet of this original maple of good quality. Besides there is a great quantity of cedar, also five million feet comprising elm, ash, oak, basswood, poplar and second growth pine. Over 300 M. feet lumber now in yard sold for winter delivery, but would give purchaser some idea of qualities. This output could be doubled this year. Have contracted already for this season 200 M. feet to be taken from the stump and sawn and piled in yard for $8.00 per thousand. Can buy also large quantities from farmers in locality. Mill in good repair ready to start. Good stables, barn and three houses, sleighs and all equipment. No encumbrance. Too much other business to attend to. Price $10,000, half cash and half secured. For more particulars apply R. R. Drysdale, General Merchant, Lanark, Ont.
21-22-64

Important Sale of Valuable Timber Limits

Sealed tenders will be received by the undersigned up to and including the **20th day of December, 1912**, for the purchase of:

Limit No. 194 of 1873-74—River Jean de Terre—tributary to the Gatineau, containing an area of fifty (50) square miles, more or less.

Limit No. 195 of 1873-74—River Jean de Terre—tributary to the Gatineau—Island Lake, containing an area of fifty (50) square miles, more or less.

These limits comprise some of the best pine and pulpwood areas in the Province of Quebec.

Map showing location of these timber limits and report thereon may be inspected at the offices of the undersigned and from whom further information may be obtained.

The highest or any tender not necessarily accepted, and the acceptance of any tender will be subject to the approval of the Court.

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 115 h.p. boiler, 100 h.p. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

Baughman's Buyer and Seller

The twelfth edition of the handy book for lumbermen just out. Revised, improved; see the new side tables, the metric system, tapering timber, to figure narrow flooring, moulding and box work, etc., five sections each indexed and separate work. Every page worth the price of the book. The book that talks to lumbermen. Not millions but more than seventy-five thousand copies have been sold to lumbermen. Bound in red flexible leather cover, $2.50 per copy prepaid. Orders mailed day received. Address H. R. A. Baughman, Indianaoplis, Ind. 19-22-18

Maltese laborers are to be brought to British Columbia to work in the mill of the Canadian Western Lumber Company on the Fraser River. A representative of the Maltese Government was in Vancouver last week in regard to the matter, and was assured by Col. A. D. McRae, general manager of the company, that employment would be given to fifty at first. Altogether 1,000 will be brought to British Columbia.

One of the important lumber specialties in the United States is pencil cedar, both for local consumption and for export. Practically all the good quality pencils are made from red cedar, and the scarcity of this wood, which is rapidly growing acute, has made of it a highly developed specialty. The greater portion of the cedar used in this industry is procured in the United States, and to supply the constant demand all available sources are being exploited, the search for the wood covering not only standing trees but also the wood in whatever form it may be found. One of the important sources of supply consists of old fences and fence posts, many of which have been in use for years and are still in sound condition, making excellent pencil material.

A somewhat paradoxical feature of this trade is the exacting demand as to quality of pencil wood, as compared with the general characteristics of cedar, which make it one of the poorest woods for lumber. The trees are generally small, crooked and knotty, and the limited demand for it as lumber exists only in cases where these defects are overlooked. On the other hand, practically only perfect wood, straight grained, soft and clear, is allowed in pencil cedar; and it is available only because it is used only in small pieces, which fact enables the perfect parts to be cut out and utilized.

Under these circumstances it is easy to understand that pencil makers have long been searching for a suitable substitute, but nothing has been found to fully meet these requirements, although it is stated that the incense cedar of California has of late come into some degree of use for the cheaper grade of pencils. No small degree of interest, therefore, attaches to the recent announcement that a wood has been discovered in East Africa which is almost if not entirely equal to the American cedar, and exists in sufficient volume to secure an abundant supply. Just how much faith is to be placed in this announcement is so far problematical, although it is stated that the new wood is already used to some extent in Germany. It is to be expected, however, that apart from the present experimental status of the wood, its comparative inaccessibility will make its effect upon the pencil wood trade of the United States a gradual one, and while it remains for the future to determine whether it becomes an active competitor of the American product, the probability of such a contingency according to present reports seems to be at least sufficient to be of considerable interest.

The damage suit for $17,000 brought by W. D. McElmon, of Serpentine, B. C., against the British Columbia Electric Railway Company, terminated in favor of the plaintiff, the court awarding him $8,500. Mr. McElmon held the railway company responsible for the loss of his mill by fire last August, when lightning ran into the mill over the wires which were improperly safeguarded. The mill was operated by electricity and the wiring was done by the railway company which also furnished the current. The case will be appealed. Many of the mills on the lower mainland are operated with electricity and lumbermen are watching the case with interest.

The cooperage industry of Canada is rapidly becoming an important competitor for the spruce wood of this country so largely used in the manufacture of paper. According to a bulletin which has just been issued by the Forestry Branch, elm still leads among the wood used for slack cooperage, but spruce is rapidly supplanting it. There were over 11,000,000 more spruce barrel staves, and 9,000,000 fewer elm staves manufactured in 1911 than in 1910, according to reports made to the branch. The elm supply is becoming diminished, and the ultimate substitute for it in making barrels is expected to be birch.

The Canadian Trade Commissioner at Belfast, Ireland, gives some figures showing Erin's imports of pulp and paper from Canada during the last few years in a recent report to the Government. Shipments of Canadian paper and pulp to Belfast direct last year totalled 481 tons, as compared with 452 tons the previous year, 505 tons in 1909 and 1,711 tons in 1908. To Dublin these shipments last year aggregated 368 tons as against 367 in 1910, 539 in 1909 and 1,053 in 1908.

Twisting a Band Saw Into Three Coils

A correspondent of The Timber News asks how to coil up a band saw into three coils so as to hang them up, or send them away. The following instructions are given in reply: Twisting a band saw into three coils is very simple when you know how it is done; yet, like a good many more things, it is very difficult to do unless you know how to do it. Having taken the saw off the machine, grasp it in the centre with your hands, one holding one side, the other hand the other side, the teeth away from you. The saw will now appear as if it was on the machine, one half will be at your feet, the other above your head. Now twist the saw with your hand, twist the top half, so that the twist does not pass to the lower half below your hand. Now twist it again the same way, and as you twist it let the top loop come towards you, then the saw will, if you open your hands, drop in three coils at your feet. All this may seem very involved, but if you go over the procedure you will find that after all it is very simple. What you must watch is to see that you do not allow the twist you give the saw to pass into the lower half, otherwise you must give it another twist to make up for it. You must be careful with small saws that have been brazed several times, or you may break the saws at one of the brazes.

Suspending the Gainer

There is a great variety of gainers and dado machines, and lots of wrinkles are used in connection with them,says the Wood-Worker, of Indianapolis. One of these is the suspending of the cutting equipment of an ordinary gang gainer from overhead, so that long material can be handled. To get the idea just right, get before you the picture of an ordinary gang gainer, study it a while, and you can see how it is practical to cut away the frame supporting the mandrel and its journals, and reverse the order of it, swinging it from above, leaving only the carriage and ways on the floor. This arrangement makes the carriage open at the ends, so that stock of any length can be handled over it. Another wrinkle along this line is the portable overhead gainer that is taken right out on the job where there is heavy framing to do.

Review of Current Trade Conditions

Ontario

There has been practically no change in the situation since our last issue, business being steady and prices unchanged. A remarkable fact at the present time is that the United States presidential elections have not affected the market to any marked degree, either in Ontario or in the United States. As a rule the elections have a tendency to create more or less of a panic on the market. Some little improvement is noticed in the car situation, shipments from British Columbia being made far more promptly than a few weeks ago. In the neighborhood of the Ottawa Valley, however, manufacturers are complaining of a shortage of labor, and this, of course, has had an effect on shipments. The mild weather which has obtained for some little time has kept building operations very active and there is a good demand for all classes of lumber, particularly in the larger centres. Now that the farmers have practically completed their harvesting operations, an increased demand may be expected from the smaller towns.

The chief demand is for the lower grade of lumber, both in hard and soft woods. Mill culls in pine are particularly scarce and dealers find difficulty in obtaining any appreciable supplies. The situation in hemlock is unchanged except that, if possible, stocks are getting shorter, while the demand is not in any way abating. There is very little dry hemlock in the yards at present and no doubt other lumber is being substituted for it wherever possible.

United States

The fall trade still continues good, although there is some falling off in enquiries and actual demand. This is especially noticeable in the southwest. The wholesale trade is doing its utmost to get lumber forward from the mills. The intensity in the car shortage situation apparently has been transferred very recently from the southwest to the northwest, but some considerable relief is expected as soon as the severe weather sets in, and it is hoped that this will regulate more evenly the demand and supply.

Chicago.—The market for northern pine still remains very firm and there does not seem any likelihood of a material drop in prices so long as the general condition of the country is prosperous. Another fact in keeping prices up is the lessened supply. The demand for low grade pine is particularly heavy, upper grades being also in fair demand. The market in hardwoods is very brisk and the low stocks and good prices which can be obtained are allowing the hardwood manufacturer to choose his business. The biggest demand is still for oak, while birch, elm and maple are also steady sellers. There is really very little stock of the lower grades to be obtained. The hemlock situation shows little change, prices being very pleasing to manufacturers. The local consumption of hemlock is exceptionally heavy, and stocks are short, both here and at the mills. The movement of yellow pine is hampered by the car shortage and this is intensified by the fact that orders have largely increased while shipments have been lighter than usual. There are more red cedar shingles on the market, and while some clears are being sold for $3.22 and some stars for $2.74, the majority of these stocks are being held for $3.27 and $2.79 respectively. White cedar shingles are still in good demand. Lath is becoming scarce and prices may be expected to advance very shortly.

Buffalo.—There is a more even demand for the various grades of northern pine than a few weeks ago, the medium grades now being in steady demand. The upper and lower grades, however, are still in the best demand, especially the low, where the stock is very limited. Higher prices seem probable. More enquiry is being found for hardwoods than was the case a few weeks ago. Low grades are scarce and prices firm. Plain oak maintains its market strength. Hemlock prices have been advanced 50 cents by the Pennsylvania mills, the base price now being $22, which is said to be the highest that has ever been known. Trade has been active now for a long time and the large amount of local building has increased the demand materially. Red cedar is still in fair demand, but not much fir and spruce are asked for. Southern pine is somewhat quiet and dealers are unable to get shipments owing to the car shortage. Business is not quite so brisk in the building trade.

Bay City and Saginaw.—The movement of northern pine is still brisk, lower grades being in particularly good demand at the recent advance of about $2 per thousand feet. Local dealers will have plenty of stocks after navigation closes. The movement in hardwoods was never more brisk, all hardwoods being included. The market is very strong and prices tend to go higher. Very little stock is on hand, everything being moved as soon as possible. Maple and birch are very short.

Great Britain

Although the London spot market is not quite so brisk as many would like, yard keepers are very busy receiving and stowing their purchases, a large number of steamers having recently arrived. There is very little change in the freight situation; boats are not quite so scarce but rates are advancing, and consequently values follow suit. Business on the whole is very active and consumers now realize that they will have to pay the enhanced prices. The outlook for the remainder of the year is better than for some time past and given fair weather for outdoor work, possibilities are that a lot of leeway may be made up. Deliveries at London docks for the week ending October 19th, 1912, amounted to 8,791 standards, as against 5,612 standards for the corresponding week of last year. Owing to abnormal freight rates the consumption of all kinds of timber has been somewhat crippled at Liverpool. Consumers are quite reluctant to buy at present prices, apparently for the reason that they have not had to pay these figures for some years past. Some of them, of course, have realized the situation, and have been getting into the market to secure their requirements. There is quite a scarcity at Liverpool of New Brunswick and Nova Scotia spruce owing to the paucity of stocks held in those provinces. As the season closes in, small parcels only will be brought in by the liners just as tonnage can be secured. The season for Canadian imports is now closing up, and a few weeks will see the end of the imports from Montreal.

Market Correspondence

Ottawa Firms Enlarging

Ottawa, November 7, (Special correspondence of the Canada Lumberman).—With the weather exceptionally mild for this time of the year, lumber dealers in Ottawa and the immediate district are exceptionally busy. When the season's business is totalled at the end of this month it is believed the figures will show a record. Every lumber dealer in the city has enough orders on his books to keep him busy for some time. The shortage of cars is still acute and shows no signs of getting better.

The extensive alterations and improvements that are being made at the E. B. Eddy plant at Hull, will, when completed early next year, practically double the capacity of the present plant. The existing pulp mills are to be removed to make way for a large central electric power house and a new pulp mill with a capacity of one hundred tons of dry pulp per day. This new power house and mill will be constructed of steel and concrete and so situated as to be near the supply of wood. During the past few years new water wheels have been added to the plant as the demand occasioned. Now, however, the whole system of the power supply is to be altered and brought thoroughly up to date. Reinforced concrete bulkheads and side walls will surround the present forebay. The latter is being deepened. A new power house is under construction that will be able to utilize all the water flowing from the north side of the Ottawa River at the Chaudiere Falls. The new arrangement will mean a gain of from six to eight feet of head. The new electric power plant will have three units of turbines and generators to develop 4,500 to 5,000 horse power each and will be operated from one station. The increase in power will be about fifty per cent. This plant will supply power to the paper and sulphite mills, bag, match, and pail factories.

According to a bulletin recently issued by the Canadian Forestry Branch, jack pine ties are taking the place of Eastern cedar for railroad work. In 1910, says the bulletin, forty per cent. of the ties used by Canadian railroads were of cedar. Last year the percentage of cedar ties used had fallen to 5.4 per cent. and jack pine had risen to forty per cent. Other varieties of ties used last year were tamarak, 19 per cent.; Douglas fir, 14 per cent.; and hemlock, 12 per cent. A total of 13,683,770 ties were used, 4,469,808 more than in 1910. The average price per tie was 39 cents. Some of the most expensive ties were supplied by the United States, such as southern pine at $1.10 each and white oak at 81 cents each. In 1911 the sawn tie was more extensively used than the hewn tie. The comparative figures are: sawn ties, 70 per cent.; hewn ties, 30 per cent. The bulletin says that creosoted ties would mean a saving to railroad companies in Canada of $1,400,000 per year.

It is learned from officials of the Conservation Commission that on account of the wet weather this year the Fire Inspection Department of the Railway Commission has not been kept very busy. Since June last few fires have occurred and those that did occur were not the fault of the railroads. The system of fire protection of the forests

SARNIA, ONTARIO

A. F. Holden, Pres. J. M. Diver, Vice Pres. and Gen'l. Mgr. E. C. Barre, Ass't. Mgr.

in Canada adopted by the Railway Commission is working out satisfactorily.

At a meeting of the directors of the Bank of Ottawa held this week, Mr. Russell Blackburn, a director of the Hawkesbury Lumber Company, was made a director of the bank to succeed the late Mr. H. F. McLachlin, prominent lumberman of Arnprior. Mr. Blackburn is yet a young man, being only thirty-six years of age, yet he is already one of the leading financial and business men in Ottawa. He is a son of the late Mr. Robert Blackburn, M.P, for Russell County. He was born in Ottawa in 1876, educated first at the public and high schools and then at the Royal Military College, Kingston. At the age of 18 he entered the head office of the Bank of Ottawa as clerk and remained as such for two years, when he left to manage the East Templeton Mica Mines, which he and his brother owned and still own and operate. When the Ottawa and Hull Power Company was organized in 1900 Mr. Blackburn was appointed general manager, a position which he still holds.

A large reinforced concrete cutting shed is being built by the W. C. Edwards Company. It will be completed this year.

In view of the increased rates on lumber which go into effect for the winter season, Ottawa lumber dealers are hustling through shipments of lumber to Montreal for export to England. The export trade from here is very brisk this year.

Business Brisk at Montreal

Montreal, Nov. 12; (Special correspondence of the Canada Lumberman).—When times are prosperous and conditions vary but slightly from issue to issue, it is difficult to write much that is fresh concerning the market. Business all round is again exceptionally good, and he must be a poor lumberman who has not picked up some money during the past season. Of course cars are again scarce, but inquiries show that in some instances there is an improvement in the supply. The local demand for lumber is excellent, and as there is every indication that the building boom will continue for some time, we may look for a satisfactory market in the immediate future. For the month of October the building permits totalled $2,846,508, an increase of $1,186,553 on the corresponding month of last year; while for the ten months the aggregate was $16,171,902, a gain of $3,092,739 on 1911. Prices keep very firm, with an upward tendency for spruce, one and two inch descriptions of which are in big request. The lower grades of pine and spruce are very scarce; lath is strong, and from the small stock available it looks as if quotations will still further advance. Shingles too, are very hard in price. All kinds of hardwoods are selling well at good quotations.

British shippers are still rushing stock to the other side and report a satisfactory market.

Trade with New York and the Eastern States is on a large scale, better in fact than since 1906, and prices are even higher than during that boom period.

Reports from some parts of the Province of Quebec state that logging operations are backward, owing to the very heavy rainfall, which has rendered it very difficult to work.

The New York State canals close on the 15th inst., and the last boats with lumber left here on the 7th. This fall freight rates by canal boats have remained stationary, owing to the decreased shipments of pulpwood, which left more space available for ordinary lumber. Under these circumstances freights were unchanged.

Canadian paper mills are now fully occupied with their water shipments. The ground wood market has considerably strengthened, much larger shipments having been made to the United States. There has been a reduction of the water fall in the United States, although the streams are still at full height. The approaching cold weather will cut off any rainfall, and it is expected that stocks, which are admitted to be heavy, will be gradually reduced, and quotations further improve in the early part of the winter. Notwithstanding the heaviest rainfall for five years, the Canadian ground wood business has done remarkably well this year, in spite of the extremely heavy new tonnage which has come into the market. The largest mill in the country has sold its output for a long period ahead, and recently purchased for European shipment about 6,000 tons held in stock by another mill.

Chemical pulp is in very great demand, and is still advancing in price. Pracically everp paper-making works in the world is now operating to its fullest capacity, and as an immense amount of pulp is being used, it is believed that quotations will go still higher.

It was pretty certain that if the Provincial Government raised the restriction on the export of pulpwood from Crown limits the United States would in turn cancel the present duty on paper manufactured from Crown limits wood. It was also pointed out that the British Columbia Government had set a precedent in the matter of allowing wood from Crown lands owned by a newsprint company to be exported into the United States, and the latter, in recognition of this concession, permitted the paper to go into the country duty free. The deputation were convinced that, if the example of the British Columbia Government were followed by the Quebec Government, it would stimulate the newsprint industry of the province.

Sir Lomer Gouin briefly discussed the various points raised, and promised that the government would favorably consider the request of the deputation.

Mr. Paul G. Owens, secretary of the Limit Owners' Association, has also submitted a memorial to the government supporting the views of the paper makers. In the same memorial reference is made to the stumpage dues, which, it is suggested, might be reduced, with advantage to the lumber business.

In the Speech from the Throne, the Quebec Government state that the wealth of the forests and hunting territories in southern Ungava and in the northern sections of the Province of Quebec is often threatened through the imprudence and wilful neglect of prospectors. The government, however, will see that all the riches of that region are protected. The government intends to promote, as is done in certain countries, the establishment of public and private parks where game and fur bearing animals can multiply.

Stocks Reduced at St. John

St. John, N.B., Nov. 6th. (Special correspondence of the Canada Lumberman): Practically no changes have taken place in demand or prices for wood goods at this port, since last writing, the prices both in English and American markets continue strong but the great trouble is to get the tonnage to remove the stocks. Freights to United States ports viz., New York and Sound, continue at $4.50 and $4.25 respectively, with very little tonnage offering at those prices. Nova Scotia is taking a large amount of tonnage at $5.00 to $6.00. This of course is always the case in many Nova Scotia ports at this time of year, as unless the shippers are able to remove their stocks before winter sets in, they will have to hold until spring as nearly all the harbors freeze up and vessels cannot get to berths. It is felt that American freights will cheapen perhaps 25 to 50c. per M. from this port in the near future as the Penobscot & Kennebec rivers will be frozen and other outports on Bay of Fundy will be in the same condition, therefore vessels will have to take less or tie up, but it is the opinion that $4.00 will be the winter rate, for some time at least at which price vessels ought to be able to put by some money. Freights by liners to London for winter have advanced from 45s. to 47s. 6d. with other ports of discharge remaining about as before.

Stocks of English deals on wharves at St. John at present time are not heavy, viz., between 30 and 40 million with only about three weeks more of open season to figure on. This is not as large a quantity as usual on hand at this time of year, as many of the mills have been sawing for the American market. Stocks of American plank and deals are quite heavy, as it has been hard to secure tonnage, therefore mills have been forced to pile up a certain amount, but in nearly every case both American and English deals have been sold, and by spring the probabilities are that it will find the mills entirely cleared of all sizes. All the mills with exception of Messrs. Stetson Cutler & Co. who will operate all winter, will close down anywhere from the 1st to 15th of December and will remain idle until about April 1st. Some mills will not start until opening of navigation, about April 20th.

It is said that a large quantity of deals will be sawn by portable mills through the province during the winter, but at this date it is not known just what the cut will be. It is felt that with the high cost of stumpage, rates of freight and labor, that many of the small operators will find it difficult to have their operations financed, therefore many of these portable mill men, unless they have old chances to work upon will not be able to operate. Of course many of the farmers are of late years hauling out their logs and manufacturing them instead of selling the logs in the round.

Stocks of laths are not heavy being about 12 to 15 million, but it is said that large numbers of mills will go into the woods both in New Brunswick and State of Maine to manufacture round wood laths during the coming winter.

Practically no low grade stocks are to be found in the yards at present, as the local consumption has continued extra good right to date.

Hemlock boards are almost impossible to get at any price, as nearly all hemlock logs in this section were manufactured into timber for wharf building, which went into immediate consumption.

Pine boards, etc.—Practically no stocks of dry last year's boards are to be found, the mills of course are sawing their usual quantity of pine but it will hardly be dry enough for use until spring or early summer of next year. Shingles still continue active, with low grades well sold up.

Prices for English deals remain about the same, viz., $15.00 for specification of 50 per cent. 7 and 8 x 3 balance 9 and up, but as practically every mill has sold its cut, the price has very little bearing upon the market at this port. Deals for winter shipment from

Works: Sherbrooke, Que., St. Catharines, Ont.

rotary mills in the interior are said to be offered at about $14.00 for above specification, of course city deals always being $1.00 to $1.50 per M. more than portable stock, as manufacture is better, also lumber is better qualified.

Very little stock is being sold in the American market less than $25.00 as a base price on good lines of two and three inch, the average length and percentage of wides having much to do in range prices. Many enquiries from New York, Sound and New England are coming in daily, which shows that the business is still in splendid condition. Good long random spruce would net about $18.00 on wharves at St. John. Laths are selling for about $2.70 on wharves here.

Shingles at Boston are bringing $4.25 for extras, but manufacturers here are not disposed to sell any large quantities at that rate. Clears $3.90. Of course the brand has much to do with the top price.

Building still continues brisk, but practically no new buildings will be started at this season of the year. For spring, many large new buildings are now being figured upon, and it is felt that next year will be a banner year in the building trade at St. John.

The Provincial Lumber Co. are shipping large quantities by vessel from this port at the present time.

Canadian Lumber Scarce at Tonawanda

The Tonawandas, N.Y., Nov. 7, (Special correspondence of the Canada Lumberman).—The Large Brothers Lumber Company is the name of the newest member of the local family of lumber dealers. Messrs. Preston T. Large, Jr., and his brother, Hamilton Large, together with Mr. Dow Vroman, all residents of North Tonawanda, are the incorporators. The new firm will have office and yard room on Tonawanda Island. It will conduct a general wholesale lumber business. Mr. Preston Large was formerly connected with the Eastern Lumber Company of Tonawanda, and Mr. Hamilton Large with Smith, Fassett & Company, and are both experienced lumbermen.

While a change in administration at Washington will occur next March, there is little apprehension on the part of local lumber dealers as to the effect on the lumber trade. "Business is entirely satisfactory and we don't intend to cross any bridges until we come to them," said a prominent local lumberman the day before election. "We don't intend to worry and from the promises made by Woodrow Wilson there will be no drastic methods used to worry business, either big or little. A possible reduction of the duty on lumber or wiping out the import tax entirely would not be considered a very serious blow to the trade. We are buying all the Canadian lumber we can get with not near enough available to meet the demand even with the tax imposed." This view appears to be general among local dealers and certainly augurs well for confidence in the future of the market as it might affect local conditions.

The favorable weather of the last two months has exerted an unusual stimulus on building in the territory supplied by local dealers and thers is more stock moving out of the Tonawandas just now than during any corresponding season for several years. Cars are fairly plentiful and shipments can at last be guaranteed with accuracy. There is more of a car shortage at the mills than elsewhere and the greatest difficulty is in receipt of stock. Canadian grades in particular are scarce. For a fortnight now and longer with some dealers there hasn't been a stick of Canadian lumber received at the Tonawandas. The reason is there is no Canadian cut to be had.

High rates, in fact record rates, are being paid for cargoes of lumber from the head of the lakes to the Tonawandas. $3.50 a thousand is being asked and there are not enough boats to go round. Several local dealers have decided to leave considerable stock at upper Canadian and American shipping points until next spring rather than pay the present high rates which are practically certain to go higher.

October, 1912, showed big shipments of lumber east via the Erie canal. Over 17,500,000 feet left the Tonawandas for New York and intermediate points. The same month last year showed canal shipments east of 13,875,000 feet. The fact that considerable of this lumber was held up by the break in the canal at Bushnell's Basin and was not included, therefore, in the September receipts, was partly the cause of the big total for October this year.

Several local dealers are receiving their last shipments of the season from upper Canadian and American mills. It is somewhat early for closing receipts but several unusual conditions this fall are the cause. Among those who are closing receipts early are the Northern Lumber Company, Smith, Fassett & Company, and McLean Brothers. The latter are large handlers of Canadian stock and will get about 2,000,000 feet more before they close their books for 1912 receipts by boat. The Northern Lumber Company will bring down 3,000,000 feet, while Smith, Fassett & Company are preparing for the receipt of about 2,000,000 feet more.

Schacht

=The Lumber Truck that Builds Big Business

Do you know that one Schacht Lumber Truck is worth more to you in dollars and cents than six to eight teams and wagons?

Men who have experimented say that horses can no longer compete with motor trucks in the lumber business.

Won't you let us show you where you can save money on your 1913 operating expenses?

Our booklet will be mailed free on request. Write for it.

Schacht Motor Car Co. of Canada, Ltd.

Hamilton, Ontario

A Few Specifications—

Motor, 45-50 H.P., four cylinders.

Ignition, magneto, with double system.

Oiling, plunger pump in crank case, separate feeds to all bearings, with splash system.

Clutch, cone, thermoid faced, 15½ in. diameter.

Transmission, selective sliding gear, 3 speeds, forward and reverse.

Emergency Brakes, internal, expanding on rear wheels, 18-in. drum. Service brakes on each end of jackshaft.

Frame, rolled steel channel section, 6-inch side members.

Frame, 217¾ in. long, 38¾ in. wide.

Axles, rear, rectangular, 2¾ in. wide, 4 in. deep, drop forged. Front Timken, 1 beam with solid section through centre, 2 in. wide, 2¾ in. deep, dropped forged.

Bearings, Timken roller bearings in wheels, jackshaft and steering knuckle, annular bearings in transmission.

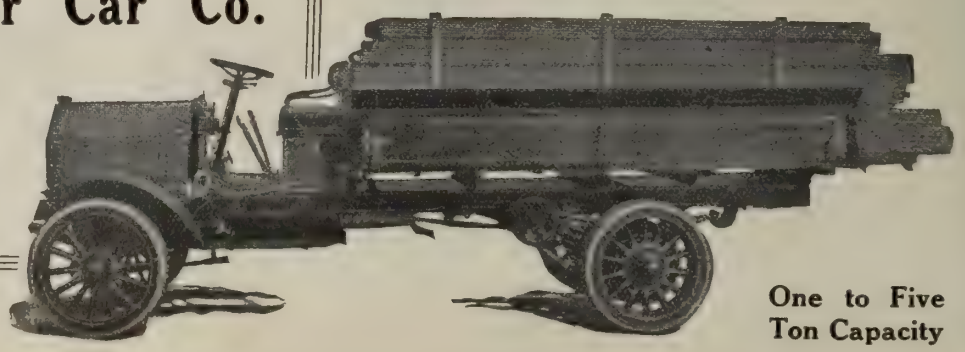
Tires, 36 x 4 in. single front, 36 x 5 in. dual rear.

Wheel Base, 144 in.; tread 64 in.

Speed, 10 to 18 miles per hour on direct.

Loading Space, 11 ft. 5 in. back of seat on chassis frame.

Body, to order.



The Truck with Good disposition — built for Canadians with Canadian money.

One to Five Ton Capacity

Bain Sleighs for Logging Operations

Famous for their great Capacity and Light Draft

LOGGING is a severe test of a sleigh.

The best is none too good, even though you may pay considerably more than for one which possibly may appear to be just as good.

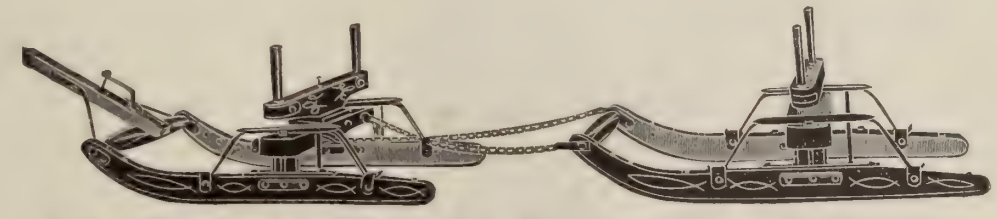
It is only by actual test—the test of time and hard usage—that the difference is apparent, and the increased first cost is forgotten. **The quality is remembered long after the price is forgotten.**

The cross chain couplings allow great flexibility and the hind bob follows in the tracks of the front when turning. Some prefer the short reach for well broken roads as a sleigh so fitted can be backed same as a wagon.

Swing bunks are an advantage in the bush, as they can be swung parallel with the runners when driving without a load.

Any of these sleighs except the heavy sloop can be fitted with 38, 40 or 42 inch bolsters for general work.

Our new catalogue No. 30 tells all about it and is yours for the asking.



The Bain One-Beam North Shore Sleigh

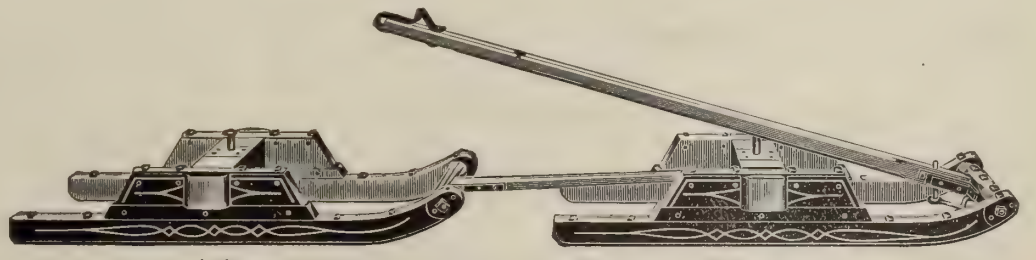
Steel Shoes; Swing Bunks or Bolsters; Cross Chain Coupling; 2 ft. 10 in. or 3 ft. Track. Clearance under Beam 9½ inches

The Bain North Shore Sloop Sleigh

Steel Shoes; Cross Chain Coupling; 2 ft. 10 in. or 3 ft. Track. Clearance under Beam 7 inches

The Bain Heavy Sloop Sleigh

Steel Shoes; Cross Chain Coupling; Furnished without Bolsters but with king bolts front and rear; 3 ft. 4 in., 4 ft. 4 in. or 4 ft. 8 in. Track. Clearance under Beam 7 inches.



The Bain Heavy Sloop Sleigh

With Short Reach Coupling

The Bain Double Beam Manitoba Sleigh

Steel Shoes, Short Reach Coupling, 3 ft. track. Clearance under Beam 9½ inches

What J. D. Shier says about the Barkey Lumber Register

Barkey Bros., Stouffville, Ont.

Dear Sirs,

Yours to hand and noted. We have been using one of the George Lumber Registers for some years past and find it still working well. It gives very accurate measurements and have never known it to make a mistake. When in need of another we will certainly get one of the same kind.

We remain respectfully yours,

Feb. 5, 1908. J. D. SHIER, Orillia, Ont.

Can be used on any moulding or matching machine.
Ensures absolute accuracy and saves one man measuring.
Sent on 30 days' trial, return at our expense if not satisfactory

BARKEY BROS.

EDGINGS

Ontario

The C. G. Anderson Lumber Company, Ltd., has been incorporated at Toronto with a capital of $40,000.

The Forest Basket Company, Ltd., with head office at Forest, Ont., has been incorporated with a capital of $25,000.

Damage by fire to the amount of about $50,000 was recently caused to the factory of the National Casket Company, Toronto.

The Algoma Hardwood Floor and Lumber Manufacturing Company, Ltd., has been incorporated at Steelton, Ont., with a capital of $40,000.

A fire which recently occurred at the Baker Lumber Company's mill at Lindsay, Ont., did damage to the extent of $20,000. A year ago last spring a similar fire occurred.

Good progress is being made on the buildings of the Ontario Paper Company at Thorold, Ont., and it is expected that work will be completed by the end of this year.

The Stone-Grant Lumber Company, Ltd., has been incorporated with a capital of $500,000 to carry on business as lumbermen and general contractors, with head office at Toronto.

E. A. Mann, H. D. Murphy and James Ludgate, of Orillia, Ontario, are completing negotiations for the purchase of 15,000 acres of timber on the Macleod River, Western Alberta, the price being placed at $100,000. The owners live in Edmonton.

Mr. Hugh A. Rose of the Canadian Western Lumber Co. Ltd., Toronto, reports that his company has just shipped from Fraser Mills, B.C., to Montreal, what he describes as four tooth picks. These are actually four poles of British Columbia fir, the dimensions of two being 14 in. x 14 in. x 85 ft. and the other two 16 in. x 16 in. x 90 ft. It is thought that these poles are to act as masts for wireless telegraph towers. The fire which occurred at Fraser Mills about two weeks ago destroyed eight drying kilns and about one-half million feet of clear fir. These are about one-half of the dry kilns, and they are rebuilding at once. Some of the kilns will be ready in two weeks and the balance in from six to eight weeks.

Eastern Canada

W. F. Vilas, Cowansville, P.Q., is preparing plans for the erection of a dry kiln, 60 ft. x 34 ft.

La Compaignie des Marchands de Bois de Quebec, with a capital of $20,000, has been registered at Quebec.

The output of the paper mill of Price Bros. & Company, Limited, Kenogami, P.Q., will be increased during the coming year by 45,000 tons.

The Grenville Lumber Company, Limited, Montreal, (Cyrille Laurin, Charles Wilson and others) has been incorporated at Quebec with a capital of $200,000.

The Lumber & Construction Company, Ltd., has been incorporated with a capital of $300,000 to carry on business as lumber dealers. The head office is at Ville St. Pierre, Que.

An association has been formed in New Brunswick and eastern Quebec of those interested in the shingle business. The name chosen is the North Shore Shingle Association.

Work for the season has just been closed by the York & Sudbury Milling Company, Gibson, N.B. This season's operations were the largest ever cut by them, about 6,000,000 logs being the total.

The Chicoutimi Pulp Company have just contracted to supply the Harmsworth paper mills on the River Thames, London, Eng., with 25,000 tons of mechanical pulp each year for a period of ten years.

Plans are being rapidly developed for the work at Grand Falls, N.B., for the erection of the large pulp and paper mills which have been projected for some time. The sum of $8,000,000 is involved in this venture.

Owing to the excessive freight rates from New Brunswick to England, very little lumber is being shipped there. Two years ago the rate was 30 shillings, now it is up to 80 shillings, which is almost a prohibitive figure.

A new method of rafting logs is expected to be tried on the St. John river, N. B. The method is what is known as "shingelling." This plan is in use on the Miramichi, and is said to be more economical than that which has been in use on the St. John river for so many years. This new step is taken as the result of the increasing cost of rafting logs.

Mr. James Reid Wilson has been appointed director of the Wayagamack Pulp & Paper Company, in succession to Sir Rodolphe Forget. He is a big holder of the company's bonds. The board now consists of Messrs. J. N. Greenshields, president; C. R. Whitehead, vice-president and managing director; Hon. Robert Mackay, D. H. Pennington and Jas. Reid Wilson.

The annual meeting of the stockholders of the Fassett Lumber Company, Limited, was held recently at the head office of the company, Fassett, Que. On looking over the past year's business they found that they had had an exceptionally fine year in all branches. The old staff of officers were re-elected. The company is planning to manufacture more lumber this year than ever.

The Maple Leaf Lumber Company, Limited, of Amherst, N.S., have purchased 18,000 acres of timber land in Cumberland and Colchester counties, from the Londonderry Iron & Steel Company. The company will operate eight or nine portable mills this winter, and expect to market about 15,000,000 feet of lumber. The Maple Leaf Lumber Company, Limited, is composed entirely of Amherst citizens. Mr. I. J. Soy being the manager.

The Hardwood Lumber Company, St. John, Nfld., are erecting a small pulp mill to run three grinders, with a capacity of twenty-four tons of ground pulp per day. The power will be about 2,000 h.p. derived from the Indian Arm River. The concrete dam is in course of construction, extending across the river gorge, being about 900 feet in length. This will give

a 40-ft. head. The construction has been going forward since May last, and the company expect to have the mill operating by August, 1913. They are spending about $100,000 on the plant. The company have 200 square miles of timberland and operate a saw mill in conjunction with the pulp business.

The Sawmill Owners' Sales Company is a private concern which has been organized with head office at 423 Coristine Building, Montreal, with the object of centralizing the sales office of twelve mills in Quebec and New Brunswick. The company will control an annual output of 40 million feet of spruce, in addition to large quantities of lath and shingle. Although the company will have the exclusive sale of the products of these mills, it is open to dispose of, in addition, the output of other mills at the option of the sales manager. Some of the N. B. mills are at Jacques River, Campbellton, and Belledune, while Quebec mills are situated at Montmagny and St. Anselme. The company will have sales offices in New York city, New England, and in Western Canada. The president is Mr. A. Culligan, M.P.P., N. B., and the managing director, Mr. U. E. Germain, Montreal.

By the judgment of the Privy Council in the case of Parsons vs. the Sovereign Bank, the latter loses about $15,000 in claims. The case arose out of the financial difficulties of the Imperial Paper Mills Company, which has since been absorbed by the Spanish Mills Company. Parsons Brothers, a firm of wholesale stationers in New York, had given orders to the Imperial people for certain paper. The Imperial Company having become involved in difficulties, the money was raised by hypothecating statements of shipments to Parsons Brothers, with the Sovereign Bank, in order to keep the mill running. The mill went into the receiver's hands and Parsons Brothers subsequently refused to pay for the goods, claiming damages from delay in shipment. The bank brought suit, and Mr. Justice Britton decided in the bank's favor. Parsons Brothers appealed and lost. The Privy Council has now reserved these Canadian decisions.

Western Canada

The city of Winnipeg have awarded a contract to the Sprague Lumber Company for the supply of 1,000,000 feet of lumber during 1912 and 1912.

The Acme Sash and Door Company Limited, Rue des Meurons, St. Boniface, Man., are erecting a $10,000 plant which will be two storeys high and 72 x 104 ft.

The city council of Prince Albert, Saskatchewan, have granted to the Prince Albert Pulp and Paper Company, Ltd., easy terms for electric power, and has also granted them a free site.

The Canadian Western Lumber Company, Fraser Mills, B.C., are preparing plans for the erection of a sash and door factory at a cost of $350,000. The factory will adjoin their present plant.

Hale & Company, Limited, have been incorporated in British Columbia with capital of $100,000, and head office at Vancouver, to carry on business as dealers in timber lands and conduct lumbering operations in general.

Representatives of the St. Lawrence Lumber and Industrial Company, the B. C. Howard Lumber Company and the International Lumber Company of eastern Canada, were in Edmonton, Alta, on October 1 and 2 looking over the city with a view to making investments in city and farm property.

Mr. H. S. Irwin, B. C. Government timber cruiser, has recently returned from a trip up the mainland coast as far as Redonda Island. Mr. Irwin's journey was with the object of estimating the value of several fractions which the government intends to put on the market in the near future.

Reports have recently been published to the effect that the Barnet Lumber Company, Renfrew, Ont., intended to erect immediately, a mill at Hope, B.C., to cut the timber on their Silver River limits. Mr. J. E. H. Barnet reports that the company do not intend building a mill this year but may do so in the near future.

Big timber limits are expected to be developed when the Pacific Great Eastern Railway Company opens up the territory in the neighborhood of the valley of the Cheakamus, B.C. This valley is estimated to contain about nine billion feet of the finest standing timber in British Columbia. The town of Lillooet is in the midst of this district.

Frank Paterson, W. L. Paterson, John Hanbury and F. L. Buckley, are among the lumbermen of Vancouver who have in view the utilization of the refuse fires to create steam heat and electricity for custom purposes. They have brought the matter to the attention of the civic authorities and are securing a franchise to enable them to lay conduits in the city.

The Phoenix Lumber Company and the Jasper Forest Sawmills Company are cutting 130,000 feet of lumber a day near Edson, Alta., west of Edmonton. The manufacturing of lumber will be one of the leading industries for some years to come in that district, on account of the demand which the development of the country and the opening of the rivers north of Edmonton will inevitably create.

The capital City Box Company, Ltd., of which W. H. Gibson is presilent, has started operating in Edmonton. Neil McIntyre, who has long experience in the box business, is a member of the company, which owns a plant valued at $25,000, of which $20,000 is represented in machinery. The equipment is the most up-to-date in western Canada. All the latest machines used in box making have been installed, including planing machines, band saws, nailing, locking, wiring, printing and other machines for the manufacture of boxes of all kinds. When running at full capacity the plant is capable of turning out between 2,000 and 3,000 boxes a day. The plant is electrically operated. At present the factory is employing 20 men.

The Canadian Puget Sound Lumber Co. has decided to install an up-to-date system of fire protection at their mill property at Victoria, B.C. The system will include a sprinkler fed from a 50,000 gallon tank, also 1500 ft. of 8 in. steel main which will be laid entirely around the plant and connected with the city's salt water high pressure system. This will permit of the installation of eight hydrants in addition to three which have already been installed on the British Columbia Electric Company's salt water system and four fresh water hydrants and one salt water hydrant of the city service located outside the mill property. Independent of the city hydrants, the company, in case of fire, will have eleven high pressure hydrants with a capacity of twenty-two streams of water.

There is the important question to ask yourself when considering belting charges. It brings you to the basis —the right basis—at once.

HOW MUCH PER DAY DO YOUR BELTS COST?

"AMPHIBIA"
(WATERPROOF)

Leather Belting

Costs less per day of Service

This makes it the cheapest belt to use although it may cost a little more per foot length when purchased.

Sadler & Haworth

Tanners and Manufacturers

For Over 35 Years Makers of the Best Leather Belts

MONTREAL TORONTO ST. JOHN, N. B. WINNIPEG VANCOUVER

☞To insure satisfaction—State where belt is to run☜

Don't Tie the Dead Weight of a Cheap Belt to Your Plant

When you install a cheap belt in your plant you are led to expect it to last as long as a good belt—if you thought it would not, you would obviously have installed a good belt in the first place.

You know the advantage of reliable and efficient power transmission in your plant—do not hope to effect this by poor equipment—cheap belts will stretch and slip and cause a shut down, with its consequent loss of time and money, for shortening and repairs. The good belt saves its slightly additional cost in its reliability and long life.

Every brand of BEARDMORE BELTING receives the same care and attention and goes through the same process, and all brands are uniform in the possession of the highest quality possible in leather belting.

You are in the market for leather belting—Let us demonstrate the advantage of buying the best on the market.

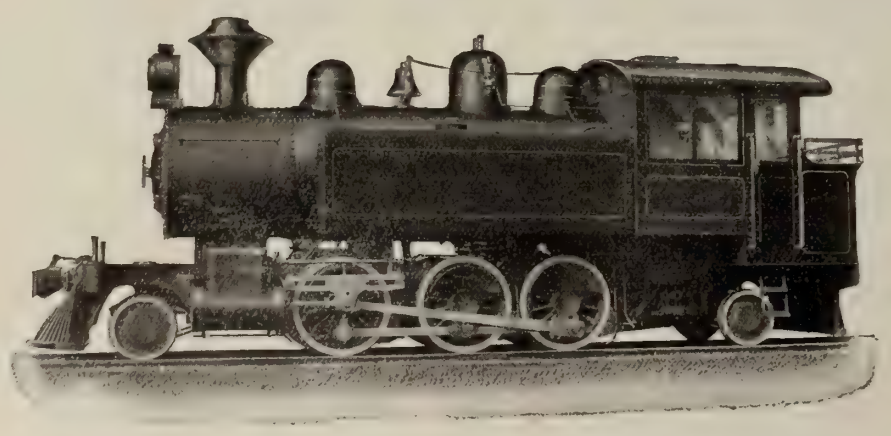
SELECTION OF LOCOMOTIVES

WHAT SHOULD BE KNOWN BEFORE YOU PURCHASE LOCOMOTIVES:—



Nature of the service.
Capacity of the cars and weight of train.
Character of track—is it new or old.
Length of haul.
Is time an important factor.
Do you want a quick locomotive or a big puller.
Distance from base of supplies and quarters for the men.
Water and coal carrying capacity.
All these items and more should be considered.
A careful study of conditions may mean larger profits.
Our experience may be valuable in considering them.
A dollar saved is more than a dollar earned.

Write or wire us, or better still, come to see us.

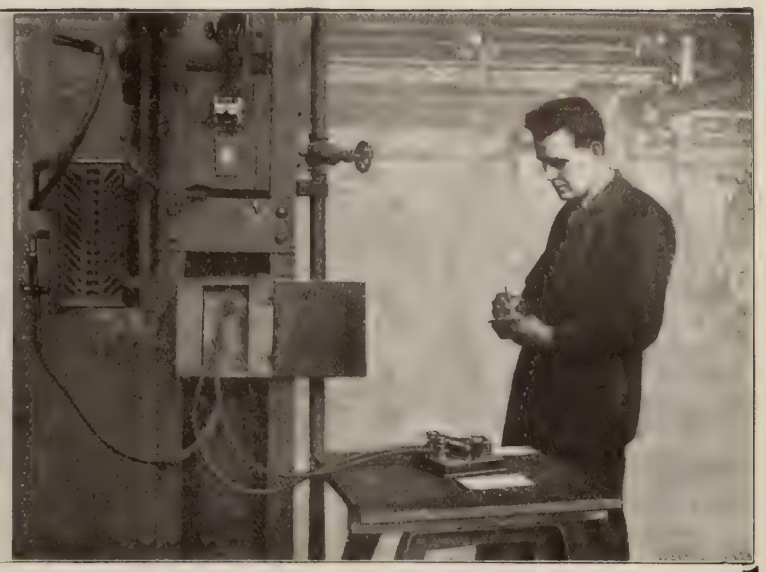
Showing Action of Gravity Tighteners on Slack Side of Belts



Power Test on Gravity and Rigid Tighteners

Save Power and Belt Bills By Avoiding Fixed Strains

THE power test made on a Berlin Matcher, as illustrated above, showed that it requires 15 to 20 H. P. more to start the machine with rigid tighteners on driving belts than with Berlin gravity tighteners. The test proved beyond question that gravity tighteners save power—that they save belt bills, wear on the matcher, and prevent hot boxes by not keeping belts under a continued abnormal strain. Yet gravity tighteners give the maximum pull for every pound of power applied.

With rigid tighteners, belts must be made tight before starting for then the strain is greatest. They never have a chance to relieve heavy strain — are kept stretched even though the necessary strain is less after the machine is running. Gravity tighteners simply take up the slack under any pull. They allow the belt to resume its normal condition immediately when the strain of starting the machine or of a heavy cut is over.

The dotted lines in the left hand picture show the action of the gravity tighteners during a heavy cut. The weight of the pulleys keeps the belt just sufficiently tight to prevent slipping. Contrast this with the rigid tightener which must keep the belt tight enough all the time to make the heaviest cuts.

Lightest Running Matchers

Berlin High Efficiency Matchers are the most powerful, fastest, and lightest running ever built. They are equipped with gravity tighteners on the slack side of all belts and automatic takeup boxes on side and cutter head spindles.

The machine is easy to operate and take care of. Working parts and adjustments are easily and quickly reached.

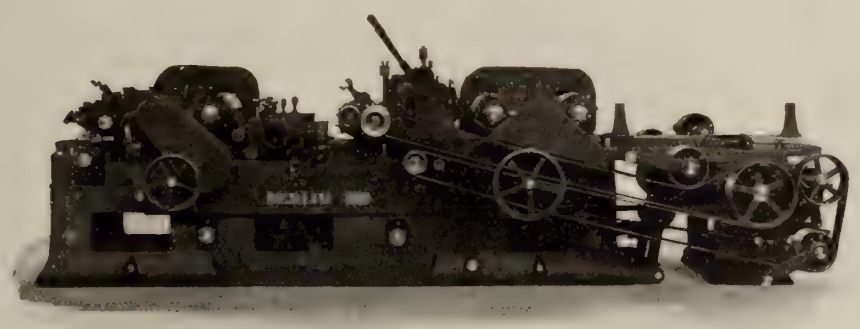
The lack of strain from belts, and the smooth running boxes keep the heads perfectly balanced. They produce a finish on stock that is unequaled. Patterns always meet association standards.

Berlin a Money Maker

Berlin High Efficiency Matchers cut producing costs 40 per cent. to 60 per cent. and save 10 per cent. to 30 per cent. in grades. They are practical insurance against mis-manufactured stock losses.

With our new automatic feed table one man can feed 250 feet and more per minute. He simply throws the boards on the table lengthwise and it takes care of them. A matcher equipped with one of these devices does the work of 4 old-type machines at a saving in grades.

Mills in every woodworking section are finding them a good investment. Write to-day for further data on the new Berlin.



A 10-page circular of the several models of this machine sent upon request.

The Value of a Reputation

The greatest business asset which any firm can possess is a reputation for the continued maintenance of superior quality, efficiency and high standards for their products.

A forceful illustration of this statement is continued in the simple lines of a postal recently received requesting a copy of a book we publish.

"Dear Sirs:

Knowing the value of 'DISSTON' tools from the practical experience of twenty-five years' use, I feel sure that your 'Farm Tool Book' would contain something that would enable me to take better care of and get better results from the use of 'DISSTON' tools and implements."

Only a few words—yet note the ***confidence*** they show in everything that is DISSTON. The reputation which has been built up for this name during the many years it has stood for all that is best in saws and tools carries with it all the recommendation a man requires.

"Here is a new tool," says the dealer.

"Is it a reliable tool?" inquires the customer as he takes it in hand to examine.

"There is the DISSTON Brand," quickly answers the dealer in a tone which implies plainly. That settles it!

And it does. A sale is more easily made when a DISSTON Brand saw, tool or file is before the customer, for, to quote another correspondent.

"Ever since we were boys, we rember the good old DISSTON Saws, the kind with the apple wood handle and the little notch filed in the heel by which many woodworkers could tell the genuine from the ***imitation.*** And even as we are dictating this letter we hark back a good many years to the time we heard of a 66-inch DISSTON Saw, tuned up 700 revolutions per minute and wading through Pennsylvania white pine on a 6-inch feed. ***There was quality in those saws.***"

There's quality in them ***to-day***—quality that has kept pace with the ever increasing requirements. We know the value of a reputation and guard ours jealously.

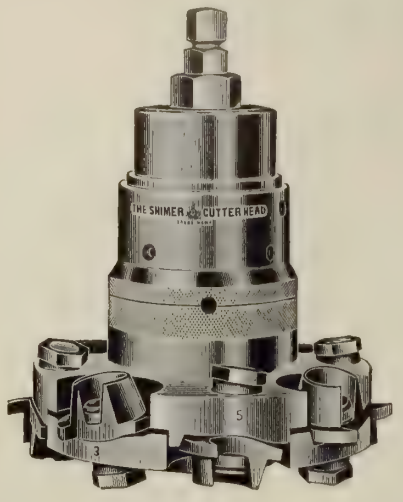
USE THE SHIMER CUTTER HEADS

For Flooring, Ceiling, Siding, Ship Lap, Jointing, Double Ceiling, Doors, Sash, Blinds, etc.

Made of steel Forgings, they represent the greatest possible strength in compact and workmanlike manner, embodying the vital principles of clearance to all leading Bit Points. The alternate and shearing effect of the cut reduces to a minimum the tearing-out tendency of cross-grained lumber. Cutters have exact shape in their exterior circles, and uniform product is maintained indefinitely without extra trouble or expense.



The Shimer Limited, with Expansion, Fig. 628. Groove Head with 8 Bits and self-centering and spindle clamping features. Price $36.23 each, complete.

The Shimer Limited in solid section, Fig. 625. Groove Head with 8 Bits and the self-centering and spindle clamping features. Price $33.50 each, complete.

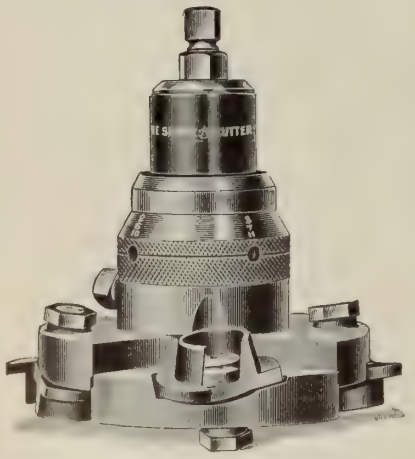


Fig. 203, Popular Expansion Groove Head with 4 bit seats, complete, net $20.48. Made also with 6 and 8 Bits to each Head.

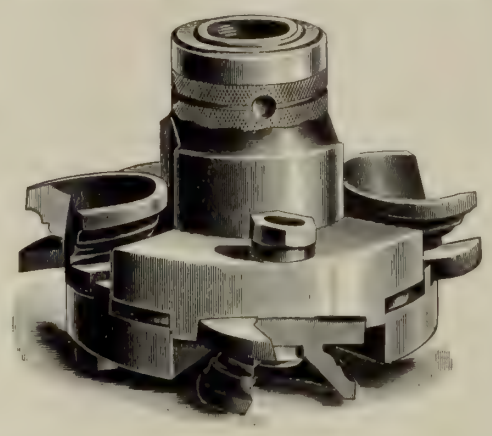
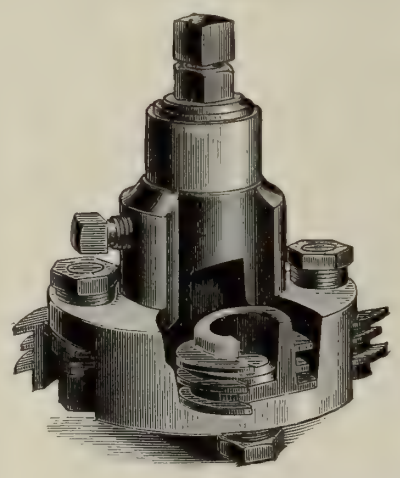
The Shimer Door and Sash Heads



Save the filing to shape at each sharpening of the cutters. They are made per order, carry in their outline the perfect counterpart of the work, thus by simply filing the Bits and setting them to the gauge the fitting of the manufactured parts is assured.

A solid Door Head with Bits to work 1 to 1¼ inch Doors costs only $18.03, and an Expansion Head only $20.63. A solid Sash Head to mould 1 to 1¼ inch Sash, complete with Bits, costs only $16.91—an Expansion Head fitted out complete only $19.51. $62.87 will give you an excellent solid section outfit, including Door Cope Heads and Sash Cope Heads. If you want the very best with Expansion the cost will be only $68.07.



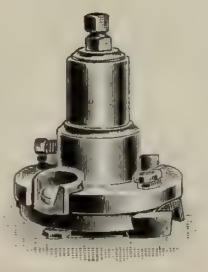
Double the Capacity of Your Matcher or Moulder By the use of the Shimer Double Ceiling and Double Flooring Heads.

Run your stock with double tongue and groove and then re-saw. 100 per cent gain in output for an investment of only $40.94 and upwards.

The Bits on the Shimer Double Heads mark the saw cut line of division on the stock so that the sawyer can at once detect any variation of the saw and correct it as the board is passing through.

These Heads are not an experiment. We have made them for years and they are in daily use in the best mills of this and other countries. You will find them very complete and practical tools, carrying the Shimer guarantee to do as represented or no sale.

Heads for making Ship Lap



The Shimer Cutter Heads for Ship Lap are so proportioned in the Bits and their seats that a perfect draw cut is made. They work interchangeably with our matcher Heads and always produce good work.

Price, per set, complete, $33.64 to $38.48, according to thickness of cut.

Extra Bits for making Wainscoting on these Heads $1.95 each.

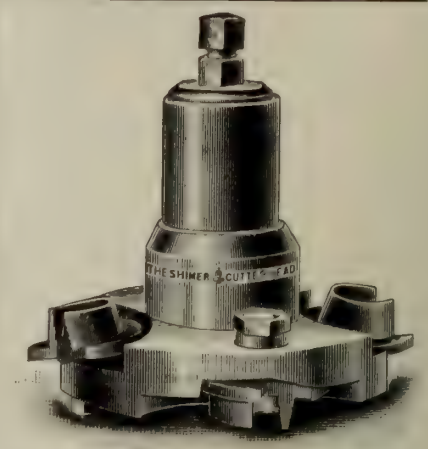


Fig. 23, a Popular Solid Groove Head with 4 bit seats, complete, $17.87. Also made with 6 or 8 Bits to each Head.

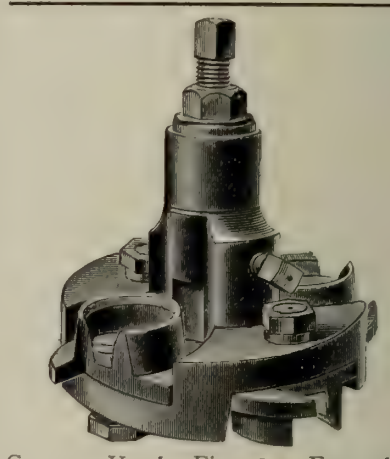
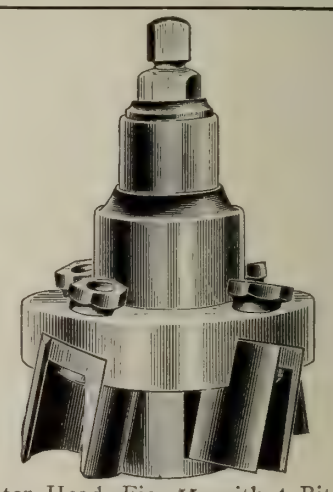


Groove Head, Fig. 2. For plain matching of tongue and groove joint, complete with Bits, $13.00.



Jointer Head, Fig. 55, with 4 Bits in line of work. Also made with 6 and 8 Bits to each Head. With 4 Bits $16.64.

Our Bedee Knives, recommended by users as the best thin steel knives on the market, can be furnished in any length or thickness on short notice. Write us about your requirements.

The Great Pulling Power of a Little "Want Ad"

A "want" advertisment is a small thing both in size and in cost, but through a a small "want ad" great things have often arisen.
A subscriber to the Canada Lumberman and Woodworker recently inserted a small ad in the "WANTED and FOR SALE" Department of this paper and received

47 REPLIES

Have you some odd lots of lumber that you would like to move quickly?
Have you some second hand mill machinery you wish to sell or exchange?
Do you want to buy some special lots of lumber or machinery?
If so **YOU NEED** the assistance of the "Wanted and For Sale" Department.
Let us assist you in filling your next want.

Toronto, Ont.

Get away from high manufacturing cost and the loss represented by your degraded lumber—use a FAY-EGAN "LIGHTNING" No. 336 Double Surfacer—

—Why be satisfied with surfacing your lumber at 75 ft. per minute, a high percentage grading No. 2 or lower, when other manufacturers are surfacing at 200 ft. per minute, every bit grading No. 1?

—Why continue to operate under a handicap of high manufacturing costs, when you can save 40 to 50% by using a Fay-Egan 336 Surfacer?

—Why continue to lose a big part of your profits through degraded stock when you can raise the grade 10 to 30%, or even more on a Fay-Egan No. 336 Surfacer?

—If you want to get away from this handicap you will find the 336 an interesting proposition.

—Since a No. 336 with one operator will do as much as your three 75 ft. machines, you eliminate right in the beginning the wages of two operators, this saving alone practically paying the cost of installation in a year's time.

—Where you now have six heads to keep in order, you will have only two, and it can be done much easier as they are ground and jointed right on the machine. Instead of buying three sets of belt you buy one set. Your big repair bills will be a thing of the past as the 336 is so powerful that breakages are practically impossible, even gear wear being reduced to almost nothing by the use of gears cut from the solid with rolling contacts and running in grease. Where you lose time for oiling and adjusting, you will again save by the sight feed lubricating system and the adjusting arrangements all on the outside. And in addition, you save the space and transmission of two machines.

—These are strong claims, we admit, but we can prove them. Give us a chance. We'll send you full particulars with samples of knotty and cross grained stock run at 200 feet per minute, upon receipt of your request.

Did you get a copy of our new handy reference Catalogue No. 86?
If not send for it today—Yours for the asking.

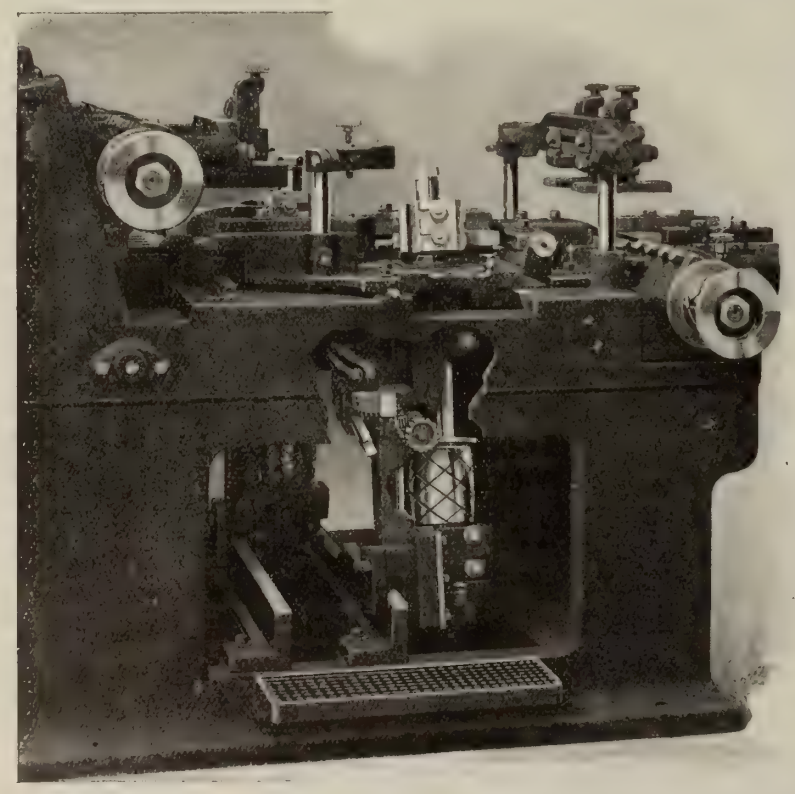
American *No. 34* Inside Moulder

This is a brand new machine. The general design and form of construction of the frame; the direct and simple system of gearing; the massive bed plate supporting the matcher legs; the side clamping boxes for both cutter heads and side head journals; the accurately fitted and easy adjustments throughout, are all features that make this the most up-to-date ***Inside Moulder*** on the market today.



The sectional view shows the angle adjustment of Matcher Legs, and the vertical adjustment of side spindles.

We have a handsome book which describes this machine fully. Let us send you one.

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

MAPLE LEAF BELTING

Strong
Waterproof
True
Running

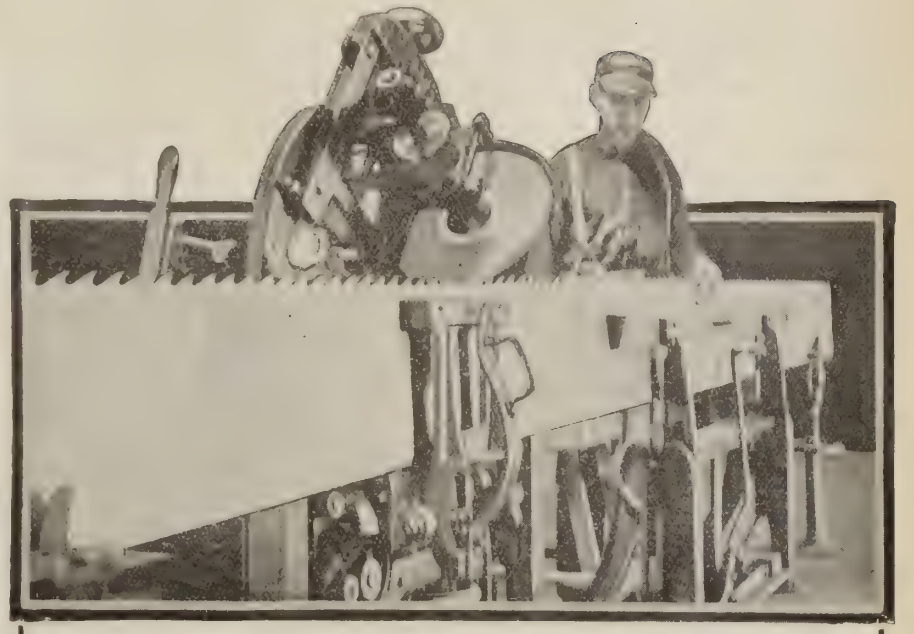
For
Indoor or
Outdoor
Work

¶ Maple Leaf is the most economic and efficient belting for power transmission and conveying, etc.

¶ It costs only half as much as leather and 25 per cent less than good rubber belting.

Write for sample and prices to the sole manufacturers

DOMINION BELTING CO.
HAMILTON, CANADA



So Can Your Filers

THERE are hundreds of saw filers throughout the country who turn out better gummed saws, in less time, at less wheel cost than ever before because they are using

Aloxite Saw Gumming Wheels

They find that the Aloxite Wheel cuts fast, clean, cool—there is no screeching or undue friction; the wheel cuts quietly, without case hardening the saw or drawing the temper. Then too, the filer can force the Aloxite Wheel to the limit, and it will cut its way free, hold its shape, show economy in long life. Aloxite Saw Gumming Wheels show the way to better Saw Service.

Let us send a Trial Wheel

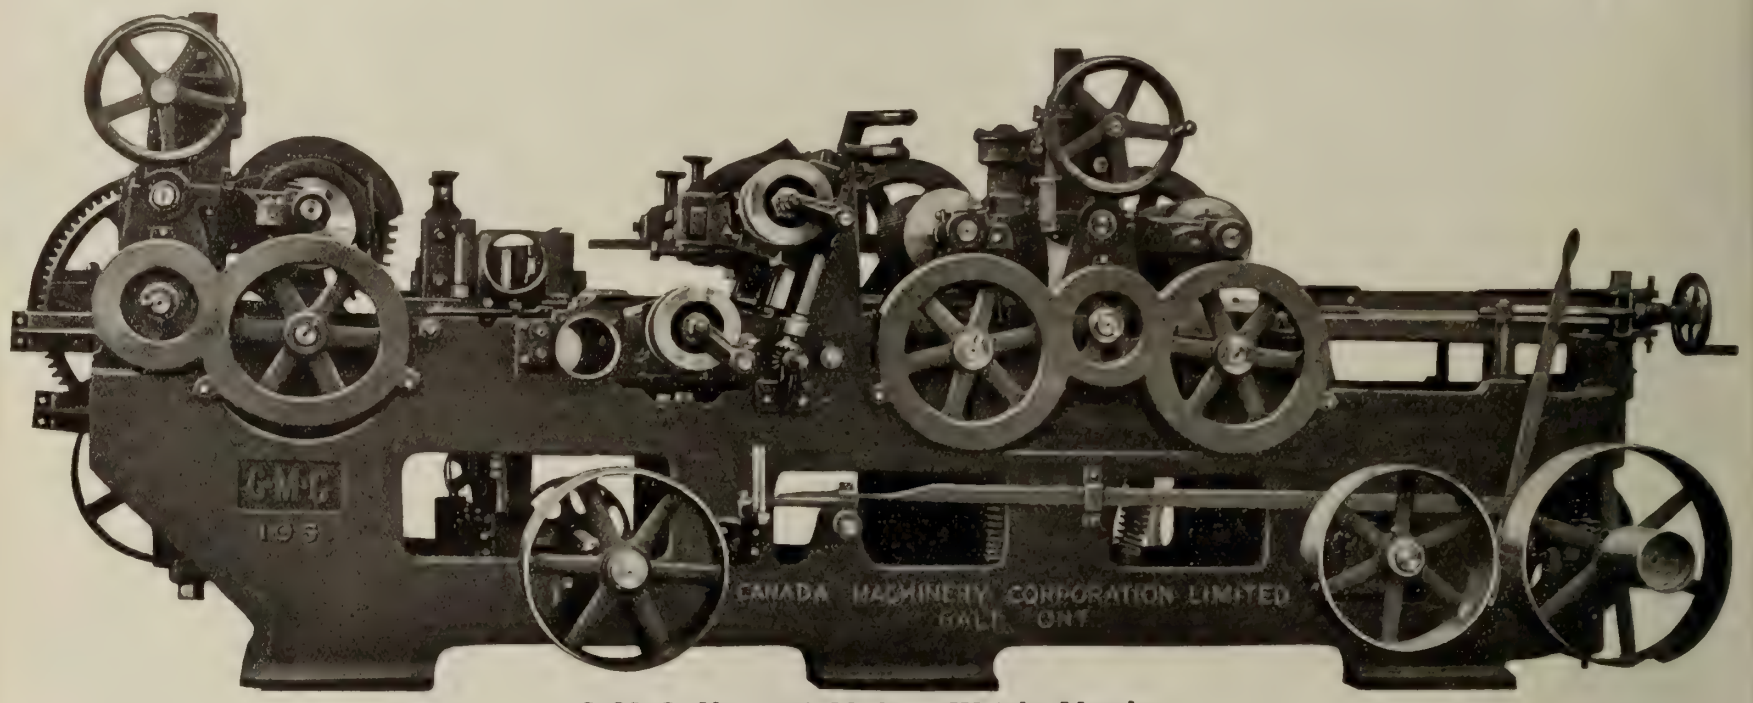
No. 105 MATCHER

C.M.C.

No. 105 MATCHER



C. M. C. No. 105 Medium Weight Matcher.

Our No. 105 Matcher is not our heavy duty fast feed machine but is a high grade medium weight matcher. It is a general purpose machine and for work up to 100 feet per minute; is without an equal.

It is supplied with five rates of feed from 45 to 100 feet per minute.

Bulletin No. 105 fully describes this machine and will be gladly sent on request.

Have you our complete catalogue? If not let us send you one.

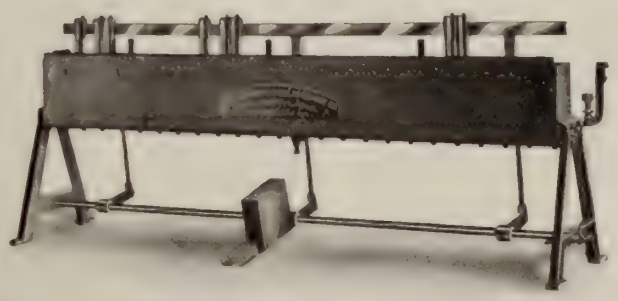
We Make the Most Complete Line of Woodworking Machinery in Canada

Canada Machinery Corporation Limited

GALT, ONTARIO

Look at the Picture!

Look at the Names!



The picture is of our stile gluer.

The names are of some of its users. Some of them have sent in duplicate and triplicate orders unsolicited. Are they the kind that would do that if the machine was not a money saver?

It Glues the Whole Stile in a Second.

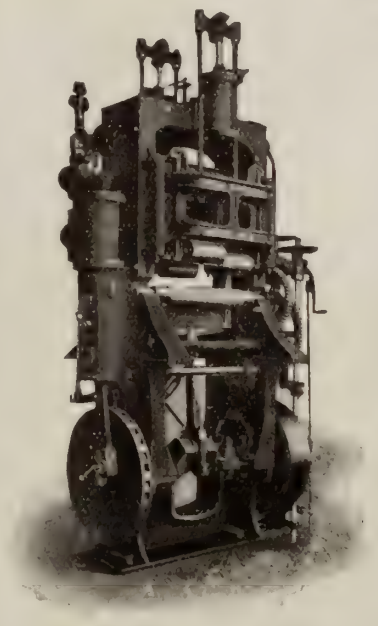
WICKES GANGS

"As Staple in a Saw Mill as Sugar in a Grocery."

FLAT GANGS Unexcelled in the manufacture of

Flooring Strips **Cedar Siding** **Shiplap**
Silo Stock **Door Stock** **Box Lumber**
Boards

from cants and flitches, from either hard or soft woods.



ROUND LOG GANGS

JUST WHAT THE NAME IMPLIES—taking all your small logs just as they come from the pond and cutting them up into boards or dimensions, getting every board there is in the log, never over-slabbing (wish we could say this of all head sawyers.) Built to handle either one or two logs at once, up to 14 in. diameter.

KEEP THE SMALL LOGS AWAY FROM THE HEAD SAW and CARRIAGE entirely, raise your cutting capacity, and install ecomony by the same stroke.

Not an EXPERIMENT, but an ECONOMIC NECESSITY.

Think it Over Carefully, then Write us for Details.

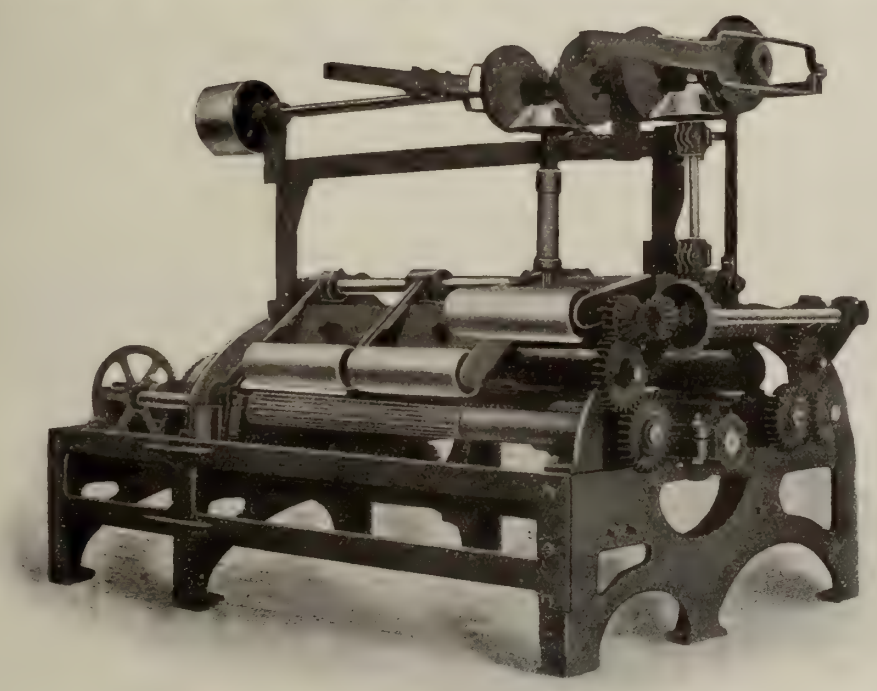
"The Gang cannot Overslab."

Wickes Brothers

410 White Building — — SEATTLE, WASH.

Head Office. Saginaw, Michigan, U. S. A.

Mowry's Jumbo Edger



Our latest model is an improvement on the one illustrated here

Mowry's "Jumbo" Combined Gang and Edger is the most useful mill machine on the market to-day.

It embodies every detail of construction essential to an adequate gang edger. ¶ We have some very flattering testimonials for our "JUMBO."

Mandrel: 4½ inches by 10 feet 6 inches long.

Drive Pulley: 20 inches, 20 inches.

Saws: 2 movable saws on edger side (more if desired) 8 stationary saws on gang side, 2 water boxes.

Let us quote you when you are in the market for Saw, Lath or Shingle Mill Machinery or Repairs.

MOWRY & SONS, Gravenhurst, Ontario

ROSSING MILL EQUIPMENT

THIS is the interior of a Rossing Mill we built some years ago for the International Paper Company, at Chatham, N. B. It contains 26 Waterous Barkers in all and turns out some 400 cords of barked wood every ten hours. We can show you dozens of similar installations.

We build equipment for any size Rossing Mill. It is not a new line or a side-line with us. We have made a special study of the handling and cutting of pulpwood and have had thirty years experience building machinery to do it most economically and efficiently.

We manufacture:

Pulp Log Haul Ups, Cutting Up Rigs, Slasher Tables, Barker Attachments, Barkers, Pulp Wood Splitters, Conveyors and Elevators, Engines and Boilers.

These machines are the last word in up-to-date Rossing Mill equipment. They are turned out in a separate department by an engineering staff and skilled mechanics who have specialized in this work.

We have records in this office of some of the most successful Rossing Mill installations operating in Canada to-day. These are at your disposal. Write us and let us show you how to build "The Rossing Mill Up-to-date."

The Waterous Engine Works Co., Ltd.

BRANTFORD, CANADA

Winnipeg, Manitoba **Vancouver, B. C.**

$5,000,000.00

worth of mixed metals is what we market every year

PEERLESS metal is compounded specially for sawmills and is the best on the market for that purpose.

FAULTLESS metal is a high grade copper hardened alloy made for heavy duty work, sawmills and engines.

Our policy is large tonnage, perfect alloys, and absolutely fair and honest treatment of the trade.

Fully Guaranteed Sawmill Machinery

This is the only kind for you to buy to ensure satisfactory and continuous operation throughout the entire sawing season.

All our sawmill machinery is sold on an absolute guarantee of proper operation and perfect construction.

Naturally, therefore, we buy only the highest grade materials and use only skilled workmen, and everything is built under the most careful supervision.

These things are necessary to produce well built machinery, but they would be useless without proper design—and the "know how" of designing sawmill machinery can only come after long experience.

We have such complete confidence that our machinery is correctly designed that our guarantee is:

"These machines are guaranteed against defective materials and workmanship for the period of one year, and their proper and successful operation is also absolutely guaranteed. Should any parts fail through defects, we will replace them free of charge, or should any machine not work properly, we will remove it at our expense and refund any part of the purchase money which may have been paid to us."

This guarantee goes with all our machines and we have never had to take back a standard machine yet.

And back of this guarantee is our fifty years' experience building sawmill machinery for stationary mills only.

It will pay you to buy your machinery from us this winter.

Timber Limits for Sale
on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

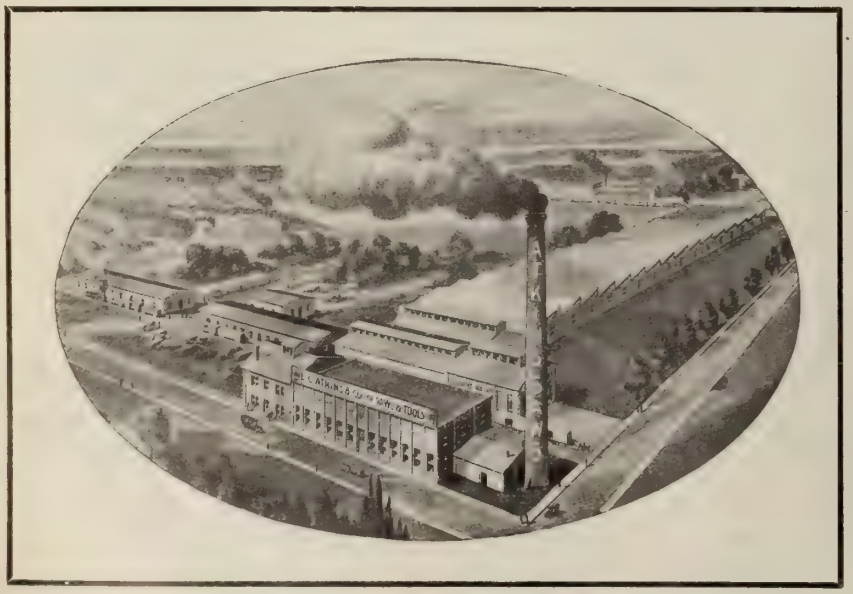
ATKINS STERLING SAWS

Made in Canada



Band,

Circular,

Cross Cut

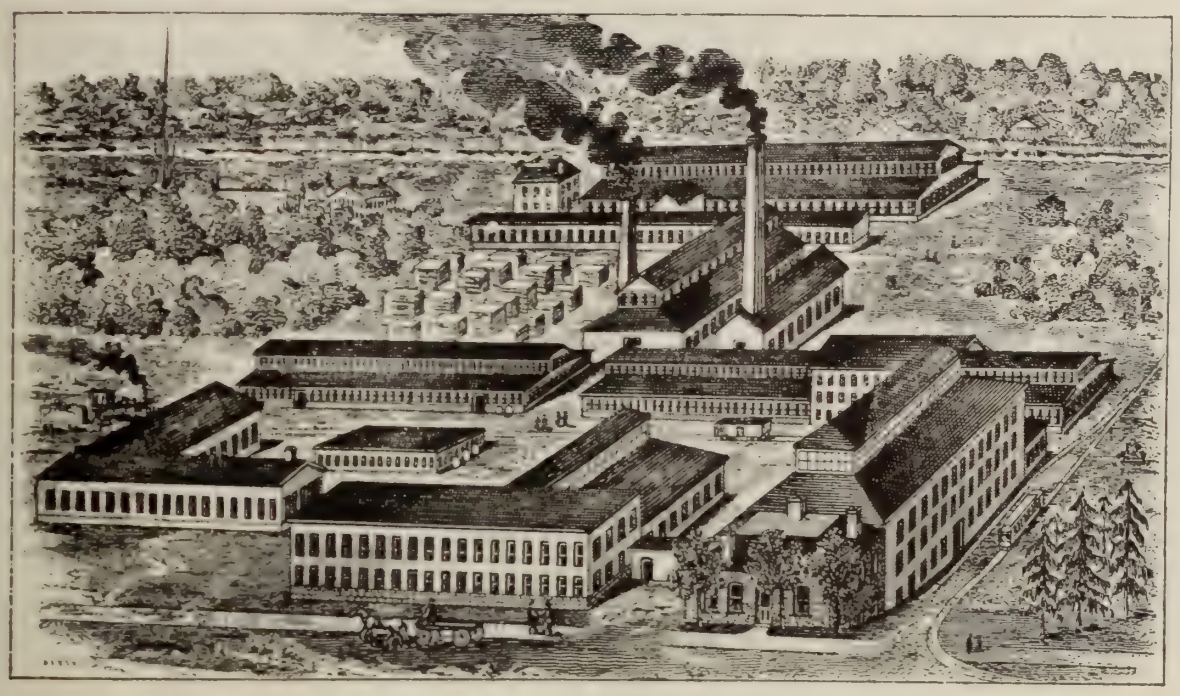
A Perfect Saw for Every Purpose

E. C. ATKINS & CO., Makers of STERLING SAWS Factory, HAMILTON, ONT.

Vancouver Branch, 109 Powell Street

MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made



The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario

GARLOCK PACKINGS

Garlock Regular Rings

For all general purposes outside of high pressure work. This Packing is a special grade thoroughly lubricated with the celebrated "Garlock" compound, and is the perfected result of over thirty years experience in manufacturing fibrous Packings.

Garlock Square Duck Packing

Made of good quality Cotton Duck and friction for cold water.

Garlock High Pressure Gaskets

Absolutely heat proof, will not vulcanize or blow out under any steam pressure, being made of long fibre Asbestos Brass Wire Insertion.

Garlock Red Sheet Packing

Made of high grade Rubber compounded in such a way as to give it great strength and reliability.

This Packing has established wide reputation on its own merits.

Garlock Cloth Insertion Sheet

Used on cold and warm water pipes. Is unexcelled in pliability, smoothness of finish and strength of Cloth Insertion.

Garlock Rubber Valves

Specially made to meet specific conditions—absolutely unaffected by oils.

Before placing your next order for supplies get our prices on Leather, Rubber and Canvas Belts, Hose, Brass Valves, Babbitt Metals, Saw Blades, Files, Emery Wheels, etc. Write for catalogue.

This shows some of the designs made with cutter-heads included in regular equipment. There are more in our big circular. Send for it. Those shown in the round are also made octagon or square.

We Have Solved the Problem of

Balusters In Small Lots

Made Profitably by Machinery

The improvements in our No. 92 Turning and Variety Machine, and the complete variety of the cutter heads, which are arranged in sections, makes it easy to match very closely almost any detail design, and to make the change to any pattern, ready for turning.

IN ABOUT 15 MINUTES
WITHOUT LOOSENING OR ADJUSTING A KNIFE

This is the only practical machine for the economical turning of inside balusters in small lots of different sizes or design, especially those made in two or three lengths for stair work. It is also an excellent Variety Woodworker, which can be kept profitably employed in countless ways when not in use for making turnings.

We shall appreciate your enquiry

SAULT STE. MARIE, ONTARIO

A Belt which Conveys ALL the Power

Practical men know the drainage of power from a slipping belt, ***and because they know,*** they are buying

GOODYEAR RUBBER BELTING

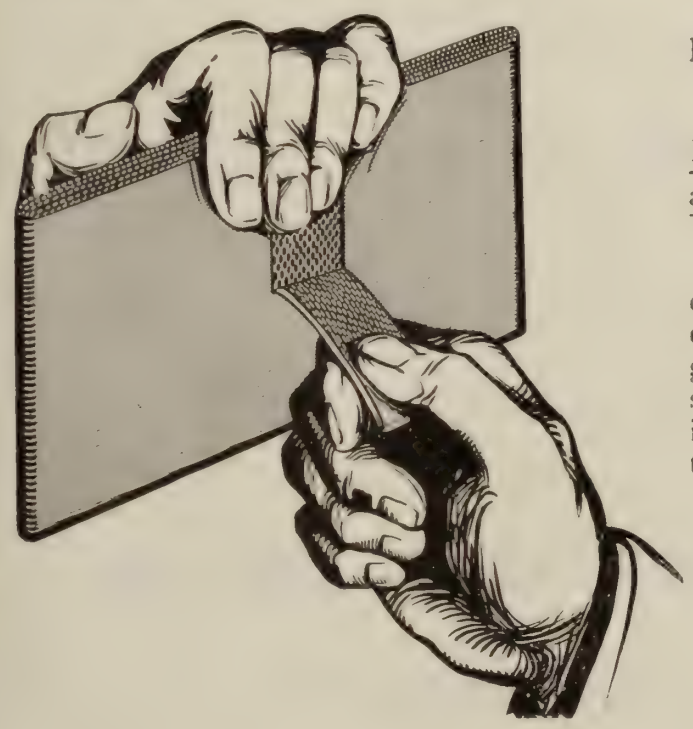
Which Neither Slips Nor Stretches

It is built up, layer upon layer, of close-woven, long-fibre, cotton fabric, rubberized and cured under Goodyear processes. And every Goodyear belt has in it the lowest possible minimum of stretch, because the belt is "cured" whilst stretched to the limit of safety in a special machine.

That is the Goodyear Method of Belt Manufacture

And the result is entirely satisfactory to belt users—a fact to which our enormously increased sales testify. What is the significance of this CONTINUED SALES INCREASE — 50% over last year? Simply that Goodyear Belting more than fulfills the claims made for it by the Goodyear people—who know what a belt should do, and make a belt to do it.

It has cost us less than $200.00 for claims or adjustment of every kind in connection with our total output for the past two years—a remarkable tribute to Goodyear reliability.



Look into the Belt for Yourself—Try to Tear It Apart.

Make a cut in the top layer—and then try to pull it apart. You will get a faint idea of its strength.

That is the result of forcing rubber at tremendous pressure through the fine cotton fabric—separating every strand—thus abolishing all internal friction or grinding. Whilst these layers of fabric are afterwards so compressed as to be almost homogeneous, the finished belt bends easily, the "duck" being so woven as to retain complete pliability in the finished belt.

For Main Drives and High Speed Pulleys GOODYEAR Belting is the Best

It has all the tensile strength necessary to absorb tremendous strain without slip, stretch or rent. The grip of rubber and the prodigious strength of hard-twist cotton fabric are united, and prove equal to every emergency.

Where the power transmitted is high, and great tensile strength is essential, Goodyear Rubber Belting proves its worth.

EVERY GOODYEAR BELT IS SUBJECTED TO A STRINGENT TEST BEFORE LEAVING THE FACTORY, and what is more, the materials used in the manufacture are also tested in the Goodyear laboratory before using.

IF YOU USE A BELT AT ALL IT WILL PAY YOU TO USE A GOODYEAR

Loss of power is loss of profit—and an inferior belt is dropping power all the time. Goodyear belting quickly earns its cost in power saved and trouble avoided.

TWO HUNDRED AND FORTY ROLLS—A TOTAL OF 72,000 FEET

We have just received an order for this quantity of GOODYEAR RUBBER BELTING from one business concern in the west, for the equipment of interior elevators. Such an order shows supreme confidence in the quality of GOODYEAR Belting.
If we have not just the belt you require we will make it for you.
In the choosing of belts our booklet would be of great assistance to you. We supply it free. Write to our nearest Branch for one.

Your hardware dealer can get this saw for you.

One of the best things for Canada lumbering was when we began making the Crescent Ground Cross-Cut Saws here at our Montreal factory. We make saws with all standard styles of teeth, but best of all, make them from Saw Steel which we get from the Simonds Own Steel Mill, and by the Crescent Ground process which the originators of this Saw in the United States have found so successful for nearly a quarter of a century.

Every Saw Covered by an Absolute Guarantee

Mr. T. H. E. Retailer,
Canada and United States,
North America.

Dear Sir:—THE SAW-MILL OWNERS SALES COMPANY is a collection of lumber manufacturers of the Provinces of Quebec and New Brunswick, representing an annual output of over Forty Million Feet B.M. of Spruce lumber (apart from the Lath and Shingles), united under one Board of Management, having supervision over the sawing of the lumber and manufacturing in general of all the Mills interested, with the sole aim of creating uniform grading and uniform manufacturing. Therefore, avoiding the great trouble experienced by wholesalers in general, which is to supply their customers with stock of all kinds of manufacture and grade, caused by the individual management of each mill, where the wholesaler buys his supplies. A state of affairs entirely beyond the control of the wholesaler. Our organization in this instance naturally gives the Retailer better satisfaction. All our individual shipments are samples of the whole output.

Then again, the millmen have organized an experienced staff of salesmen, under the supervision of a sales manager, condensing in each and every salesman these three great points, so important for the continuance of the retailer's patronage—Quality, Quantity and Responsibility. Three points known to very few of the trade.

At present our stock is very low, but we have Five Million Feet in our different yards. Some of this ready to ship, notably some merchantable spruce: 2 x 4, 2 x 5, 2 x 6, 2 x 7, 2 x 8, 2 x 9, 1 x 4, and up, also 1 x 4 Mill Cull Pine.

We remain, Dear Mr. Retailer,
Yours respectfully,
THE SAW-MILL OWNERS SALES COMPANY.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, December 1, 1912 No. 23

The St. John River Driving Problem

One of the time-honored problems which have troubled the lumbermen of New Brunswick, is that connected with the driving of logs on the St. John River. The difficulty, which is of an international character, continued for many years, until not long ago, when it led to blows and even to bloodshed. It was then taken up seriously by the governments of both countries with the result that present indications point to a solution which, while involving a considerable outlay in money, will make driving conditions more certain and pleasant for all time to come. In another part of this issue will be found a synopsis of the report of the consulting engineers who have been looking into the problem for two years. The report is very definite in its conclusions and recommendations and leads to the belief that the problem will soon be completely solved.

The St. John River, which is the main stream of the Province of New Brunswick, takes its rise from a watershed in the Province of Quebec, close to the northwest boundary of the State of Maine. Its course is at first notheasterly to a point known as Upper St. Francis, on the Canadian boundary between Maine and New Brunswick. From this point to Grand Falls on the Canadian side, a distance of about thirty-five miles, it forms the dividing line between Maine and New Brunswick, its direction being first northeast, then southeast. From Grand Falls the general direction of the stream continues southeast through the Province of New Brunswick until it enters the Bay of Fundy at St. John. For many years the St. John River has played an important part in the lumber operations of the State of Maine and the Province of Quebec, and forming as it does a boundry line between the two it has been a stream of international importance, involving international disputes at times between rival lumbering concerns of the United States and Canada. It is essentially a highway for the lumber trade, and along its course between the two countries it has been so used by American and Canadians alike. Of late years the flowage has at certain seasons proved inadequate to the demands for log driving, the inevitable jams followed, and sometimes it was an American's logs and sometimes a Canadian's that would suffer. One man's misfortune brought on those of another.

Matters at last reached the stage when government interference became necessary to prevent bloodshed, and an international commission was appointed to look the river over and to devise some way of improving the flowage, so as to remove the cause of the friction between the rival lumbermen. This commission comprised two prominent Canadians and two Americans, with a consulting engineer from each country to do the actual expert investigating. For two years these engineers have proceeded with their investigations. The time may seem a trifle long and the expense of the investigation rather heavy, but from all accounts the report has been a thorough one and well worth while.

The result of investigations by the engineers has been a recommendation of an expenditure of nearly half a million dollars for dams, so as to raise the level of the stream sufficiently to facilitate the log driving, though to render it of still further utility would considerably more than double this outlay and involve additional expense in shape of damage from overflow. The engineers suggest also that the driving be entrusted to an authorized company, which some concern might undertake under the improved conditions recommended. These improvements are set forth in detail in the report of our correspondent.

Hemlock Meeting Competition

In the Canada Lumberman of November 15th an editorial was published dealing with the danger of substitution of other woods to take the place of hemlock, which to-day, is held at prices that a year ago would have been considered altogether impossible. There is no question that the present situation in connection with hemlock is critical. The prices which are being offered and asked are exceptionally high. In fact the trade is scarcely regulated by prices at all. The chief consideration is the ability of the seller to deliver the stock. The editorial referred to above attracted comment from many quarters.

One well-posted dealer has drawn our attention to the fact that the conditions predicted are already in effect and that woods from other parts of Canada and from the Southern States are being delivered in Toronto at prices which make it profitable to handle them instead of hemlock. These woods will soon find a steady trade and will, to that extent, reduce the demand for hemlock, causing a permanent injury to the hemlock market which will make itself felt severely when the next period of depressed trade arrives. The warnings of the prophet are generally laughed at or neglected. We are not exactly prophets ourselves, but some of those who have been handling hemlock of late are sufficiently posted to prophesy safely that a time of reckoning is likely to come, unless the producers of hemlock are extremely cautious.

The recent meeting of the hemlock manufacturers in Toronto would indicate that they are awake to the necessity of going slowly. They refused to ask for higher prices at present, but there were some who believed that higher prices were justified. Possibly they are justified by the conditions of supply and demand to-day, but the real question is whether they are both justified and wise. We have little hesitation in saying that in our opinion hemlock is to-day at a figure in Ontario which is encouraging substitution and is likely to cause trouble a little later on. Those who are manufacturing hemlock will be well advised if they make a close study of these conditions and watch closely for indications of substitution, so as to be ready to hold the markets for their own stocks.

That the danger to hemlock already exists may be seen by anyone who will examine into the present trade conditions. New Brunswick and Quebec spruce are coming into Ontario to-day in largely increased quantities. In the Maritime Provinces manufacturers have just passed through a year during which it has been almost impossible to make shipments to the Old Country on account of the high ocean freight rates. They have been obliged to look to all rail markets for an outlet and they have found one of these in Ontario. Eastern

spruce is welcome in Ontario. It fills many good bills and gets the trade on its merits. Present conditions, however, are enlarging its outlet at the expense of hemlock and the chances are that before long eastern spruce will be a much more important factor in Ontario markets than it has been in the past.

Spruce from Eastern Canada is being delivered in Ontario markets to-day at prices below what hemlock for the same purpose is bringing. Merchantable spruce, 2 x 4 to 2 x 8 can be delivered in Toronto to-day at prices not exceeding $21. At the mills in Ontario they are asking $19 to $19.50 for number one hemlock, 2 x 4 to 2 x 10. The freight on this would be from $2.50 to $3 per thousand according to the condition of the lumber. It is more often $3 than $2.50, as hemlock is now shipped pretty close to the saw. It is clear, therefore, that the hemlock manufacturer is asking just about all that it is safe to ask at the present time.

That eastern spruce is likely to improve its hold upon Ontario trade is becoming more and more certain. An active campaign on the part of manufacturers of spruce in Eastern Canada at the present time would probably bring forth profitable and lasting results. Not only is spruce taking the place of hemlock, but it is making itself felt in the white pine trade. To a very large extent, 1 x 4, 5 and 6 in. spruce is taking the place of white pine of the same width, and making the demand for the intermediate grades of white pine very sluggish.

Spruce is not the only wood that is finding new or improved markets in Ontario. There are indications to-day that southern woods which have never touched the Ontario markets to any extent as yet, are looking covetously at the trade here. The Canada Lumberman was shown a few days ago some samples of tupelo and of loblolly pine from the Southern States which a well-known wholesaler is preparing to place on Ontario markets. He is going into the matter seriously and is confident that the present market conditions make the proposition an attractive one.

All these little straws indicate the direction in which the wind is blowing. They do not indicate a storm but they do give warning that there is wisdom in being prepared for the future by going cautiously in the present, no matter how tempting may be the inducements to make hay while the sun shines.

Causes of High Ocean Freight Rates

The high levels to which freight rates have advanced for the shipment of lumber by ocean going vessels have been discussed frequently in these columns. Everyone who is engaged in the export lumber trade has felt the effect of this situation and has wondered whether the situation was normal or exceptional. There is a general belief that the advances are due to the exceptional demand for vessel space, resulting from a remarkable prevalence of trade activity in all the chief manufacturing countries of the world. According to this view, the vessels have not sufficient space to move all the cargoes offering and their owners are simply accepting the best offers and neglecting anything else.

Among the numerous references to this question that have recently appeared in the lumber press one of the most interesting was published recently by the Lumberman's Review. "Transportation rates by water," says the article, "seldom reach the height that has prevailed during the past six months, due, we have every reason to believe, to the operation of the law of supply and demand. It cannot be claimed that steamship capacity is decreasing, but evidence is not wanting to prove beyond question that the day of the sailer is numbered, even in the face of the high rates now being secured by sail tonnage in all American waters as well as for the deep sea voyages. A rate approximating $5.00 from St. John, N.B., to New York would have been considered prohibitive a few years ago, but that rate prevails to-day, and premiums are being paid for both large and small vessels to move lumber cargoes from the tide water points in Maine to New York and New England points, while $6.50 to $7.00 per thousand is still being quoted for vessels from Georgia and Florida ports to New York and Boston, respectively. The demand for vessels to move cargoes from exporting points on the Atlantic Coast to the Argentine Republic has for the past twelve months squarely exceeded the supply, and rates have ruled sufficiently high to make this long voyage very profitable to the vessel owners. Steamer room for lumber from Southern ports to the English Channel is very difficult to secure, and for the eastward voyage from Great Britain the rate for moving mahogany logs to New York is $10.00 per thousand and higher, whereas the prevailing rate for many years has ruled between $6.00 and $8.00, with the actual charge seldom equaling the latter figure. That the sailer as a large bulk cargo carrier is to step out of the game and make room for the combination power boat and sailer propelled by a screw as well as by sails, is as sure as is the passing of the old-fashioned fisherman to make room for the power boat fisherman, who is to-day supplying most of the fish for the country. A new Diesel engine, when applied to a craft equipped also with sails, gives a combination motive power which will enable the owner or shipper to figure surely within days, and perhaps within hours, as to the time required for a voyage, thus adding an element of security, safety and regularity to water transportation at a low cost not hitherto enjoyed. This new power development is making rapid progress and will soon occupy an important place in the field of water transportation. It should prove particularly valuable for the movement of lumber on the Great Lakes, for in addition to moving lake cargoes under a time schedule, this new power equipment would add an element of safety, for it would be possible to make a safe harbor within a short time from almost any point on the lakes, where this would be entirely impossible when depending wholly upon sails, and perhaps meeting a very strong and adverse wind. This, of course, does not apply to the barge that is being towed up and down the lakes by a steamer, but as this modern engine may be applied to a barge of any capacity it offers a means for practically revolutionizing lake transportation, which is to continue to wield an important influence on the movement of lumber for many years to come, or until the Pacific Coast and the Far West have given up their primeval stand of timber, which will be many years hence."

Will Study Lumbering and Forestry Problems

Lumbermen, timberland owners and foresters of the United States and Canada will be interested in plans which are under way and almost completed for a thorough investigation of a number of questions which are of importance to these interests. This investigation, when finished, will, it is expected, have beneficial results as regards forest conservation, scientific lumbering, the taxation of growing timber, the practical end of the lumbering business, and general forest education. All the associations interested in the timber business will, it is now apparent, lend their aid in the work.

The undertaking is to be under the general direction of the American Forestry Association, with headquarters at Washington, D.C. The plan originated at the recent Fourth Conservation Congress held in Indianapolis, where representatives of the American Forestry Association, of various lumbermen's and timberland owners' associations and state foresters held a sectional meeting. Every one present was impressed with the need of more active co-operation between the various interests represented in the endeavor to secure the solution of certain specific problems relating to forest conservation and the lumber industry. After a three days' discussion of various plans the meeting appointed a committee composed of E. T. Allen, forester of the Western Forestry and Conservation Commission, of Portland, Ore.; Capt. J. B. White, of Kansas City, Mo., one of the most prom-

inent lumbermen of the United States, and Henry S. Graves, chief forester of the Forest Service, of Washington, D.C., to confer with a committee named by the executive board of the American Forestry Association, and arrange the details of the investigations which were planned. The American Forestry Association subsequently named a committee consisting of Charles L. Pack, of Lakewood, N.J., the new president of the Conservation Congress and a lumberman of national prominence; Col. W. R. Brown, president of the Berlin Mill Company, of Berlin, N.H., a prominent timberland owner and paper mill owner; and E. A. Sterling, a forest and timber engineer, of Philadelphia.

This committee has outlined a tentative plan of work, which will probably be adopted. Two distinct lines of activity are proposed. One involves the appointment and guidance of standing committees which shall report to a forestry section of the Fifth Conservation Congress on problems relating to forestry and lumbering, following careful investigation. The other is to have the program of the next Conservation Congress arranged so that a great deal of prominence and publicity shall be given to forest problems. While the subjects assigned to the committees will not be definitely decided until after conference at Washington, Portland and Seattle, it is suggested that among them shall be forest taxation, forest legislation, forest fires, forest education, state forestry, and publicity.

High Prices of Timber—Effect upon Operations

The effect of higher prices for standing timber, upon lumbering operations is outlined clearly in an article by N. P. Wheeler, which appeared in a recent issue of American Forestry. Higher prices for standing timber and its products, says Mr. Wheeler, will tend to conserve the forests. When timber is cheap it is wasted; for, when cut, it is not worked up, nearly as close as when more valuable. I am confident there has been more timber burned up and destroyed in the State of Pennsylvania than has been manufactured. I have seen 8 or 10 acres of the finest white and red oak girdled just to kill it, so that it could be burned up to clear the land. In fact, that was the common way of clearing the land, the only way of marketing in those days was by manufacturing by water power and seeping down the tributaries of the Allegheny and the Allegheny and Ohio to Cincinnati and Louisville. Only the best of the white pine was taken. The stumps cut breast high and fifteen feet of the bulk of every tree left in the woods and all the tops above the limbs. Not to exceed 50 per cent. of the selected tree was taken, the rest being left to rot. No hardwoods could be floated and were therefore not considered valuable. I have seen white pine girdled to kill it to clear the land. Once when our rafts were lying by for high water in the Ohio a larger mass of fence rails brought down by the high water collected behind the rafts. To my surprise I found these fence rails were the finest of black walnut. When the tanneries first came up into Western Pennsylvania hemlock was cut just for the bark, and thousands of acres after the bark was taken off were left to rot or burn. Now that hemlock has become valuable, it is all gathered up that will make lumber. In many places the limbs, tops and branches are gathered up for pulpwood and not enough left to make a bad fire, thereby protecting and conserving the forest. When blackened over by fire it cannot be used for pulpwood. These are some of the reasons why I am confident higher prices will tend to conserve the forests.

Editorial Short Lengths for Busy Readers

The protection afforded wild animals in Algonquin Park has resulted in a great increase in the number of beavers, which have become so numerous that they have done considerable injury to the farms bordering on the park by damming the streams and flooding the fields. Over 1,000 were killed last year and the number is to be further reduced this season. The deer have also multiplied rapidly and complaints are made of damage to growing crops from their depredations. The legislation respecting the park will probably be modified to allow the shooting of deer under reasonable restrictions.

Several months ago the railways in the Southern States issued new schedules advancing the rates for Southern pine and other lumber from points in the United States south of the Ohio river to Canadian points. On the complaint of the American lumbermen's associations, these advanced rates were suspended by the Inter-state Commerce Commission until December 31, pending an investigation as to the propriety of the advance, and also as to the lawfulness and reasonableness of the higher schedules. Although no date has been definitely set for the hearing, it is probable that the Inter-state Commerce Commission will hold it during the third week in December at St. Louis, Missouri.

The most serious matter at present affecting the lumber trade in Canada is the shortage of cars for the shipment of stock. Business is exceptionally good in practically all parts of Canada and if there were sufficient cars to move the lumber, there would be in progress to-day a record trade. Not only is there an excellent demand for all classes of lumber but the prices that are being paid are exceptionally strong in practically all lines. Many reports have been received by the Canada Lumberman regarding the shortage of cars. In fact a great number of the letters received on ordinary business contain some reference to this difficulty. One of the latest to hand is a communication from a firm in New Brunswick who manufacture large quantities of lumber and who are dependent upon the Intercolonial railway for their shipments. They report that for the past two and a half months they have been seriously handicapped for want of empty cars. The Intercolonial Railway, they cay, have allowed practically all their cars to go off their line with the result that they are now unable to take care of their customers who are dependent upon them for cars to move their lumber. The situation has been a very serious one for some time, and they are losing business steadily for want of cars in which to make prompt shipment.

This is really a regrettable situation. The Department of Railways unquestionably knew as well as anyone else in Canada that there would be danger of a shortage of cars for the movement of lumber and all other classes of freight during the last few months of the present year. The importance of the lumber industry in the Maritime provinces would have justified them in taking exceptional measures to provide it with sufficient cars to move most of its stock. If there had been a slight shortage of cars the matter would not have been so serious, but when the company have permitted practically all their cars to go off their line at a time when under ordinary conditions a serious shortage is certain to develop, the situation calls for some very definite explanation. The Department of Railways owes it to the lumber industry of the Maritime provinces to rectify the situation immediately and in future to take effective measures to prevent a recurrence of so serious a shortage.

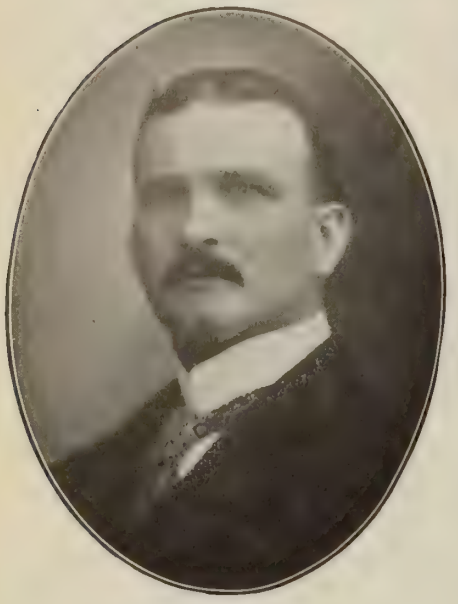
In the annual report of the Minister of Lands and Forests of the Province of Quebec, just laid on the table of the Legislative Assembly, it is stated that the revenue of the Department totalled $1,658,475, the increase being due to the change in the tariff of ground rents and stumpage dues in connection with timber concessions. The ground rents amounted to $323,584, and the stumpage dues to $1,173,393. Penalties totalled $19,635. During the year 179,130 acres of land were sold, of which 177,277 acres were for colonization and farming purposes. There is now left 7,066,755 acres of public land surveyed and available for farming and other purposes.

The Minister reports a great improvement in the supervision of lumbering operations, and also in the protection from fire, as shown by the decreased loss from this source during the year.

Supplementing this report, it may be stated that, according to the budget speech of the Provincial Treasurer, last year's revenue from lands and forests indicated that steady progress had been made in the lumber, pulp, and paper business. For the last fiscal year the actual receipts exceeded the estimates by $248,458. For the current fiscal year there was an increase of $52,930 in the first four months compared with the same period in the previous fiscal year. The estimate of revenue for the current fiscal year was increased by $102,000.

Progressive Quebec Lumber Producers

Three Modern Mills and Up-to-date Woods Equipment of the Lotbiniere Lumber Company, Lyster, P. Q., Manufacturing Lumber and Pulpwood



E. W. Tobin, M. P.
President Lotbiniere Lumber Company

FROM small beginnings, the Lotbiniere Lumber Company of Lyster, P. Q., has become one of the most progressive concerns in the province of Quebec. While it is not as large as some of the other companies it has excellent plants and timber limits 14 x 6 to 10 miles, aggregating 100 square miles of freehold property. The offices are at Lyster, P.Q., and the three mills are situated at Duchene, about a mile from Deschaillons, Kingsbury; and Chaudiere Junction, County of Beauce, some 8 miles from Lewis. The Duchene mill, operated during the six summer months has a capacity of 16 million feet, while the Kingsbury mill, operated in winter, has a capacity of 8 million feet, or 100,000 feet of logs and 60,000 feet of logs per day respectively. The Kingsbury mill is located on the limits, and the Duchene mill a few miles off, about a mile from the St. Lawrence River.

Foreign Shipments the Chief Business

About 25 per cent. of the output of the Duchene and Kingsbury mills goes into pulp. Most of the balance is shipped to the United States and Great Britain, there being a very small local business. Owing to the advance in ocean freights this year, by far the greater proportion of the lumber has been going to the United States. Spruce and fir comprise about 75 per cent. of the cut, hemlock accounting for the rest. At the Duchene mill 100 men are employed and at Kingsbury mill 65, but including the third mill about 500 people are employed all the year round.

A stream runs through the limits, which is utilized for floating the logs to the mills. The company has excellent shipping facilities, as it has easy access to the Intercolonial, the Quebec, Montreal & Southern, and the Grand Trunk railways, the first named running through the property. From the Duchene mill the lumber is conveyed by rail to Deschaillons, and from there by an inclined cable railway to the river, from whence it is shipped by boat to New York and Hudson River points. The capacity of the inclined railway is 100,000 feet per day. The Duchene mill is particularly well equipped, and Mr. W. H. Mitchell, the general manager, claims that it is the fastest mill in the province of Quebec. At the mill there is an incinerator built from the design of Mr. W. H. Mitchell, general manager of the company. It consumes all the sawdust and waste which is not sold.

Colonization Work of the Company

From Lyster the Lotbiniere and Megantic Railway runs right through the centre of the limits as far as Deschaillons, and with the aid of a little car, run by gasoline, Mr. Mitchell is able to visit both mills. The car travels over 30 miles an hour, and Mr. Mitchell, who is an ardent sportsman, is able to have some good sport while travelling in this manner. The track was sold last last year, but the right to travel on it was retained by the company. Some colonization work has been done by the company, which last year built a number of houses and a church at Kingsbury. The population of Duchene is 3,000, and of Fortierville, which is at the junction of the Quebec, Montreal & Southern and the Lotbiniere & Megantic, 800.

F. N. McRae, M. P.
Vice-Pres. Lotbiniere Lumber Company

The mill at Chaudiere is nominally the property of the Chaudiere Lumber Company, but it is controlled by the Lotbiniere Company. There is a very large water power near the property, capable of developing from 5000 to 7000 horse power, but up to the present nothing has been done in the way of development. The mill handles pulp wood to the extent of 40,000 to 50,000 cords, and its capacity is being increased so as to enable 75,000 to 100,000 cords to be dealt with.

The Company's Chief Officers

The Lotbiniere Lumber Company was established in 1902. Its president is Mr. E. W. Tobin, M.P.; the vice-president Mr. F. N. McRae, M.P. Mr. W. H. Mitchell, the general manager, has been with the company from its inception, and has had a large share in its development. He has had many years' experience in the lumber trade, and began his business career with the Estate of C. F. Clark & Co., of Brompton Falls, later being connected with the International Paper Company.

The equipment of the mills of the Lotbiniere Lumber Company is thoroughly modern and efficient. Much of it was installed by the Waterous Engine Works Company, Limited, Brantford, Ont. The Waterous machinery installed includes log haul-up, circular saw frame, saw carriage, 38-in. resaw, four saw edger and a 12 x 14 engine.

The Hon. J. D. Rolland, president of the Rolland Paper Company, died suddenly on November 16, at his residence in Montreal. Mr. Rolland was a prominent business man, at one time being presi-

Kingsbury Mill of the Lotbiniere Lumber Company

Duchene Mill of the Lotbiniere Lumber Company

Interior of Kingsbury Mill, Lotbiniere Lumber Company

dent of the Manufacturers' Association, of which he was a founder. He was president of the Bank of Hochelaga. In 1896 he was made a member of the Legislative Council of the Province of Quebec. Mr. Rolland was the head of one of the most important paper manufacturing firms in the country, with mills at St. Jerome and St. Adele. Recently the capital of the company was increased, and the Northern Mills purchased. Mr. Rolland was also interested in timber limits in the northern part of the Province of Quebec.

Want Permission to Export Crown Land Pulpwood

The Government of the province of Quebec have taken under consideration the question of relieving manufacturers of paper in the province of Quebec, of the surtax placed on paper entering United States when it is manufactured from pulpwood grown upon Crown Lands in the province of Quebec. Under present conditions, pulpwood cut from Crown Lands cannot be exported in its natural state. It must be manufactured into pulp or paper. The United States impose a duty amounting to $5.65 per ton on paper made from any wood, the export of which to the United States is prohibited. On October 31st a deputation of paper manufacturers in the province of Quebec waited upon the Provincial Cabinet with a request that they abolish the restriction on the export of pulpwood from Crown lands to the United States. The companies represented were the Laurentide, the Belgo, the Wayagamack and Price Bros. The deputation explained that the restrictions were a serious handicap to those who were manufacturing paper for export to the United States. They pointed out that the province of British Columbia had set a precedent by allowing wood from Crown lands owned by a newsprint company to be exported to the United States. The United States Government in recognition of this concession had permitted the paper to go into that country free of duty. They were convinced that if the example of British Columbia were followed by Quebec, it would stimulate the newsprint industry of the province.

Sir Lomer Gouin discussed the various points briefly and promised that the Government would consider the request seriously.

Mr. Paul G. Owen, Secretary of the Limit Owners' Association of the province of Quebec submitted a memorial in support of the proposal. He also took occasion to suggest in the memorial that the stumpage dues of the province should be reduced.

Logging Engine at work, Lotbiniere Lumber Company

Hon. Jules Allard, Minister of Lands and Forests, states that a decision on the subject will be announced shortly. He has given no suggestion as yet regarding the government's attitude but states that in regard to this matter as in all others affecting the industry of the province, the government will do its best to encourage successful development. He has declined as yet to say whether the embargo will be removed either wholly or partially.

The purpose of placing the embargo upon the export of pulpwood grown on Crown lands was to give the province the benefit of the manufacture of its pulpwood into paper. This would enable the province to utilize its wealth of water power and provide employment for its population, thus preventing an exodus to countries outside of the province. Not only was the manufacture of paper in the province a benefit to its people, but it was better for the United States paper manufacturers to establish their mills on the Canadian side of the line. It would be cheaper for all new mills to adopt this course so as to save freight charges on pulpwood and to take advantage of the cheap water power available in Quebec.

New Paper Bag Company

The amalgamation of the Smart Bag Company, of Montreal, with Woods Limited, of Hull, Que., will, according to present arrangements, go into effect on January 1 next. The authorized capital of the new company is $5,000,000. It will purchase as going concerns the two companies, the first named having factories for the manufacture of paper and other bags in Montreal, Toronto and Winnipeg, and the last named having a factory at Hull and agencies at Montreal, Winnipeg, Calgary and Vancouver. It is understood that Col.

Kingsbury Yard Scene, Lotbiniere Lumber Company

Charles A. Smart, of Montreal, will be president and managing director, and Col. J. W. Woods, of Ottawa, one of the vice-presidents.

The consolidation of these two Canadian bag companies into the Smart-Woods Company, Ltd., draws attention to the large interests held in Canada by a United States bag companw, known as the Union Bag and Paper Company of New Jersey. This company, which has a capital of over $30,000,000, has immense timber holdings in the province of Quebec, and has also recently established a pulp mill near the city of Quebec at a cost of half a million dollars. It controls the following companies operating in Canada:

Charlemagne and Lac Oureau Lumber Company, which has 600 square miles of timber lands on the Assomption and the Lac Oureau rivers; also mills at Charlemagne, near Montreal, and at St. Adele and Montcalm.

Gres Falls Company, which owns 1,173 square miles of timber land on the St. Maurice and its tributary rivers; also saw mills, terminals, etc., at Three Rivers, Que. The St. Gabriel Lumber Company, which owns 285 square miles of timber land on the Maskinonge and its tributary rivers; also mills and terminals at St. Gabriel de Brandon, Que.

In addition to these lands the company owns 485 square miles of timber lands located on the tributaries of the St. Maurice River. These Canadian properties aggregate 2,550 square miles.

When the company acquired these woodlands, six or seven years ago, it was estimated that there was sufficient timber upon them to meet the requirements of the company for the next fifty years. But as the company does not now wish to reserve the timber for its own use only, it is selling a large amount of lumber, the average being about 35,000,000 feet a year.

The pulp mill near Quebec, which was started in June last, is now turning out daily about 100 tons of ground wood pulp.

Engineers Report on St. John River

Improvements Required for Satisfactory Driving Conditions would Cost $471,510—Outline of Proposed Changes

The board of consulting engineers of the St. John River Commission has submitted a report of its findings to the commission which will go far toward settling some of the international vexing questions anent the stream.

For many years there has been a conflict of lumbering interests on the St. John River, chiefly over the use of water for driving purposes, and the delays experienced by the St. John drive at the sorting gaps of Van Buren, where logs intended for use at that Maine town are taken out of the general mass of timber en route down the river, and in 1905 this friction culminated in violence almost amounting to open warfare between the American and Provincial lumbermen, an exciting incident being the blowing up of a boom by dynamite. To prevent a recurrence of these troubles the International St. John River Commission was appointed by the governments of the United States and the Dominion of Canada to gather such information as might be necessary to a thorough understanding of the situation along the river, and to serve as a basis for an amicable arrangement between the two countries concerning the river and its uses. This commission is at present composed of M. G. Teed, K.C., of St. John; Hon. John Keefe, of St. John, N.B.; Hon. George A. Murchie, Calais, Me.; Hon. Peter Charles Keegan, of Van Buren, Me., with Hon. Oscar A. Fellows, of Bangor, as counsel for the United States, and Hardy S. Ferguson, of New York, and S. J. Chapleau, of the Dominion Department of Public Works, as consulting engineers.

After nearly two years of work and the expenditure of many thousands of dollars under the direction of Mark H. Ranney, civil engineer, of Mohawk, N. Y., the consulting engineers have now submitted their report, which is the most complete study of the valley of the St. John ever attempted.

The engineers have found that with the expenditure of $471,510 for dams, the waters of the river and its tributaries can be raised to a comparatively high level, and so maintained, which would greatly facilitate log driving on the river. To raise the river to a level sufficiently high for all purposes would cost, according to the engineers, $1,273,576. To these amounts must be added the flowage damages, which in some localities would be heavy.

In order to improve the conditions for log driving at many points along the river, the engineers say that from $200,000 to $300,000 might well be expended at the rate of $10,000 to $15,000 annually for a series of years.

The engineers believe that it would be desirable for the best and most economical handling of the water if one corporation could be made responsible for driving the logs through the whole length of the river, at least as far up as Seven Islands. It has been stated that no corporation or individual would care to contract for driving the logs on the upper St. John under present conditions. These conditions would be so improved by the works suggested that a practical river man would not hesitate to assume the responsibility of handling the logs.

While the St. John River is one of the largest streams in the country, and the upper part of its drainage basin is at a comparatively high elevation above sea level, the fall is, with few exceptions, quite uniform, and the opportunities for economical water power development are therefore few. This also applies to the tributaries.

The best power sites are found on the Allagash and Fish Rivers, where the opportunities for storage are exceptionally good.

The engineers met in Bangor with the commission on November 14, to consider the report. The members of the commission will report later to their respective governments.

The general improvements suggested by the engineers are divided into three classes: Channel improvements, driving or flushing dams and reservoir dams. It is stated that the more the river channel can be improved, the less the reservoir development will be found necessary or the greater will be the reserve of water for power purposes.

The chief improvements will consist of storing as great a portion of the spring floods as possible, thereby reducing the height of the freshet stage and forming a reserve to be used when dry weather comes, as it usually comes every summer.

Taking into consideration the matters of economy and return on investments required, the engineers suggest that instead of undertaking at once all of the improvements which have been suggested, the most feasible way is to extend them over a series of years doing that part of the work first that would appear to produce the greatest effect and halting the work when that stage of improvement has been reached, beyond which expenditures do not seem to be justified by the results to be obtained therefrom.

All of the channel improvements suggested should be undertaken and carried through as promptly as circumstances permit. The reservoirs and driving dams suggested for the upper St. John and Big and Little Rivers are necessary to insure safe driving.

The storage reservoirs which can be developed on the St. John River are much greater in capacity than that required for log driving alone. Until there are some water power requirements on the river, a complete development of these reservoirs to their utmost capaciy would not be justified.

The engineers recommended that sufficient capacity be developed at an early date to meet the requirements of the log drivers. When the suggested improvements are carried out to something like completeness, the last of the drive will arrive at the lower section of the river at a considerably earlier date than is now the case and there will be ample water in reserve to raise the level of the river enough to enable the rear driving to remove easily and quickly the logs as they work down the river, and to arrive at Fredericton with a "clean rear" in midsummer.

It is not a large quantity of water that is best for driving logs but as steady and uniform a flow as possible throughout the entire driving season. Absolute uniformity of flow cannot be obtained on the St. John River, as there are opportunities for storing only a limited proportion of the spring freshet. By the construction of the reservoir dams recommended, the freshets will be materially reduced in heights, and in some of the branches will be nearly eliminated, thus reducing the expense and delay now experienced by returning to the water logs that have stranded at the height of the flood.

St. John Drift Drive All Rafted

The drift drive that broke away from Douglas boom on the St. John River, N.B., in mid-summer and went into South Bay is now about rafted. Nearly 150 men have been busy at the work for many weeks and the task has been a very difficult one. The case is the only one ever known in this district where logs jumped the boom in mid-summer. The gang of men moved next to Government Island on Wednesday to begin rafting 10,000 pieces which drifted into there. Only part of the crew will begin the work but later it is expected to re-engage all the men. The work is being done by the St. John Log Driving Co.

Railways Want Higher Demurrage Charges

The Canadian Pacific, the Grand Trunk, the Michigan Central and the Canadian Northern Railways have applied to the Dominion Board of Railway Commissioners for permission to charge shippers or consignees who retain cars for loading or unloading beyond the free time allowed by the present rules during the time between December 1, 1912, and April 1, 1913, $2 per car for the first 24 hours after the free time, $3 per car for the second day, and $4 per car for the third and each succeeding day after the allowed free time. One dollar per car per day, after 48 hours, is the present charge. As a result of this application by the railways the Railway Board will have a hearing in Ottawa on November 27. The Canadian Manufacturers' Association have received notice of this hearing.

Mr. James E. Walsh, Manager of the Transportation Department of the Canadian Manufacturers' Association, referring to the subject said: "I do not consider this proposition of the railways altogether a fair one. It is pretty well known that much of the delay complained of is due to the carriers themselves. Some of the reasons are lack of locomotives and of proper terminal facilities in the larger centres. This Association might not object to a revision of the car service rules, provided there was some reciprocal arrangement whereby the public would be compensated for losses suffered through negligence on the part of the railways."

Montreal Retailers Discuss Car Shortage

The car shortage question was considered by the members of the Montreal lumber branch of the Retail Merchants' Association of Canada at a recent meeting, and a deputation was appointed to interview the railway officials in order to secure better conditions. Complaint was made of the losses due to the very poor car service and also to the demurrage charges which were incurred owing to the delay in unloading cars. It was a serious matter for the retail lumbermen, who found it difficult to get even a single car.

The meeting also took up the question of the lien law, under which notice has to be given to a proprietor of a building in the course of erection where lumber and other material is supplied to a contractor. This notice is compulsory if the retail lumberman desires to protect himself. The law was stated to be impracticable, and the members expressed a desire for the better protection of their interests.

Letters to the Editor

Believes Inspection Would Benefit Whole Trade

Toronto, Nov. 26th, 1912

Editor Canada Lumberman:

Replying to yours of Nov. 25th would say, I have read (with a good deal of interest) the article appearing in your paper in reference to a uniform mode of inspection being adopted in Canada. So far as hardwoods are concerned at the present time most of the dealers so far as I know, in making contracts name the National Hardwood Lumber Association rules of inspection to govern in case of dispute, and as we have here now stationed in Toronto, a representative of that organization, there is no trouble in having him inspect the lumber, provided either one of the parties are members of the Association.

Personally I believe that all dealers who are handling hardwoods to any extent, should be members of the Association so that they could call upon the inspector in case of dispute. Our firm has found it to be an advantage on two or three occasions, in the settlement of disputes which in every case were amicably arranged by referring the matter to the official inspector.

So far as pine is concerned, I do not think there would be very much trouble in arriving at a uniform system of grade. Practically, we have such now in operation, although we have not got it reduced to writing and made official, however I believe that there would be very little difficulty. If the manufacturers and dealers get together they could soon arrive at a basis which would be satisfactory to all concerned. This might necessitate the employment of perhaps one-half dozen inspectors, whose duties would be where called upon to settle disputes, should they arise. I am satisfied that enough business could be found for them, so that their salaries could be paid without very much expense to the association. These of course are my own personal ideas and the result of some years experience in the business.

Hoping that some good may come out of the discussion, and with kind regards, believe me to remain,

Yours truly,

Wholesaler.

Education The Chief Requirement

Montreal, Nov. 23rd, 1912.

Editor Canada Lumberman:

Referring again to the subject of grading rules, about which (in regard to hardwoods) I wrote you a month ago with reference to their application to Montreal and its district, the first point, to my mind, is educational. Those who buy hardwoods from dealers require to be told by circular or otherwise, that they are in danger of being dissatisfied in buying without some solid guarantee, and they should be told to buy only of trustworthy dealers, who will not misrepresent. They should also obtain from such dealers, say a printed slip copied from the rules of the National Hardwood Lumber Association of the U. S. showing what is:

1sts and 2nds	No. 3 Commons	Selects
No. 1 Commons	Wormy	Strips
No. 2 Commons	Saps	

stating also how the widths and the lengths will run in each grade they buy, and having the seller's name signed to it. This would show the customer just what he should get in each of these grades, and would largely do away with the necessity of having a resident inspector here, which would mean a good deal of expense for salary, etc., the money to meet which would not be easily obtained. The buyer could see for himself whether the lumber was right, and if there should arise a dispute, an umpire or third party known to both, and accustomed to hardwoods could be called in.

In regard to soft native woods, such as pine, spruce, and hemlock, a common sense way would be to gradually influence the manufacturers to grade into No. 1, No. 2, No. 3, No. 4, No. 5 and No. 6, dropping the jumbled up "grading" (so called) now in vogue.

Quebec Lumberman.

Good Business Outlook at Boston

Boston, Mass., Nov. 20, 1912.

Editor Canada Lumberman:

The general market in the United States has been pretty good all this year. There seems to be a slight hesitation developing since the election, but we look for a good winter business.

There is a very considerable scarcity at the present moment of low grade pine, white pine, and in spruce boards. We rather look for some further advance on these items.

Shingles have also been scarce and high, although red cedar shingles have been fluctuating both up and down. Apparently they took quite a start some weeks ago, but since then have fallen off somewhat.

On the whole, however, conditions in nearly every line look to be healthy and prices are firmly maintained.

Yours very truly,

Shepard & Morse Lumber Company.

Seeking a Duty on U. S. Shingles

The rapid increase in the importation of United States shingles into Canada has induced a number of the shingle manufacturers of British Columbia to take steps towards having the government place a duty on shingles. A delegation of Vancouver shingle manufacturers comprising Messrs. T. Kirkpatrick, Hugh Davidson and Albert Cotton, recently interviewed Mr. J. D. Taylor, M.P., at New Westminster upon the subject and the matter is also being taken up with Mr. H. H. Stevens, M.P., and other British Columbia representatives at Ottawa. The delegation which visited New Westminster presented figures showing that between April 1 and September 30, 1910, the importation of American shingles into Canada reached about 2,000,000. During the same period last year it climbed to something like 31,000,000 and between April 1 and September of this year reacher the large total of 102,000,000.

At one time Canadian shingles competed on good terms in the markets of the United States. The result was the placing of a duty of 50 cents a thousand on shingles entering the United States.

Great Future for B. C. Lumber Trade

Visiting Timber Owner Foresees Greatly Increased Markets After Opening of the Panama Canal

Mr. D. G. Curtis, president of the Erie Lumber Company, of Erie, Pa., who has large timber interests in British Columbia, is visiting on the coast. He is enthusiastic regarding the possibilities of the lumber industry following the opening of the Panama canal resulting in giving access to new markets on the Atlantic seaboard of North and South America.

The visitor and his associates have in contemplation the erection of a large sawmill up the coast to cater to that trade. Their holdings are estimated to exceed one billion feet, distributed at various points, including Huaskin Lake, Drury Inlet, Broughton Island, Gilford, Bute, Knight and Loughborough Inlets. They have been doing considerable logging at Huaskin Lake during the past three or four years.

Mr. Curtis' views are outlined in the following interview: "The rate on lumber, including canal tolls, from British Columbia ports to the Eastern Atlantic seaboard as far as Boston does not promise to exceed $10 per thousand feet, as compared with the prevailing all-rail rate of about $20. This will give the inferior grades of lumber of the Pacific coast access to a vast market throughout the Eastern and Middle States, in addition to a wider field on the east coast of South America.

"New York state is expending millions of dollars in building a ship canal from Buffalo to Albany, there connecting with deep-water navigation on the Hudson River. This canal will prove a great factor in ensuring cheap transportation of western lumber to the big centres in the interior. We are now selling coast cedar siding and shingles in that market in preference to anything that can be produced back there. Good timber of other kinds is also getting scarcer every year. It may surprise British Columbia millmen to know that Pennsylvania hemlock, the poorest variety of lumber turned out, is selling at the mills for $21 per thousand feet.

"At present the high rail freight rates prohibit the use there of anything but the highest grades of Pacific coast lumber. Under changed conditions the demand for western lumber of every grade will be enormous, ensuring wonderful prosperity for the industry in California, Oregon, Washington and British Columbia. Southern yellow pine makes very inferior lumber, but it is used very extensively in the northern and middle states."

With a forest area of 182,000,000 acres, estimated at 360,000,000,000 feet, British Columbia hopes to turn the Panama canal to advantage with regard to its lumber industries. In 1910 the timber cut of that wonderful province was 1,620,000,000 feet, worth approximately $25,000,000, nearly one-third of the entire cut of the Dominion. Lumber experts anticipate much greater activity in the industry.

At present, few mills in British Columbia are shippers of any consequence to Europe. Rates from Vancouver or the Fraser River to Europe through the Panama canal will be about $8 per 1,000 feet of lumber, as against $16 through the Suez canal to-day. Instead of costing $300 or more to ship a carload of 40,000 pounds of lumber from the Pacific to the Atlantic seaboard by rail, it will cost only in the neighborhood of $160 through the canal, even with the payment of canal tolls.

Cutting Ties from Dead Timber

Victoria, Nov. 18th.—Mr. H. R. MacMillan, chief forester of the province, returned recently from an extended trip to various points in the interior. At Greenwood he inspected the work which has been done in connection with the survey of the lands comprised in the Columbia and Western land grant. The survey, Mr. MacMillan says, is being carried on under considerable hardships owing to the season of the year. Local men, familiar with conditions, have shown themselves exceedingly unwilling to engage as packers, and the work has been more or less handicapped from this cause.

From Greenwood Mr. MacMillan took a trip along the Kettle Valley route to see what kind of country it is. He found it a good valley, with abundant timber. The right-of-way is being kept in excellent shape. At Nelson he met and received a report from the men who have been making an examination of the railway right-of-way in Southern British Columbia. These men are not only making a minute examination of the rights-of-way, but are preparing a map showing where there are any slashings or other debris, and where standing timber is to be found on the rights-of-way or in the immediate vicinity thereof. This information will be forwarded to the Dominion Board of Railway Commissioners, so that they may know how far their instructions have been carried out with reference to the precautions against fire. The maps also will be very useful to the provincial fire rangers next summer, as enabling them to know the location of the danger areas and govern themselves accordingly.

After a brief stay at Cranbrook and Fernie, where he met a number of lumbermen and made himself familiar with the local conditions, Mr. MacMillan proceeded to Tete Jaune Cache, the chief object of his tour being to inspect that district and to see what is being done in the way of tie-cutting for the Grand Trunk Pacific. The company has the right to cut ties on government land for its use in construction, and the government has been careful to see that this cutting is as much as possible confined to particular districts so that no unnecessary damage may be done to commercial timber. The company estimates that about 600,000 ties will be cut in the neighborhood of Tete Jaune Cache. Under its agreement it is entitled to take all of these from live wood, but an arrangement has been made with Mr. MacMillan whereby one-quarter of these ties, or 150,000, will be taken from wood fire-killed last year. This is in the nature of an experiment, as the chief forester is persuaded that this fire-killed wood will prove quite as durable as the live wood.

In this district also Mr. R. E. Benedict is going over the tie-cutting areas with the railway contractors in order to decide upon the disposal of the brush. Representatives of the railway have agreed to burn all the brush for a distance of three hundred feet on either side of the right-of-way. As an indication of the development which is to take place in the near future in the Upper Fraser Valley, Mr. MacMillan says that the firm with which Senator Edwards is identified has made arrangements to put in two sawmills which will each have a capacity of 175,000 feet per diem, and which will each yield to the province a daily revenue of about $80.

B. C. Timber Receipts for October

Departmental figures for October show a considerable increase in timber industry receipts by the Government. During the month 638 licenses were issued west of the Cascades, and 430 east of that boundary, the revenue from the former being $95,631.15 and from the latter $52,289.10. Transfer fees were $790; penalties, $1,928; royalty on sawlogs, $39,594.07; timber tax, $3,712.33; scaling fees, $4,081.51; registration of timber marks, $33; hand loggers' licenses, $175; lease rentals, $8,271.73; miscellaneous receipts, $2; a total of $206,504.89. Payments to the forest protection fund amounted to $11,135.54. Reports made by those in charge show that last season there were 109 fires in the Dominion Railway belt under the New Westminster agency, but only in one case was damage done to standing timber. This record was made owing to efficient patrol and favorable weather. The district is approximately 120 miles long by 20 miles, and extends from Port Moody to North Bend, on either side of the railway. Twenty-one rangers kept watch.

H. W. Johns-Manville Company Open Branch in Atlanta

The H. W. Johns-Manville Co. have recently opened a new southern warehouse at No. 31½ South Broad street, Atlanta, Ga. The entire building, embracing three floors and a basement, with a total floor area of about 10,000 square feet, will be utilized exclusively as a warehouse for a stock of such J-M products as roofing, boiler and pipe coverings, cements, packings, fire extinguishers, electrical, railway and automobile supplies. A feature of particular advantage in this new site will be found in the location of the Atlanta office of the H. W. Johns-Manville Co. in the same building with the local warehouse, which will materially help to minimize the chance of delay in deliveries.

Forest Surveys in British Columbia

By H. K. Robinson, Assistant Forester of B.C.

To quote from the address of the Hon. Mr. Ross on the guardianship of the public forests of British Columbia, we want to find out what forests we have and where they are.

The province is about 700 miles long and 400 miles wide, but about one-quarter of it need not be considered at the present time.

I will not repeat figures which have already been given by others, except to say that our work deals with an area of about 130 million acres, according to the latest and most conservative estimate.

At present very little is known about most of the province, and that information is held by a number of surveyors, prospectors, hunters, trappers and others, who are difficult to find and who when found cannot usually describe the country in the manner wanted by the Forest Administration, and have never looked at the country from the Forester's point of view.

In addition very little of the province has been surveyed. The coast line, international boundary, railways, patches of settled land in different parts, the Dominion Railway Belt, a few areas surveyed by the Geological Survey of Canada, and some of the leased and licensed timber areas are about all that has been done.

The work has been carried out by a large number of different agencies and is linked up by no triangulation of the country or system of townships.

Difficulty of Collecting Data

All this makes the collection of reliable data much more difficult, and without such data it is impossible to organize the province by districts for forest administration.

Our aim is to have at headquarters a map and a well arranged store of information from which we can see what land is timberland and what not timbered, according to the definition contained in the Land Act of British Columbia, which says that timbered land is land bearing 8,000 board feet or more to the acre in the country west of the Cascades and 5,000 board feet or more to the acre in the country east of the Cascades.

The timbered land again may be good, medium or poor, so we want to know roughly what the stand is in each part of the country.

We have no desire to make a close cruise, as it would serve no good purpose and be a waste of time and money, so we are contenting ourselves with an ocular estimate showing classes 0-5000, 5000-10,000, 10,000-20,000 and 20,000 board feet to the acre and up.

We also want the maps to show rivers, lakes, roads, trails and rough topography.

To obtain this ten forest assistants have been sent into the field. Each man obtains locally the transport and assistance he may require, and works on a detailed set of instructions. Wherever possible he takes a surveyed line like a piece of railway or boundary of the Dominion railway belt or the international boundary as his base and triangulates from that. Where existing surveys do not lend themselves for use as base lines he has to lay out a base line for himself and tie it on to some existing survey, as an example of this latter method, one forest assistant has made a base line between the tops of two hills, and made a transverse down to the tangent peg of a large curve on the line of the Canadian Northern Railway as a tie.

Each assistant has to build up a series of triangles and fill them with transverses or plane table work, or with both. He records the stand of timber in the four classes already mentioned and sketches in all burnt areas, showing the approximate age of the second growth on them. At the same time he has to keep a special look out for land suitable for agriculture, which is to be reported to headquarters without delay.

What the Maps Show

His map shows all rivers, lakes, roads and trails, and is supported by notes on species of trees, climate, logging facilities, water powers and anything else which is likely to be useful at headquarters. In addition, each party is provided with a camera, so as to be able to illustrate his report with photographs.

It is intended that the maps shall be on a scale of two inches to the mile, so that no feature covering an area of forty acres need be missed.

The protection of watersheds by the erection of forest reserves at strategic points is a very important matter, and the men in the field have been instructed to pay particular attention to it. They have also to report what they consider suitable lines for trails and telephones and suitable lookout stations for fire preventive work.

Qualified Men Scarce

The Forest Service of British Columbia is only about three months old, and qualified men are very hard to get for it. In consequence work has begun very late this year, but the short time left to us is not being wasted, and we are confident of completing our preliminary reconnaissance by the end of 1915. The chief difficulty I foresee is that as the country gets organized and divided into districts the greater number of my reconnaissance men will be turned in-

to supervisors and enough recruits will not be forthcoming to take their places, a fact that the young men of this country who are looking for an outdoor life should take careful note of. I may add for their benefit that not only is forestry a good open air life but is the most fascinating study that I can imagine.

It must be borne in mind that this is not an ordnance or geodetic survey and that inaccuracies are bound to creep in owing to the rough methods employed, but, in view of the fact that at present we have no information whatever on record, it is absolutely essential to us.

In every other country that has carried out a reconnaissance of its forests there has been some system of surveys on which to base the work over the greater part of the area, but British Columbia being a new country the difficulties are immensely increased, and there is nothing for it but to tackle the work and conquer the difficulties as they arise.

Effect of Timber Values on Operations

Forest Trees the Cheapest of All Crops in United States Even at Present Prices—Interesting Consideration of an All-Important Question

By Robert Fullerton*

The value and importance we attach to natural resources is based on the abundance and not on the time or labor cost required in their production or reproduction. The one time supposed limitless area of virgin forest lands in the United States seeded by Mother Nature with no human aid and maturing for centuries on the unexplored, untaxed public domain, was considered of little or no value; a sort of elemental inheritance like water and sunshine, often looked upon as an obstructing, expensive embargo in the civilizing progress of the pioneer homesteader when clearing his land for the cultivation and production of necessary food crops. Some modern industrial critics with little knowledge of early pioneer times, or lacking capacity to rightly understand conditions confronting the homesteader and the lumberman in their strenuous efforts to make a living in the wilderness outposts of civilization, accuse these hard working nation builders of thoughtless predatory vandalism and wanton wastefulness of an indispensable natural resource. Going back to colonial times, the abundance of growing timber in New England was often considered a nuisance; a troublesome hardship to be cut down and burned up to clear the land for farming purposes.

A forest of giant oaks or towering pines is a beautiful sight and fills the eye with delight. But our forefathers, while appreciating the beauty and value of their forest resources, could not subsist on the diet of acorns, and pine cones, and the obstructing forest trees had to surrender their first lien to the soil and the sunshine to make room for some food producing crop. The American oak had to make way for the Irish potato and the pine and the spruce were deadened and destroyed that corn and wheat might grow. Our forefathers slaughtered their forest trees that mankind might live; a survival of the fittest, that calls for no apology from the generations that preceded us.

The first settlers in this country were poor and proverbial for economy; they wasted nothing that seemed to them of value; they came from countries where timber was scarce and highly prized; to cut magnificent groves of pine and oak trees that had been maturing for centuries, and consign their splendid lumber-making trunks to the flames, must have occasioned a feeling akin to sacrilege in the minds of Puritan pioneer homesteaders. No settler at any time ever cut down valuable timber from a spirit of pure rapacity, and no lumberman ever permitted a single log to rot in the woods, if there was any visible or prospective profit in hauling such logs to his mill and converting them into lumber.

This statement does not imply that farmers have not destroyed and wasted much valuable timber, and that lumbermen have not left millions of logs in the woods to rot and burn up, but in every instance where a farmer destroyed obstructing timber, it was done from absolute necessity, and the lumbermen left low grade logs to waste in the woods rather than involve himself and his associates in bankruptcy, as the market price obtainable for lumber made from such logs, was less than the labor cost of its production. Lumbermen who own and operate saw mills are more interested in saving and utilizing their forest resources than any altrustic politicians demanding legislation to compel the American people to practice economy and avoid waste in the management of their business.

When the individual becomes the owner of any resource, it requires no legislation to compel him to take care of his own. Zealous but impractical advocates of conservation, newspaper and magazine muckrackers, political demagogues and insurgent office-seekers, have in late years joined in a chorus of indignation and condemnation of American lumbermen as predatory robber barons, united in law-defying combinations, branded as undesirable citizens, public enemies wasting and exploiting the people's inheritance of forest resources. Consumers of forest products, childlike in their requirements, want to eat their cake and have it too; demanding cheap lumber which means the rapid slaughter of our lumber-making forest trees. Any concerted limitation of the production of lumber to correspond with the demand is looked upon as a crime, a violation of the Sherman anti-conservation law. The cheapest commodity in the United States to-day is forest trees, suitable for saw logs, the present price of stumpage, whether it be hard wood or soft wood, is only a fraction of what it would cost if the trees had to be grown like any other soil crop.

Twenty-five or thirty years ago, forest trees in this country had only a nominal value and lumber prices were based on the cost of bringing the logs from the woods to the mill and converting them into lumber, the value of the raw material or stumpage being only a few cents per thousand feet. Under such conditions only the large mature trees easily accessible and of good quality were harvested by lumbermen and all inferior or defective logs were left in the woods to rot or add fuel to recurring forest fires. Good lumber was so cheap that low grades could not be sold for the cost of production and freight charges to points of consumption.

The need or importance of conserving our forest resources received little thought or consideration. Timber lands were cheap and abundant. The magnificent forests of the Pacific Coast States were just being explored, cruised and estimated, revealing a supposed limitless supply of the finest lumber-making trees in the world. The yellow pine of the Southern States was first beginning to attract the attention of northern lumbermen whose stumpage holdings in the white pine forests of Michigan, Wisconsin and Minnesota began to show signs of exhaustion, and a corresponding enhancement in stumpage values. The development of these new forest resources kept lumber cheap. Select timber lands selling at two to five dollars an acre, yielding ten to twenty thousand feet to the acre, made a choice pine or oak tree scaling one thousand feet worth less than fifty cents.

Contrast the nominal value placed on this superb forest tree that had been growing and maturing for a hundred or two hundred years, surviving the hazard of devastating cyclones, insect ravages and destructive forest fires, with the cost of such a tree, if planted by the hands of human foresters, the land on which it grew progressively taxed for a hundred years, the capital invested in the forest farm doubling itself every ten years through interest and taxes compounded. Suppose our forest resources were exhausted and the American farmer, forester or lumberman should undertake to grow forest trees for profit, assuming that lands suitable for forest growth could be obtained for $5.00 an acre and, allowing $3.00 an acre for planting and protecting the young trees from fire, he would start with an investment of $8.00 an acre, the first year. In ten years his investment has doubled by the addition of annual taxes and interest charges compounded. At the end of ten years his investment is $16.00 an acre. Continuing this calculation, at the end of seventy years, the sons and grandsons of the original planters would find their inherited holdings in growing timber representing an investment of $1,000.00 an acre; and, suppose the forest crop has now reached sufficient maturity to be manufactured into lumber, having escaped the hazard of fires and cyclones and yielding 20,000 feet of merchantable logs to the acre, we find a stumpage cost of $50.00 a thousand for immature timber grown to order in contrast with a present average stumpage price of $5.00 per thousand now obtained for giant forest trees that have been seeded and matured in Nature's forests since Columbus discovered America.

The above figures reveal the low estimate we place on a natural resource that is fast being exhausted. The consumers of lumber complain at any advance in its price and saw mill owners confronted with annually increasing taxes on their reserves of standing timber, cannot limit their operations. Their stumpage must be cut into lumber and sold at competitive prices to pay taxes, deferred interest and principal on his bonded raw material. Not one lumber manufacturer in a hundred can afford to conserve his forest resources by cutting only the mature trees which would double the cost of log-

*Reprinted from American Forestry.

ging operations, making his product thus obtained so expensive that no profit would result.

Stumpage values in recent years have steadily increased in value, but even at present prices, forest trees are the cheapest crop that grows out of the ground; cheaper than cotton at two cents a pound or corn at five cents a bushel. Suppose wheat or corn were century plants like pine and oak trees; it would require an adding machine to compute the price of a loaf of bread.

The American people do not realize or fully appreciate the splendid quality and low price at which they have been buying their forest products, demanding clear or high grade lumber for many purposes, when lower grades would economically have served their purpose. Extreme cheapness in any commodity always results in waste and improvidence in its use.

Fifty years ago our western plains were stocked with great herds of buffalo, a nature product, common property, roaming the prairies unowned, costing no man anything for sheltering, care or pasturage, tempting the cupidity of reckless pot hunters to proceed to their wholesale slaughter, the hide and tongue being the only parts of this valuable animal resource of sufficient value to be profitably transported and sold in competition and substitution of domestic products for a like use. It is hardly believable by the present generation that fifty years ago a full grown buffalo, in prime condition, weighing one thousand pounds, had a less market value than a single porterhouse steak served to-day in any first-class hotel or restaurant.

There is no immediate danger of a serious shortage in our supply of lumber products, but the time has come when conservation of our forest resources demands thoughtful consideration. The National forest reserves should be withdrawn from sale and held in cold storage just as long as privately owned stumpage is cheap and abundant. The present sawmill owners are financially unable to pracice effective conservation of their stumpage holdings. Increasing annual taxation of forest lands, and the exceptional nature of lumbering operations, requiring the purchase of extensive timber holdings to provide raw material sufficient to keep their saw mills supplied with logs long enough to justify the investment in building and equipping a modern plant to manufacture lumber, necessitating the owners of saw mills to borrow large sums of money, or bond their reserves of standing timber.

The pressing interest charges, added to the increasing annual taxes on his stumpage holdings, force the continuous operation of the saw mill, and the sale of the product at whatever the market price may be, to furnish means to pay his imperative obligations. This is not a theory but a condition governing the lumber industry, making conservation of privately owned forests impracticable except in rare cases where ample capital enables the operator to cut only the mature trees, preserving and protecting the younger growth, hoping that advancing prices of stumpage will repay him for present loss through his more expensive logging operations.

Human nature shows very little change since the days of Solomon; self interest in large measure still controls our actions. Conservation of our privately owned forest resources will never become effective until there is a present or prospective profit in practicing conservation. Our National forest reserves, now under legislative control and administration, should be supplemented by the several State governments, as only the Nation or the State can afford to hold forest lands in reservation. The cost of protection and reforestation being borne by all the people, forest lands now held by the State or the Nation should be withdrawn from sale, protected against fire and reserved for future use, following the wise providence of the rulers of Egypt, who in years of plenty stored up their corn against the time of scarcity or famine.

Canada's Trade in Paper

The imports into Canada during the five months ending August of the present year had a value of $3,280,051. During the same period of last year the value was $2,462,696. The United States continues to be the principal source of supply, and the imports from that country for the period of this year, covering which statistics have just been issued by the Department of Trade and Commerce, totalled $2,250,969, and those from Great Britain $712,165.

The exports of wood blocks for pulp, toward the prevention of which, by means of a prohibitive export duty, advances have recently been made to the Canadian Government, increased from $2,568,352 to $2,950,505, the United States providing a market for all the pulp wood shipped from the country. The same country took wood pulp from Canada amounting to $1,650,941 out of a total of $1.950,516 exported during the period. The value that went to Great Britain was $287,937. Last year's total for the period was $1,902,950.

Paper exports also increased substantially, the value for the five months of last year being $1,414,648, as compared with $1,786,067 this year. To the United States the exports during the period of this year covered by the figures amounted to $1,066,000.

Ontario's Forestry Commissioner

Prof. E. J. Zavitz
Ontario Commissioner of Forestry

Prof. E. J. Zavitz, of the Guelph Agricultural College, has been appointed Forestry Commissioner for Ontario, a new position in connection with the Department of Lands, Forests and Mines. In his new office Professor Zavitz will advise the department with regard to all matters of cutting. No lumbering operations will in future be allowed without his recommendation. He will see to the destruction of debris and slash from lumbering, and will also deal with re-forestation and conservation on a general scale. The principal work of Professor Zavitz heretofore has been in connection with the re-forestation scheme in Norfolk County, where some 1,500 acres of waste land are being reclaimed. Considerable reorganization will immediately be carried out, at the conclusion of which the Government will extend the work of reclaiming waste areas.

As provincial forester, Prof. Zavitz will be connected with the Department of Lands, Forests and Mines. While reforestation on the waste lands of old Ontario will, of course, be made a part of the government's forestry policy, it is likely that for a time Prof. Zavitz will give particular attention to Northern Ontario.

Until other arrangements are made Prof. Zavitz will continue his lectures at the Ontario Agricultural College and his supervision of the Norfolk reforesting station. It is probable that in the organization of the work the Norfolk station will be turned over by the department of agriculture to the new branch of the service.

Good Times Ahead for Lumbermen

Alexander Maclaren, Buckingham, P.Q., who is largely interested in lumbering operations in British Columbia, as well as in Quebec Province, and who is on a visit to British Columbia, gives it as his opinion that the lumber trade of British Columbia may expect a big building year in 1913. In fact he believes that this will apply pretty generally to the whole of Canada.

"I make this prediction because of the crops," he said. "As everyone pretty well knows by this time, this year's harvest has been a very good one, and in this country crops are everything.

"An additional element going to insure a prosperous year in lumber here, is that the same condition as to crops obtains this season in the United States. When crops are not quite up to the mark in the States, the lumbermen there dump their products into Canada. This time, however, their home prosperity will take up their yield, and leave the Canadian lumbermen to handle the Dominion demand, unmolested.

"It is especially gratifying to look forward to a good building year, because business, for a short while past, has been somewhat quiet. With plenty of money at his command, however, the farmer has means with which to improve his place, and put up houses and barns, and to invest in real estate. That has been the invariable history in Canada, and will be repeated next year."

Sudden Death of C. W. Leonard

Mr. Charles Weston Leonard, of the firm of E. Leonard & Sons, London, Ont., manufacturers of engines and boilers, died suddenly on November 22nd. Mr. Leonard had been enjoying his usual good health and had attended to his business at the office on the day previous. He retired that night in apparently good health, but death came at an early hour in the morning. Mr. Leonard was the third son of the late Hon. Elijah Leonard and had lived all his life in London. After attending school at London and at Upper Canada College, Toronto, he became a partner in the business of E. Leonard & Sons in 1873. He is survived by his wife, one daughter, two sisters and one brother, Mr. Frank E. Leonard, of the same firm. Mr. C. W. Leonard was well known to lumber manufacturers in all parts of Canada.

Personal News of Interest to Lumbermen

An Enterprising New Ottawa Concern

The firm of D. G. Gilmour & Co. of Ottawa, have recently taken over the lumber and pulpwood interests formerly operated by Mr. D. G. Gilmour of that city, including the large new saw mill at Kazabazua, Quebec. Just at the incorporation of this company the mill was completed destroyed by fire, but with the aggressiveness which has characterized both members of this firm in their past connection with the lumber business, preparations were at once made for rebuilding and they have now completed at Kazabazua one of the most modern mills in that section of the country.

Mr. D. G. Gilmour is a son of the late John Gilmour who was one of the most successful lumbermen in Eastern Canada, building up the extensive business now carried on by Gilmour & Hughson of Hull, Que., of which Mr. D. G. Gilmour is now vice-president. Besides his connection with this firm Mr. Gilmour was interested in several other lumber operations in the Ottawa Valley.

Mr. John A. Belford, his partner, is equally well known in the Ottawa Valley. Prior to joining forces with Mr. Gilmour he was for sixteen years connected with the firm of W. C. Edwards & Co., Ltd., of Ottawa, rising in the ranks steadily until he became office manager of that large concern.

Ottawa has been and is the headquarters of some of the largest

D. G. Gilmour, Ottawa

John A. Bedford, Ottawa

and most successful lumbering interests in the Dominion and the many friends of the new company predict an equally successful career for D. G. Gilmour & Co., and wish them every success in their new venture in which the Canada Lumberman heartily joins.

W. J. MacBeth, of the Parry Sound Lumber Company, Toronto, and C. G. MacBeth, of the R. Laidlaw Lumber Company, Toronto, recently made a two weeks' business visit to New Brunswick. They purchased a quantity of New Brunswick pine and spruce for their respective firms and report that they are able to dispose of the stock to considerable advantage. They also report that the manufacturers in New Brunswick are turning more extensively to the markets of Ontario and the Eastern States on account of the high freight rates prevailing for ocean shipments.

Two years ago George Barbey, a French capitalist largely interested in the West, bought thirteen timber limits on Howe Sound for $300,000, on the representation that they held 300,000,000 feet of timber. A more recent cruise places the figure at 50,000,000 feet, and now he is suing to have the agreement of sale set aside, or in the alternative damages to the extent of $350,000. The defendants are J. B. Marquette, original owner of the limits; J. G. and J. D. Allan, who held an option and sold to Mr. Barbey; Ed. Francis, Mr. Barbey's agent; Louis Alexander, a broker associated with Mr. Francis, and J. A. Judy, who cruised the limits in Mr. Barbey's interests.

Mr. James M. Scott of Fredericton, N.B., has purchased a portable mill from Alexander Watson, of St. John, and plans to operate it on the St. John river about eight miles below Woodstock. Work has been begun on the erection of the mill building near Woodstock, and Mr. Scott will manufacture laths and ties during the winter.

New Chief of Forest Survey Inspection

Mr. H. Claughton-Wallin

Mr. H. Claughton-Wallin has been appointed to take charge of the inspection of forest surveys under the Forestry Branch of the Department of the Interior. Mr. Wallin is a native of Sweden and took his forestry course in that country at the Royal Forest Institute at Stockholm, from which he graduated in 1902. He was first employed supervising logging operations in Sweden, and then decided to try his fortunes in Canada. On his arrival here he was employed for a short time in the engineering department of the Canadian Pacific Railway and later entered the Forest Service of the Dominion. He did nursery work and forestry survey work during several years for the Forestry Branch, and then returned to Sweden for two years to make a further study of Swedish methods. On his return from Sweden he was again employed in the service of the Dominion on various forest surveys, particularly in the province of British Columbia. The reports and maps of forest surveys which were submitted by him proved so thoroughly satisfactory that it was decided to transfer him to Ottawa in general charge of the development of the forest service work which is so important a division of the work of the Forestry Branch.

The forest survey division will have charge of the laying out of methods of survey on the forest lands of the Dominion, the preparing of the instructions for such surveys and the working out of efficient equipment for survey parties, and the methods of mapping and compiling data to be employed. The surveys will include exploratory surveys to determine where the tracts of timber and of non-agricultural lands, including forest reserves, are located; timber surveys to ascertain the quantities and condition of the timber on special tracts, and the methods of mapping the results of surveys. For this purpose a general map legend has been worked out carefully, and it is hoped that it will be generally adopted for forest mapping throughout the Dominion.

Sweden is of all countries in Europe perhaps the one which most nearly approaches Canada in forest conditions, and the experience gained by a training in Sweden will be exceedingly useful in Canada. Sweden took up the question of forest surveys some sixty years ago and has improved its methods very much, but as compared with the methods employed in Germany they are not so far advanced and therefore the methods employed there can be more readily employed or adapted to Canadian conditions. The Royal Forest Institute of Stockholm requires a very thorough course in forestry. The entrance to the Institute is by competitive examination, and as not more than twenty or thirty students are accepted each year, while there are usually applications from one hundred to two hundred, it will be seen that the requirements for the course in this Institute are very high.

The Thurston Flavelle Lumber Company, Ltd., Port Moody, B. C., successors to the Emerson Lumber Company, Ltd., intend to push the sale of their cedar products in Ontario, and to this end have appointed the Gull River Lumber Company, Ltd., with head office at Lindsay, Ont., their representatives for the province. In addition to all classes of cedar lumber, the Thurston Flavelle Company manufacture a high grade red cedar shingle which is in strong demand on the prairies and throughout Ontario.

W. J. MacBeth, of the Parry Sound Lumber Company, Toronto, who is well known to the lumber trade of Eastern Canada as one of the most successful and genial travellers on the road, is a candidate for election to the Commercial Travellers' Board. There is a field of 14 candidates, from whom 9 are to be selected. Ballot papers will be sent out soon and it is to be hoped that readers of the Canada Lumberman who have a vote will do their best to see that he is elected to represent them on that important body.

R. E. Edwards, Vice-president and General Manager of the Wolverine Cedar and Lumber Company, Little Current, Ont., was in Toronto on a business visit recently.

THE WOODWORKER

Making a Wooden Cone Pulley

If one desires to construct a cheap cone pulley, let him take a board of 2-in. dressed stuff, and on this, with a compass, mark out the different sized circles he needs. After sawing these out with the band saw, let him glue and nail one piece upon the other, making one solid chunk. Through the center of this let a hole be bored just large enough to allow the spindle to be driven in tightly. Placed in the lathe on this spindle, the whole thing may be finished off in a jiffy, to the required dimensions, without further ado, actually ready for immediate use.

But this hastily-put-together product, after all, is a poor excuse for a real cone pulley. Built of solid blocks, these will be more or less subject to shrinkage, while the chances are that one or more will split in course of time. There is really nothing to prevent these undesirable results in a pulley thus shabbily and hurriedly thrown together. Every once in a while it will need retouching to avoid a wobbling motion of the belt or uneven running of the machine, two extremely objectionable features in any kind of a pulley.

Now, to build a real strong, serviceable cone pulley, such as will last a lifetime, if need be, an entirely different plan from the foregoing must be adopted. In this instance, the pulley will need to

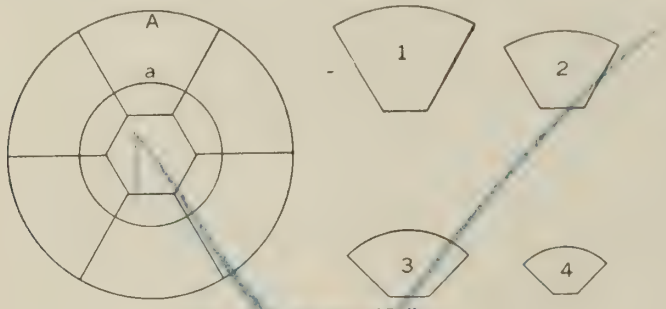


Fig. 1—Construction of Pulley.

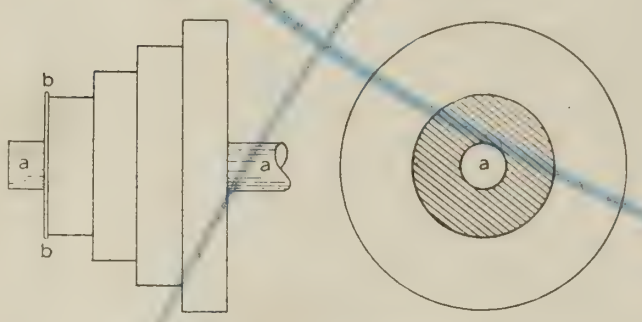

Fig. 2—The Finished Pulley.

be built up gradually, on a regular raceplate, and of thin material. In fact, each step should consist of no less than three separate layers of segments, each course, in turn, being firmly glued and nailed onto the other.

To be sure, this work is slow, tedious and runs away with considerable time, but when done the result will more than repay all extra trouble. An article will be produced at once solid and unshrinkable, destined to stand the wear and tear of many years of hard usage.

Fig. 1 will help to give the reader a clear idea of the work of construction, showing, as it does, the largest sized step in the pulley. As will be seen, this consists of six segments, ¾-in. in thickness in this case, and each corresponding in size to 1. Of these segments, there are three courses in each step. In the same way also are built the smaller steps, consisting of segments tallying with 2, 3 and 4, only in the case of 3 and 4 the number of segments is four instead of six. Each one is fitted snugly to its place and fastened on with glue and nails. Thus the process continues until the whole structure is completed.

Of course, at this stage of the work the pulley still remains in a rough, unfinished condition, and needs smoothing off and turning down to its proper size and shape. In order to do this, a recess 3/16 in. deep is turned in the surface of A, as shown by circle a. In this a thin brass plate is inserted, flush with the face, and firmly screwed to the wood. In the center of this plate, as indicated in Fig. 2, a, a hole 1½ in. in diameter is bored for the insertion of a spindle.

On the small side of the pulley, Fig. 2, b b, another thin brass plate is screwed on, with this difference, however, that in this latter case the recess of ⅛-in. is in the plate to allow it to slip over the small end. This also is screwed on, and contains a center hole corresponding in size to the one in the other plate. The next step, of course, is to drive in the spindle, care being taken to fasten the pulley firmly upon it at the point desired. With all these details attended to, the whole thing can then be placed in the lathe to undergo the finishing touches, a matter that need consume only an hour or two.

When the turning is done it is always advisable to give the whole surface at least two coats of shellac varnish, both for the sake of improving its appearance and protecting it from the harmful effect of the atmosphere.

As to the kind of material advisable to use in a job of this description, it may be said that ordinary pine will answer very well, in case one can afford nothing better. But if a person desires an article that will stand the wear and tear of long years of service, and give him no trouble to keep in good order, he should by all means use mahogany, because there seems to be no wearing out of this wood.

I know of a mahogany cone pulley that has been in constant use on a lathe for a period of over forty years, and is so well preserved to-day that it looks as if in condition to last that of time again, if not longer. It is just as strong and runs just as true to-day as when first placed on the machine. It has never given the owner a bit of trouble. So, for a strong, lasting, serviceable cone pulley, there is no material comparable to mahogany.

Fig. 2 is designed mainly to show the finished article, with the brass plates and spindle inserted in their respective places.—The Woodworker, Indianapolis.

Planing Mill Management

By N. J. Millette

Part III

The foreman in a woodworking plant could fittingly be termed the manager's right hand. He is the man who delivers the orders, recommendations, rules and criticisms of the manager. The men's interest in the factory's welfare will be good or bad, according to the foreman's comment (unless there be something radically wrong). If the men are not in touch with the situation as it exists the foreman is the one to look to for an explanation.

One word of the foreman can counteract a whole speech from the manager, and unless the foreman is loyal, faithful and true, it is unreasonable to expect a loyal disposition on the part of the men. Therefore the manager should cultivate the foreman. He should understand clearly the foreman's disposition and ability and should be able to depend on his carrying out to the extent of his power all his duties. In this way the manager will be able to stand by all his orders and comments, and if the men know that the foreman's decision will not be changed, it will cut short many discussions.

On the other hand the foreman should not take any important action unless it is in accord with the factory rules, and all his actions should be directed with these rules in view. If the men can see in the foreman's conduct, a true and faithful administration, his task will be easy in handling the men. The foreman's loyalty has so much effect upon the men that he will have little necessity to enforce his authority by speech if his actions are right. If he uses the factory's influence to carry out a personal idea regarding some employee over whom he has lost part of his control, and then gets him turned down by the manager his authority is defeated. It is impossible to regain lost power.

Look After the Little Details

A common fault which we all possess more or less is that of neglecting minor details. A person often looks for a more responsible job, at the same time feeling the annoyance of the small details of his present occupation and neglects them. This is the greatest mistake that a man can make. He might believe that a "big job" involves fewer small things to look after, and that is where the man makes a mistake. Every job has its little details, and unless they are all attended to, and on time, they will make trouble, as a little thing deliberately overlooked will affect a man's credit more than the value of the neglected item.

If the writer could have a word of warning to address he would say, take good cars of the small details of your present occupation and a better situation may come to you sooner than you will really feel prepared for it.

If the situation you are holding is not worth your entire attention and ability, drop it. Get to work where you will be able to devote all your talent and attention for your employer and be confident that it will turn sooner or later for your own benefit.

Protecting the Employees

Planing mills are often the scene of serious accidents. Frequently a man will be crippled. The majority of these cases are due to neglect of the operator personally, but many of these can be avoided by the vigilance of the foreman. It is his duty to follow the operations and insist on having the men work in such a way as to protect themselves. Each factory has its own peculiar machines and its particular points about the manufacture of stock, as well as the methods of operating. The foreman is supposed to be familiar with these details. The stranger (even if he is an experienced man) may feel a little uneasy and take a poor method of doing his work and run the risk of an accident. Constant vigilance of the foreman can do more good for the men than any form of education, to render planing mills as safe for the employees as any other branch of the industry.

A Successful Combination

I have been for about two years taking care of a combination rip and resaw, and never handled a better mill for the size. The wheels are 3-in. face and we run 4-in. saws on them, and can give a good man all he wants to do to take away the lumber. The wheels are crowning, and I am never troubled with cracks. There is not much room for a 4-in. saw to go either back or forward without striking iron, but we only watch it closely until the saw wears down some. Of course, that takes some time, for I don't believe in doing as some filers do, put the saw on the grinder and let it grind for an hour or more. I grind once around on the face and back, then take it off the face and go over the back once, and it is as sharp as it can be made. What is the use of doing more? It only wears out saws and emery wheels. Of course, when I swage I have to go over them oftener, as you have to get the steel from somewhere, to spread out. I have my swage turn the point down, so I don't have to grind off the face much —never more than twice around. Then, when I have to get a very strong corner for hardwood, the balance has to come off the back, and that keeps the teeth from getting hollow backs.

There is a cast iron piece that goes on this mill that takes the place of the boards a former correspondent spoke of clamping on behind the rolls. We saw some lumber so crooked I don't see how the saw follows the crooks. So you see there is one combination that is a good one, at least.

As to a short-log mill, I think a better way than having long and short saws is to have the top guide come off and give room for a large log. You need not be afraid to take it off if your saws are running right. In a Wisconsin mill the sawyer run the log against the upper guide and broke it off. All thought we would have to shut down, but I told them to go ahead and try. We ran two weeks without the upper guide, and made good lumber, until the new pieces came. I had a notion to not put them on, but the sawyer thought he could push a little harder, so I put on the guide.

There are mills that have removable upper guides and the arm can be run up close to the upper wheel. I was taking care of a mill in North Carolina where we had a good many very large poplar logs, and the upper guide would not go up near the upper wheel—not within 8-in. They used to chop a place for the guide the whole length of the log, and sometimes had to do so on two sides of the log. Of course, the mill was idle while they were chopping. Once a chip flew under the saw as it went over the top wheel and cracked the saw about 3 inches. It certainly did snap when it went over. I wanted the foreman to have a piece cast that would raise the guide 8 inches, but he never did, but kept on chopping.—D. J. Wood.

Communications—A New One

Here is a new one for the boys to chew the rag about. One of our most successful filers claims that a band saw will do better work, and stand the greatest feed, if it oscillates. If his saws come "true" from the shop, he puts the oscillation into them. He has no fixed rule as to the extent of this movement edgewise, but his saws all look to run about the same, and, measuring the movement by the eye, I would think they oscillate from ⅛-in. to ¼-in.

We all know—that is, every filer or sawyer that wants to know "why"—that the oscillation is put into the gang saw to clear the teeth on the upward stroke, especially where the feed is continuous. I have asked this filer if he can give me the theoretical reason for the better work of his oscillating saws, over that of the ones that run true edgewise, but he fails to give me an answer. He says he has them to oscillate because they do better and more work, and are less liable to dodge or snake when the feed is crowded.

Now, if he is correct in his method—and he claims he can demonstrate it in practice—I would be pleased to have some of the experts explain the why, or refute it, as the idea may look to them.

It is unpardonable for a filer to allow cracks in the back of a saw. I have a friend who is a filer (my apprentice twenty-two years ago), who says it is onto the filer to have cracks at any point in his saws. As a matter of fact he does not have any on his saws. Another filer of my acquaintance has a standing offer to me of $5 for every crack I can find in his log bands or resaw bands, and after five years of watching his saws I have the first money to yet collect from him. I have sold his employers all the saws they have used during this time (Disston's) for a 9-ft. band and a 6-ft. McDonough resaw. They cut principally oak and largely quartered, and their annual cut is about 10,000,000 feet, with a two or three months' vacation in midsummer.

Now, boys, speaking of cracks, take a crack at the oscillating idea. Some of you older fellows may remember that I once wrote an article entitled, "Why Band Saws Crack." I now wish to amend the reasons I gave, by saying "because they don't crack if properly handled"—supposing, of course, they are the right brand to start with.—J. D. in the Wood-Worker, Indianapolis.

Jointing—Resaw Trouble

Keeping a round saw round without jointing may be possible, but when a few teeth only get dull, then a little jointing will make the saw round, because the saw will not get dull in one place and then another if it is round. What I mean is, a round saw that is round. For gang edger saws or saws for rough ripping, it is not necessary to joint them, for they can be filed so they will work all right, and keep fairly round, but if you want to keep an 18-gauge 18 or 20-in. resaw round, a little jointing will do it good. I say a little. Do not joint except when necessary, and then lightly. When a few teeth only get dull, the round saw is not round.

In an automobile body shop there was a small band resaw using a 3-in. saw. It was a machine in which the feed rolls would swing back out of the way and they could use a narrow saw for scroll work. They had been having trouble, and got some new saws, but the first one tried would not go. I had seen this machine before and noticed the trouble, so I told the filer what I would do.

This saw would run all right at top and bottom of the cut, and run clear out in the middle of a board 20 inches wide by 1 inch thick, in resawing it ½ inch thick. The straining device had weights for each width of saw, but when they put on the resaw the weight was not enough. They thought it was because the bottom boxes would get hot. As I had told him to put on the weight, he did, and the boxes melted out. He rebabbitted them, lined the roller up perfectly with the saw, filed the saw—for it was poorly filed, although it had just come from the factory—and the saw has done perfect work since.

The trouble was; not enough weight on the straining lever, the saw was not filed square, and the swage was too heavy on one side.

—S. W. McLean.

Cost Finding—Its Importance to Success

By G. E. Collins

In recent years, the question of cost accounting has become an absolute necessity; both large and small corporations are realizing its importance.

In the pioneer days of lumbering the main object of the lumberman was to turn his product into money and his profits were represented by what was left of this medium at the end of the year. Prices were based on what the buyer would pay and the manufacturer peddled his product without regard to its cost; indeed he had no idea of the cost. Land and timber rights were bought for a song, and were not counted at all in the estimate of the value of the lumber.

How envious must the modern lumber manufacturer be of his pioneer predecessors; not envious of their partial success, but rather of their opportunities. The great forests of these former days are now practically denuded and the farms and stumps are all that are left to conjure up the dreams of what might have been. But the history of all human endeavor teaches us that the "what might have been" in the past can be and may be in the present, if we will profit by the two great elements of success, the experience of the past and the improvements of the present. These two factors judiciously combined will surely make the triumph of the future.

The practically free stumpage of the past has melted into the past; cheap labor and cheap living of former days have disappeared and will not return; cheap, unclassified transportation charges and run-of-the-log sales are ancient history, and thus it would seem that the opportunities for profit in the lumber business have gone with these conditions. Let us see if this is true—timber rights to-day cost money, big money, but modern methods of accounting can determine almost to exactness how much per thousand feet that cost is.

Modern logging, while entailing a large initial investment, gets results; and a proper system of operating expense will tell you, when the logs are in your mill pool, just what it has cost to put them there. Modern labor is more costly than that of bygone days, but the advent of modern machinery and the constantly developing efficiency of labor

are productive of results that probably offset the increased wage. Transportation charges are definite and the modern band saw provides for accuracy in weights. Lumber is sold to-day in grades that are so uniform as to allow an exact grading at the mill, and it is not difficult to arrive at the result of the run-of-the-log.

Probably a more important consideration than all these is the fact that prices are now fixed; not that this fact supposes a trust, but it is nevertheless a fact that manufactured lumber has now a definite value in contrast to the old method of peddling in the market, and the manufacturer knows just what he can get for his product.

Now, by comparison of conditions, the lumberman of to-day is better equipped to make real profits and know what they are, than was his pioneer predecessor, if he takes advantage of modern methods. He must needs know:

The actual cost of his timber on the stump, irrespective of future land value of the fee, if he owns it.

The cost of cutting and delivering the logs always keeping in mind the cost of the logging plant, its depreciation and future value when the tract is cut.

The cost of manufacturing and piling from the pond to the sticks, always keeping in mind the depreciation of machinery and buildings.

The cost of shipping and the cost of selling. Finally, the products' share of the overhead and executive cost.

These figures are indispensable to the manufacturer in managing the mechanical end of the business efficiently.

The successful operator to-day is he who maintains a balance of profit among a complexity of receipts and expenses. The delicacy of the balance demands an accurate and minute knowledge of costs in every department of production. Without it there can be little efficiency—or little success. For under present-day conditions efficiency means success.

Of Course it Paid

I have always been an advocate of close kerf and keen cutting corners, but am surprised how recklessly timber is cut at this late day. Some years ago a careful test was made in a large white pine mill, by running 16-gauge saws on one mill, set 1⅛-in. to get a 1-in. board, while the other two mills used 14-gauge saws, set 13/16-in. for a 1-in. board. The cut dropped 5,000 feet a day, log scale, for the whole mill, but it was found that the overrun in lumber was more than sufficient to pay for the experiment, so the 14-gauge saws were sent to the factory and ground down to 16-gauge for the next season's run. The result proved very satisfactory, although the cost of sawing was raised 9c per 1,000 feet log scale, but they claimed they had five per cent. more merchantable lumber in the yard, out of the same class of logs. It ought not to take a good lumberman long to figure out a handsome profit on that.

Did I work in that mill? Well, yes. I filed saws there for some three years. Our foreman had a way of his own to manage things. For instance, he said: "Now boys, I want each of you to file for one band mill. I will give you each a complete outfit, and then see who can put up the best figures at the head of the log slide." It kept us hustling, but I managed to keep near the top. I didn't take chances on saws, either. Every tooth had to be fitted as nearly perfect as possible. No guesswork about the gauge of swage, either. Hardly ever did I put a saw on the mill more than twice before looking the tension over on the bench. You ask, did it pay? Well, the firm must have thought it did, else it would not have been so anxious to continue such work.—J. F. P.

Business Booming in the West

Mr. M. Walters, of H. Walters & Sons, Limited, Hull, P.Q., manufacturers of saws, axes, axe handles, lumbering and logging tools, machine knives, etc., returned recently from an extended trip to the Pacific Coast in the interests of his firm. Mr. Walters reports that the prospects for business in western Canada are most encouraging and he is enthusiastic over the opportunities for increasing the trade of his own firm in the West. As a result of Mr. Walter's trip, the firm have decided to cater strongly for western business. They anticipate doubling the capacity of their present plant in the near future so as to be able to take care of their rapidly increasing business.

Sash and Door Association Meeting

A meeting of the Ontario Sash and Door Association will be held at the King Edward Hotel, Toronto, on Friday, December 13th, at 11.30 a.m. At the last meeting, which was reported in our issue of November 15th, some very important points were brought up for the consideration of the members. A report will no doubt be forthcoming from the Committee which was appointed to go into the question of the importation of United States doors into Canada, and it is hoped that all who are interested in this subject will make a special effort to be present at the meeting on December 13th.

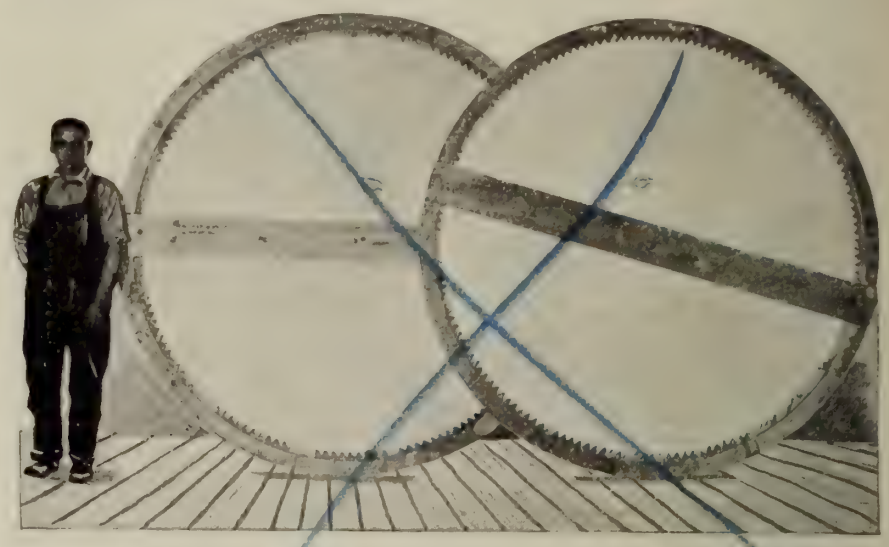
An Up-to-Date B.C. Shingle Mill

One of the most modern and up-to-date shingle mills ever erected in British Columbia is now in process of construction at Ruskin, about 40 miles east of Vancouver. The Stoltz Manufacturing Co. is the name of the company putting up this modern plant. This company is comprised of Mr. James Sobey and Mr. Stoltz. Mr. Sobey is a practical shingle manufacturer and the new mill is being equipped with the very latest machinery for manufacturing high grade shingles.

In place of the old method of using drag saws for cutting up logs, this mill will run two 84-inch Simonds cut-off saws which are the largest cut-off saws ever used in this section of the country for making shingles.

Eight of the latest improved Schaake upright shingle machines are being installed, and Hanchett Automatic Sharpeners for automatically sharpening the large cut-off saws and the shingle saws are also being installed.

The company are sparing no expense in their efforts to make this the most modern shingle mill ever built in this territory.



84" Simonds Cut-off Saws installed in a B.C. Shingle Mill

The accompanying illustration shows two large 84-inch Simonds saws which are being furnished to this mill. It is probable that other mills will find it necessary to put in a similar equipment.

Protecting Forest Wealth of B. C.

Approximately $177,000 has been expended by the British Columbia government this year upon forest protection and the number of men permanently employed has been greater, while the number of fires has been smaller than usual. Mr. H. R. McMillan of Victoria, chief forester, has returned from Greenwood, where he inspected the work of the engineers surveying the tracts of land owned jointly by the province and F. Augustus Heinze. Loss from fire, on account of the newly organized system of forest protection and the wet summer, was very small compared with that in previous years.

"This annual loss we hope to reduce still further because it is on the timber wealth that much of the prosperity of British Columbia depends," said Mr. McMillan in an interview. "Danger of huge losses from fire to our forests is always great unless for the protection of the timber. In the Crow's Nest, for instance, one big blaze might sweep through the valley if it were not promptly controlled and the same thing applies to other parts of British Columbia."

Mr. McMillan while in the Boundary district, made a trip up the west fork of the Kettle river to the end of construction of the Kettle Valley railway at Carmi. He was greatly impressed by the agricultural possibilities of the district. The orchards, although young, showed a most promising growth, while the grain crop this year was so good that 35 bushels of wheat and 90 bushels of oats were grown to the acre, he said.

Word received in Montreal from the New York agents of the Wayagamack Pulp and Paper Company states that they can dispose of all the Kraft paper the company can deliver. The paper, it is added has made an immediate success on the New York market owing to its quality and high tensile strength. At present the mills at Three Rivers, P.Q., are turning out 50 tons of kraft paper per day.

The forestry students of Laval University recently held their third annual banquet at Victoria Hall, Quebec. Among those present were Sir Lomer Gouin, Premier; Hon. J. Allard, Minister of Lands and Forests; Dr. Dechene, Mr. P. E. Piche, Mr. P. Blouin and Prof. Marcil.

CAMP DEPARTMENT

Sanitation in the Logging Camp

It is most gratifying to notice the increased interest that the subject of sanitation is receiving and has received of late, especially as adapted to communities which must work out their own rules of healthful living. In most villages, towns and cities there are established boards of health which either give their time or are compensated for it and whose duties are to make regulations and see to the enforcement of them, to the end that these communities shall be protected against the ravages of distase or to take means to control it should it once gain a foothold. Of these health officials much is expected and demanded, for they are men who have been scientifically trained along the line of prevention and control of disease. But when we come to handling the camp situation we find a different set of conditions. One would hardly expect to go in the woods in a logging camp and find laboratories fitted up and equipped for work which comes under the head of medical science; nor would it be practical to establish such an institution, for the rules of sanitation have been well worked out, and if it is the desire of those in control to supply them the only thing necessary to do is to point out the way in which they may be applied economically and efficiently.

This subject deals with the laws of health and the rules for hygienic living and is worthy of the deepest consideration from both an economic and humanitarian standpoint; and efficient action upon the principles involved means much to both employer and employee in health and comfort.

It is now known that many of the diseases ordinarily encountered, and especially those which might be a source of danger to a community living as people must in camps, are produced by minute organisms of miscroscopic dimensions which are capable of being transferred from one person to another and producing the same condition in the one to whom they are transferred as in the one from whom they came. These small organisms multiply with remarkable rapidity and in a vary short time a large number of persons may become infected from the one source. And so it is that these organisms become potent factors in the life and health of communities, be they large or small.

Knowing then that we are in constant danger of being invaded by these bacteria through the medium of air, water supply, personal contact, and by insects of different kinds, the essential thing to know is the most effective way to prevent this threatened invasion either of our people or our communities. To this end much attention has been paid by investigators and carefully made rules laid down, with the result that sickness has decreased materially in places where large bodies of men are quartered, especially in the army; and when disease in epidemic form threatens it is controlled rapidly and effectively. As applied to camps these rules differ but little from those as applied to villages, towns or cities. There are certain fundamental principles involved that apply the world over, and if carefully observed and strictly enforced make for healthy communities.

Be careful of your selection of the camp site. It should not be located on a spot that has been recently used for the same purpose. The site should also be frequently changed in order to avoid the effects of soil pollution which might result from long continued occupation. The site should be selected with reference to several important particulars. The soil of the locality should be dry, sandy in character, and well drained. The site should also be so located as to afford a plentiful supply of pure and wholesome water. Too much stress can not be laid on this point. Low-lying, damp, or marshy localities should be avoided for obvious reasons.

The camp should be as compact as will be permissible with health and cleanliness. When tents are used, a trench at least 2½ inches in depth should be dug around each tent to exclude surface water; and this should lead, with the trenches from other tents, into a larger one so as to conduct the rain water from the camp ground. The camp should be laid out in streets and these should be cleaned regularly every day and all rubbish burned as promptly as possible. All kitchen refuse should be collected twice a day and removed from the camp grounds or buried in trenches dug for the purpose. The tents or houses should be aired every day, and all bedding should likewise be exposed to the air every day unless the weather prevents.

Water Supply

There should be an abundant supply of pure water for all purposes for which it is needed. When the wholesomeness of the water is doubtful some means of purification should be provided. For this the Forbes portable water sterilizer is now much used. This apparatus is in common use in army camps in the tropics, and good reports are made in regard to its efficiency in preventing the development of typhoid fever and diarrheal diseases. Provision should be made for ample opportunities for bathing. In the absence of bodies of water large enough for swimming shower baths at least should be supplied. Keeping the body clean is one of the greatest factors in the prevention of disease and the preservation of health.

The latrines should be situated at least from 400 to 600 feet to the leeward of the camp and not near the source of the water supply. A deep and narrow trench should be dug for the purpose. It must not be too wide or it will require more earth to cover the excreta. At least three times a day the excreta should be covered to a depth of from 6 to 9 inches with earth or slacked lime. The dry earth readily absorbs the putrifying material and thus renders it inoffensive. This will also protect it from flies and insects, and limit one source of general infection should there be unrecognized cases of typhoid fever in the camp. The excreta of all cases of typhoid fever and dysentery should be disinfected at once, and should never be thrown into the trenches without this precaution. The excreta in the trench may also be burned daily by pouring kerosene upon them and igniting it. New trenches should be dug when the old ones are filled to within 18 inches of the top, the old ones being completely filled with earth. The latrine should not be near the kitchen or mess-room, nor near the sleeping quarters.

Besides healthful sites, the essential conditions of sleeping quarters are dryness, warmth, light, amount of floor space and air supply. Each man should have at least 100 cubic feet of air space and 12 square feet of floor space. There should be more space allowed if the quarters are constantly occupied. This, of course, refers to quarters where many are living together, as in bunk houses.

Ventilation

In frame quarters ridge ventilation is entirely satisfactory, or it may be accomplished by means of double inlet and outlet tubes in the roof, so constructed that the fresh air enters through the outer tube and the vitiated air takes its exit through the inner tube. When an epidemic of tonsilitis occurs in camp, deficient ventilation may be suspected, and the accumulation of infective dust along with vitiated air is frequently the cause of tuberculosis and pneumonia.

Since flies and mosquitoes are frequent carriers of disease, they should be rigidly excluded from the quarters. They light upon all kinds of filth, and in this manner their bodies become infected and they no doubt carry the bacteria from place to place and contaminate whatever they light upon. During the summer months, therefore, all the doors and windows should be provided with screens or mosquito bars to exclude them.

This briefly covers the conditions necessary to obtain the proper sanitary conditions of a camp. They are not difficult to conform to and neither is the matter of expense of any moment. The camp can just as well and as economically be laid out along the right lines in the first place, and great benefit will result to all concerned in more and better work, better health and a better frame of mind if the simple rules of hygienic living are understood and applied.—W. R. H. in the American Lumberman.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

1258. **Wood-working machinery.**—A South African firm of import and export merchants wishes to communicate with Canadian manufacturers and exporters of wood-working machinery. Quotations should be English currency both f.o.b. seaboard and c.i.f. Durban.

1265. **Woodpulp waste.**—A London firm are anxious to secure supplies of a waste product of the woodpulp industry, and would like to be placed in communication with manufacturers in Canada.

1270. **Pine.**—A firm of match manufacturers in the Netherlands requires supplies of Canadian pine, and would like to receive correspondence for shippers in the Dominion.

Considerable interest is being taken by British Columbia lumbermen in the forest protection congress which is to meet in Seattle on December 2nd and 3rd. The subjects to be discussed will include such important topics as "How to use the forest laws we have, and what changes are needed," "Co-operation between the railways and the lumbermen," "The possibilities of wireless in fire work," etc. A large attendance from British Columbia is expected at the congress, and it is hoped to make it an international organization and meet next year in British Columbia.

Utilizing the Wastes—the Tr

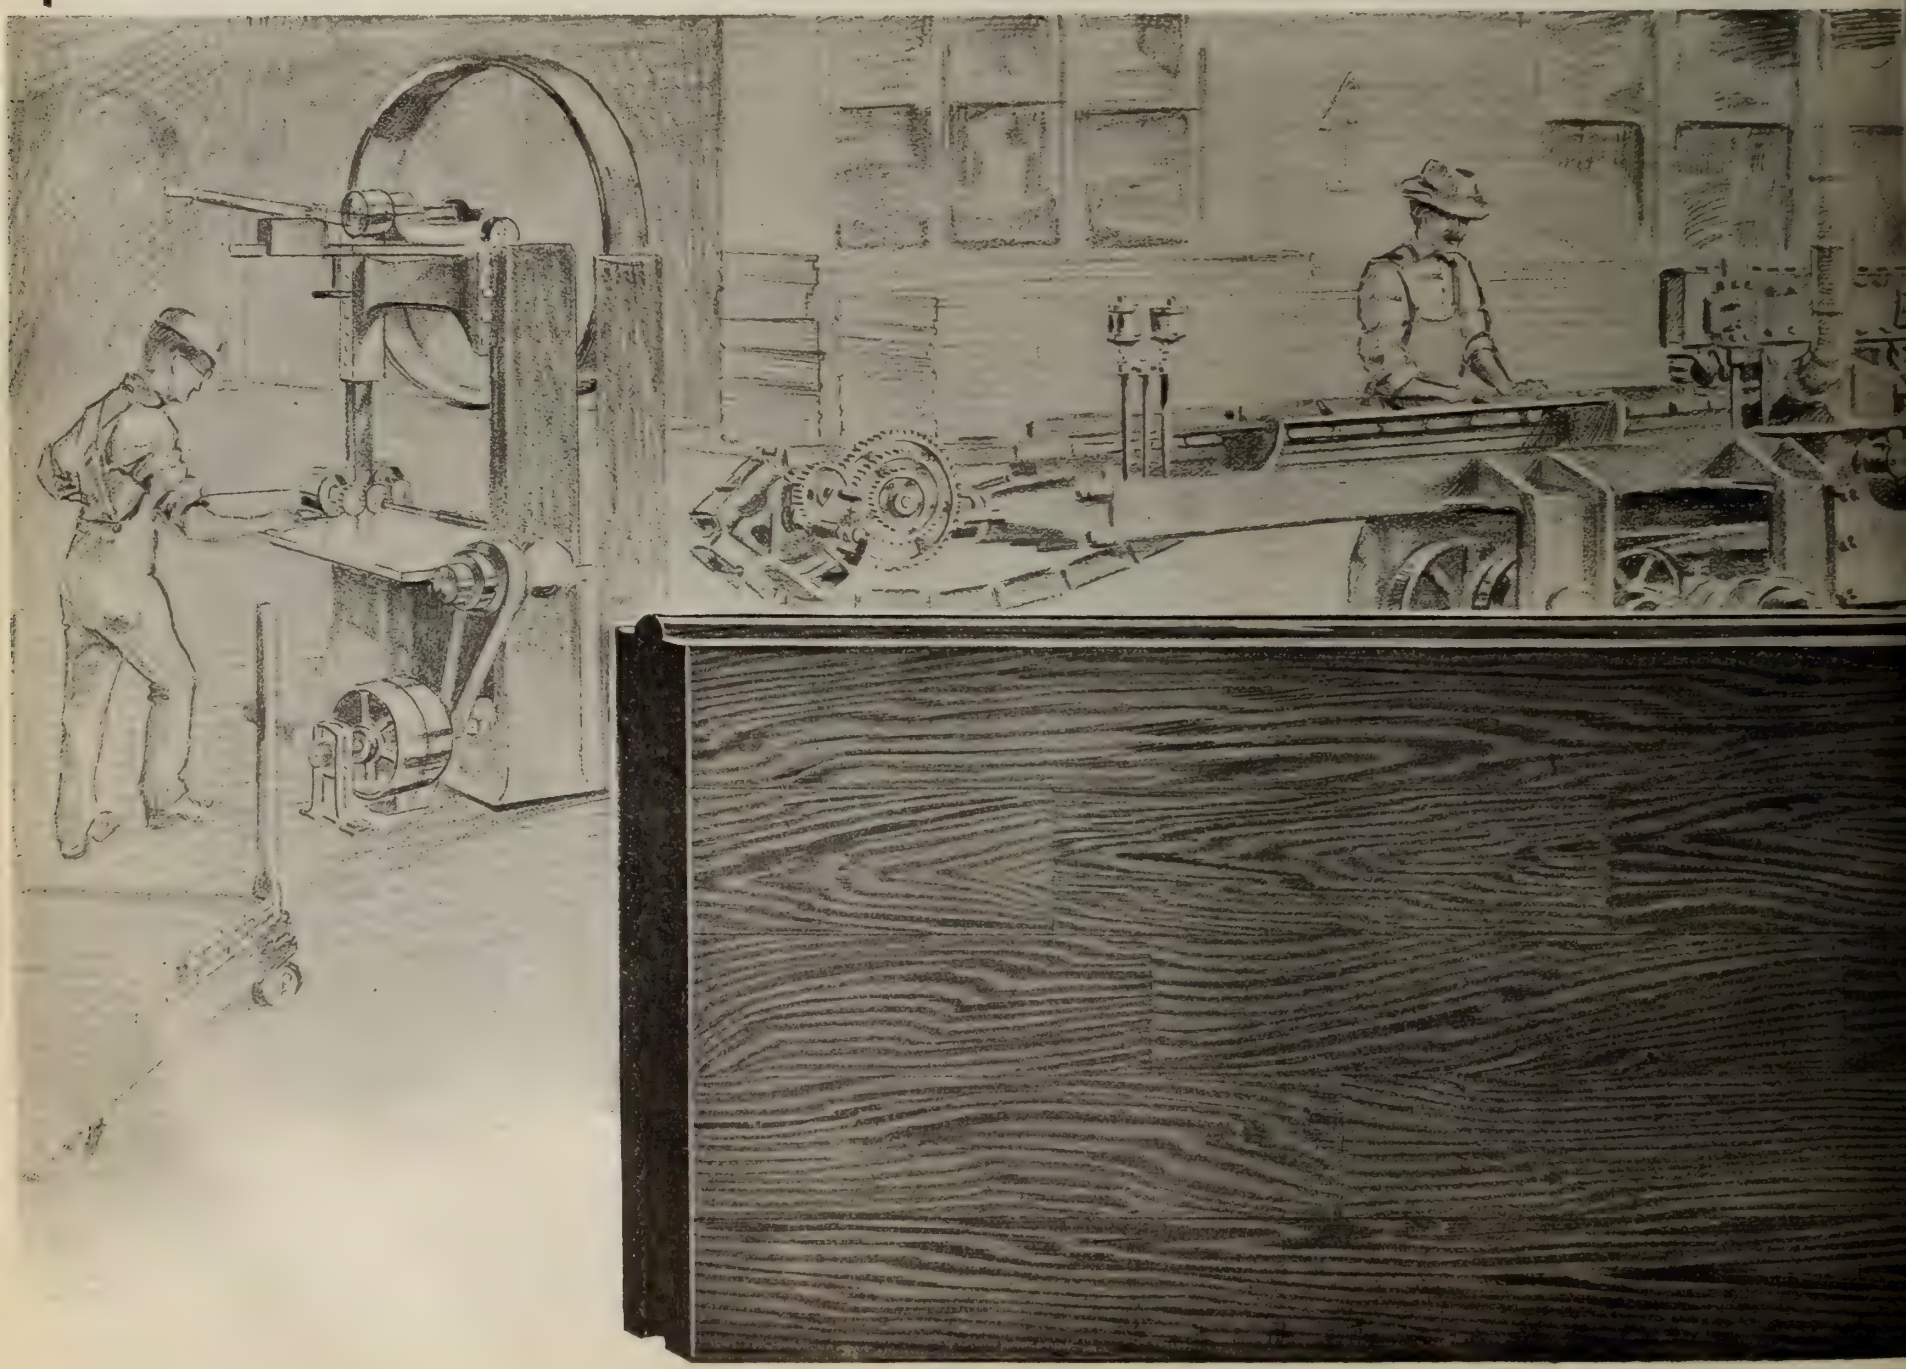
The practice for years of seeing the loss in the by-products does not of necessity mean that they cannot now by modern practice be converted into real profits.

The illustration below shows the possibility of converting short lengths of flooring into a composite board which will enable a manufacturer of flooring to obtain a greater price for this material than it is possible to obtain in any other manner, the same scheme can be followed out whether the material be rough lumber, ceiling, siding, or other products.

By the use of a Linderman Dovetailer in practically any mill it is possible to convert or eliminate from 5 to 15 per cent. of the present waste so that the manufactured product will return a fair profit over and above the original cost of the lumber and the cost of manufacture. As each manufacturing plant has its own problems and as but seldom are the conditions in any two plants alike, it is impossible to give information in an advertisement that will apply to each individual case, but the following list gives a few uses where the Linderman Machine can be used with considerable profit,—

In the manufacture of Doors, particularly the cheaper grades of solid doors, it is becoming a very serious problem how and where to obtain the clear stock for the stiles, rails, and panels, the more progressive manufacturers are joining up two 3-in. strips for the 5-in. stiles and rails, having an invisible joint discernible only by the color or grain of the wood, and in like manner using wider width stock for the panels and bottom rails, using also the cuttings from sash and door departments, whether they be 2-in. 3-in. or longer pieces, converting them into core stock for veneer doors, thereby utilizing what would otherwise be waste material.

CANADIAN LINDERMAN COMPAN



e Economy in Manufacture

In a like manner casing, base, stair treads, wide molding stock, shelving and other required wide stock are built up, giving a product which is as strong or stronger than the natural wide material and effecting a very large saving in the original cost of the material over and above the cost of joining it, which in most instances will average from 50 cents to $1.00 per thousand board feet.

Cuttings from the Matchers 8-in. 10-in., 12-in. or longer lengths, whether flooring or ceiling, can be joined up into wide widths and through the Eastern Provinces find a ready sale among the various box plants and should bring at least $12.00 per thousand at the mill, where now they are bringing but $2.00 for 600 board feet as kindling, in a like manner can the cuttings of planks and deals be resawed and worked into box material.

2-in. x 4-in. can be converted into 4-in. x 4-in., 4-in. x 8-in., 4-in., x 10-in., 4-in. x 12-in., etc., producing a plank having greater strength than though it were wide stock.

In fact any kind of lumber, of any width 1½-in. and wider, of any length up to 16 ft. can be worked up into wider widths on the proper size Linderman Dovetailer, bringing a greater price than can be obtained for the narrow widths, plus the cost of manufacture and making it possible to obtain a ready sale for what at the time being may be slow moving stock.

Are you interested in reducing your waste to a minimum, in obtaining a greater price for your product? If so, we will gladly call, investigate closely your conditions and give suggestions as to where we could be of benefit.

The Retail Dealer and His Problems

How I Won Success in the Retail Lumber Business

The records of the mercantile agencies do not prove that there are fewer failures in the retail business than in other lines of trade, but the fact that most retail lumbermen begin business after they have served an apprenticeship in the school of experience, and have learned the business thoroughly under some older head, seems to point to greater chances for success than are possessed by the business man who jumps in with little besides nerve and a few thousand dollars between him and failure.

Such was the case of the dealer about whom this little sketch is written. If Dr. Osler had applied his theories about the period of usefulness of men in the retail lumber business, it is certain that he would have had to place his age limit nearer 70 than 40. The successful retailer of 40 is, of course, in most cases, just rounding into full possession of the varied assets of experience and business connections which insure increased trade, and it is a safe estimate that most of the time preceding was spent in finding out the whys and wherefores of the business in the service of some veteran establishment. But the druggist of 40, or the shoe dealer of 45, or any average retailer at this stage of the game, often begins to think of approaching half century mark with the realization that the scion of his line, aged 22 or 23, must soon assume the major responsibility of active business. The average retail lumber dealer, on the other hand, invariably feels that he is just secure in knowledge of the game from A to Izzard when he has reeled off a couple of score years.

Mark Lane, with whom this story deals, is no exception to the rule. Mr. Lane is now the owner of a successful lumber yard in a city which is the metropolis of its state. He is a business producer and a business getter, an advertiser as well as an authority on frame construction and the sale of lumber of all sorts. Young Mark Lane, tanned and sinewy and alert to every new development in the trade of 20 years ago, just as the stalwart figure of Mark is to-day, was in the employ of a pioneer lumber concern whose yards were located only a few squares from the present headquarters of Lane & Co. Incidentally, a few of the old yardmen and some of the equipment of the earlier company are now in the employ of the aggressive concern of to-day, for the old company went out of business late in the '90's.

A Valuable Asset

"I've been in business only ten years and I don't care who knows it," says Mark. He is confident that the backing of a decade of aggressive effort, which shows a healthy percentage of increase for each year, is as effective in modern business and in working up new orders as the reputation of the oldest inhabitant of the local trade, who has been working with fairly profitable but with varying success for 30 or 40 years at the same old stand. Ten years of actual business experience, perceded by ten years of comprehensive apprenticeship in the trade, serve as a valuable asset for Lane, just as they do for many another of the strictly up-to-date, younger generation of retail lumber dealers.

"Say, young man," Mark says to inquirers with that humorous gleam which is so barely discernible that it is sometimes taken for a glint of unwonted fierceness, "Do you know why the man who is 27 or 28 or 30 years old never imperils his career unnecessarily if he works into the lumber business with a little experience? It's because he doesn't have a chance to subject his credit to all kinds of ridiculous strains. He has to have the substance before he can put up a front. You'll find the down-town district thick with ambitious young merchants who have started out too early for comfort.

"Every time I walk through the avenue I see half a dozen shops which I feel sure are going to the demnition bow-wows. There's a haberdasher's here and a shoe store there and a ready-to-wear shop farther on, with a drug store on the corner. All of them have been started within the past year by young fellows who had a couple of years' experience in their respective lines, a couple of thousand dollars capital and unlimited enthusiasm. But the latter asset doesn't always settle bills. These establishments are overstocked from cellar to roof. Probably many of the novelty goods they carry were placed with them on consignment, and lots more of them are carried on terms of 60, 90 or 120 days on the books of the manufacturers. You find the opportunity for this sort of thing reduced to a minimum in the retail lumber trade. That's why I say that its hazards are reduced for the progressive business man."

Mark Lane ran into some valuable experience in this line. He had just passed his 29th birthday and was in the employ of the old Saunders-Rawlins Lumber Co. when the crisis came and he went into business for himself. For eight years previous he had worked for Harvey Saunders and Frank Rawlins, whose partnership was a matter of thirty years' foundation.

Getting a Start

Young Lane, out of high school, through two years at his State university and having completed a six months' course at a business college when he was compelled to leave the State institution, started out as a shipping clerk at $50 a month and worked his way through the lumber inspection, sales and office departments of the concern to the position of secretary at $150 a month in eight years. He had supported his mother during that time, and the two of them had accumulated nearly $6,000 by scrupulous economy and a couple of fortunate investments. This was his capital when he turned 29 and when old Mr. Saunders died, leaving the concern in charge of the weaker member of the firm.

"It took me just about two months to see that the Saunders-Rawlins Lumber Co. was on the toboggan, after Saunders' death. I pulled out just as soon as I had learned from Mr. Rawlins that he was going to wind up the property and retire in green old age," is Mr. Lane's own version of his start. "I reckon it was about 24 hours after I reached this decision that I was dickering with Brewster & Green, the real estate agents, for a lease of this property. You see, the Central Southern was pushing its yards over this way, although we never thought of a private switch back at the old yards half a mile away from here, I figured that it wouldn't be long before I could induce the railroad to run in a spur for me. I was right, for inside of a year we had cars here on our own hub."

Mark leased the yard at $100 a month for two years. The real estate men thought they saw an opportunity to divide the tract into building lots or factory sites in a couple of years, and they were glad to secure a good tenant for a short term. Subsequently, the Lane rentals have increased, but the business has grown accordingly and the location is so good that the lessee is willing to stand for what might be considered a stiff price.

That the original Mark Lane lumber yard was a small one, so far as stock is concerned, is to be accepted as a matter of course. In describing its impressive appearance, Mr. Lane tells that there were nights when he lay awake fearing that his supplies would be entirely vanished the next morning, because of the repacious desire on the part of the neighboring railroaders and residents of the poorer quarter for kindling wood and chicken coop materials.

"I remember one night," he relates, "I had read of thieves down in the state depleting a general store with a couple of wagons. A couple of wagons! I trembled as I thought what a couple of teams could do to my little stock of choice flooring, or what might happen to me if a drayload of that car of quartered oak disappeared. So I dressed and trotted half a mile down to the yard, just to be sure that its stock lay there undisturbed in the moonlight. Since then I've employed a night watchman."

An Established Success

In the years that have passed, making Lane's lumber yard one of the leaders in its field, it has become axiomatic in that community that you can get anything from an inch strip of white pine to a drayload of oak joists there. Just as wide an assortment as his assets would allow, with special care bestowed in certain lines commanding a wide market locally, have made Mr. Lane's trade notably successful. You never can tell what an order from the consumer will amount to nor what direction it will take, he avers, and there is substantial profit to be figured upon lath just as upon inch boards. It is a variety of sales, as well as quick ones, that does the business. At present it is probable that the Lane yards compare favorably in assortment and grades of lumber with any establishment of their class in the country.

Just to look at the snowy shirtfront, the neatly pressed suit and the spotless shoes of the head of the house of Lane suggests to the observer that cleanliness runs godliness a close race in scoring for the modern business man. The lumber dealer says that cleanliness in his yards has done just as much for him in his business.

The Lane lumber yards are kept thoroughly departmentized, of course. Practically all of the stock is under shed, and as much of it as possible is kept in compartments formed of light scantlings nailed together. Thus it is elevated from the moisture of the earth and is easy to load, unload, check up and keep dusted. In one bin there may be flooring, in another plain oak boards, in another cedar strips, in another weather boarding, and so on. The effect is of a neatly

arranged library of lumber, from which the yard owner may cull his deliveries with a minimum of time and trouble and the least possible waste or yard depreciation.

Now comes a combination of circumstances which has resulted in a final and lasting success for the Lane yards, according to the autobiographical story of their owner:

"I had been in business for myself a little over a year when I was married," said Mark, losing his brusque air and lapsing to the personality of the easy-going, prosperous family man. "Yessiree—the only thing I ever did in my life about which I have never entertained a doubt. Ever meet my wife? Well, let me tell you what that youngster of mine said this morning: 'Well, it's a big building year and I've passed for the third grade at school; you'll buy that auto, won't you, pop?" He was cute enough to see that his marks in school meant as much to me as the records of the building inspector's office."

"Coming back to the point, I might say that business widened out tremendously after I was married. Guess it was because I stuck closer to my prospects than I did when I was thinking about the times the boys would have at the association convention. I opened a builders' hardware department in connection with the yard, and it has been one of the best paying ventures I ever struck. Practically every lumber order has been augmented through the sale of suitable hardware, all the way from nails and spikes to the handsome door locks and fixtures home builders are demanding nowadays.

"I don't believe in diversifying your interests too greatly. There is enough money in the retail lumber business to justify a man in sticking to it closely, but you cannot lose anything and you stand to gain a great deal in not overlooking a good bet like builders' hardware. It is the logical line for the lumber retailer to handle, for whenever a man buys lumber he wants nails, and the chances are that you can sell them more readily than anyone else when he is on your ground."

Mark maintains a good stock of builders' hardware, therefore. Investigation into the policy of management for this department shows that he profits in turning his money over quickly. Although the list price upon locks, or the market quotation on nails, may vary but little in the course of a year, he does not sink too much capital in single purchases and consequently realizes profit upon every transaction.

The story of Mark Lane has ended, for present intents and purposes, but in realty it is just beginning. In the prime of life, he is in the possession of an established business run along progressive lines. The dust brush and hardware department testify to the latter feature. Ten years ago he was just beginning, with scant assets save a thorough knowledge of his line and such acquaintance among builders and contractors as he may have acquired through employment with the old lumber company. In the lumber trade everywhere there are similar instances of men who have made haste slowly and achieved success by building upon a substantial foundation.—Lumber World Review.

A Fastidious Yard Owner

Order being nature's first law, it is commendable in all walks of life, and particularly in those where there are many things to keep in order. A lumber yard? Yes, that is one of them. A good size retail lumber yard presents as many opportunities for the exercise of a sense of order, almost as a library or a 10-cent store. Where there are two or three hustlers to look after, a yard man has plenty to do on his hands to keep things picked up and laid straight, especially when business is brisk and there is a large variety of stocks in the sheds. One of the most finnicky men ever heard of, about order in his yard, was a dealer in an eastern city who handled about everything that ever entered into the make-up of a lumber yard, and a number of things besides. He employed five or six men—selected for their abnormally large bumps of order—who were constantly on dress parade, and it was "Careful, Jeremiah, watch your sticks; keep them straight. There, James, brush off the sawdust from that board. You are very careless to load lumber in that condition," and so on. He was as careful of his boards as he was of his clothes, and they were always "spick and span." As the aforementioned Jeremiah once remarked, "It's a great pain in me face I have from blowin' the dust off av th' lumber. Next thing we know that jood boss av ours will be after makin' us use feather dusters on it, bad scran to him!"

The office of this man's yard was as neat and tidy as a lady's boudoir, and it was with fear and trembling that any one of the yard hands approached its outer portal. Once a careless or forgetful employee expectorated tobacco juice on the walk just outside the office door, and the lecture that he was compelled to listen to gave him such a jolt that he bolted his "cud" and, like Bill Nye's dog "Entomology," went outside and regretted it. This dealer stood high in the community, however, and was widely known for his clean business dealings as well as for his clean stocks. He was as careful of his business reputation as he was of the appearance of his office and sheds, and although his men called him finnicky, they freely accorded him the respect to which he was entitled.

Getting in the Money

There is a universal feeling among all merchants against saying or doing anything that will jeopardize their trade with a customer. In fact they will allow themselves to be so strongly influenced by this sentiment as to permit their customers to take privileges that are inimical to their own interests. I suppose this is natural and comes from a desire to conciliate and retain the preference of their trade for them. This can be carried too far, however, for when a business man releases any of his own rights he is doing an injustice to his business. I have known of lumber dealers who had the reputation of being "easy" with their trade and the consequence was they were always hard up and complaining of collections. They knew what they ought to do but lacked the will power and nerve to carry it iuto action. And I believe that I am not far from the truth when I say this disposition on the part of dealers to be lax in asserting their rights and maintaining them is the greatest evil in the retail lumber business. We meet and talk among ourselves about our troubles and project different ways to lessen them but we are too apt to overlook the fact that we ourselves are chiefly to blame for most of them and our own inner consciousness condemns us as the party at fault. It is a weakness common to all. Some 'tis true, have it more than others but when we see a man who is strong in having his own way in what he should have we admire him for it and wish we had the same backbone as he has, in standing for our rights.

Lumber dealers have often wondered why it is that farmers are so ready and particular to meet their obligations at the bank when due and let them wait till they got ready to pay their accounts which represent cash as much as the money does which the bank passes over the counter to them as a loan. It strikes them as curious also that the most financially strong among them will never think of demurring against giving their note to the bank for a loan and are gratified and pleased if it is taken without additional security other than their own name. But these same men would consider it almost an insult if a dealer should ask them for the same as at the bank and even the class of men of whom the bank require other security than their own on a note would feel the same way over such a suggestion from the dealer. The difference is the banks all require it and there is a coherence of action among them to live up to the rule and enforce its stipulations if necessary. But with comparatively few exceptions there is nothing of the kind with the lumberman and with the majority of them they have a timidity of feeling about even dunning their "good" customers who are delinquent in paying their long past due accounts.

Outgrowth of a False Attitude

One reason for this is the false attitude which both dealer and customer holds towards each other in the transaction of purchase and sale. The farmer thinks and assumes he is bestowing a benefit when he gives his patronage to the dealer and quite often he has a patronizing way when he does it. On the other hand when he goes to the bank he is pleased if the cashier thinks he is good enough to grant him a loan and is glad enough to consent to any requirement that is asked. The shoe of obligation is on the other foot in this case you see. The lumber dealer, however, treats the farmer differently. He runs after him and seeks his trade and lets him know that he wants it. Although his lumber is practically as much a necessity to the farmer as the bank's money is, his actions have a tendency to lead the farmer to think that it isn't. So there has grown up a sentiment that lumber at the yard and money in the bank are two different things altogether and hence this difference in the attitude of the farmers in general towards them. The bank dictates absolutely to the farmer what he shall do in the matter of accommodation and the farmer practically dictates to the lumberman his own terms when he makes a purchase on credit and not infrequently he dictates the prices as well as in the case of buying a bill that has gone the rounds of competitive effort.

How many accounts have you, my friend, got on your ledger today that you feel a sort of hesitancy about pressing for immediate payment?

Every auditor of a line yard concern can tell of instances where the manager of a yard has told him of some names on the ledger of men who were perfectly "good" but it wouldn't do to press them too hard for a settlement because they would be liable to get offended and go elsewhere with their trade. The manager has an on-the-ground feeling and therefore is more sensitive about offending those of his personal friends among the best customers of the yard. I know what this personal feeling is and yet at the same time I have often felt my own lack of stamina in pushing for collection when my business judgment told me was the thing I ought to do. The great

strife among competitors for trade tends to taking the stiffening from their backbone in enforcing such business terms as are common with the bank and even such terms as they theoretically may have of their own. So it has come about that dealers in general are in a way forced to do what others do because of being enmeshed in the bonds of a custom of their own making. There has been a great improvement, however, in this respect during later years as the younger generation have taken their place in the business. Some of the old dealers, too, have changed their methods in the business dealings and relations with customers. I know personally of a number who are as strict with their credits as the banks are and who have succeeded in educating their trade up to their way of doing. As may naturally be supposed such a change required long and persistent effort.

Difficult To Go It Alone

It is extremely difficult for one dealer in a town to carry out a system of strict business methods when his competitors persist in continuing on in the old way of catering to the prejudices of the farmer customer. However this may be, it is possible because any dealer who has any business sense at all favors the idea of better methods in dealing with credits and only his lack of confidence in himself and competitors keeps him from taking a step towards it. Therefore I say it is possible and if one dealer inaugurates a departure from the old system and persistently follows it out regardless of what his neighbors may do, the almost inevitable result will be that they, seeing he is determined in his course, will begin to have confidence in his sticking to it and think more favorably of trying it out themselves. The fact that the first one to make the start has made it easier for them to follow and when they all get into it the farmers will recognize that it is a fixed thing and they will accept it in time just as they have with the banks.

Now I don't want to be understood as meaning to do away with the credit system as that is a different matter entirely. What I want to press home to you is the possibility of governing your credits instead of wearing their collar and have them dictate to you for you know as well as I do that under the present system you are not your own "boss." Just think this over and see if I'm not right. Calling attention to a wrong thing is easy enough and therefore to be of benefit to you, I always try to suggest a remedy that I believe is practical and likewise practicable.

It is approaching the time of year when there is a considerable amount due on bills that were sold in the early part of the fall and however disagreeable the task may be you have got to look sharp after more or less of them or some will be dragging over till next year. It is not a pleasant job to punch up a man who already has paid you a good lot of money but if he has exceeded the time when the last payment should have been made according to the stipulations made at the time of selling the bill steps should be taken for a settlement as soon as possible no matter whether he is "good" for it or not and if the party is a contractor the necessity is more urgent if anything than with the direct owner. In the latter case it is unwise to say the least to let a matter like this slide along without action simply for the reason of not wanting to offend the contractor. You have no means of knowing just how he is coming out financially on his fall contracts. The chances are that he may have lost or only come out even on some of them and from the rest his profits are not likely to be very large. And if you don't watch pretty closely you may have to carry him for more or less till he gets work next spring. His being a good fellow and honest in his intentions to pay won't alter the injustice of your having to carry him.

Diffcult to Dun a Friend

Speaking for myself I confess it was the most difficult thing in my experience to separate friendship from business considerations. I have made more mistakes I think from this one cause than any other. I have often wished that I was so cold blooded in business matters as some whom I know that would unhesitatingly sever the ties of a friendship in adhering to a strict construction of business principles. After one has run a yard in a country town for a number of years he can't help but for a good many personal attachments among his customers and he knows too that the large majority of those who trade with him do so because of their personal liking for him. He knows very well they could buy their lumber as cheaply and of the same good quality anywhere else but he holds their trade because they like him and his ways. So when some of these good friends get a little careless or have some setback in their affairs so as to place them in the list of delinquents on his books he is naturally reluctant about taking measures calculated to force them for payment. I think it is a fact we all are cognizant of that we unconsciously presume on our friends notwithstanding the fact also that we know it is unfair for us to do so.

Country yard retailers may be said to be educators in a business school with every customer for a pupil, for there is scarcely a day goes by that a dealer don't have to instruct some customer in the mysteries of business as it is a thing they don't understand. Many a time have I had a farmer say to me that as I had the lumber on hand it might as well be out on his farm as there in the yard where it was lying useless and he was honest in thinking so because he felt sure of paying for it as soon as he could. They don't see either why it is that if they pay the dealer a profit on what they buy from him on time they should pay interest on the account, for to their understanding he has already received interest on his money in the form of the profit charged them. They can understand why the bank should charge them interest on money borrowed, but they don't see why they should pay the lumberman what they consider is double interest. These and many other things which are repeatedly coming up of like character for the dealer to argue and explain to his customers constitute the educational part of the direct personal nature of it. Each individual has to be treated according to his temperament and degree of intelligence and also with tact and patience to deal with the natural prejudice, selfishness and suspicion which this class of trade entertain towards the seller of goods in a country community.

Talk to Them in Print

If people understood more about business and the correct principles which should govern it there would be less difficulty in the lumberman's doing business as he knows it ought to be done. And hence the reason for my so often suggesting the medium of the local paper for use by the lumber dealers in talking to the public and saying to the people collectively what they do to them individually as customers when they come to the yard. In this way the public could be made to understand that the giving of credit is not done as a personal favor to the individual, but solely as a business proposition for the dealer, and if both dealer and the public would come to understand and recognize that, there would be less of hard feeling toward the dealer who was strict in insisting and enforcing his terms.

The public is learning more of this sort of instruction by means of its business dealings with the mail order houses. No doubt, many a farmer has thought it was unnecessarily strict in them to exact the cash in advance for an order he was sending in when he was "as good as the wheat" for anything he might order. Some have sent their personal cheque in with the order and had them returned because exchange was not included and the order was held back till the proper remittance was made.

Some farmers have what seem to a business man, queer notions about such things. I knew one who got the office of postmaster under the first Cleveland administration. He was well fixed financially and a typical western pioneer with the careless ways of that class. He called me into a back room of his office one day and told me of the way the post office officials at Washington were "pestering" him because his accounts with them were a few cents out of balance. He had sent in the difference in money to the department, but this was not sufficient. The "d—d fools," as he called them, insisted on his looking up the error and making a clear report. I explained to him the reasons for their wanting it and went over his accounts with him and found the error for him. He got some new ideas while he held the office that he never dreamed of before, and so does every farmer when he leaves the farm and goes to town and enters an unknown world of business complexities and trouble. 'Tis true, farming is of itself a business proposition, but in his business transactions the farmer looks mainly after the two essentials, buying and selling. He sells for cash and buys on time and in a great measure pays when it suits his convenience. So in this respect the farmer is after all a pretty good business man in looking after his own interests and might be imitated by many merchants who deal with him.

The Filing of Mechanic's Liens

Doubtless many of you at this time of the year are confronted with what is to some an unpleasant proposition, the filing of a mechanic's lien. I term it unpleasant although it ought not to be, because it is purely a business proposition for those who are willing to take advantage of the justified protection that is at the hand of every lumberman. And if he sees fit to take the risk involved of letting the time for filing it go by it is his own fault if he loses the amount of the account. I agree that it is unpleasant, for many times it involves also the breaking of the hitherto friendly relations between the dealer and his customer. No one likes to do that, especially in these days, when territory is limited and new customers are few and far between and more difficult to hold when you have them. It was sometime before I had nerve enough to file a lien. I hated like the dickens to be forced to it but after I had filed one or two I got over feeling so nervous about it.

The conditions of filing a lien in those earlier days, however, were different from what they are now. All I had to do then was to make out the list of items, attach it to a properly filled out blank, swear to it before a notary and send it in to the county clerk for filing and recording. All this could be done without letting the owner know that it was done. The debt was secured, however, and if it was paid

before the two years expired wherein we could foreclose it if we wanted to, the owner never would know it until the occasion rose when his title had to be examined in the case of his making a loan on the property. But all this way of doing has undergone a change since then. In every state now the law provides that the owner shall be notified before the act of filing takes place and there is no way to prevent hurting his feelings in keeping it from him. I presume this is a more just way than the old, but it is more unpleasant for the lumber dealer. He not only ruffles the owner, but he is liable to get "at outs" with the contractor as well, for such action on his part means to them that he is afraid they would pay the account.

The Fault of the Contractor

Many of the liens filed nowadays are chiefly owing to the contractor's inability to properly estimate the cost of the job. The owner having contracted with him for the whole job complete, very naturally supposes he knows his business well enough not to take it at a price that will not pay his bills and hence he resents the attempt of the dealer to have him stand good for the balance due on the bill of material.

There is only one way to do in every case when the dealer sells a bill direct to the contractor for the erection of another man's building, and that is to have a definite understanding with both owner and contractor that should the latter fail to have his estimate high enough to complete the job he will look to the owner for payment of whatever is due. Better still is the securing of an order from the contractor on the owner to pay for all the material that he furnishes for the job and if the owner is good for the amount, there will be no necessity for the filing of a lien. I think it would be a good plan to publish the main essentials of the lien law in the local paper and explain them so every one reading it may understand clearly what they mean. This would aid materially in letting people know some things about building they are ignorant of, and preventing the misunderstandings that are liable to arise in the selling of bills to contractors. As a rule there are few foreclosures of liens in proportion to what are filed. But when you are in doubt about filing a lien make one out and file it.—C. H. Ketridge in the Mississippi Valley Lumberman.

My Policy if I were a Sales Manager

By P. A. Gordon

A good writer could write a book of several volumes on the above named subject, but as I have some very definite ideas on the subject, I am going to try in as few words as possible to tell you what I would do were I suddenly elevated to such a position.

The first thing I would do would be to cut out a whole lot of the useless red tape that the present day sales managers use. I believe that better results can be obtained by giving the salesman the necessary information regarding stocks and prices and conditions at the mills in as few words as possible, as the average salesman in these days of close competition has neither the time nor the inclination to read several pages of "whereases and hences" and such stuff, which may be very edifying from a literary standpoint but of no practical use when you are trying to convince some well-informed retailer that he needs your stock, even though it costs a trifle more than some other fellow is offering his.

I would hire the highest-priced salesmen I could find, for I firmly believe that the best is the cheapest. I would endeavor to get salesmen who have the confidence and respect of the trade in their territory, even though I had to pay them a little more than I could hire peddlers for. In over twenty-five years on the road selling lumber I have not found a railroad that will haul a cheap man for less than it will haul a good man; nor have I found a hotel that will house a cheap man for less than it will a good one. Of course, I know that there are cheap hotels, but I would not keep a man who made a practice of stopping at poorer hotels than I did, for I believe that a house is judged by the man who represents it, and if he is continually to be found at cheap places it is not to be wondered at if the trade rates the house he represents as being also cheap.

I would want my men at the mills often, at least every three months, for I would insist that they be thoroughly posted as to what the manufacturing end of the business was doing, and no amount of letter writing will give them the information that a good man, who has his heart in his work, can gather by spending a few days in the mills and yards; I would insist that they be thoroughly posted as to grades and manufacture, so that I would not have to have an inspector following them most of the time.

I would not ask my men to do things I would be ashamed to do, and would insist on absolute honesty, between ourselves, and between them and their trade.

I would not nag at them, nor find fault if they charged up an occasional laundry bill; I have known sales managers to write a whole page to some salesman telling him that his expense account for the last month was altogether too high, and that they could not allow the ninety cents he had charged for laundry bills, and that Mr. Sellem's expenses were $9.50 less than his, but they forget to state that Sellem sold less stock, or that he sold it cheaper, or else he had to have an inspector following him most of the time, whereas the man who was being "called," while not turning in as many orders sold only to the very best people, at the top of the market, and sold it so well that there was a profit on it to his house, and no possible chance for his trade to find fault, if it were so inclined.

I would consider the man who only sold 20 cars a month, at a profit, more valuable than the one who sold 100 cars at cost or less, and would endeavor to keep the former satisfied, and on my pay roll, and would not wait until he threatened to quit before giving him a raise.

I would devote a whole lot of my time to "getting next" to the man at the head of the manufacturing end of the business, and would endeavor to convince him that we could accomplish more by pulling together, and agreeing that each needed the other, than by any other method.

To sum it all up I would endeavor to get a corps of salesmen on the road who knew their business, and in whom I had implicit confidence, and would then put it up to them to get results, without taking up my time with small matters that a man on the ground, who is in touch with his trade, and has their confidence, can handle to the best advantage, thus leaving me free to watch the small things that are so often unnoticed about the office, and in the mill and yards. After getting this corps together I would treat them in a manner that would insure my having their respect and confidence, and have them all fighting for the firm all the time.

Whenever a customer complained of a shipment, I would not write him that "we have taken this matter up with our shipping department, and the inspector who loaded this car remembers distinctly that it was strictly up to grade in every particular, and therefore you must be wrong, and we would ask that you keep the stock intact until we can send an inspector to go over same." Instead I would refer the matter to the salesman in the territory, and leave the settlement entirely to him, and simply write the customer to that effect. A salesman who is posted as to manufacture and grades, and who has the interests of his employer at heart, is going to get a better settlement every time than can possibly be secured by any other method, and if he is properly treated and supported, he can be depended on to be just to all concerned.

I would not insist on my men pounding their customers fifty-two weeks in the year, nor would I let them travel when we had nothing to offer, except a few cars of 2 x 4—24 No. 2 common or a few odd and out-of-date patterns of mouldings, or a few odds and ends for which there was no sale. There would be just as much sense in a boot and shoe manufacturer sending his men out with a few left-foot boots that he happened to have on hand, and which he would make money on by burning up, and sending his men off on fishing trips.

I would insist that the selling end of the business be given just as much consideration as the manufacturing end, which would be somewhat of a departure from the present method, and I believe the successful operator of the future will admit the necessity for so doing.

I would insist that I was not to be interferred with, but that I was to be supreme, and that I would be held responsible for the failure or given all the credit for the successful marketing of the output of the operation, and would insist on hiring and discharging my men.

I would want all my men at headquarters at the same time, so that we could hold experience meetings, which would surely be beneficial to all.

I know that I could make some large operator more money by employing the above methods than he is making at present.

I know the above will seem too radical by some, but I think that all must admit that the sales end of the lumber business has been given altogether too little attention, unlike other successful businesses, such as steel and iron, etc.

I would want at least to advise what forms of advertising were to be adopted, for I firmly believe that a salesman who represents a firm that is a liberal and judicious advertiser can always get a more liberal hearing than one who represents an unknown concern, and I believe that with the right kind of an organization a live sales manager could find time to attend to the advertising, and if he have any originality at all his acquaintance and personal knowledge of what would appeal to the trade would surely prompt him to keep his stock moving. Of course a man who has travelled and therefore has a personal acquaintance would be better able to do this than would one who was simply sales manager because he was related to the boss.

I would want to visit the trade in company with my different salesmen as often as I could find time to do so, therefore keeping as closely in touch with them as possible, and this would also give me an opportunity of studying my man so that when I had to do so I could write him the kind of letter that would appeal to him.—American Lumberman.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted

1,000 cars ordinary Sawmill Sawdust. Will accept now or later. State what you have. Box 639, Canada Lumberman, Toronto, Ont. 22-1-68

Birch Logs Wanted

Wanted about 500 logs, Prime Quebec Birch, 18 inches and up. Quote F.O.B. Box 711, c/o Goulds Advt. Offices, 54 New Oxford Street, London, England. 23-2-82

Wanted

Large quantity of Birch, Maple, Elm, Ash and Basswood, 1 inch and thicker, Log Run Dry or can place orders for spring delivery. Box 636 Canada Lumberman, Toronto, Ont. 21-24-63

Wanted

Five million feet Hemlock and Spruce, 1-in. to 2-in., for delivery next spring or summer. Can use portion now. State what you can supply. Box 640 Canada Lumberman, Toronto, Ont. 21-24-66

Wanted

One million feet 4 x 4 to 8 x 8 Maple, Beech, Birch or Elm Squares. Will accept hearts of knotty stock, for rough work. Delivery now or during 1913. Box 638, Canada Lumberman, Toronto, Ont. 22-1-67

Birch Wanted

We desire to buy 100 M. to half million feet 4/4, 5/4, 6/4, and 8/4 log run No. 2 common and better Unselected Birch. For sufficient quantity will send representative to load stock. Terms cash upon inspection. Apply to Louisville Point Lumber Company, Louisville, Ky. 20-23-43

We use yearly five hundred thousand to one million feet of Birch, Basswood and Ash in our business and are open to contract with responsible mill men for same. We would be willing to advance money on the logs and also on lumber as sawn. Write us, Manufacturer, Box 619, Canada Lumberman, Toronto, Ont. 20-37 T.F.

White Pine Wanted

Venezuelan importer wishes to purchase 200,000 to 250,000 feet of white pine. The lumber is to be 16 x 12 x 12; 50 per cent. to be free from knots on one side. The goods must be f.o.b. any Canadian port on the Atlantic side. Address "Venezuela" c/o Canada Lumberman, 119 Board of Trade Bldg., Montreal, Que. 23-89

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Lumber Wanted

Four, five and six quarter, Spruce, Hemlock and Norway, four, six, eight and ten inches wide, rough, also surfaced. White Pine Mill Culls and Lath. Box 615, Canada Lumberman & Woodworker, Toronto, Ont. 20-1-34

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

FOR SALE—LUMBER, ETC.

For Sale

For quick shipment, 100 M. ft. 2-in. Birch, December, 1911, cut. No. 2 C. & B. at $20 per M. on cars. Farm Point, Que. Hall Bros., 174 Mutual Street, Toronto, Ont. 16t.f.

For Sale

Five thousand pieces small posts, 3-in. to 4½-in. top, peeled and in good shipping condition. The Baker Lumber Company, Lindsay, Ont. 20-23-30

For Sale

140 M. ft. Hemlock, 22 M. ft. Ash, 27 M. ft. Birch, 13 M. ft. 1-in. Maple, 90 M. ft. Spruce, 55 M. ft. Pine. For prompt shipment. The Baker Lumber Co., Lindsay, Ont. 23-91

Yellow Pine Timbers

We have on hand in London, three carloads of Yellow Pine Timbers, 8 x 14 to 12 x 14, 12 x 24 ft. long. Prompt shipment can be made. For further particulars apply to The London Lumber Co., London, Ont. 23-24-86

Timber For Sale

About five hundred thousand feet of standing white pine timber; about three thousand five hundred trees; ten miles west of London, Ont. Price and full particulars, apply to E. Todd, 336 Main street east, Hamilton, Ont. 23-72

For Sale

500,000 ft. Maple squares, 1¼-in., 1½-in., 1¾-in., 2-in., 2¼-in. and 2½-in. Any length from 12-in. up.

Car lots and upwards.

M. Mitchell, P. O. Box 204, Lucknow, Ont. 23-2-79

Lumber For Sale

400,000 ft. 3 x 7 and up Merchantable White Pine.
200,000 ft. 2 in. Merchantable White Pine.
200,000 ft. 1¼ in. Basswood, Log Run.
500,000 ft. Hard Maple, 1 in. to 4 in.
Apply to

GEO. C. GOODFELLOW,
Montreal, Que.

FOR SALE—MACHINERY, ETC.

Two Saw Mills For Sale

Two second-hand portable Saw-Mills, each fitted with cut-off saw and 52-inch inserted tooth saw, also one double edger and one 24 h.p. Stationary Engine and Boiler. Everything in first-class condition and good working order. Reply, Messrs. Thomson & Findley, Terra Nova, Ont. 23-24-59

For Sale

⅝-in. Yellow Poplar saps. One carload 10-in. to 16-in. wide. Also one carload 2-in. panel and No. 1 Poplar 12-in. to 24-in. wide.

CHARLES F. SHIELS & CO.,
21-24-60 Cincinnati, O., U.S.A.

Locomotive To Rent

Twenty-five-ton Locomotive available for rental during winter months at reasonable rate. Apply, John J. Gartshore, 58 West Front Street, Toronto. 23-77

For Sale—A Snap

Ten sets Sleighs. Runners 4-in. x 7-ft., 5 ft. wide. Bunks 8 x 9 x 8 ft. Bench 9 x 10 x 6 ft. $15.00 per set. Box 603, Canada Lumberman, Toronto, Ont. 20-23-27

Keg Making Machine For Sale

Consisting of one bilge drum saw, American make, entirely new; one stave equalizer, also new; one heading turner (this is not new but in good order). Has attachments for turning barrel headings. For further particulars write J. E. Waterous, Brantford, Ont. 23-88

Saw Mill For Sale

Huntsville Lumber Company, Limited, will in the future only run one of their two double cutting Band Mills, which is now cutting fifty thousand feet per day.

They will sell the same with engine, boilers and all other machinery along with building. Also will sell blacksmith's tools and a number of saw-log sleighs and chains.

Huntsville Lumber Company, Ltd.,
22-42 T.F. Huntsville, Ont.

WANTED—MACHINERY, ETC.

Wanted

An up-to-date Planer and Matcher. Must be in first-class condition. Write all particulars to C. A. Spencer, Eastern Townships Bank Building, Montreal. 23-85

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Experienced office man wishes position as secretary or accountant in lumber company. Has good knowledge of lumber manufacturing, planing mill work, and selling end. Also capable of keeping books, handling correspondence, etc. Good references. Open for immediate position. Box 651, Canada Lumberman & Woodworker, Toronto, Ont. 23-84

WANTED—Position as superintendent or manager. Have had over twenty years' experience from stump to market with large concerns in Canada and the States. I am practical and have been successful operating at low costs. Can furnish best references as to character and ability to produce results. Reply to Box 652, Canada Lumberman, Toronto, Ont. 23-24-87

Situation wanted in Alberta or Saskatchewan with firm having good prospects for promotion, starting as salesman. Have thorough experience from stump to market. Four years manager for firm in Ontario having annual cut of two million feet. First class references. Canadian, age thirty-four; married. Reply to Box 654, Canada Lumberman, Toronto, Ont. 23-93

Position Wanted

Young man, French-Canadian, (21), first-class commercial diploma, French and English Correspondence, fair knowledge of shorthand and typewriting; diploma of Quebec Log Scaler. Three years' experience in the lumber trade (office, mill, logging, store). For the last year manager at a branch mill. Just out of employment on account of employers cutting down business. Open for engagement in the same trade in any place. Address, mentioning wages and position, to M. A. M., P. O. Lagace, Co. Bonaventure, Que. 23-76

WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

A Band Resaw Filer to take care of a 5-in. Resaw machine. Reply, Edouard Ruel, Lauzon, Levis, Que. 23-92

WANTED—For a well-equipped, up-to-date sawmill, a good setter, trimmer and edger and other men who have had experience in sawmills. Address Dominion Mahogany and Veneer Company, Limited, Montreal West, Que. 23-81

WANTED—Office man to take charge of books at a fair salary, and purchase interest in established wholesale car-load lumber business in Edmonton. Three to five thousand dollars required. Splendid opportunity. Address, Wholesale Lumber, P. O. Box 1353, Edmonton, Alberta. 23-24-94

MISCELLANEOUS

WANTED
1000,000 Railway Ties

The Central Railway Company of Canada invites tenders for supplying railway ties in lots of five to one hundred thousand, for delivery at Ste. Agathe, LaChute, Montreal and Grenville, in the Province of Quebec, and Hawkesbury, McAlpine, Ottawa, South Indian, Carleton Place, Bannockburn, Fenelon Falls, Orillia and Midland, in the Province of Ontario.

Tenders will be received until noon on December 20, 1912.

For specifications and other particulars apply to

F. STUART WILLIAMSON,
Chief Engineer,
44 Beaver Hall Hill,
23-90 Montreal, Que.

BUSINESS OPPORTUNITIES

Timber limits wanted on the Ottawa waters. Box 648, Canada Lumberman, Toronto, Ont. 23-75

Lumber Merchants or Manufacturers desiring additional capital address

G. DALRYMPLE,
23-80 Box 115, Newark, N.J.

For Sale

Saw Mill and fifty-three miles timber limits in County of Bonaventure, Quebec Province. For further particulars apply to J. D. Sowerby & Co., Oak Bay Mills, P.Q. 22-71tf

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 115 h.p. boiler, 100 h.p. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

Mounting Circular Saws

In mounting circular saws on a saw-spindle care should be taken that in addition to being absolutely round they are an easy fit—to allow for expansion—but not a loose fit, as in this case when running the saw is thrown out of centre; consequently a number of the teeth do not act on the wood at all, and perhaps

three-fourths of them have to do all the cutting, says the Timber Trades Journal. Consequently, the feed remaining constant and the cutting action of the teeth being more or less intermittent, rough and scored work is the result. On the other hand, the steady-pin and hole should be a fairly loose fit to obviate any chance of their binding. In addition to the saw having a perfect running balance, to do good work the teeth should be absolutely alike and uniform in length, shape, pitch, gullet, space, temper, and set. If a circular saw be only out of balance an ounce or two, owing to the great speed at which it is run an enormous amount of centrifugal force is set up, which is very detrimental to good work, and it also unduly wears the belt and also heats and wears the bearings. If the saw is in perfect balance and all the saw teeth uniform and each taking its fair share of duty, it will be found that much less frequent sharpenings will be necessary, and the quality of the work will be greatly improved. A saw, when properly mounted, should in the horizontal line incline very slightly towards the timber, so that the teeth at the back of the saw may rise without scoring the wood. Of course, saws can be forced through wood in almost any condition, but there is no doubt it will amply repay all users to keep them in what may be termed scientific order, as undoubtedly, as someone has truly observer, "the tool room is the heart of the saw mill."

Sappy Oak

Sap oak has suffered unjustly from abuse, and has been neglected because it has not been properly understood. The sap part of oak has been considered as inferior, and the outside or sappy boards have never been regarded with much favor.

All the same, if properly cared for from the time it is cut until it is used, sap oak will often give good results. For certain schemes of finish in cabinet work it is really a better body to work on than heart oak. It is the same way in flooring.

If one but takes care of the sap and segregates it from the heart stock so as to get it all together for harmony in texture and color, there is a chance to do just as effective work with sap as with heart. There is no comparison of sap with heart for timbers and exposed work outside where durability is an object under the method of using the timber plain; but with the modern systems of treating wood, the sap part of oak is being made much more useful and durable even for outside work.

If sap-oak flooring is selected and laid with care, and properly stained before finishing, it will present a beautiful appearance. The same applies, but in a higher degree, to furniture and cabinetwork. The only thing necessary is to take care of the sap stock from the time it is cut until it is ready to be used.

To have the sap dominating in the particular work in which it enters, and the work carried out right, one can get new appreciation of the possibilities and beauties of sap oak. The sappy part of oak is more likely to check from the sun and wind.

Idle Pulleys

The idle pulley—that is, the pulley on the lineshaft that may have been put there to drive something one day, but is not in use now—is an unnecessary burden, says The Wood-Worker of Indianapolis, and should be taken off and carefully put away for future use. If such pulleys are of the split variety, it is easy enough to do this, as it will only take a few moments with a wrench. When you take such a pulley off, go over it carefully, clean it up thoroughly, and then give a coat of shellac or varnish to the outside. This will protect it from moisture, and make it look better, too. Then put it away carefully in the shop or stock room, some place where it will keep in good condition.

Review of Current Trade Conditions

Ontario

Great difficulty is being experienced by lumbermen at the present time in obtaining a sufficient supply of labor. As a result, the work of cutting is being very much retarded and unless many more men can be obtained in the next two or three weeks, the cut is likely to fall much below the average. Taking this into consideration, and the fact that the stocks at present held by the mills are remarkably low, there is every likelihood of an all round stiffening in prices. The supply of cars is still far from normal, a shortage of box cars being particularly noticeable just now on the Canadian Northern Railway in the Sellwood district.

Very little alteration has taken place lately in the hardwood market; the demand being still very brisk and prices firm. Many enquiries are also coming through for the United States markets.

The middle grades of pine have started a sharp movement after being practically inactive for some time past. In these grades, 1 inch by 6, 8 and 10 inch, and 2 inch by 4 inch and wider, in white pine, and 2 inch red pine have shown a marked improvement. The demand for the lower grades and mill culls shows no decrease. Prices for white pine at Sarnia show a considerable increase. An advance of $1 is being asked for mill culls; No. 1 cuts are selling at $44 for 1 inch by 8 and up wide; common and dressing has increased by $1 and is selling at $23; box is stronger by $1 to $3 for No. 1 and $1 for No. 2. Hemlock prices are inclined to rise owing to the heavy demand and the exceptionally short stocks obtainable. It is difficult, however, to quote prices as manufacturers may be said to be making a special price for each individual sale.

Eastern Canada

Reports from St. John, N.B., indicate that a firm market still continues for New Brunswick lumber. In some cases prices are firmer than they were a fortnight ago. The only really important consideration in making a deal is whether the stock required can be secured at all. Woods operations have been started throughout the province of New Brunswick, with weather conditions rather adverse, on account of lack of snow and the wet condition of the woods. Prices of supplies for the camps are high in many cases, particularly for hay and oats.

The good market conditions have resulted in a number of rotary mills starting operations in the woods. Rotary sawn deals for winter delivery are bringing $14.50 f.o.b. St. John, for a specification of 50 per cent., 7 and 8 x 3, balance 9 in. up, averaging 14 ft. long. City deals are practically all sold. Present prices are about $15.50 on the wharf at St. John for a specification of 60 per cent. 7 and 8 x 3, 40 per cent. 9 in. and up. There is a scarcity of merchantable spruce boards 4 inches and up wide. The present price is about $13.50 per M. for an ordinary specification, clears out. The clears are bringing $25 and are scarce. Low grade and refuse stock are in good demand but very scarce. Refuse boards or planks would bring $10 per M. Pine boards of 10 ft. contents and up, 8 inches and up wide, are selling at about $23 on yards. Stocks are very scarce.

Freight rates to the English and United States markets remain high. In the New England States trade is good and is being carried on upon a $25 base, delivered at Boston. Indications are that a $27 base would not be a surprise in the near future. About 40,000,000 ft. of logs will be held over in the St. John booms this winter. With a continuance of the present active demand, holders of these logs will be able to take orders for early delivery in the spring.

A notable scarcity is reported in low grade white pine and in spruce boards at Boston, and it is not unlikely that an advance in these items will take place before long. Shingles also are rather scarce and prices have advanced. Red cedar shingles however, have been fluctuating both up and down. A few weeks ago they seemed to take quite a start but since that time they have fallen off. On the whole, trade conditions are healthy and prices are firmly maintained. The general market in the United States is reported to be good although some slight hesitation has developed since the election. Most of the large dealers, however, are looking for a good winter business.

Eastern spruce at Boston is in good demand. There is a fair volume of business in frames on a $25 bases. Random is in fair demand but buyers are not in a mood to take on large stocks. Holders of spruce boards will make no concessions whatever. Buyers simply have to pay the full price asked or lease the stock for the next buyer. Quartered oak is selling well at Boston at $88 to $90. Plain oak and maple are in good demand. Hemlock at Boston is in fair demand at firm prices. Eastern clipped boards have been bringing $23.50. Northern hemlock boards are firm at $22. There is a firm demand for shingles at Boston and prices are firm. Holders of extras are asking for $4.25 and for clears they want $3.90 to $4. The market for lath is steady at $4.50 for 1⅝ in. and $4 to $4.25 for 1½ in.

At New York there is a firm tone to the market for eastern spruce. Manufacturers are able to control prices. Stocks among local yards seem fairly plentiful for the winter trade, but the present rate of consumption would not take long in bringing about a shortage. Yard managers are figuring upon replenishing their stocks during the winter by carload shipments. Continued strength is reported in the hardwood markets at New York. There is every indication of continued strength in the demand for hemlock at New York.

Western Canada

In the prairie provinces the lumber markets are still characterized by a remarkably strong demand for all classes of lumber and at the same time by a continuance of the inability of the railroads to take care of orders. The wheat crop of the present year was enormous and, as a result of the failure of the railroads to supply the rolling stock necessary for its shipment, many warehouses and elevators have been built in which to store the grain.

The following are some of the prices quoted by retailers in Winnipeg:

No. 1 Pine, Spruce, Tamarac, Fir, Larch and Cedar

2 x 2, up to 16 ft.	$30.00
2 x 4, 2 x 6, 6 to 16 ft., except 10 ft.	29.00
2 x 8, 6 to 16 ft., except 10 ft.	30.00
2 x 4, 2 x 6, 2 x 8, 10 ft.	31.00
2 x 10, 8 to 16 ft., except 10 ft.	31.00
2 x 10, 10 ft.	33.00
2 x 12, 8 to 16 ft., except 10 ft.	33.00
2 x 12, 10 ft.	35.00
3 x 4 to 6 x 8, 8 to 16 ft.	32.00
3 x 10 and 4 x 10, 8 to 16 ft.	33.00
3 x 12 and 4 x 12, 8 to 16 ft.	34.00
2 x 4, 2 x 6, 2 x 8, 18 to 22 ft.	33.00
2 x 4, 2 x 6, 2 x 8, 24 to 32 ft.	36.00
2 x 10, 2 x 12, 18 to 22 ft.	35.00
2 x 10, 2 x 12, 24 to 32 ft.	37.00
2 x 14, 4 x 14, up to 32 ft.	39.00
2 x 16, 4 x 16, up to 32 ft.	40.00
2 x 18, 4 x 18, up to 32 ft.	41.00
2 x 20, 4 x 20, up to 32 ft.	42.00
3 x 4, 4 x 12, 18 to 32 ft.	38.00
6 x 6 and 6 x 8, 18 to 32 ft.	37.00
6 x 10, 6 x 12, 8 x 12, up to 32 ft.	38.00
6 x 14, 8 x 14, 12 x 18, 18 x 20, up to 32 ft.	40.00
6 x 16, 8 x 16, 14 x 20, 16 x 20	43.00
For lengths 33 to 35 ft., add per M.	3.00
For lengths over 35 ft., special price.	

Flooring

No. 1 and No. 2 Fir, Edge grain, 3 or 4 in.	$53.00
No. 1 and No. 2 Fir, Edge grain, 6 in.	50.00
No. 3 Fir, Edge and Flat grain, 4 and 6 in.	44.00

Siding

No. 1 and 2 Fir, 6 in.	$44.00
No. 3 Fir, 6 in.	40.00
No. 3 Fir, novelty, 4 in.	40.00

The prices prevailing on oak run from one inch plain rough $120, to quarter-sawed one inch rough $162. Two inch quarter-sawed $147. Birch, bass and white pine timber are commanding good prices.

It is claimed that throughout the prairies practically all the dealers have been obliged to refuse orders because they were unable to secure lumber. A greater lumber famine is predicted.

The Canadian Pacific Railway recently put an embargo on some companies in Winnipeg and Regina and against the towns of Saskatoon and Edmonton. It was claimed that the merchants in these last two towns held cars a very long time before unloading. It was found that some shipments made to Winnipeg were held sixty days before unloading. Dealers were not always to blame, however, as the railroads themselves have had many a delay in handling cars.

The quantity of logs scaled in British Columbia during October was not so large as in the month previous, but it was well up to the high average which has been made during the present year. Official returns are 64,139,728 feet, showing that the large totals are still being maintained. Production of logs will be larger this winter than last, since in the interior, mill stocks are very low and many men will go into the woods. Last winter, because of the slow lum-

A. F. Holden, Pres. J. M. Diver, Vice Pres. and Gen'l. Mgr. E. C. Barre, Ass't. Mgr.

ber market, interior lumber manufacturers relied mainly on the stocks of logs they had on hand.

Demand for lumber continues strong, and in all lines of trade business is good. Export trade at Victoria is also brisk. The only backward feature with business with the prairies is car shortage, which is quite serious, and there is little prospect of alleviation for some time, since the wheat crop is given first attention. It is reported from Saskatchewan that dealers there want lumber badly, their stocks being low, but are unable to get their orders filled owing to the scarcity of cars. One of the causes of the scarcity is that merchants do not unload goods promptly, preferring to pay demurrage charges rather than warehouse the goods. It is estimated that in the vicinity of Vancouver alone there are six hundred cars held in this way.

United States

A slight falling off in the demand for lumber is reported from a good many of the markets of the United States, although the trade in the Northern States is about as active as usual. General indications are that there will be a continued heavy demand from the building trade throughout the balance of the present year. Heavy sales of northern pine are reported from the Tonawandas as purchasers have shown a strong desire to secure stocks. The increasing scarcity of box and other low grades is causing the price to stiffen and there is every likelihood of higher prices before next spring.

Chicago:—Northern pine is firm and all sales are being made at higher prices than those which prevailed a year ago. Most of the yards are carrying light stocks and are ordering only as they require stocks to keep up with orders in sight. Full prices are being paid by the trade without question in practically every case. The hardwood market continues very strong. Wholesalers report that enquiries and orders are plentiful. Red and white plain oak are firm in all grades. The demand for quarter sawed white oak shows an improvement. Birch, maple and basswood are more than holding their own. Hemlock stocks in second hands are lower than usual. There is a good prospect for a heavy demand during the early part of the winter and a slight advance in prices would not be a surprise. The demand for southern pine yard stock is strong. Stocks at mill points are reported badly broken.

Buffalo:—There is a good demand for northern pine, with low grade stock bringing a good price on account of scarcity. The trade in shop lumber is about up to the average. It is often easier to sell lumber than to secure cars in which to ship it. Low grade hardwoods are in good demand at high prices. The demand for hardwood railway ties has brought about the scarcity which prevails. Stocks of low grade hardwoods are much lower than they were a year ago. Plain oak is being sold about as fast as it comes on the market. Large stocks of hemlock are all in for the season. Dealers would like to get more if they could.

North Tonawanda:—Heavy sales of northern pine are reported. The increasing demand for box and low grades and the scarcity of these stocks, have resulted in strong prices. Predictions are frequently made that they will soon go much higher.

Great Britain

Trade reports from the Old Country show that the total imports of Great Britain for the month of October, totalled £71,000,000, an advance of more than £10,000,000 compared with October of 1911, or an increase of 17 per cent. The exports amounted to more than £48,000,000, an increase of almost £5,000,000 or an improvement of 10 per cent. For the ten months the imports show an increase of 9 per cent., the total being nearly £600,000,000, or about £50,000,000 more than the total for the corresponding ten months of the previous year. The exports amounted to £402,000,000 for the ten months showing an increase of 7 per cent.

The spot market at London continues active, and forward contracts are quite numerous, in spite of the fact that at this time of year this class of business is not usually very brisk. Apparently, importers are more confident that usual. Prices continue steady and dealers are showing an encouraging desire to secure goods. The high level of freights continues in spite of the increase in new ships building. Deliveries at the London docks for the week ending Nov. 9th, totalled 11,816 standards as compared with 3968 during the corresponding week of last year. At Churchill & Sim's recent auction sale, a lot of 3 x 8 to 14 in. 9-19 ft. U/s spruce from Halifax brought £9 15s. per standard. A lot of 3 x 5/7 in., 8/20 ft. U/s brought £8 15s: A shipment of pine from Quebec, 3 x 8/9 in., 13/14 ft. fourth Bt. sold for £11.

No change of any importance is reported in the trade at Liverpool. The controlling factor in connection with prices of shipments from Canada is the high price of freight. Shippers of spruce deals from New Brunswick or Nova Scotia who are under contract for delivery, would willingly pay extreme rates to secure tonnage before the season closes, but the tonnage cannot be secured as it is finding better employment in other directions. There have been practically no spruce deal importations at Liverpool for some time and it is not considered likely that any will arrive from St. John or Halifax until the regular liners from Montreal and Quebec are unable to make those ports. The tonnage which is released from the St. Lawrence will then be available for the St. John and Halifax trade. This however, will only permit small parcels to be shipped.

Stocks of spruce at Liverpool and in the surrounding district have been greatly reduced in all the favorite sizes. An interesting reference to the spruce situation at Liverpool is made in a recent issue of the Timber Trades Journal which says: "Some of the small merchants seem to be imbued with the idea that the whole of the spruce industry in New Brunswick and Nova Scotia has its sole existence centred in this district. The sooner the consumers get this out of their heads the nearer they will approach to a sane view of the real state of things and realize that there are other markets and other countries who are consumers of spruce deals."

The pine deal market at Liverpool is unchanged. Some favorite sizes and qualities have become quite scarce.

Indications are noticeable at Manchester of an easing off in the timber trade as a result of the bad weather conditions which have prevailed, together with the firm prices. Prices of spruce and pitch pine have broken all previous high records for the past 20 years and are being easily obtained. Spruce deals are dearer. Recently they were selling on the quay at £10 10s. for 7 x 3, in. At latest report, they had advanced to £11 and were selling rapidly.

The timber trade at Glasgow continues fairly brisk with encouraging indications for the immediate future. All of the wood consuming industries are well supplied with orders.

British Columbia Log Market

Owing to very windy and wet weather only a few logs reached Vancouver recently from up the coast, and there are very few booms of fir for sale there. The tendency is for an advance in prices, good booms bringing as high as $7, $10, $13 and from that down to $6.50, $9.50 and $12 for the poorer lots. The mills are all running up to capacity, and it seems likely that there will be something approaching a log shortage about the middle of February next. Shingle cedar is bringing from $8 to $9.50, lumber logs from $10 to $12, hemlock about $6.50 to $7. Prices for lumber are well maintained and the mills have plenty of orders.

Barbados Trade Report

S. P. Musson, Son & Co., Barbados, B.W.I., report under date of November 7th, regarding lumberstuffs, as follows: White pine—There have been no arrivals to note during the fortnight, but receipts are expected, and further shipments should sell to advantage. Spruce—The position is very similar to that of white pine. Stocks are light, and supplies are wanted. Pitch pine—We note the arrival of the "M. J. Taylor" from Scranton, Miss., with 356 m. ft., and 75 m. by S. S. "Trym" from Mobile, both of which were contracted for many months ago. Shingles—No arrivals, and supplies are wanted. Shooks—Some 905 bdls. have come to hand for dealers' account. Woodhoops—We have received a shipment of 531 bdls. French hoops.

Tonawanda Grading Rules for Soft Woods

The Tonawanda rules are so often mentioned among lumber dealers that a mistaken idea prevails that these rules have actually been drawn up and authorized by some recognized Tonawanda association. The Canada Lumberman frequently receives enquiries for these rules and the only reply is that they are not to be had in printed form.

The question "What are Tonawanda grading rules for soft woods?" is perhaps best answered in the words of a pioneer Tonawanda lumberman, now dead, who replied "there are no rules for Tonawanda grading of lumber. Tonawanda inspectors (the men who do the sorting) are not governed by rules. They are educated by long familiarity with grading that has come down from the early days of the Tonawandas as a lumber market." In other words Tonawanda lumber grading is not by any fixed rule or set of rules. The grades have deviated very little from those established when the local market was in its infancy. The grades are fixed, but it is impossible to draw up a set of rules for the guidance of any one not familiar with the traditions of local lumber.

A recent report from Seattle, Wash., says that approximately 100,000,000 feet of lumber has been purchased in the last ten days from Oregon and Washington mills by the three Eastern car building companies, according to information given out yesterday by lumber agencies here. The orders are to be delivered in large lots this winter to the following: Canadian Car and Foundry, 20,000,000 feet; American Car and Foundry, 40,000,000 feet; and the Pullman Company, 40,000,000 feet.

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Prices Stiffening at St. John

St. John, N.B., Nov. 20; (Special correspondence of the Canada Lumberman): The lumber business in this section of the country still continues in the same firm position as two weeks ago. If anything, prices are somewhat firmer but it is not quite the question of price that is important. Rather, it is whether the party buying is able to get the stock which he wants, as stocks are about all purchased and mills are sold up to time of closing of navigation, which is expected to take place mostly any time.

Practically all the operators have started work in the woods, but are much hampered by shortage of labor and the wet conditions of the woods as this has been a very wet season from beginning to end. Wages for woodsmen run from $27.00 to $35.00 per month according to the class of men, and it is really very hard to get good men. Operators are forced to take what they can get. This, with the bad condition of the woods, will be very apt to shorten the cut of logs in this section. The same will apply to northern New Brunswick and the State of Maine. It will also tend to increase the cost of logging as it is making the work of yarding very slow. Prices of hay and oats are very high, especially hay, which is a short crop. It is felt that later in season prices may recede, but it will then be too late to get in a supply at a cheap hand. Taken as a whole therefore, it is felt that the cost of logging this year will be somewhat higher than before.

Rotary Mills After the Business

Many rotary mills are starting operations in the woods, as, since the rise in price of lumber, more men have decided to operate. The writer is aware at the present time of eleven operators within twenty-five miles radius, who will saw out about 15 million, nearly all English deals. This, it is felt, will pay better than American stock, as the latter is expensivc to saw and, being largely two inch, will not turn out the scale of the log.

Prices for rotary sawn deals for winter delivery or early spring f.o.b. St. John are, for a specification of deals 50 per cent. 7 and 8 x 3 balance 9 in. up to average 14 feet long, $14.50 per M. sup. feet; 3 x 4-5-6, $9.75 per M. superficial ft. Deal ends are about the same. as scantling. For this stock sawn into American sizes say about 60 per cent. 2 x 3, 2 x 4 and 2 x 6, 40 per cent. 2 x 8 and up about $13.75 is being offered f.o.b. cars St. John.

City cut deals are practically all sold, but if any were for sale, the seller at present would be able to realize for a specification of 60 per cent. 7 and 8 x 3, 40 per cent. 9 and up $15.50 per m. on wharf at St. John; 3 x 4-5-6 would bring $13.50 and ends about $12.00.

Merchantable spruce boards 4 in. and up wide, are very scarce, In fact very few dry boards are to be had. The spruce at present is $13.50 per m. for an ordinary specification of boards, clears out. These are bringing about $25.00 per m. and are also scarce.

Low Grade Stocks Good Sellers

The market for low grade or refuse stock is also good, but practically no stocks remain as local demand has been good up to the present. Parties having any refuse boards or planks are able to realize $10 per m. with refuse deals 3 x 5 and up $9. Refuse 2 x 3, 2 x 4, and 3 x 4 bring $10.

Pine boards of smaller sizes under 10 feet contents are in good demand, the price being about $16 f.o.b. cars, with the larger boards 8 in. up wide at about $23 on yards. Stocks of dry pine are practically all sold up, the new sawn pine being green and not ready for shipment.

Freight rates to the English market remain the same as at last writing. Large quantities of deals, scantlings, etc., are now waiting liner shipments, which will begin in a few days as a C.P.R. boat is due Nov. 23. The quantity in scows would probably be in the vicinity of 4 million feet.

Freights to United States ports still remain at $4.25 and $4.50 to Sound and New York, with very few vessels to be had. Quite a large quantity of American stock from interior mills is being held on scows awaiting vessel shipments.

Good Demand in New England States

Business in New England still continues good and no business is being done at less than $25.00 base, delivered Boston. It is felt that with three to four of the very large mills being tied up for the season the capacity of which was over the 2 million mark per week, the price will increase and possibly reach the $27.00 base price in the near future, should the present rate of consumption increase.

A large quantity of logs will be held over in the St. John booms this winter, in fact about 40 million feet, but if business keeps as at present, the holders of these logs will be in a position to take orders for early delivery and thereby get the benefit of the early spring prices, which has not been the base for some years as there has been a shortage of logs for early sawing.

The St. John River Log Driving Co. have finished the season's rafting and booms have been taken up for season. The total quantity of logs rafted was about one hundred million feet.

Brisk Trade at the Tonawandas

North Tonawanda, N.Y., Nov. 22.; (Special correspondence of the Canada Lumberman): An accident to the swing bridge over Tonawanda River to Tonawanda Island has tied up half the lumber business at the Tonawandas. The lumber barge Helvetia struck the abutment to the island approach of the bridge, which is the only communication with the mainland, and dislodged it so much that the draw cannot be closed for a week or ten days. Meanwhile four big mills in Tonawanda Island have shut down and most of the yards have laid off all workers. The fifty freight cars which is the average daily allotment for the Tonawanda Island lumber district have been filled with lumber and no more will be dressed or made ready for shipment until the bridge is in commission again to permit communication by rail. There are in all between 150 and 200 freight cars more or less loaded with lumber on the Island which is the home of half the local lumber industry.

Leonard Wiedeman, prominent in local lumber and wood-working circles, died yesterday after a brief illness from consumption. The deceased had been in ill health however, for a year. He was injured while making an inspction of his mill when a lumber truck tipped up and he was pinned beneath the load. Mr. Wiedeman was a native of Germany. He came to the Tonawandas 30 years ago and grew up in the lumber business. He started with nothing and at the time of his death was the owner of a large wood working plant at the north end and was interested in other enterprises in connection with local lumber trade.

An active market the last two months has greatly depleted stocks at the Tonawandas which in connection with an unexpected dearth of tonnage in the lumber trade will mean that more stock than usual will be held over at upper Canadian and American ports for transportation to the Tonawandas in the spring. Boats are rapidly laying up and rates are almost prohibitive. As high as $5 a thousand has been paid during the last ten days for cargoes of hardwoods from Lake Michigan ports while as high as $4 has not been unusual even for white pine. Most of the local wholesalers have closed their receipts for the season. White, Gratwick & Mitchell, one of the largest handlers of lumber at the Tonawandas, will be compelled to leave 8,000,000 feet on the docks at upper lake ports in spite of the fact that they will have boats on the way down right up to the close of navigation.

While coming down Lake Superior bound for the Tonawandas, the Str. Barth of the Edward Hines fleet, lost a deck load of lumber consigned from a Canadian port to Smith, Fassett & Company of North Tonawanda.

82,386,618 feet of lumber was shipped east over the Erie canal from the Tonawandas during the season of navigation just closed for 1912. This total is 11,000,000 feet more than during 1911 and 1,000,000 in excess of 1910. Shippers who are familiar with the local market say that the 1912 total for lumber sent east over the Erie canal would have been close to the 100,000,000 feet mark had it not been for the six weeks stop in navigation on account of the Bushnell's Basin break which was responsible for much lumber being shipped by rail that otherwise would have gone by the water route.

Building continues active in the territory supplied from the Tonawanda market. Representatives of local dealers report more favorable weather than usual at this time of the year and that building contractors are making the most of it in the erection of houses, factories, etc. The great fruit belt of New York State had particularly favorable crops of all kinds of fruit and the farmers and fruit growers are buying heavily. Here in the Tonawandas there is an exceptionally heavy building boom. One capitalist has twenty houses under construction and will complete thirty more early next summer. These fifty houses are all worth at least $3,000 a piece and are being built in a section of the city that has just been improved by the extension of city sewers and water. Another large residence

section in the south end will be improved by the erection of another 100 houses the first of which will be started in the spring.

Ottawa Cut Exceeding all Records

Ottawa, Nov. 23rd.; (Special correspondence of the Canada Lumberman): According to figures compiled the lumber cut in Ottawa this year will be the largest in the history of the city. The total cut will measure approximately 350,000,000 feet, of which 90,000,000 feet will be by J. R. Booth, 75,000,000 feet by the W. C. Edwards Company and 20,000,000 by the E. B. Eddy Company. McAuliffe & Davis, and Shepard & Morse, the two other largest lumber dealers have not yet totalled their cut, but representatives of both firms say the totals this year will be nearly two million feet more in each case than any previous year.

Spruce and pine will make up the most of the cut. Cedar and hemlock have been more scarce this year than last. There are about 4,000 men in the shanties employed by Ottawa firms, all of whom are getting higher wages than has ever been paid before. The average pay with board being: foremen $75 a month, cullers $50, and shantymen $30.

There never has been such a demand for lumber as there has been this year, say the dealers here. Orders have come from all parts of Canada. Building has been phenomenally active all over the country particularly so in Western Ontario, and Ottawa has been called on to supply a good deal of the lumber required. A single example to corroborate this is given by a local lumberman who says that in the small town of Leamington, with population of 2,650, 80 houses have been built this year.

Several exceptionally large buildings now in course of erection in Ottawa will keep local woodworking industries busy until spring in preparing the interior woodwork. Mr. Russell Blackburn, a director of the Hawkesbury Lumber Company, is building a modern ten-storey office block on Sparks street, which is sufficiently far advanced to begin work on fitting up the interior. As a matter of fact lumbermen are spending the most money in Ottawa just now in putting up modern buildings on the principal streets of the city.

The Balkan war is having a bad effect on the lumber camps. Many of the men in the camps were from the Balkan states and Austria. Since Austria became involved in a dispute over certain territory which the Bulgars wanted in the event of peace being declared, reservists of the army of that country working in the camps have been called home. Every man on the reserve list of the Balkan states armies was summoned to return to his native land soon after war broke out. One jobber, it is said, whose employees were nearly all Austrians, found himself almost without a man after the call to arms was issued by the Austrian government.

In order that the Dominion forest reserves may be better administered and protected they are being divided into ranger districts and houses are being built at the most convenient points for the use of the rangers. The first of these houses has just been built at the Duck Mountains reserve, near Kamsack, Sask. The ranger at this point has charge of about 230 square miles of spruce and poplar forest.

Mr. R. R. Williams, treasurer and chief salesman for the McAuliffe Davis Co., has returned from a business trip through New York State and Vermont. He reports business as remarkably good.

An extension to the present plant of the Ottawa Car Company is to be built at once. Taylor & Lackey, of Ottawa, have just been awarded a contract to build a $40,000 extension on Slater street. Next spring work on an entirely new plant will be begun on the 75 acres of land the company bought recently, about six miles from the city. The most modern car works known to the trade will be built on the site. Model cottages for workmen will also be built by the company. Most of the plant which is now in the centre of the city will be transferred to the new site, but there will always be a city branch, of which the new building will be a part.

New Zealand Will Need Canadian Timber

That New Zealand will call upon British Columbia and (with the completion of the Panama Canal) eastern Canada for timber supplies to a greater extent as years go by, is proved by the following extract of a report by the New Zealand Lands Department:—

"From the more accurate information that is now available, it will be seen that there is ample justification for the diminished estimate of our timber supply. An impression prevails that, owing to the increased use of substitutes for timber in the construction of buildings, the future demand may not be so great as was anticipated. But, as the population of the Dominion is constantly increasing, and there is a rapidly increasing demand for timber in every branch of industry, we must realize that our timber resources will be taxed to their utmost capacity in a very few years, and the future generations will have to face a serious problem that, up to now, has not been regarded with much concern.

"Out of the gross amount of superficial feet of milling timber estimated to exist at the present time," the report continues, "it will be noticed that nearly one-third is composed of timber not commercially used to any extent, also a large portion is situated on land too difficult of access to be profitably worked for many years to come. The net quantity likely to be available for sawmilling would therefore amount to 16,000,000,000 superficial feet."

The report goes on to state that, as the present output of timber is over 400,000,000 superficial feet, it is a fair assumption that the average output for the next generation will be about 450,000,000 superficial feet. If the present estimated supply is divided by this amount, it will be seen that there is only sufficient timber to last the sawmiller for about 35 years, and this is without taking into account the inevitable loss that periodically occus through accidental fires.

During this period large supplies of foreign timber might be expected to arrive, and so reduce the strain on local forests, but, as every country in the world would be feeling the effects of the universal demand, it was not to be expected that such timber could be procured after 10 or 20 years, save at much higher prices than now are current, and in gradually decreasing quantity.

Improved Trade in Montreal

Montreal, Nov. 27. (Special correspondence of the Canada Lumberman): Both wholesalers and retailers report that business is again in good shape, and that in certain lines it is impossible to supply the demand. The scarcity of low grades of spruce and pine is more accentuated, and prices are naturally stiff. Present indications are that the market generally will continue to keep up, and that, if anything, quotations will advance still further. To some extent the position will be governed by the European political situation and its effect on money, but in the event of matters adjusting themselves in a peaceful way, there is every reason to expect that trade will be more brisk than ever. Lath is very firm in price, while shingles are difficult to secure.

There are again complaints of the shortage in cars and the congested condition of the terminals. One firm waited two months for a mill to get cars, and then found that the railway company refused to take the goods to certain points, owing to inability to handle the lumber. The retailers as well as the wholesalers are now getting after the companies, but they will doubtless be told the same tale—that the companies are doing all they can to relieve the situation.

A Good Year in English Trade

Exporters to Great Britain state that they have had a satisfactory season, and that present appearances point to an increase on the shipments of the previous year. This is in spite of strikes and increased freights.

Manufacturers in the province of Quebec report that it has been extremely difficult to get help, and that there is a scarcity of men to take out the logs. This circumstance, together with the heavy rains rendering the woods impassable in many places, points to a reduction in the cut as compared with last year.

The Canadian paper mills continue to operate under high pressure, as the demands are a little more than they can conveniently take care of. Prices hold very firm at the advance which has recently been made in all lines except that of news, and it is profitable that, on account of the high cost of raw materials, still further advances will be made in wrapping, writing, book, manila and bag papers at the beginning of the year. There will be no rise in newsprint, on account of the products of the new mills, but prices are strong, and probably will be influenced later by the general tone of the market. In box boards the scarcity of old papers for raw stock is becoming pronounced, and quotations are soaring.

Sulphite Market Stiffening

With regard to the sulphite market, there are signs of a world-wide shortage during 1913, and those consumers of chemical pulp who have not provided for their supply will no doubt have to pay very dearly for spot lots. European advices bear out this view, and from them it is learned that the supply at the mills is getting very scarce. Freights, too, will have an important bearing on the situation, as it is difficult to secure tonnage at anything like reasonable rates.

Steadiness characterizes the ground wood market. Very heavy stocks are being carried by the Canadian mills, but it is felt that, now the fall rains are over, the demand will improve considerably as the winter progresses. Seventeen to eighteen dollars per ton at the mill is the general price, according to the mill and freight facilities.

The Abitibi Pulp and Paper Company will have their ground wood mill in operation in 1914, but will not add newspaper until the following year.

Wholesale Lumber Prices in the United States

The U. S. Forest Service in its quarterly report upon wholesale prices of lumber during July, August and September, deals with market conditions as follows:—

The advance in wholesale lumber prices during April, May, and June, 1912, continued during the months of July, August, and September. The Pacific coast species which continued to rise were red cedar, Douglas fir, western hemlock, and redwood. Western yellow pine and Sitka spruce failed to follow the advance, but western larch, which showed no change during the second quarter, sold at better prices. In eastern soft woods yellow pine made decided advances; North Carolina pine and hemlock advanced somewhat, while the prices of white pine and spruce made no general change. Among the hardwoods prices were generally higher in the Southern and Central States, except on gum, while in the Northern States ash, basswood, beech, and birch were somewhat lower and maple somewhat higher.

In Washington western red cedar beveled siding No. 1 rose $2, shop No. 2 over $3, and the grades of shingles 25 cents to 50 cents. Douglas fir flooring No. 1 V. G. advanced $2.80 in Oregon and Washington, while timbers 12 inches by 12 inches, average 32 feet, rose about $1 in both States. The following advances occurred in western hemlock sales in Washington: Flooring Nos. 1 and 2 over $1, finish Nos. 1 and 2 nearly $4, dimension No. 1 common, $1.60, and ship-lap $1.25. Western larch prices show the following advances in Montana: Flooring A and B $1.25, finish A and B $2, drop siding A and B $1.50, common boards No. 2 over $2, and dimension No. 1 common, $4. In Idaho western white pine finish C select advanced $2 and finish D select declined $4. Western yellow pine shop No. 1, 6/4, rose 70 cents in California, $1.15 in Washington, but declined 80 cents in Idaho, while common boards No. 2 rose $1 in California but declined in both Washington and Idaho. In California redwood sales clears advanced slightly, sap clears declined $1.25, while common boards No. 1 advanced $2 and common boards No. 2, 75 cents. In Washington Sitka spruce shop No. 1 advanced $1.80, finish No. 2 clear and better declined $1.38, and flooring No. 2 clear and better more than $3, but beveled siding B advanced $2.50 and common boards advanced $2.

The advance in yellow pine prices applies almost without exception to all grades in all producing states. Finish B and better, 6 inches and wider, shows the following advances; Arkansas, $1.43; Louisiana, $1.36; Mississippi, $3.16; Alabama, $1.10; Missouri, 50 cents; Georgia, $1.80. Dimension No. 1, S1S1E 2 inches by 8 inches, 16 feet, made advances as follows: Texas, $2.62; Arkansas, $1.49; Louisiana, $3.17; Mississippi, $3.26; Alabama, $1.55. Mill-run values show the following advances: Texts, $1.42; Arkansas, $1.42; Louisiana, $1.80; Mississippi, 93 cents; Alabama, 88 cents; Missouri, $2.08; Florida, 63 cents. All grades of North Carolina pine quoted in this record advanced except dimension 2 inches by 8 inches, 16 feet, which declined slightly in South Carolina and North Carolina, and box edge, 4/4, which advanced in North Carolina but made no change whatever in South Carolina. The advance on No. 1 Edge 4/4 amounted in North Carolina to $1.38.

Hemlock prices were higher in the Lake States, but not generally in the Eastern States. Two-inch piece stuff advanced $1.08 in Wisconsin, but only 57 cents in Michigan. Boards No. 1 advanced $1.34 in Wisconsin and $1.42 in Michigan. In white-pine sales prices obtained for the upper grades were generally lower, while the lower grades sold at advanced prices. Selects C and better declined $2.80 in Minnesota and $4.45 in Wisconsin, and fencing No. 2 rose $2.09 in Minnesota and slightly in Wisconsin. Prices of New England and West Virginia spruce were generally lower, while Adriondack values were higher, except in the case of No. 1 and clear, which declined slightly.

Basswood firsts and seconds advanced $2.20 in Tennessee, while in New York there was a fall of $1.50. Unselected birch firsts and seconds advanced 65 cents in Michigan, $1.55 in Wisconsin, and $1.20 in New York. Hard maple firsts and seconds advanced $2.25 in Ohio, $1.15 in Indiana, 83 cents in Michigan, $1.82 in Wisconsin, 75 cents in New York, but declined $3.17 in Pennsylvania. Chestnut values were generally higher throughout the chestnut-producing States. Firsts and seconds advanced slightly in North Carolina and West Virginia, $2.26 in Tennessee, $1 in Kentucky, $2.37 in Virginia, and $4.53 in Ohio. The prices of plain oak were generally higher except in North Carolina. The following advances are shown in firsts and seconds; Arkansas, $1.96; Mississippi, $3.08; Missouri, $3.60; Tennessee, $2.14; Kentucky, $4.60; Virginia, $2; West Virginia, $2.41; and Ohio, $5.33. Yellow poplar values advanced in several States, but in Virginia and Tennessee all grades quoted declined. In other States the advances on firsts and seconds were as follows: North Carolina, nearly $3; Kentucky, $2.50; West Virginia, 89 cents; Indiana, nearly $4. Cypress firsts and seconds advanced $1.36 in Arkansas, held firm in Louisiana, and in Florida advanced $1.27. Red gum firsts and seconds declined 82 cents in Arkansas, $1.50 in Louisiana, but rose $2 in Mississippi. No. 1 common in both sap and red declined in Arkansas and Louisiana, but not in Mississippi. Tupelo firsts and seconds declined $2.46 and No. 1 common $1.45 in Louisiana.

No Chance for the Steel Barrel

James Innes, Chatham, Ont., in a recent letter to the National Coopers' Journal, belittles the possibility of steel slack packages taking the place of the wooden barrel and in the course of his letter, Mr. Innes says:—I cannot see where the steel slack package can be used for many of the purposes for which the present wooden barrel is used. It might possibly be used for shipping goods packed in excelsior, where covering only was required.

It is made from 28-gauge sheet steel, with about three corrugations to the inch. A sheet of steel is stretched in the middle in this corrugating portion, so as to give the barrel a bilge about the same as if made from 5/8-inch bilge staves. It is rolled into a circle, and held together by wire that is put through holes that are punched in the sheet. The head is somewhat like a tin-can cover, in which corrugations are formed low enough to make a chime for the barrel, with holes punched through both the head and the barrel, and four sheet iron keys are put through the head into the barrel to hold the head in shape. In other words, your description of the tin barrel fully covers the case.

The barrel would not hold sugar, flour, fine salt, or in fact, any foodstuff that has weight, as it has no hoops on it to support it when being rolled, and if thrown on its side, would go out of shape. The barrel is not suitable for cold storage, as it would rust if not galvanized, and would sweat badly if galvanized, as iron, as you know, is one of the greatest conductors of heat or cold.

I cannot see for the life of me where there is any field for this barrel to be used to any large extent, unless for something that can be poured into it that would solidify after being poured in. In other words, the only uses to which the barrel can be put would be as a cover, the same as straw boards or tin sheets—and not as a retainer requiring strength. We, therefore, do not think that the steel slack barrel is going to enter into competition at all to amount to anyhing with the wooden barrel, and, if used at all, will be used instead of paper cartons, or pulp boxes, where light goods are shipped, as it certainly could not be used as a returnable package, for, if handled in the ordinary way that freight is handled, it would be so much out of shape when returned, that it would be impossible to put it together again.

To Build Up Order

The following is a part of the letter sent out by the Supreme Nine of the Concatenated Order of Hoo-Hoo to all Vicegerents.

The new Supreme Nine extends greetings and good wishes to all of the Vicegerents as we enter upon the New Hoo-Hoo Year. Many of you, like most of us, are serving our great order officially for the first time. We of the Supreme Nine strongly realize that the success we all so much hope for this year depends very largely upon the earnest, faithful, enthusiastic work of the Vicegerents. The nature of our order does not require very much administrative machinery, but for that very reason a very large responsibility rests upon the comparatively few officers we have. Let each one of us do his best to put Hoo-Hoo upon a firm and lasting basis.

As we thus enter upon our new duties we have had placed before us some guiding principles which it is hoped will be faithfully followed during the year. We call your especial attention to the closing paragraph of the report of the Committee on Constitution and By-laws at the late annual held at Asheville, N. C., which reads as follows:

"Your committee further recommends that at its earliest convenience the Supreme Nine carefully prepare additional suggestions and instructions to be sent each Vicegerent, urging upon him that greater care be exercised, both as to the character and standing of men initiated and the conduct of Concatenations, to the end that the personnel of Hoo-Hoo shall be brought to a higher standard, and all of its meetings be invested with greater decorum and dignity."

Sulphite Production in Canada

One of the largest producers of sulphite pulp has furnished the United States Consul at Ottawa with a memorandum concerning the amount of sulphite and sulphate pulp manufactured for sale in Canada compared with 1907.

According to this statement, there is now some forty per cent. less sulphite produced for sale in the Canadian market than there was five years ago, or, including the sulphate pulp, the present production for sale is twenty per cent. less. The mills' daily production for sale

is given as follows, the mills starred being users of sulphite pulp in their own paper manufacture. The amounts given for these are surplus productions.

The history of sulphite making in Canada has in the past resulted unfavorably to a number of mills. The business, however, is now profitable and increasing in volume, but my correspondent expresses the belief that it is not likely to increase in production much more rapidly than the Canadian demand for sulphite pulp.

The amount of unbleached chemical pulp now being exported annually to the United States from Canada for sale is said to be between 40,000 and 50,000 tons, the balance of the export being destined for paper mills owned by the companies producing the sulphite pulp. It is claimed that the amount of Canadian sulphite exported to the United States for sale in the open market is less than it was a few years ago, while European shipments of this character to the United States have increased very materially.

Government Forest Management

.. By J. R. Dickson, F. E. ... ...

There is a tendency among people to view the lumbering industry and all it implies, from too narrow a standpoint; a tendency to regard the lumberman as the sole beneficiary in the exploitation of our timber resources and the great and only sinner concerned and responsible for the deplorable way in which so much of our timber land is to-day being destructively mined instead of intelligently cropped. This is wrong.

The lumberman, in large measure is not a felon, but a useful member of society, whose enterprise creates more wealth for his fellows than for himself. It is true that in doing so he is usually reckless in sacrificing the future producing power of the forest, but let us be careful to place the blame for this, not at his door, but where it truly belongs—with the body politic which permits and even encourages this thing, by stupid taxation laws, and the absence of any earnest attempt to enforce existing regulations through the actual and effective supervision of trained men on the ground.

In a word, then, this economic sin is consequent on the serious failure of the nation and the community to realize in this matter their own best interests as affecting this generation, their great and patriotic responsibility as affecting the next and all following ones. This, too, although we Canadians have only to look across at the Lake States to see a striking picture of what happens when a people or community permit their timber wealth to be exploited by unregulated private greed.

The people of the United States allowed the lumbermen to mine, instead of assisting him to crop, their once virgin forests, and already this "limitable" resource has almost vanished. In recent years hundreds of sawmills supporting thousands of workmen have been forced out of business, leaving behind them vast denuded, fire-swept wastes, now growing only scrub oak and brambles, yet these very sand barrens might to-day and forever have been producing an annually increasing timber crop, had a forest policy been adopted in time, and a few trained foresters been employed and empowered to make the lumbering industry permanent. Never doubt it.

That old time prophet was surely thinking of forestry when he said, "for want of a vision the people perish." Certainly from every standpoint, to secure their own best immediate and lasting interests the people of any forest supported or aided community must look ahead, and co-operate with the lumbermen on a just and rational basis commensurate with the mutual benefits received. For every dollar the lumberman nets he pays out to you and to me at least three dollars for labor, machinery, supplies, transportation, stumpage and taxes. The fact is that even after selling any given timber limit the public still has a greater business interest in it, both direct and indirect, than has the lumberman who ostensibly owns it.

Here in Canada the nation or province happily owns the land, the community supplies the labor, and the lumberman brings the capital and enterprise. What more right and natural than that this trinity of interests providing respectively the three elements of wealth production should co-operate cordially on a proper basis of rewards and responsibilities, in guaranteeing that our forest land shall be permanent producer of increasingly valuable dividends.

Inasmuch as the first move toward this end must come from the people, I would suggest the advisability of each government concerned requiring all lumbermen operating within its domain, on absolute forest land to submit annually an estimate covering the amount and location of the timber which it is proposed to log during the ensuing season.

Then, as fast as men with the needful training and judgment to do the work can be obtained, the timber properly removable from these cutting areas should be definitely marked, and later on, its removal during the logging operations should be carefully supervised. This will insure full utilization of all marked trees, adequate care of the unmarked growing stock, and a reasonable disposal of the lumbering debris, in accordance with given requirements.

Splendidly Equipped Lumber Yards

Elsewhere in this issue will be found the advertisement of George I. McClure, wholesale hardwood lumber merchant, of Detroit, Mich. Mr. McClure's yards are among the most completely equipped in Michigan. Located therein is the storage warehouse of the Hanson-Ward Company of Bay City, which is under the management of Mr. McClure. The building is 140 x 50 feet and contains at all times a complete line of maple and oak flooring, veneered panels, stiles, rails and doors. The Hanson-Ward line is well known and is characteristic of the high grade of lumber carried by Mr. McClure in his own business. This firm specialize in mahogany, walnut and cherry, and can ship direct from mills or from Detroit. Associated with Mr. McClure in the conduct of the business are his brothers, Charles McClure, Robert McClure and Harold McClure, all with long experience in the lumber business.

Tobins Limited of Ottawa

Tobins Limited of Ottawa, manufacturers of tents, awnings, blankets, etc., are this season carrying a special line of lumbermen's supplies, which should appeal strongly to the trade. Their blanket department is complete with a varied line from the cheap shanty blanket to the all-wool covering, including a fine line of horse blankets and tarpaulins. Besides the ordinary line of oilclothing they are carrying a special high grade English make, of gloss finish, which is greatly superior to the ordinary brands. They are catering strongly to the lumber trade in tents, tarpaulins, blankets of all kinds, house covers and oilclothing and their large and spacious factory is prepared to take care of all orders from any part of the country.

We direct attention to the enlarged advertisement of the Imperial Timber & Trading Company, Ltd., Vancouver, B.C., in this issue. The Ontario orders booked by this firm have shown a healthy increase during the past two years, which they are no doubt justified in attributing to the uniformly high quality of the stock sent forward. The firm specialize in long timbers, but supply all B. C. products on demand.

We'll Stand the Cost of J-M Permanite Packing if it Doesn't "Make Good"

We have so much faith in J-M Permanite Packing that we are willing to accept your order and let you test it entirely at our risk.

We put it up to the Packing. And you are to be the judge as to whether or not it makes good.

Try it on the most troublesome joints in your whole plant—joints which heretofore, with other packings, have needed constant attention.

If J-M Permanite Packing doesn't put an end to the troubles these joints have been giving—if it doesn't make them permanently leak-proof,—if it doesn't eliminate the need for following up—then return what you have left and we'll refund the full amount of our bill. The trial won't cost you a cent.

Surely it's well worth your while to find out—under the protection of our money-back offer—whether J-M Permanite Packing will put an end to those leaky joints and all the vexations and delays they cause.

Send our nearest Branch your order now with the above understanding, stating the conditions you have to overcome and the size of packing desired. We're making you a straightforward offer on which you have nothing to lose. We take all the risk.

EDGINGS

Ontario

Hammond Bros.' sawmill at Gorrie, Ont., is reported to have been sold.

J. A. Duval & Sons' sawmill at St. Marys, Ont., was recently injured by fire.

Wm. Welsh, Hensall, Ont., has moved his planing mill from that place to Toronto.

The Algoma Hardwood Flooring and Lumber Co., Ltd., Steelton, Ont., have been incorporated.

Smith Bros. have registered a partnership to carry on a milling and lumber business at Windsor, Ont.

The Spanish River Pulp and Paper Mills will probably have the two additional paper machines ordered recently, in operation by the beginning of February, when the paper output of the company will run about 200 tons a day.

The Beaver Board Company, Buffalo, N.Y., of which James Battle is the Canadian representative are contemplating the erection of a factory at Thorold, Ont. They have purchased a site and will apply to the council for a fixed assessment.

The city of Toronto is calling for tenders for various supplies, including lumber, cedar posts, and paving blocks. Specifications may be secured at the office of Public Works, Purchasing Department. Tenders will be received until December 10th.

In spite of several reports which have been published of late to the effect that arrangements have been made for rebuilding the large plant of Graves, Bigwood & Co., at Byng Inlet, Ont., the company report that no definite arrangements have yet been made.

Mr. J. A. Heise, lumber dealer, and sash and door manufacturer, of Stouffville, Ont., has sold out his entire business. The planing mill and sash and door factory has been bought by Mr. W. T. Boynton, and the lumber yard and general building supply business has been bought by D. M. Heise & Co. The members of the partnership are Mr. J. A. Heise and Mr. D. M. Heise. Mr. J. A. Heise is retiring from active management, and Mr. D. M. Heise will have charge of the company's business.

The Herman H. Hettler Lumber Co., of Chicago, recently closed a deal whereby it became the owner of over 20,000,000 feet of white pine logs owned by Graves, Bigwood & Co., Byng Inlet, Ont. This transaction involved an outlay of about $275,000. The Graves, Bigwood & Co.'s mill burned last May, so they had to sell their logs, of which the Hettler company secured the choicest. Mr. Hettler states that he has made arrangements with four mills in the vicinity of Midland to saw these logs into lumber. Most of the lumber manufactured in the Hettler Georgian Bay operations goes to the eastern trade.

The Lake Superior Corporation, which controls the paper mills of the Lake Superior Paper Company, have had an extremely successful year according to the report presented at the annual meeting of the corporation, held recently at Camden, N. J. T. J. Drummond in his annual address reviewed the progress made in the year ending June 30, 1912. The earnings from the operations of the subsidiary companies (paper, steel and power), he said, had amounted during the year to $1,579,000, an increase of 30 per cent. over last year. The completion of and commencement of operations at the paper mills of the company would materially increase the earnings of the subsidiary companies of the corporation, as the Lake Superior Paper Company was a large consumer of power and wood.

Eastern Canada

Jasmin & Cantin, sash and door manufacturers, Cartierville, P.Q., have been registered.

D. N. Dube's saw mill at Amqui, P.Q., was recently destroyed by fire. It will be rebuilt.

J. N. Ducharme & Fils Limitee, lumber dealers, etc., St. Eleuthere, Que., have obtained a charter.

J. H. Leboeuf & Cie, sash and door manufacturers, Ville St. Pierre, P.Q., have dissolved their firm.

Jos. Desrochers and Quevillon, sash and door manufacturers, Montreal, P.Q., have been registered.

J. & L. Bougie have been registered to carry on business as sash and door manufacturers at Montreal.

Chevalier & Frere, Montreal, P.Q., have been registered to carry on a sash and door manufacturing business.

Ferdinand Bouffard's sawmill at Bromptonville, P.Q., was recently destroyed by fire. The loss was partly covered by insurance.

The Ville St. Andre & Co.'s sash and door factory ,Montreal, P.Q., was recently destroyed by fire. The loss was covered by insurance.

A report from St. George, N.B., states that the Woodland Pulp and Paper Company are considering the erection of a paper bag mill at that place.

J. Bouffard's saw mill at Bromptonville, P.Q., was destroyed by fire on November 14th., the loss being $6,000. The mill will be rebuilt and the owner will require new machinery.

Mr. James W. Sewall, Forester and timber estimator, of Old Town, Maine, is in northern New York, making a careful sub-division and cruise of an extensive tract in the Adirondacks.

Mr. Bonner, of New York, is reported to have sold to Pennington & Gagnes, of Quebec, eighty superficial miles of timber limits in Mount Murray Seigniory, adjoining Murray Bay. The price paid was $250,000. The whole Seigniory was bought by Mr. Bonner ten years ago for $45,000.

Donald Fraser & Sons, of Fredericton, N.B., have purchased the timber lands of the Scott Lumber Company and the Oromocto Lumber Company,

including 35,000 acres of soil right land, and the timber licenses owned by the Scott Company; also licenses on 72 square miles. The price is said to have been $150,000. The Scott holdings have recently been controlled by the Bank of Nova Scotia.

Construction work has begun on the news mill of the Donnacona Paper Company, and it is expected that the news mill, which will have a capacity of about one hundred tons per day, will be completed within the next year. The site is at Donnacona, on the Jacques Cartier River, in Quebec, and the Ambursen Hydraulic Company have the contract. A power plant will be erected as well as a dam 1,200 feet long and about forty feet high.

The new natural resources department of the Canadian Pacific Railway has decided to enter on a policy of reforestation of the waste lands along its lines in New Brunswick and Nova Scotia. The company announces that, if not held up by high prices, it will buy any waste lands along these lines that are not suitable for farming, put the best foresters in the country in charge of them, and start raising trees, the idea being to specialize in trees suitable for railroad ties and pulp wood.

According to a despatch from Fredericton, N.B., Donald Fraser & Sons propose to fit up the Victoria mill at Fredericton with band saws and other modern machinery and to operate it next summer, cutting about 10,000,000 feet annually. They are asking the city to give them a fixed assessment of $10,000 for a period of 20 years. The company have practically closed their purchases of the Scott and Oromocto Lumber Company properties and intend to make Fredericton their headquarters for these operations.

The Laurentide Pulp and Paper Company, Ltd., are about to extend their plant at Grand Mere, Que. Tenders have been called for the work, and contracts are to be awarded at an early date. It is intended to start work almost immediately on the building of a new power dam, which, when completed, will make an additional 25,000 horse power available. A large proportion of this power will, for the time being, be sold to other concerns, and several offers for it are now under consideration. The new pulp digester which is being installed will be in operation by January 1, and will have an output of 30 tons a day. This output has already been sold for two years ahead. The capacity of the ground wood department has also been increased by 25 tons a day.

Western Canada

P. & A. Friesen, sash and door manufacturers, Steinbach, Man., have dissolved.

James Leigh & Sons, Victoria, B.C., are considering plans for the enlargement of their plant.

The Excelsior Lumber Co. Ltd., has been incorporated with head office at Vancouver, B.C., and capital stock of $10,000.

The Menzies Bay Timber Co. Ltd., has been incorporated with head office at Victoria, B.C., and capital stock of $300,000.

The East Coast Logging Co. Ltd., has been incorporated with head office at Vancouver, B.C., and capital stock of $50,000.

Hill-Tout & Anderson have started a small mill at Abbotsford, B.C. They have a tie contract that will keep them busy for eight months.

A law suit has developed in Vancouver between Mr. Geo. Barbey and the sellers of thirteen timber licenses, involving $300,000. Mr. Barbey claims misrepresentation.

The mill of the Wattsburg Lumber Company at Proctor was totally destroyed on the first of November by a fire which is believed to have been started by an incendiary.

At Green City on the Nelson & Fort Sheppard line, East Kootenay, B.C., Mr. Peterson and associates, who own 19,000 acres of limits there, will build a large mill to employ 200 men.

The Kerr & Adams Manufacturing Co., Ltd., has established a woodworking plant at Humboldt, Sask. The company will manufacture high-grade millwork and interior finishing materials.

L. Robinson and J. Shrive will erect a large planing mill at Sutherland, Saskatchewan, on a site covering four and a half acres. The plant will be equipped for manufacturing special work and furniture.

Recently the British Canadian Lumber Company completed its large mill on Lulu Island at New Westminster. About $90,000 is to be spent on a planing mill, storing sheds and permanent office buildings.

The Empire Lumber Company's saw mill at Nanoose, B.C., is almost completed and at latest reports operations were expected to be commenced in a few days. The mill has a capacity of 150,000 feet per day.

The Great West Iron, Wood and Chemical Co., will erect an iron and wood working factory at Prince Albert, Sask., at a cost of $150,000. Information may be secured from Felix Frank, c/o the Prince Albert Board of Trade.

A factory is shortly to be erected in Calgary, at a cost of $75,000, to manufacture coarse grades of paper and card-board out of straw. This will be the only plant of the kind in Canada, although there are a number of similar factories in the United States.

The Johnstone Strait Lumber Co. Ltd., have been incorporated under Dominion charter to carry on business as lumber manufacturers with head office at Vancouver, B.C., and capital stock of $500,000. W. E. Burns, barrister of Vancouver, is attorney for the company.

Johnson & Smith are building a mill with about 50,000 feet capacity at Rosedale, near Chilliwack. Mr. Johnson was for a long time woods superintendent for the Abbotsford Timber & Trading Company, operating in the Fraser Valley, about twenty miles this side of Chilliwack.

The project of a group of English capitalists announced recently will result in the opening up of large areas in pulp wood situated in the northern parts of Alberta and Saskatchewan and around Hudson Bay. The proposal is to build what will be known as the Alberta, Peace River and Eastern Railway, spanning the distance of 2,000 miles which separates Hudson Bay from the Pacific Ocean. Sanction from the Government has already been obtained for the first 400 miles of the new road. The group behind the scheme is made up of such men as Rt. Hon. Lord Farrer, of Abinger Hall, Barking, Surrey, the director of a number of large English companies. The head offices will be in Ottawa.

SCANDINAVIA BELTING — FEDERAL ENGINEERING & SUPPLIES LIMITED — TORONTO

is the original solid woven, impregnated cotton belt.
This belt is not made in plies and cannot come apart. It wears the same as any solid belt.
We can save you money on your belting maintenance, as well as your first cost.

Write for our descriptive bulletin

Federal Engineering and Supplies, Limited

TORONTO - MONTREAL

GOODHUE BELTING WILL SAVE YOU

Time—Trouble—$$

Not only in its initial cost but in the delays and accidents it will prevent.

We make these claims for Goodhue Belts, because they stretch from 15% to 25% less than ordinary belts. This feature lessens the possibilities of accidents from loose belts, and insures the utilizing of all the power generated.

The "Acme Waterproof" Belting is made for wet places, and is very popular for this class of work. Use "Acme" for the wet places in your mill—it will save you hours of trouble and unnecessary delay.

Our Literature will interest you—write for it.

J. L. Goodhue & Company, Ltd., Danville, Quebec

Schacht

—The Lumber Truck that Builds Big Business

Do you know that one Schacht Lumber Truck is worth more to you in dollars and cents than six to eight teams and wagons?

Men who have experimented say that horses can no longer compete with motor trucks in the lumber business.

Won't you let us show you where you can save money on your 1913 operating expenses?

Our booklet will be mailed free on request. Write for it.

Schacht Motor Car Co. of Canada, Ltd.

Hamilton, Ontario

The Truck with Good disposition — built for Canadians with Canadian money.

A Few Specifications—

Motor, 45-50 H.P., four cylinders.

Ignition, magneto, with double system.

Oiling, plunger pump in crank case, separate feeds to all bearings, with splash system.

Clutch, cone, thermoid faced, 15½ in. diameter.

Transmission, selective sliding gear, 3 speeds, forward and reverse.

Emergency Brakes, internal, expanding on rear wheels, 18-in. drum. Service brakes on each end of jackshaft.

Frame, rolled steel channel section, 6-inch side members.

Frame, 217¾ in. long, 38¾ in. wide.

Axles, rear, rectangular, 2¾ in. wide, 4 in. deep, drop forged. Front Timken, 1 beam with solid section through centre, 2 in. wide, 2¾ in. deep, dropped forged.

Bearings, Timken roller bearings in wheels, jackshaft and steering knuckle, annular bearings in transmission.

Tires, 36 x 4 in. single front, 36 x 5 in. dual rear.

Wheel Base, 144 in.; tread 64 in.

Speed, 10 to 18 miles per hour on direct.

Loading Space, 11 ft. 5 in. back of seat on chassis frame.

Body, to order.

One to Five Ton Capacity

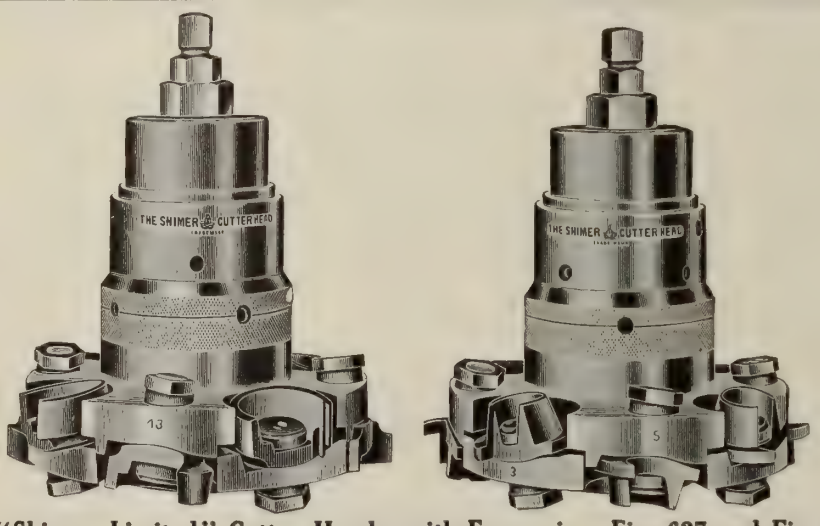
THE SHIMER CUTTER HEADS

Quality Machine Work

The planing mill man, furniture worker or any one who uses machines to finish wood products, will always find in the Shimer System of Tools the remedy for mill troubles, the power to increase output and the facilities to make a superior product.

No matter whether your work is Single Matching, Double Matching, Ship Lap, Jointing, making Glue Joints or Door and Sash patterns, if you desire to turn out quality product get the Shimer System in your mill.

Look over this page and then let us have your specifications.



The "Shimer Limited" Cutter Heads, with Expansion, Fig. 627 and Fig. 628.

For the High Speed Matcher

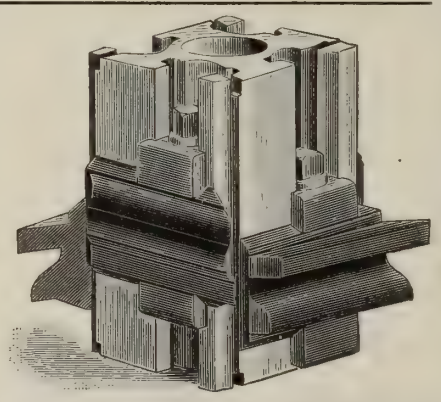
These Heads have a chucking device which self-centers them on the spindle and grips firmly thereto when the device is drawn up, overcoming the objectionable set screw as a means of fastening the Head to the spindle. It is reliable and practically perfect in results.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to the parts coming into contact with the lumber.

They are simple and strong throughout, have no delicate parts to break down or get out of order, and are safe and efficient tools for matching flooring, etc., at high speeds.

Price, net, for Flooring, $72.46 the set complete.

The Shimer Combination Head for Door, Sash, Blinds and Mouldings



The Head illustrated herewith is intended more particularly for the mills which make only a few mouldings or Door and Sash patterns and change work several times a day. Where a mill runs on stock or has much work to do we advise running the Shimer Heads with Circular Bits on account of the greater wear and the fact that the Heads are always ready to be slipped on the spindle.

This particular outfit consists of one Combination Head with one set of Sash Bits, one set of Door Bits, one set of Cope Heads with Door Cope Bits and two Sash Cope Bits for the lower Door Cope Head. The outfit is sent complete for the low price of $47.31.

The Bits are quickly changed and set to the gauge, when the Door and Cope moulds or the Sash and Cope moulds will match to a nicety. There are no complications to puzzle or annoy operators. As the Bits are moulded on the back at an angle, they work with perfect clearance and maintain standard patterns. Bits can also be adjusted for different thicknesses of Door and Sash mould.

This Head is very strong and durable and with its combinations is applicable to every class of work. It will take Bits to make Door, Sash and various other mouldings and these Bits are quickly and accurately changed and adjusted by the use of a gauge.

We guarantee these tools to be of the best material and workmanship, and will send them on 30 days trial to any responsible lumberman returnable if not satisfactory.

Send measurements at once.

Our Popular Cutter Heads

Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13/16 to 1¼-in. in thickness with tongue and groove proportions expanded to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench $40.95
Extra Bits for Flooring 11.44
Extra Bits for Ceiling 10.40

ith 4 Bits to Each Head

Jointer Heads

Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

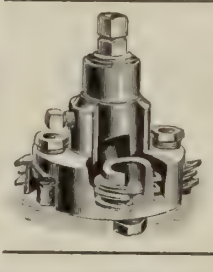
Price, Heads, complete with Bits for 15/16 to 1¼-in., net only $31.20
Extra Bits 1½-in. face, the set 10.40
Extra Bits, 2-in. face, the set 12.48

O. G. Batten Heads

Figs. 48 and 49 represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads, complete with Bits, net only $31.98
Extra Bits, each, net 2.08

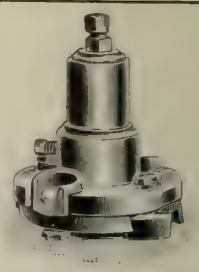
Double Ceiling Heads



Figs. 45 and 46, are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, net $40.94
Extra Bits, per set of (8) 16.64

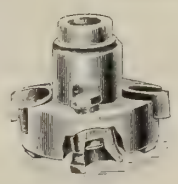
Ship Lap Heads



Figs. 38 and 39 are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices:

Heads with one set of Bits to work 15/16 to 1½-in. thick, net $34.84
Extra set of Bits 11.96

Door, Sash and Coping Tools



That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

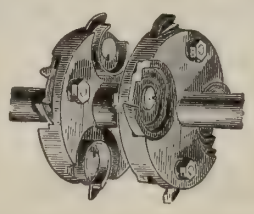
DOOR AND SASH HEADS

Fig. 82, solid flange, Door Head $10.75
Fig. 84, Expansion Door Head 13.35
Fig. 86, solid flange, Sash Head 9.75
Fig. 206, Expansion Sash Head 12.35
Bits to work 1-in. to 1¼-in. Doors, 4.. 7.28
Bits extra to work 1 to 1¼-in. Sash (2 Moulded Bits, $4.30; 2 Rabbeting Bits, $2.86) 7.16

COPE HEADS

Fig. 83, Cope Heads (2) $12.90
Coping Bits, each 1.43

The Shimer Box Board Matching Heads



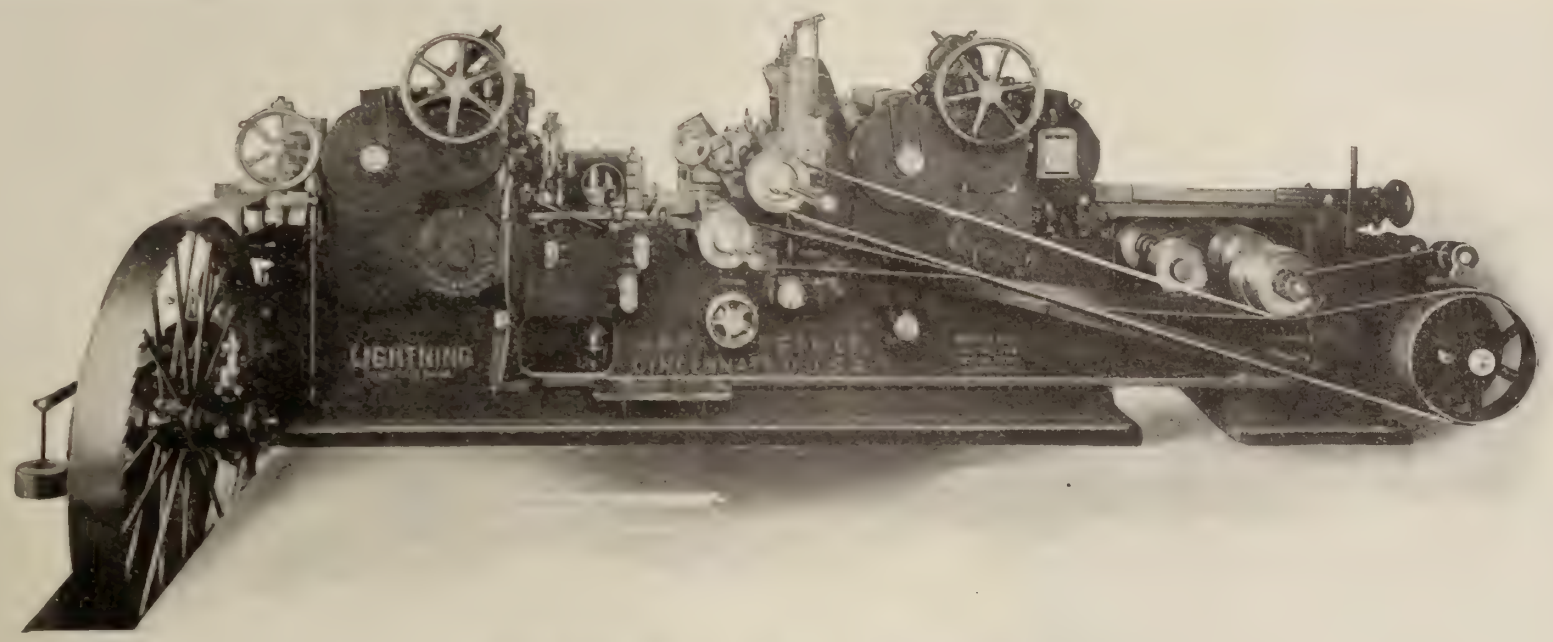
make a uniform cut and close fit, as well after years of use as when new, with no friction upon the Bits. For thicker material the Bits can be expanded.

Price for two Cutter Heads to match ⅜ to ½ inch, $29.15.

We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, $11.05.

Samuel J. Shimer & Sons, Inc.

Milton, Pa., U. S. A. - - - Galt, Ontario, Can.



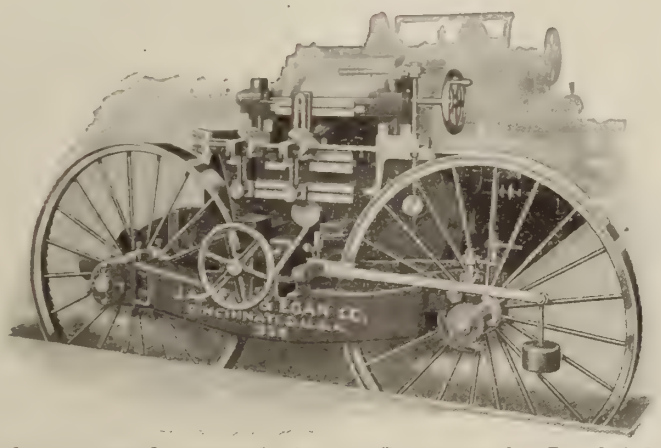
FAY-EGAN "LIGHTNING" **No. 333-335**

Matcher - Resaw

Cuts labor costs one-half—increases output 100 to 200% and raises grades 10 to 30%, in manufacturing bevel siding, ship-lap, box shooks, ceiling and flooring—

—You now use two men on the matcher and two men on the Resaw to manufacture bevel siding, ship-lap, flooring, ceiling, box shooks, etc., at 75 to 100 ft. per minute. On the new 333-335 Matcher-Resaw you can do this same work at 150 to 200 ft. and upward per minute, (a 100 to 200% increase in output) with only two men (one-half your present labor cost).

—and you save the cost of trucking and handling between the machines.



End view (guards removed) showing Resaw set for Bevel Siding, showing also easy accessibility to all parts.

—in addition to doubling and tripling capacity and cutting labor cost one-half or more, this machine will manufacture lumber without tearing out on knotty and cross grained stock, (raising grades 10 to 30%).

—Where it is possible to plane and match double thick and resaw after, this new machine will effect a wonderful saving—just figure it out for yourself.

—This new machine is a combination of our "333", the greatest matcher ever built, and our No. 335 Horizontal Band Resaw placed ***below the bed-line of the Matcher,*** eliminating dangerous overhead rigging and giving a steadier and more accessible mechanism. Blade is easily slipped off the wheels when Matcher only is to be used.

Write today for details of manufacturing lumber on a 333-335 Matcher-Resaw—"With the Resaw below the bed-line of the Matcher."

Lumber Camp Ranges and Heaters

All Kinds of Stoves for Large or Small Camps

Our stoves are specially designed to meet all requirements of camp work.

We know exactly what is necessary and desirable in this class of stove.

We put into all our stoves the best of material and workmanship coupled with the best of expert experience.

The 'Leader Range' for coal and wood, shown in this cut is specially adapted to Lumberman Camps, Boarding Houses, Hotels and Railroad Construction Camp Work. We also make this Range with side hinge doors.

It is large, heavy and strongly built. Has good oven space and large heating surface. When a good, solid, reliable stove is wanted the 'Leader' will give satisfaction.

Write for our catalogue.

Griplock Riveted Chain Belt

Cross Section of Griplock Riveted

No More Breakdowns—No More Delays

This is the slogan that users of **Griplock** Chain Belt have adopted. No hooks to be opened up, no breaking of chain belt in **Griplock.** **Griplock** is so constructed that it will withstand the severest kind of service. It is built by the Chain Belt Company, Milwaukee, Wis.; a concern that fully understands the requirements of the Lumber and Saw Mill Trade.

We would be very glad to mail you sample links for your inspection.

Locomotive Boiler on Skids

"John Bull" *Larrigans*

Wear Like Iron

WE tan the leather these larrigans are made from and know they will stand all kinds of wet and rough usage when properly cared for. We put a counter stiffener in our larrigans and sew it in with the leg when soled and heeled—a very durable feature in our goods.

Next time you buy larrigans see that you ask for **"John Bull."**

R. M. Beal Leather Co.

"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.

Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9' wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. **Brazel Plows** cut 6" wider than logging sleighs, roll snow oustide track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12" of loose snow each time the plow passes over.

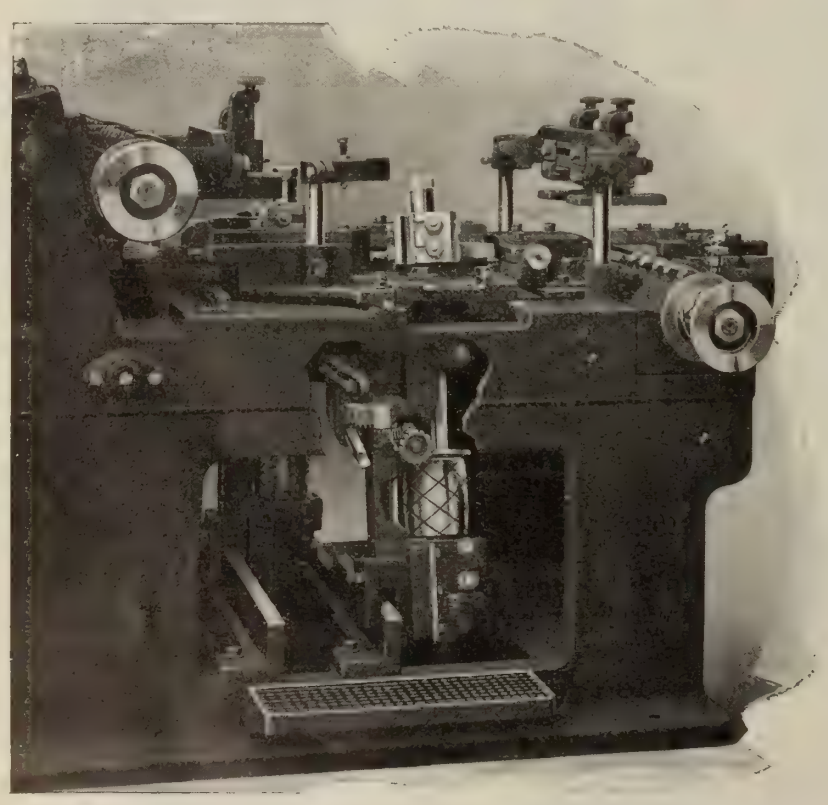
American *No. 34* Inside Moulder

This is a brand new machine. The general design and form of construction of the frame; the direct and simple system of gearing; the massive bed plate supporting the matcher legs; the side clamping boxes for both cutter heads and side head journals; the accurately fitted and easy adjustments throughout, are all features that make this the most up-to-date ***Inside Moulder*** on the market today.



The sectional view shows the angle adjustment of Matcher Legs, and the vertical adjustment of side spindles.

We have a handsome book which describes this machine fully. Let us send you one.

Instead of Repairing That Old Belt Buy a

VI-BALATA

Vast improvements have been made in recent years in the manufacture of Balata belting. No old belt however good or however well repaired could possibly give as much satisfaction as a new one of more recent manufacture.

VI-BALATA Belting embodies every improvement of importance that has ever been made in Balata Belting—it is the evolution of scientific experiment—the finished and perfect product of the most modern and complete process.

VI-BALATA Belting is preminently the most suitable for outdoor work or in any place where it is impossible to keep the belt dry, it is absolutely waterproof and stretchless.

Full particulars sent on request.

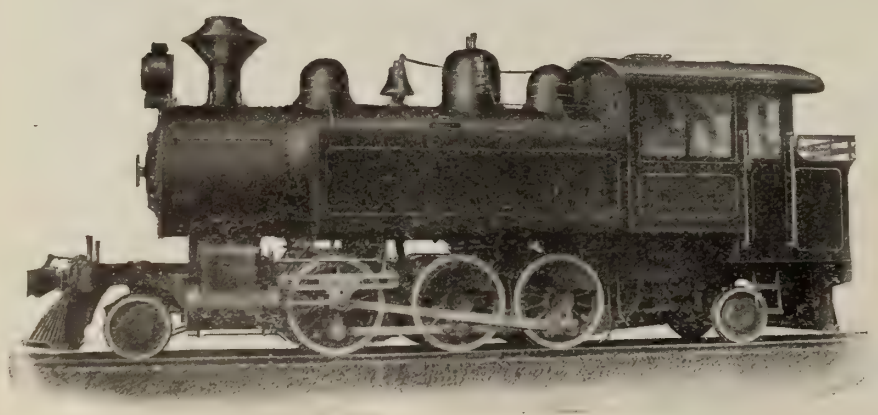
SELECTION OF LOCOMOTIVES

WHAT SHOULD BE KNOWN BEFORE YOU PURCHASE LOCOMOTIVES:—



Nature of the service.
Capacity of the cars and weight of train.
Character of track—is it new or old.
Length of haul.
Is time an important factor.
Do you want a quick locomotive or a big puller.
Distance from base of supplies and quarters for the men.
Water and coal carrying capacity.
All these items and more should be considered.
A careful study of conditions may mean larger profits.
Our experience may be valuable in considering them.
A dollar saved is more than a dollar earned.

Write or wire us, or better still, come to see us.

MONTREAL LOCOMOTIVE WORKS, LTD.

Dominion Express Building, MONTREAL, CANADA

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

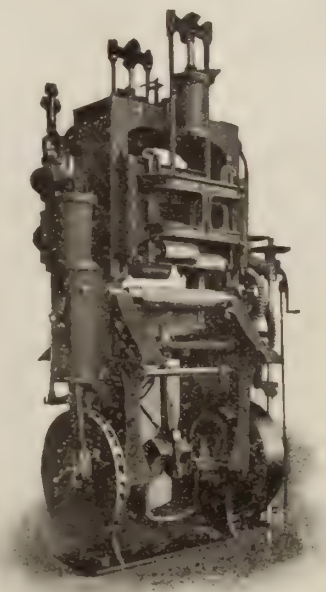
WICKES GANGS

"As Staple in a Saw Mill as Sugar in a Grocery."

FLAT GANGS Unexcelled in the manufacture of

Flooring Strips **Cedar Siding** **Shiplap**
Silo Stock **Door Stock** **Box Lumber**
Boards

from cants and flitches, from either hard or soft woods.



ROUND LOG GANGS

JUST WHAT THE NAME IMPLIES—taking all your small logs just as they come from the pond and cutting them up into boards or dimensions, getting every board there is in the log, never over-slabbing (wish we could say this of all head sawyers.) Built to handle either one or two logs at once, up to 14 in. diameter.

KEEP THE SMALL LOGS AWAY FROM THE HEAD SAW and CARRIAGE entirely, raise your cutting capacity, and install ecomony by the same stroke.

Not an EXPERIMENT, but an ECONOMIC NECESSITY.

Think it Over Carefully, then Write us for Details.

"The Gang cannot Overslab."

Wickes Brothers

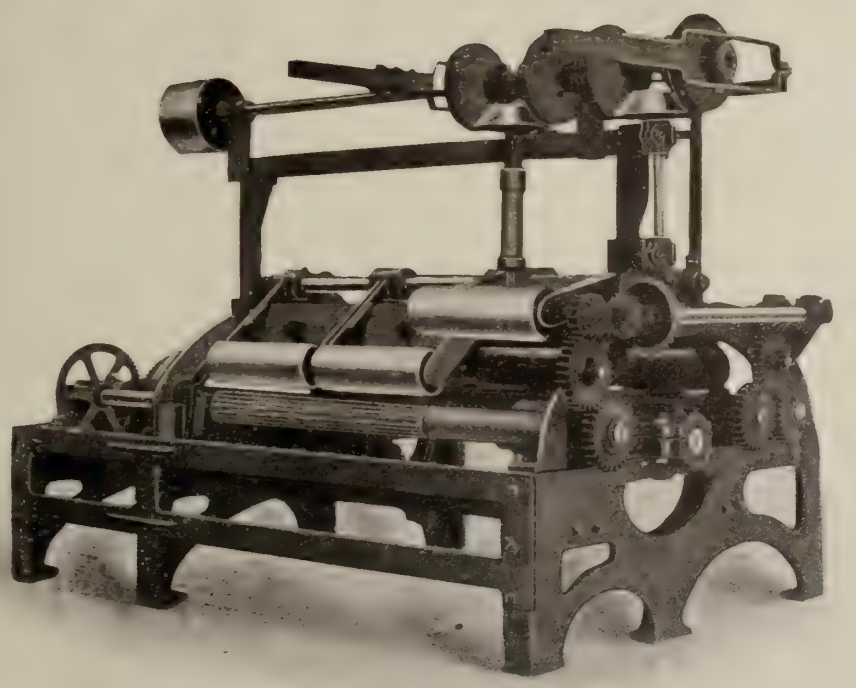
Mowry's Jumbo Edger



Our latest model is an improvement on the one illustrated here

Mowry's "Jumbo" Combined Gang and Edger is the most useful mill machine on the market to-day.

It embodies every detail of construction essential to an adequate gang edger. ¶ We have some very flattering testimonials for our "JUMBO."

Mandrel: 4½ inches by 10 feet 6 inches long.

Drive Pulley: 20 inches, 20 inches.

Saws: 2 movable saws on edger side (more if desired) 8 stationary saws on gang side, 2 water boxes.

Let us quote you when you are in the market for Saw, Lath or Shingle Mill Machinery or Repairs.

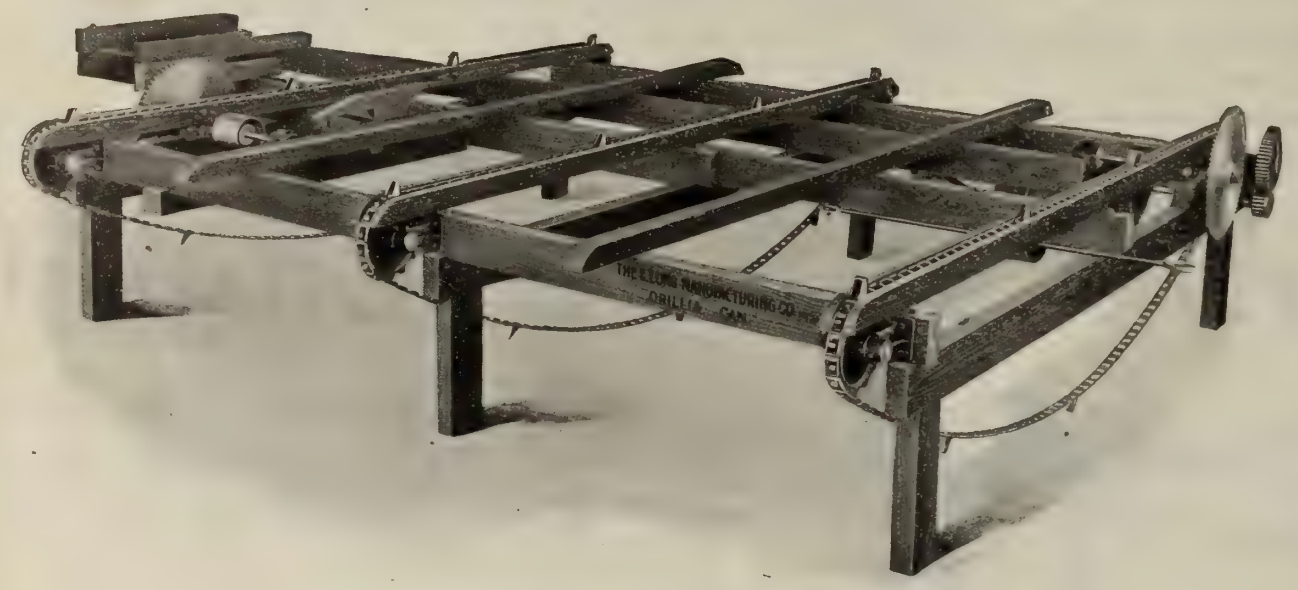
MOWRY & SONS, Gravenhurst, Ontario

The Mark of *Quality*

It will greatly increase the value of your output.

It will do a maximum amount of work with a minimum amount of power.

No. 1, Two Saw, Right Hand Trimmer



It will sell your lumber, when untrimmed lumber will not sell.

It will pay for itself in less than a season.

No. 2, Two Saw, Left Hand Trimmer

We build this style trimmer in two sizes, for Portable mills and mills of medium capacity, also automatic trimmers for mill of heavy capacity. Full information on application.

Replace that worn-out chain

"A Chain is as strong as its weakest link"

A worn-out link means a broken chain when you least expect it. In going over your mill after this season's cut you will find there are a good many feet of chain that need replacing.

We have the chain to do it right

Our line of haul-up chain includes a special type of flat and round link chain forged from the best refined wrought iron, made with 6 inch pitch and in weights from 2½ to 15 lbs. per foot. We have used it with our haul-ups and rough wood conveyors for many years and can honestly recommend it.

We also build a long link coil chain with links up to 1¾ inch diameter, which is unexcelled for a slow moving conveyor or haul-up subjected to heavy duty. A short link coil chain in size up to ¾ inch diameter used for transfer work will also give you lots of service.

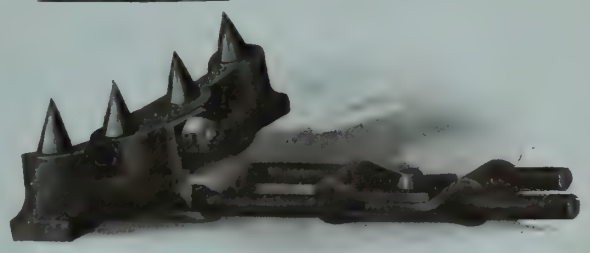
Some special higher priced forged steel and malleable chains, alligator pulpwood chain, and the well-known line of Ewart Detachable Link-Belting complete the list.

Our Chain Bulletin

just issued, illustrates these chains individually, the specials—steel, malleable and cast iron that are used with them and shows the various sprockets, idlers, spools and drums that we can supply.

Sprockets and Idlers

We build sprockets and idlers, drums and end spools to fit any style and size of chain. Our list of extensible tooth sprockets is especially complete. For nice running sprockets that are easy on the chain we can recommend our make. Supplied in weights up to 680 lbs. complete with shafts and boxes. Illustrated in Bulletin No. 108.



Sawdust Chains

Our complete line of sawdust chains comprises single and double strap and round link types. These are adapted for conveying sawdust, chips, refuse and pulp blocks and will give excellent satisfaction and long service. Supplied with sprockets and idlers, in any length. Listed in Bulletin No. 108.

Send for it—No. 108, a postcard will do

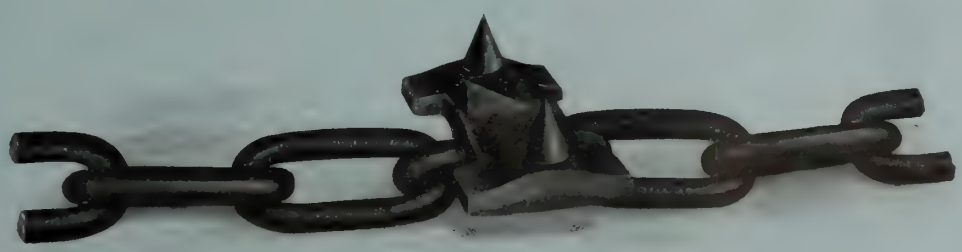
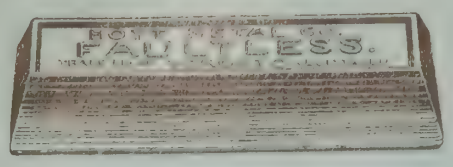
Brisbane, Australia



Haul-up and Transfer Chains

Only the best materials go into these chains. We will back them for long wearing qualities. Both coil chain and the combination coil and flat chain are tested before they leave the works, as are the specials they are supplied with. Look over our types of specials shown in the Chain Bulletin No. 108.



$5,000,000.00

worth of mixed metals is what we market every year

PEERLESS metal is compounded specially for sawmills and is the best on the market for that purpose.

FAULTLESS metal is a high grade copper hardened alloy made for heavy duty work, sawmills and engines.

Our policy is large tonnage, perfect alloys, and absolutely fair and honest treatment of the trade.

NO FRAYING AT THE EDGES

Dick's Balata Belting possesses perfect uniformity throughout, whereby true and steady running is ensured, fraying at the edges rendered impossible, and perfect success in fork driving guaranteed. The combination of strength and uniformity in Dick's Belts is due to the process of solutionizing to which the textile portion of the Belting s subjected, and which thoroughly solidifies and unites the whole material.

You can get all the facts in our Catatog No. 17.

Fully Guaranteed Sawmill Machinery

This is the only kind for you to buy to ensure satisfactory and continuous operation throughout the entire sawing season.

All our sawmill machinery is sold on an absolute guarantee of proper operation and perfect construction.

Naturally, therefore, we buy only the highest grade materials and use only skilled workmen, and everything is built under the most careful supervision.

These things are necessary to produce well built machinery, but they would be useless without proper design—and the "know how" of designing sawmill machinery can only come after long experience.

We have such complete confidence that our machinery is correctly designed that our guarantee is:

"These machines are guaranteed against defective materials and workmanship for the period of one year, and their proper and successful operation is also absolutely guaranteed. Should any parts fail through defects, we will replace them free of charge, or should any machine not work properly, we will remove it at our expense and refund any part of the purchase money which may have been paid to us."

This guarantee goes with all our machines and we have never had to take back a standard machine yet.

And back of this guarantee is our fifty years' experience building sawmill machinery for stationary mills only.

It will pay you to buy your machinery from us this winter.

Timber Limits for Sale
on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

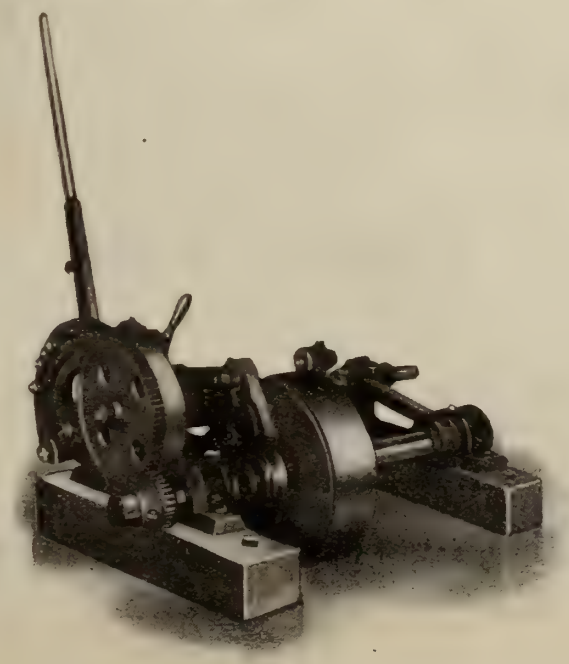
The Importance of Efficient Mill Machinery

In Millwork, where every portion of the equipment has to undergo the severest treatment with unusually hard conditions only the best machinery will serve. No mill can be run at a profit with inferior equipment. This is an expression of the opinion of men of wide and varied experience in the business.



P. Payette's Improved Mill Machinery, is built to stand all the strain and hard usage of mill work. This machinery is of the special Payette design and embodies many improvements, which add considerably to the efficiency of mill equipment.

The New Patent Saw Mill Dog which operates in soft or hardwood timber of any kind will do good even work in summer or winter with perfect safety.

Payette's Improved Set Works will set even thickness of lumber in all class of timber and will set any size log with perfect ease, Can be changed instantly so as to make either thick or thin lumber and can be put on any make of carriage.

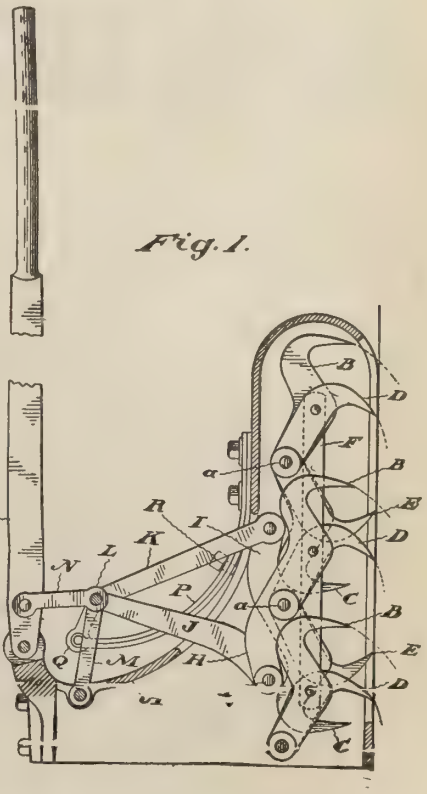


Fig. 1.

We want to prove to you the advantage of this set works in your mill and we are prepared to demonstrate its efficiency and superiority. Full information sent on application. Ask for our booklet on set works.

P. Payette & Co. Engineers & Machinists **Penetanguishene, Ont.**

HARDWOOD FLOORING

¶ We can ship from stock any quantity of Birch, Maple or Oak Flooring on shortest notice.

¶ This flooring is the best that the most modern and up-to-date machinery and skilled workmen can produce from selected woods. It is as near perfect as possible and we can guarantee every foot of it.

¶ We are also manufacturers of Hemlock, Spruce, Pine Dimension, Timber, Lath and Shingles, Interior finish of all kinds, Sash and Doors, Box Shooks, etc., all manufactured in modern and up-to-date mill and with an equipment that can supply your needs on the very shortest notice.

GARLOCK PACKINGS

Garlock Regular Rings

For all general purposes outside of high pressure work. This Packing is a special grade thoroughly lubricated with the celebrated "Garlock" compound, and is the perfected result of over thirty years experience in manufacturing fibrous Packings.

Garlock Square Duck Packing

Made of good quality Cotton Duck and friction for cold water.

Garlock High Pressure Gaskets

Absolutely heat proof, will not vulcanize or blow out under any steam pressure, being made of long fibre Asbestos Brass Wire Insertion.

Garlock Red Sheet Packing

Made of high grade Rubber compounded in such a way as to give it great strength and reliability.

This Packing has established wide reputation on its own merits.

Garlock Cloth Insertion Sheet

Used on cold and warm water pipes. Is unexcelled in pliability, smoothness of finish and strength of Cloth Insertion.

Garlock Rubber Valves

Specially made to meet specific conditions—absolutely unaffected by oils.

Before placing your next order for supplies get our prices on Leather, Rubber and Canvas Belts, Hose, Brass Valves, Babbitt Metals, Saw Blades, Files, Emery Wheels, etc. Write for catalogue.

No. 5 Rounding Chamfering, Cornering, Planing, Shaping and Boring Machine

"THE IMPRINT OF SATISFACTION"

In this slogan is summed up the whole DEFIANCE policy—the policy that has placed and maintained

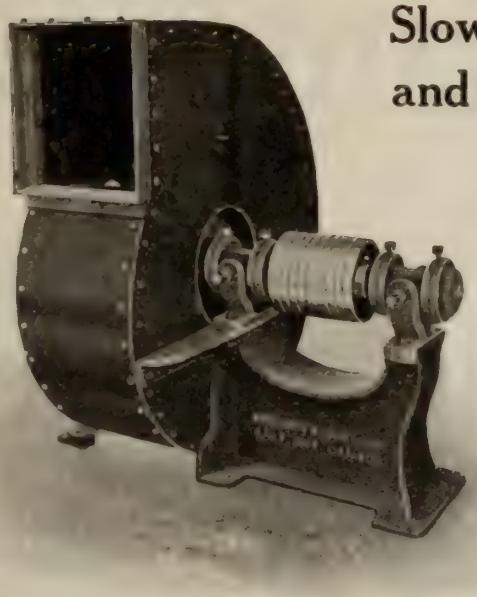
"DEFIANCE" WOOD-WORKING MACHINES

in their commanding position in the woodworking world.
This policy of making the best tools we know how to make, of giving the manufacturer what we know he ought to have, has been the DEFIANCE policy from the beginning.
Our ambition has never wavered in its determination to build upward instead of downward, therefore, today our tools are the largest selling single brand of machines in the world. It will pay you to investigate and write us for our complete catalog.

THE DEFIANCE MACHINE WORKS, 426 Perry St., Defiance, Ohio, U.S.A.

Representatives:—A. R. Williams Machinery Co., Toronto, (Ontario) St. John, (New Brunswick), Winnipeg, (Manitoba), Vancouver, (British Columbia), Reid-Newfoundland Co., St. John, (Newfoundland), Williams & Wilson, Montreal, (Quebec), W. L. Blake Co., Portland, Me., (Maine, New Hampshire and Vermont).

SHAVING EXHAUST FANS



Slow Speed and Reversible

Our Exhausters are specially adapted for Woodworking Machinery. They will handle Shavings, Sawdust, Dust, etc., (Wet or Dry) and have a saving in power and speed of 25% to 40%

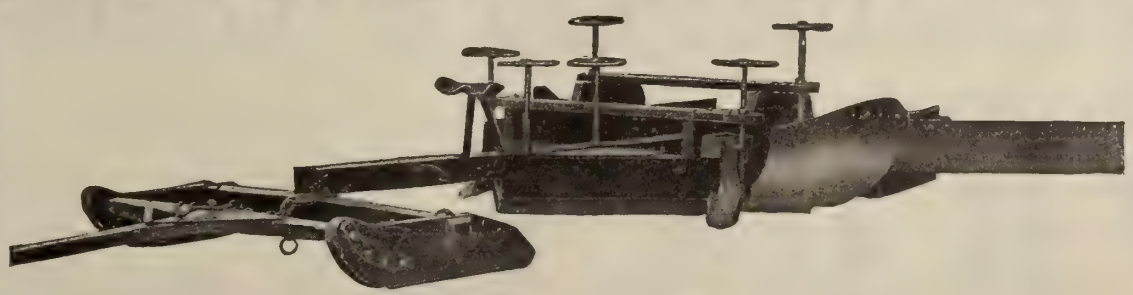
"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.



Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9' wider than sleigh track or narrower if desired. Height of mouldboards prevent snow falling back on track. **Brazel Plows** cut 6" wider than logging sleighs, roll snow oustide track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12" of loose snow each time the plow passes over.

A Belt which Conveys ALL the Power

Practical men know the drainage of power from a slipping belt, ***and because they know,*** they are buying

GOODYEAR RUBBER BELTING

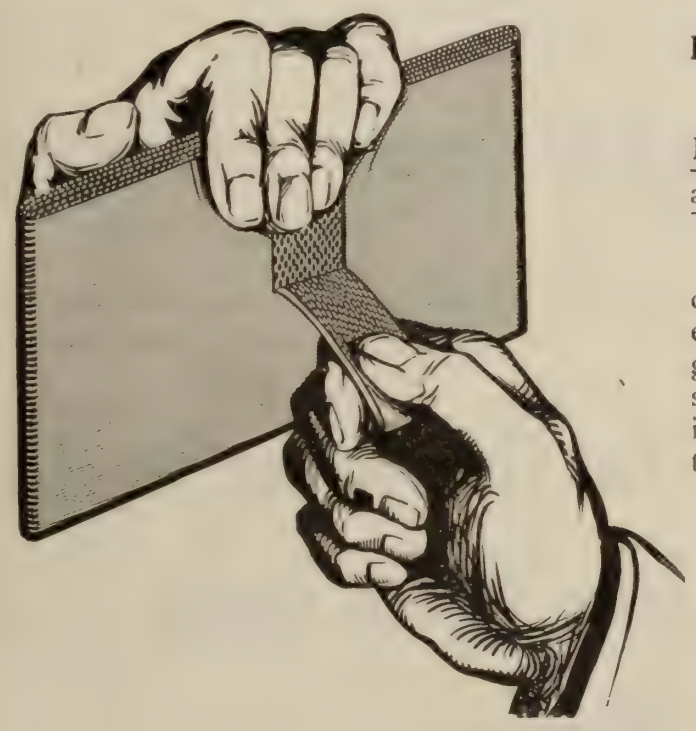
Which Neither Slips Nor Stretches

It is built up, layer upon layer, of close-woven, long-fibre, cotton fabric, rubberized and cured under Goodyear processes. And every Goodyear belt has in it the lowest possible minimum of stretch, because the belt is "cured" whilst stretched to the limit of safety in a special machine.

That is the Goodyear Method of Belt Manufacture

And the result is entirely satisfactory to belt users—a fact to which our enormously increased sales testify. What is the significance of this CONTINUED SALES INCREASE — 50% over last year? Simply that Goodyear Belting more than fulfills the claims made for it by the Goodyear people—who know what a belt should do, and make a belt to do it.

It has cost us less than $200.00 for claims or adjustment of every kind in connection with our total output for the past two years—a remarkable tribute to Goodyear reliability.



Look into the Belt for Yourself—Try to Tear It Apart.

Make a cut in the top layer—and then try to pull it apart. You will get a faint idea of its strength.

That is the result of forcing rubber at tremendous pressure through the fine cotton fabric—separating every strand—thus abolishing all internal friction or grinding. Whilst these layers of fabric are afterwards so compressed as to be almost homogeneous, the finished belt bends easily, the "duck" being so woven as to retain complete pliability in the finished belt.

For Main Drives and High Speed Pulleys GOODYEAR Belting is the Best

It has all the tensile strength necessary to absorb tremendous strain without slip, stretch or rent. The grip of rubber and the prodigious strength of hard-twist cotton fabric are united, and prove equal to every emergency.

Where the power transmitted is high, and great tensile strength is essential, Goodyear Rubber Belting proves its worth.

EVERY GOODYEAR BELT IS SUBJECTED TO A STRINGENT TEST BEFORE LEAVING THE FACTORY, and what is more, the materials used in the manufacture are also tested in the Goodyear laboratory before using.

IF YOU USE A BELT AT ALL IT WILL PAY YOU TO USE A GOODYEAR

Loss of power is loss of profit—and an inferior belt is dropping power all the time. Goodyear belting quickly earns its cost in power saved and trouble avoided.

TWO HUNDRED AND FORTY ROLLS—A TOTAL OF 72,000 FEET

We have just received an order for this quantity of GOODYEAR RUBBER BELTING from one business concern in the west, for the equipment of interior elevators. Such an order shows supreme confidence in the quality of GOODYEAR Belting.
If we have not just the belt you require we will make it for you.
In the choosing of belts our booklet would be of great assistance to you. We supply it free. Write to our nearest Branch for one.

SIMONDS SAWS

"Crescent Ground" Cross-Cuts

Make cutting easier and faster. Save time and labor.
Your hardware dealer can get this saw for you.

One of the best things for Canada lumbering was when we began making the Crescent Ground Cross-Cut Saws here at our Montreal factory. We make saws with all standard styles of teeth, but best of all, make them from Saw Steel which we get from the Simonds Own Steel Mill, and by the Crescent Ground process which the originators of this Saw in the United States have found so successful for nearly a quarter of a century.

Every Saw Covered by an Absolute Guarantee

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, December 15, 1912 No. 24

Christmas and the Lumber Jack

Christmas is upon us again and every lumber jack who is lucky enough to be able to get out of the bush and strike the trail for home to meet the old folks, is getting his turkey packed and preparing to hike down the cadge road. In these modern days many more are able to get away for Christmas than in the earlier days when railroads were not so plentiful and when the woodsman had to be content with a holiday in the bush and a celebration at camp to mark the festive season. And yet we question whether, after all, the good old days were not happier and better days for some of the lumber jacks. They stayed in the bush and celebrated Christmas in a picturesque fashion all of their own and they really felt something of the true Christmas spirit in a manner perhaps which, while rough and peculiar, helped them to feel that there was a spirit of good will afloat among men and that they themselves were performing their allotted tasks in the development of Canadian manhood. To-day, while there is many a lumber jack who gets back to the home circle for Christmas day, there are many also who do not get much farther than the first town, and who celebrate the time of good will among men by getting gloriously drunk and returning later to their work in a much less fit condition than when they left. The influence of the shantymen's Y. M. C. A. and other mission bodies is doing a lot to improve this condition, but the task is a big one and will take many a long year to reach even a reasonable success.

Christmas this year will be a joyous one for many a man in the lumber trade. During the summer which has passed the lumber business has got back upon its feet. Prices have returned to a standard at which it has been possible to save a little money and business has been better than for years past. More than this, we feel fairly safe in counting upon a good expansion in business during the coming year so that a year from now we will have another really merry Christmas.

The ideals which we all encourage at Christmas time are good ones. Even though the season is brief it puts us in a frame of mind which lasts for more than a day or two and gives us a kindly feeling for those who are less fortunate than ourselves. We have no wish to present the lumber jack in the light of a poor unfortunate, but he is a man who lives on the frontier under conditions which call for our sympathetic interest. Those who have it in their way to make the lot of the lumber jack more pleasant owe it to themselves to do what they can; and in doing so they will be doing good business, for in these days the most important and probably the most expensive factor in lumbering operations is the cost of labor. By looking well after the interests and the comforts of the men in the bush the lumber operator will be increasing the return on his money. But let him forget this feature of the case for a few days at Christmas and commence a genuine movement in the direction of studying the interests of the men in the woods.

A great change has come over the life of the lumber jack of late years. The operator has in most cases learned for himself the importance of the ideas which have been referred to above, but there is still room for improvement even in the best camps of to-day. In wishing our readers a Merry Christmas and a Happy New Year we hope that all who have camps in their charge will hand along the good cheer and give the lumber jack also the benefit of all that is coming to him.

Exports of Wood to the United States

Statistics of the exports of wood and manufactures of wood to the United States, which are published elsewhere in this issue, afford several interesting points of comparison between the trade of the present year and of the four preceding years. The total exports of wood and manufactures of wood to the United States were valued at $30,065,206 for the fiscal year ending March, 1912, being the smallest during the past five years, with the exception of 1909, when the total was $29,595,046. The highest value of exports during the past five years was in 1910, being $36,120,828. Practically the same relation exists in the exports of manufactured wood, the total of which during the year ending March, 1912, was $25,444,986, which was the smallest of any of the last five fiscal years. The year 1910 showed the largest value of manufactured exports of wood, the total being $31,778,622.

The exports of planks and boards during the fiscal year ending March, 1912, were valued at $13,634,108, which represented the value of 776,992,000 feet. During the fiscal year ending March, 1911, the total was 847,948,000 feet, valued at $15,948,791, and during 1910 the exports of planks and boards to the United States totalled 970,413,000 feet, valued at $17,877,863. The exports under this head for the fiscal year ending March, 1909, amounted in value to nearly $15,000,000, and those for the fiscal year ending March, 1908, to $15,341,263. It will be seen, therefore, that exports under this head to the United States during the past fiscal year were smaller than those of any of the four preceding fiscal years, although the quantity of exports under this heading during the fiscal year ending March, 1912, was practically identical with the quantity during the fiscal year ending 1909.

Exports of pulpwood amounted to 879,775 cords, valued at $5,697,901. During the two preceding years the values were a little over $6,000,000, and during the two years previous to that, the values were about $4,500,000.

Exports of wood pulp mechanically ground amounted to 3,728,141 cwt., valued at $2,834,329. This shows a decrease compared with 1911, when the total was 4,673,922 cwt., valued at $3,796,427. Compared with 1908, 1909 and 1910, the exports under this head show an increase. The exports of chemically prepared wood pulp amounted to 834,483 cwt., valued at $1,585,615, which is an increase over 1911, a slight decrease as compared with 1910, and a slight increase as compared with 1908 and 1909.

The revenue from Crown lands this year will be considerably less than the amount collected last year, according to the returns being made to the Department of Lands and Mines for Ontario. The rev-

enue last year from the several sources totalled $1,711,438. Of this $426,718 was bonus, $1,173,283 timber licenses and fees, $104,525 ground rent and $7,110 transfer fees. The falling off is due to the decreased cut.

Imports of Wood from the U.S.

During the fiscal year ending March 31st, 1912, pitch pine to the extent of 91,441,000 feet, valued at $1,929,923, was imported into Canada from the United States. During the fiscal year ending March 31, 1911, the imports amounted to 94,048,000 feet, valued at $2,111,818. During these two years the imports were much greater than during the three years preceding, but the value of the imports of pitch pine showed, comparatively speaking, a considerable decline. During the fiscal year ending March 31, 1910, the imports of pitch pine amounted to 42,341,000 feet the value of which was $1,028,423. During 1909 the imports amounted to 42,317,000 feet, valued at $1,049,668. During the fiscal year ending March 31, 1908, the imports of pitch pine amounted to 68,946,000 feet, valued at $2,170,143. It will be seen from these figures that the imports for the year 1908 amounted to a little over two-thirds of the imports for 1912, and yet the value of the 1908 imports was $240,000 greater.

The imports from the United States of sawed boards, planks, deals, etc., subject to duty, during the fiscal year ending March 31, 1912, amounted to 52,538,000 feet, valued at $687,659. These imports have shown a rapid increase during the last few years. In 1911 the total was less than half that of 1912, namely 22,848,000 ft. In the years preceding the figures were as follows: 1910, 7,617,000 ft.; 1909, 6,942,000 ft.; 1908, 4,537,000 ft.

The imports of oak lumber during the fiscal year ending March 31, 1912, amounted to 62,280,000 ft., valued at $2,411,766. In 1911 the total was 57,519,000 ft., valued at $2,316,618. In the three preceding years, the imports were as follows: 1910, 50,556,000 ft.; 1909, 32,220,000 ft.; 1908, 54,536,000 ft.

Under the heading of sawed or split boards, planks, deals and other lumber dressed on one side only, which are free of duty, the total imports for the fiscal year ending 1912, were 378,202,000 feet, valued at $4,984,737. This total was nearly double that of 1911, which was 193,177,000 feet. The value, however, of the 1911 imports was, comparatively speaking, much greater than those of 1912, being $3,496,496. During the last two years the imports were a great deal higher than during the three preceding years, which were as follows: 1910, 84,666,000; 1909, 50,811,000; 1908, 79,013,000. It will be seen, therefore, that the imports under this heading for the fiscal year ending March 31, 1912, were greater than those of the three years 1908. 1909 and 1910 combined.

Statistics of the export and import trade of Canada for the twelve months ending with September, 1912, are now available. Canada's exports of forest products for that period amounted in value to $41,968,315, as against $40,970,101 in 1911, $47,798,570 in 1910 and $44,808,647 in 1909. For the twelve months ending September, 1912, the exports of forest products stood fourth in the list, being exceeded by those of agricultural products, mining products and animal products. For the six months' period ending September, 1912, the exports of forest products occupied the same relative position as during the twelve months, the total being $23,810,713, against $22,807,072 during the corresponding period of 1911, and $27,267,228 during the corresponding period of 1910.

Demurrage Rates to be Increased

Canadian shippers received a pretty raw deal the other day, when the Dominion Board of Railway Commissioners, with remarkable haste, granted the application of the railway companies for permission to increase the demurrage charges. True, the railway companies were not permitted to put into effect the full increase they were seeking, but they were given permission to double the charge for the first demurrage day and to charge three dollars for each succeeding 24 hours. Contrasting the speed with which the railway companies were accommodated in this case with the length of time which it frequently takes for the shippers to secure redress when it is required, one is led to a belief that the Board in the present case have not given the interests of the shippers sufficient consideration.

The railway companies were very shrewd in bringing their application before the board at a time when shippers all over the country were complaining of the shortage of cars. They practically based their application upon this situation, claiming that with an increased demurrage charge cars would be returned into service more quickly by the shippers and that there would be an improvement in the car situation. This point will bear close watching by the shippers and there is this consolation in the result of the case that it will give the shippers an additional argument in favor of granting the application of the shippers for reciprocal demurrage.

In the State of California, reciprocal demurrage is in force and the conditions in Canada to-day call for it as forcibly as do those in California. It is doubtful in fact, whether a more unbearable situation could be imagined than the present one in Canada, where it is next to impossible to obtain cars for shipping goods, and where the railway company is able to make exhorbitant charges for delay in unloading cars which is in many cases directly due to their own inability to avoid delivering cars in bunches.

Now that the order of the Board of Railway Commissioners has been granted in accordance with the application of the railway companies, there is little left for the shippers to do but press their appli-

Christmas 1912

A slap on the Back
A glad word in the Ear
Makes a Good Fellow
Thruout the whole Year

New Year 1913

cation for reciprocal demurrage. Their claim for this was justified clearly before the present situation developed. It is now so strong that we cannot but believe that the Board of Railway Commissioners will make an order bringing it into effect at an early day.

A report of the application of the railway companies for the increased demurrage charges and of the finding of the Board of Railway Commissioners upon the application will be found in another section of this issue together with some interesting comment upon the subject by a well-known Montreal lumberman.

In view of the situation as it now stands, shippers ought to leave nothing undone which will assist them in securing reciprocal demurrage. If higher demurrage charges will remove any of the car shortage, reciprocal demurrage ought to put a complete end to it. Lumber shippers ought to send facts of their inability to get cars to the Dominion Board of Railway Commissioners at Ottawa. If all would do this for a short time the Board would quickly realize that the troubles of the shippers are even greater than those of the railroads.

Discrepancies in Freight Car Weights

Many discrepancies occur from time to time in connection with the weighing of car loads of lumber in the United States. The same applies to Canada and, we suppose, to every country under the sun where shipments of lumber are made. In Canada we are continually bringing matters of this sort before the Board of Railway Commissioners. In the United States the same problems are being discussed continually before the Interstate Commerce Commission and at present one which is of considerable interest and importance is under consideration. A meeting of the Commission was held at Boston on November 25th, when the National Wholesale Lumber Dealers' Association through its traffic manager presented evidence covering some 50 shipments on which incorrect weights had been assessed. The evidence showed that errors had been made in calculation; weighing figures had been transposed and the wrong tare weights had been inserted. Several instances were cited where investigation failed to develop that the cars had actually been weighed, notwithstanding that the gross, tare and net weight figures had been inserted on the billing. Other cases showed that the assessed weights were exhorbitant when compared with recognized estimates. Evidence was also presented covering 50 shipments which were loaded on flat and gondola cars equipped with car stakes, and on which no car stake allowance had been made at the time of scaling.

A resolution was presented to the Commission which had been passed by the National Lumber Manufacturers' Association and the National Wholesale Lumber Dealers' Association. After reciting the unsatisfactory condition at present in existence, the resolution suggested that the Commission should require the railroads to show on the bills of lading, the gross, tare and net weights, less allowance for stakes, dunnage, etc., on each car, or furnish a weight certificate. In case the consignor or consignee should request another scaling, the resolution suggests that it should be weighed at the next point ahead of the car and if a difference of over 1000 lbs. be shown, the weights authorized by the various lumber associations should be recognized. The resolution also suggested that a joint committee should be appointed consisting of railroad officials and lumber shippers who within a reasonable time should agree on a schedule of weights to be used between the parties.

Editorial Short Lengths for Busy Readers

The annual destruction of young evergreens for use as Chistmas trees has taken place this year to probably a greater extent than in former years. It is certainly the duty of the Governments concerned and their departments of forestry to take steps which will prevent this from occurring in future. A concrete example of the destruction involved will probably bring the matter home very definitely to all who are in any way interested. A well known lumberman in Toronto recently saw at the railway crossing on Queen street east no less than eleven flat cars loaded with young spruce trees destined for use as Christmas decorations. He estimated that there were probably about 1200 trees in a car load at least, as they were packed very tightly. They formed a solid mass of boughs reminding one of the manner in which hay is packed for shipment. These young trees, all of which had passed the dangerous period of their early growth were practically all certain to develop into full sized trees not many years hence. Now they have been cut down and wasted all for the celebration of an event which could be just as well celebrated in some other manner, or with trees equally effective, but made of some artificial material. We have called attention of this matter regularly at Christmas time each year. We hope that the Conservation Association and the Government will soon do something to stop this waste.

The Pennsylvania Chestnut Tree Blight Commission has just issued for the information of the public, Bulletin No. 1, a brief, illustrated publication giving the means of identifying the chestnut blight disease and suggesting remedies for its control and eradication. The interesting document points out the great danger of extermination that menaces Pennsylvania's vast chestnut resources, and urges a prompt and vigorous co-operation generally in the effort in progress to stamp out this new, but terribly destructive pest. The disease has already entailed losses to timber owners in Pennsylvania amounting to fully ten millions of dollars, having been especially virulent in South Eastern Pennsylvania, where thousands of both old and young chestnut trees were killed by the blight. West of the Allegheny Mountains, through a concentrated effort on the part of the employees of the Commission and with the co-operation of timber owners and others, the blight will practically be wiped out by the close of the year, thus giving the assurance that a large portion of Pennsylvania's many millions of dollars worth of chestnut may be saved, and the disease checked before it can spread into the valuable timber of adjacent states. Copies of the bulletin are available and will be sent without charge upon request, by writing to the Commission, at 1112 Morris Building, Philadelphia.

With a view to disposing of all the fringes and gores of forest land that have been left over after the survey of timber limits in British Columbia, cruising parties for the provincial government are now out measuring up the timber on numerous fringes of timber land at Pender Harbor, Powell Lake, Gordon Pasha Lake, Deer Bay, Deception Sound, Redondo Island, Point Grey and Green Point Rapids. Timber Inspector McKay states that so soon as the cruisers' reports are received, the timber will all be put up for public sale. Sealed tenders will be invited and the government will dispose of the timber to the highest bidders. All burned over timber lands in the coast district are also to be surveyed forthwith, and the timber thereon offered for public sale. Fires last year on the upper Fraser are stated to have swept through immense areas of spruce and tamarack, which, like the white pine, are unfit for use unless cut within two seasons after fire visitation. After that time such timber is usually eaten into by insects, while the sap is drawn back into the earth from the dead trees, and they rot at once. In the case of cedar, fir and harder woods, the timber will keep alive much longer. It will be necessary to log off the upper Fraser limits in 1913 and 1914 if the timber is to be saved from total waste.

THE CHRISTMAS TREE AT PINEVILLE

HAPSBURG LIEBE

IT was a little town—perhaps to say it was a village would sound better. It had been made and afterward kept in existence by the big sawmill that stood down beside the river, now fringed with ice. To the east and to the west, to the north and to the south, lay vast stretches of timberlands more or less cut over, but still able to furnish the monster sawmill with many more years of work.

Being isolated from the rest of the world, the people of Pineville were much on the order of one big family. There were never any dissensions, no factions; all was cordialty and kindness among them, and such a thing as different degrees of society was totally unknown. The company which owned the lumber operations was a good payer, and supplies were never wanting.

Consequently the Pineville folk mourned little over their solitude. When mill foreman John Fenwicke suggested an innovation in the shape of a Christmas tree, he was immediately lauded for his thoughtfulness by the men to whom he mentioned it, who were Arthur Allen the sawyer, and Billy Hixon the filer. Then the three talked the matter over with the entire mill crew, and every man of them fell in with the idea with great enthusiasm—and at the same time reached for their pocketbooks, which proved that the spirit was there.

The result was that the next river steamer carried to Bartow, the nearest city and a seaport, a comparatively large order of the things that go to make up the line of presents one usually sees dangling from candle-lighted green branches, with artificial snow and glittering decorations.

The presents came in due time, and the crew chose a committee of three to arrange the tree, which had already been brought and erected in the back of a large vacant cabin in the outskirts of the village. The committee composed of the foreman, the sawyer, and the filer, had gathered on Christmas afternoon to prepare everything for the coming evening, when the event was to take place. The others very thoughtfully remained at home that they might not bother, and that the surprise might be more effective.

For what, indeed, is Christmas without a surprise?

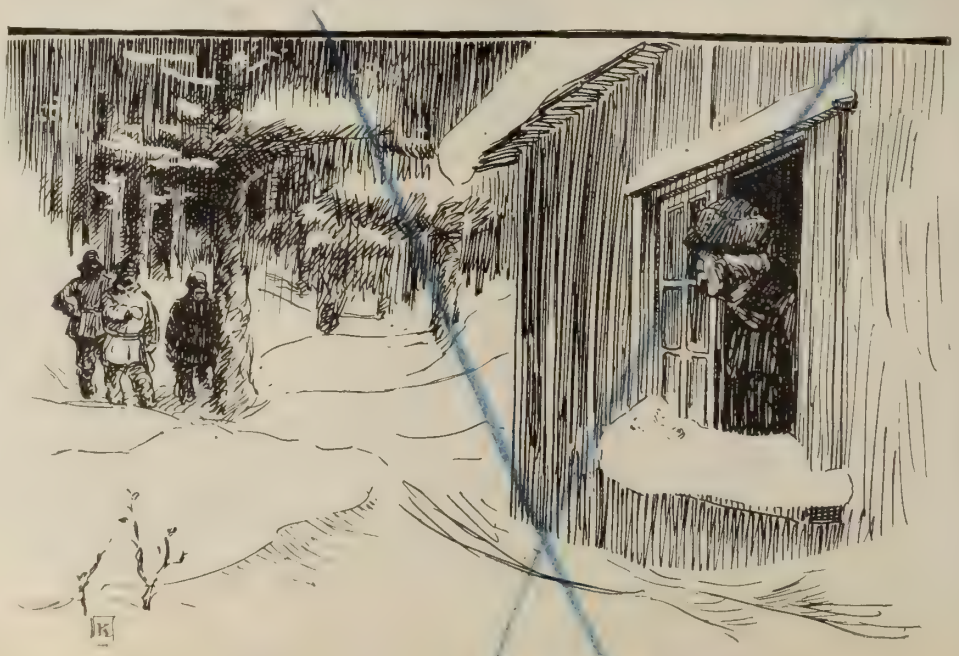
As the three stood surveying the packages and bundles, the dolls and sweets and air rifles for the children, the sawyer gave an exclamation of regret, then turned and gazed thoughtfully out of the nearest window and to the sparkling snow.

"What's wrong," asked Fenwicke—"forget something?"

"As sure as you're a foot high," said Allen, facing the foreman.

"There is one little woman here who had no husband to hand in his list; and the rest of us, in our own enthusiasm, forgot to get her a single thing. I mean the Widow Morgan, Big Jack's wife.

The other two frowned also, and for a moment there was a silence that accorded illy with the outlay of gifts, the Christmas spirit, and the waiting tree of green in the back end of the cabin.



"We're coming to climb your Christmas Tree and shake it."

It was a pitiful story, the story of Big Jack Morgan's wife. Big Jack had gone down to Bartow just a year before, and had never come back. Inquiries had revealed only the fact that he had drank rather heavily—a thing which he rarely did, be it said to his credit. And for reasons regarded sufficient by the good folk of Pineville, this bit of information had been well hidden from the ears of the little woman who still sorrowed for her giant of a husband.

Morgan's presence had many times been wished for by the men of the isolated sawmill village, because of the rowdyism of several fighting men from a town to the north called Wolfton. These rude fellows, since Big Jack had been gone, had taken a keen delight in stalking through the crooked streets of Pineville and daring its men out for a fight. The men of Pineville were not cowards; they were there for the sole purpose of working hard and saving their money, and fighting was a thing that came utterly foreign to them. However, so insolent had the Wolftonites been on certain occasions that only the influence of the Pineville women had prevented some very lively jousts.

It had been different in the time of Big Jack Morgan. He had been the greatest fighter of his time, and he had left his footprints on the faces of more men than one. Big Jack had been the law, and the natural protector of Pineville; and the Wolftonites had feared him much.

"What," asked Hixon, looking from one of his friends to the other, "are we going to do for a present for the little widow?"

"Search me!" replied Fenwicke and Allen in a breath, each throwing his hands outward in a gesture of utter helplessness.

"Money wouldn't do, of course," mused the filer, thoughtfully rubbing his forehead. "She's too proud to touch it. You both know the trouble we've had in making her believe the money we've given her came from insurance the company carried on Big Jack's life."

"No," Fenwicke agreed, "money wouldn't do; she wouldn't touch it."

"If we had a little more time," began Hixon, "we might yet—"

The foreman, who had turned and stood looking from the window toward the snow-heavy forest which lay but a few rods away, interrupted the filer: "Look at that!" he said angrily, and raised the window. Then he called to someone whom he had seen trying to hide in the bush:

"Well?"

The other two of the committee approached Fenwicke, curious to know whom he had addressed. And at that moment, realizing that they had been observed, three of the rowdies from Wolfton stepped out into plain view, standing in the snow halfway to their knees!

"We thought we'd say to you," growled out Nig Bartele, a particularly insolent man, "that we'd be here to climb your Christmas Tree and shake it to-night, nothing hindering."

"Come in and shake it now, if you think you can!" dared

A prominence about Fenwicke's Equatorial Regions suggested Sofa Pillows

Allen, who was impulsive and rather hotheaded in spite of himself.

"Nothing on it now," returned Nixey Dethrow; "we'll wait until to-night, when the presents are all arranged—and besides," he added with a malicious grin, "there'll be an audience then."

"Don't worry over our failing to put in an appearance," called the third Wolftonite, a huge, dark man named Sam Black, and who was more often addressed as "Black Sim"; "we'll be here alright."

"And you'll get filled so full of lead," answered Allen, choking with rage "that it'll take a steam crane to lift you!"

Fenwicke and Hixon were not so hotheaded as Allen. They lowered the window that there might be no more conversation between their friend and the rowdies from Wolfton.

"We must not get into it with those fellows," said Fenwicke, "until we have no alternative. They make a business of fighting, and we do not; besides, we mustn't have a fight here on Christmas."

"We'll have a fight here on Christmas if those skunks attempt to come here and shake the presents off the tree," Allen declared, "whether we win or not. We can't stand for that, you know, Fenwicke."

"In that event," replied Fenwick, "of course we'll give them all we've got, whatever it happens to be."

"I wish, by George," said the filer, "that Big Jack Morgan could be here. He's the fellow we ought to have with us. He's whipped half a dozen of those Wolftonites at one and the same time, and they're sure afraid of him."

"But we can't have Big Jack with us, I'm sorry to say," returned the foreman, with a sorrowful shake of his head.

As he finished speaking, a stone came crashing through the nearest window, sending bits of glass flying in all directions.

Allen uttered a few words that were entirely out of place with the spirit of the occasion, and bolted for the door.

"I'm going to get a gun, boys," he said as he put a hand hastily on the latch. "A man's a fool if he doesn't take up for himself in a case like this!"

Fenwicke leaped to the irate man's side and closed the barely opened door, at the same time dropping a hand on Allen's arm.

"Don't," he implored. "If they come here to-night, we'll fight them; but I think it's wisdom to take a little of their insolence now. Speaking of going after a gun, if we were to break the old law of the woods and start gun play, they'd be sure to take it up in the future; don't you realize the danger there'd be for the women and children?"

"They've gone," the filer informed the foreman and the sawyer. "I see them hitting the trail for home."

Fenwicke's mind returned to the thing that had stumped them so hard and so completely a few minutes before, the matter of a present for the wife of Big Jack. He suggested that he mention it to Mrs. Fenwicke and left the cabin for his home.

And when he returned, half an hour later, he told the other two members of the committee that he had solved the difficulty. Although there was scant necessity for it, he whispered it to them; and both the filer and the sawyer slapped him on the back and told him he was great, that only he could have thought of it.

While easily angered, Allen was also easily brought back to his customary good humor, and soon he was as busily talking and laughing and writing names on bits of shoe-box cardboard as the other two. Then Fenwicke and Hixon began to fasten the gifts to the branches of the tree, while Allen busied himself with arranging the decorations—the tinsel, the candles of many colors, and the artificial snow—and the latter seemed peculiar, considering the amount of real snow that lay banked everywhere on the outside.

Darkness had fallen by the time the committee of three had finished the tree of gifts, picked up sufficient chairs to accommodate the audience, and brought wood for the stove that the little folks and their fathers and mothers and the rest of them might be comfortable while the entertainment was in progress.

Then Hixon and Allen put lamps in place on the walls, and busied themselves in making the room warm, while the foreman hied himself homeward to don the Santa Claus outfit his wife had been making for the past two or three weeks.

An hour later the good people of Pineville began to fill the many different kinds of seats—and Hixon and Allen, as ushers, were careful to see that the women and children took places near to the walls, with the men sitting near the aisle. The latter precaution, of course, was taken in anticipation of any trouble the Wolftonites might cause.

A gentle hum became evident over the room. Many there were who gazed with smiles and gay whisperings toward the tree of tinsel and white and green, and allowed themselves to be transported back to their youthful days in another and less isolated world. Little boys laughed at little girls—while really wondering concerning the future disposal of certain air rifles—and pointed to the array of yellow-headed dolls; and the little girls blushed happily and dreamed the most delightful dreams of coming motherhood. Grave matrons wondered vaguely about the many and beribboned packages, and affectionately called their husbands sweet names under their breath. Men with a bit of gray at their temples observed it all and grinned in a manner that would have seemed absurdly silly on any other occasion.

The little wife of Big Jack Morgan was a trifle late. Perhaps she felt that she had no part in the affair, that she was really a dependent. She would have taken a back seat had not Allen,—who was of course as bighearted as he was hotheaded, as such persons usually are,—led her to the front and esconced her and her pair of curly-headed boys in a place of honor.

"I want you to sit here, Mrs. Morgan," he smiled, "where the children can see better. You don't mind?"

"Thank you, Mr. Allen," the woman said thickly.

Then there appeared in the doorway John Fenwicke, as Santa Claus; and so well was his face disguised in a heavy, flaxen beard that his own children did not recognize his features. He wore a red blouse trimmed with fur, high boots, and a pointed hat; and, to those who knew, there was a prominence about his equatorial regions that suggested the theft of some three or four sofa pillows—for John Fenwicke was rather slender and lean.

A hush fell upon the assemblage. The grown people grinned into their hands; the juvenile members of the audience crowded closer to their mothers and gasped wide-eyed—for this was their first glimpse of the much talked of old fellow who had a strange liking for sliding down sooty, smutty chimneys when there were doors that would have served his purpose a great deal better.

And, although it is neither here nor there, some of the more inquiring minds of these juvenile members of the audience wondered how he ever succeeded in negotiating certain chimneys of small calibre, considering the magnitude of his before mentioned equatorial regions.

Fenwicke nodded right and left as he strode with ridiculously long strides up to the tree of tinsel and white and green that stood in the back end of the room. Then he faced about in a very soldier-like manner, bowed as though at the court of a king, and said a few appropriate words—such words, they were, as only Santa Claus, the sly old rascal, could have thought of. And his voice, one of the children remarked afterward, sounded exactly like a bear talking.

Upon being asked, Billy Hixon told him that all the little ones of Pineville had been good with the exception of John Fenwicke, the foreman, who had been kept at home as punishment for fighting—which, of course, explained the mysterious absence of Fenwicke.

Everybody laughed; even Santa Claus himself let out a giggle that seemed wholly out of place for such a dignified person. And Santa Claus barely refrained from shaking his fist at Billy Hixon.

Soon the dolls began to move from the tree to the arms of the little girls, and the air rifles began to find themselves clasped in the arms of the little boys; and later the beribboned boxes found their way to the older people. Hixon and Allen were the carriers, and they did the work with as much pleasure to themselves as to the others.

And then Allen saw the door open slowly, and there peered in the dark and evil eyes of Black Sim, one of the rowdies from Wolfton! Allen knew Black Sim was not alone; that several of his friends were behind him.

The sawyer was not in the least surprised; he had expected the Wolftonites much sooner. He stole quickly to Santa Claus.

"They're here," he said in a low tone.

"Just wait until they start in to climbing the Christmas Tree," Fenwicke whispered back.

At that moment the door was pushed roughly wide open, and the forms of Black Sim, Nig Bartele, Nixey Dethrow, and Curley Barnes, the devil's own pick

There had been so many, many delusions

and choice of the Wolftonites, came up the aisle and toward the tree of tinsel and white and green, scattering snow from their feet as they walked!

Santa Claus faced the intruders, asked them to wait one moment, and addressed the audience:

"Good people," a note of triumph in his voice despite its assumed gruffness, "these boys have deluded themselves into the idea that they are going to shake our Christmas Tree. But do not be afraid, good people, for I have with me an automatic fighting machine that can thrash the four of them and not feel that it has had decent exercise. The machine will please come forth!"

The machine came forth in response to the request of the man in the flaxen beard and the red, fur-bordered blouse—from behind a few boards that had been set upright in a corner to hide it. It strode with heavy steps, steps that made the floor vibrate, toward the four men from Wolfton, who were watching developments with a sudden interest.

It was a regular giant of a man, wearing a heavy black beard; his hands were doubled into fists that seemed as large as small hams. His eyes flashed their oldtime hatred of his oldtime enemies.

The four rowdies knew him and started back. Then Black Sim, in a spirit of daredeviltry, halted his fellows with the words:

"Stop—we're four to one!"

"Yes, stop—you're four to one!" jibed the giant.

"At him!" cried Bartlle.

The fighting machine lunged forward with a blow that would have shaken any pine within a mile. It struck the foremost of the bad men, no other than Black Sim himself, and sent him crashing against his fellows. Another blow—a veritable shower of blows—followed; and within another minute the huge man had driven all four of the Wolftonites, badly bruised, out into the snow. It was a fight that they still talk of in Pineville.

"Now," said the fighting machine, "what do you think of shaking Christmas Trees?"

The Wolftonites slunk off in the snow, each rubbing some bruised spot, each swearing under his breath—since he did not dare to swear openly.

John Fenwicke seized both Hixon and Allen by the shoulders and began to shake them crazily—at least it seemed crazy to see Santa Claus acting like that.

"Now," said he, "what do you think of my plan?"

"Fine!" cried the sawyer and the filer in one voice.

Then Hixon and Allen stepped down and escorted the fighting man to Santa Claus, who was still doing his utmost—and without a vast amount of success—to make his equatorial regions shake with laughter.

John Fenwicke placed his hands on the giant's shoulders and turned him round, facing him to the members of the audience, who sat as silent as stones in their astonishment. Then Fenwicke looked toward the little wife of Big Jack Morgan, who had straightened tensely, one arm about each of her two curly-headed boys.

Perhaps she feared to believe that which her own eyes showed her; for there had been so many, many delusions!

"It's spoiled a little, I guess," smiled the rascally Santa Claus; "but it's pretty good as it is. Mrs. Morgan, in all my years, in all my Christmas experiences, I have never made a present that gave me as much pleasure as the making of this one to you—your husband, Jack Morgan, God bless him and you and your babies, and may many happy years be the lot of you all!"

Big Jack went to his knees before his wife, and buried his great, dark head in her lap. The little woman gave a smothered cry of gladness, bent and sobbed in her unexpected happiness, while Santa Claus allowed a glistening drop of water to roll from each eye to his heavy, flaxen beard.

Morgan had been shanghaied at Bartow, and afterward forced to serve as a deck hand on a slow vessel that sailed around the Horn; then he had been shipwrecked and cast upon an island in the South Atlantic. Fenwicke had met him while on the way to confer with Mrs. Fenwicke concerning a gift for the woman they then regarded a widow; and, after some pretty strong persuasion, Morgan had agreed to delay his meeting with his family—the reasons for which, as well as the results of which, we already know.

At the inquiry before the Railway Commission, Ottawa, into the application for increased demurrage charges, the lumber section of the Montreal Board of Trade was represented by Mr. Arthur H. Campbell, of the Campbell-MacLaurin Lumber Co., and Mr. W. S. Tilson, the transportation expert of the Board of Trade.

The Laurentide Company, of Grand-Mere, P.Q., have, it is reported, purchased the only water-power available on the St. Maurice around the Grand Piles district. It is capable of developing 25,000 horse power. The owners were the Canada Iron Corporation.

Legal Title in a Timber License

Important Decision of Privy Council Regarding Execution Creditor's Right to Timber

One of the most important legal decisions from the point of view of the lumber industry in Ontario, that has ever been given by the Privy Council, was recently made public in the case of Allan McPherson and another vs. the Temiskaming Lumber Company, Limited. This was an appeal from a judgment of the Court of Appeal for the province of Ontario of September 20, 1911, reversing a decision of Mr. Justice Teetzel.

Lord Shaw of Dunfermline, in delivering their Lordships' judgment, said the appeal arose out of inter-pleader issues, and the particular issue was whether certain saw-logs seized in execution by the sheriff of Nipissing, Ontario, were exigible as against the claimants, the Temiskaming Lumber Company, Limited.

After reciting the circumstances of the particular case his Lordship said the point which had been taken by the respondents was this—that while it was conceded that under the law of Ontario execution might proceed against both the goods and the lands of a debtor, a timber license and all the rights, privileges, and interests of the licensee thereunder constituted, so long as the timber stands, neither the one nor the other, but formed an unattachable legal entity. That point—which was of much importance to the province—gravely affected the rights of timber licensees, their mercantile credit, and the security which they were able to afford in commercial dealings.

In the present case Mr. Justice Meredith was unable to understand why the interest in land of a licensee under the Crown Lands Timber License was not an interest in land liable to seizure and sale under a writ of execution as well as liable to assessment for the purpose of taxation. Their Lordships found themselves in the same position. The Court of Appeal, however, held that the matter was concluded by authority, and in particular by the case of the C. P. R. Company vs. the Rat Portage Lumber Company, decided in 1905 (10 O.L.R., 273).

It was important to note that the scheme of the Execution Act of Ontario was plainly meant and was fitted to attach not only goods and chattels, but also landed rights. Citing, with approval, Lord Davey's judgment in The Glenwood Lumber Company (Limited) vs. Phillips (A.C., 1904, p. 408), their Lordships said, in their opinion a title to the land itself, subject, of course, always to the restrictions, conditions, and limitations laid down in the license, was in the licensee of timber lands.

In their Lordships' view the construction of the statute was clear. Under the act the position of the holder of a timber license was: (1) That he was the possessor of an asset of the nature of land; (2) that that asset was accordingly subject to execution; (3) that the execution did not interfere with the property of the debtor or his power to assign or transfer, subject only to the security of the execution creditor not being impaired; (4) and when there was cut timber on the land at the date of execution, that timber was, of course, the instant subject of seizure; (5) should the timber be cut subsequent to the date of the execution, it was then instantly attached, and the execution could not be defeated, because the cutting operations had been made by an assignee or transferee to whom, in the interval between the laying on of the execution and the cutting of the timber, the licensee had transferred his rights; and (6) the only exception to this was the case of a title being acquired by a third party in good faith and for valuable consideration and without notice of the writ having been delivered to the sheriff and remaining unexecuted.

It seemed to their Lordships that if those principles were violated the way was opened up to the defeat of the execution creditor's rights, and, as the circumstances of this case very plainly showed, to transactions of a questionable nature under which debtors would endeavor to avoid their just obligations.

The only question remaining in the case was whether the respondent company so acquired in good faith, and for valuable consideration, and without notice. In their Lordships' opinion the whole circumstances were such as to show that there had been an attempt to defeat the rights of the execution creditors, and that the respondents were aware of that attempt and had pursued a course of conduct with a view to its success. In the result their Lordships were of opinion that the rights of both of the appellants under the three executions referred to fell to be satisfied out of the $10,000 secured by the bond, and that the appellants should be found entitled to the costs of this appeal and in the courts below.

Their Lordships would humbly advise his Majesty that the judgments appealed from should be reversed, that the cause be remitted to the Court of Appeal to dispose of the actions in accordance with this judgment, and that the costs should be dealt with as above stated.

Wood Consuming Industries of Toronto

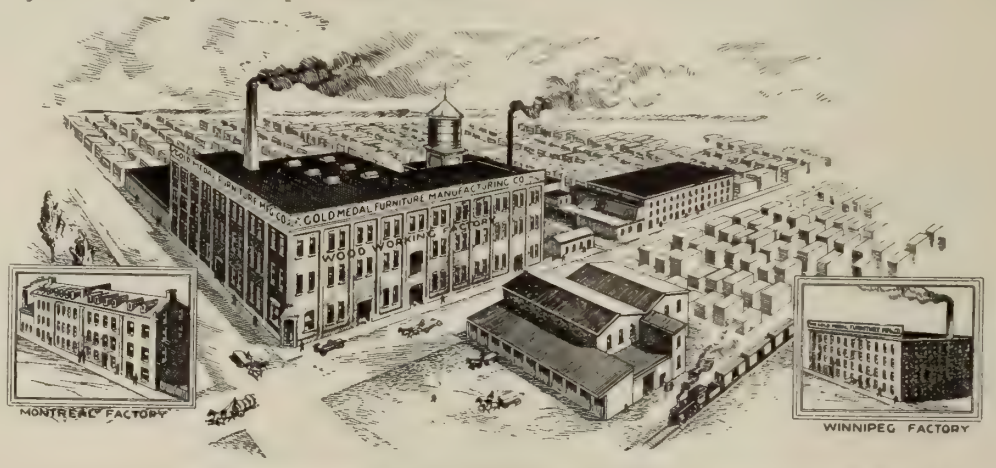
No. 1—A Furniture Manufacturing Company Which Converts 4,000,000 Feet of Lumber into Bed Frames, Couches, Etc.—The Gold Medal Furniture Manufacturing Company, Limited

Toronto, as the capital city of the largest lumber producing province of Canada, is naturally an important point both for the distribution and consumption of lumber. A great deal has appeared in these columns dealing with the distribution of lumber from Toronto. As a consuming centre however, its importance is, if anything, even greater. The present article, and others which are planned to follow, will deal with this feature of Toronto's lumber trade and describe a number of the important industries located at Toronto, which use lumber extensively as a raw material for manufacturing.

One of the most obvious uses to which lumber is put in the production of a finished article is as a raw material for the manufacturing of furniture. There are a number of important furniture factories with headquarters and plants at Toronto. Among these the Gold Medal Furniture Manufacturing Co. occupies an important position on account, both of the extent and variety of their output and the excellence of their finished products. The chief lines of furniture produced by the Gold Medal Furniture Manufacturing Company, are parlor chair and couch frames, diners, davenport and bed frames. "Gold Medal" products of this nature are favorably known throughout Canada, as all the best furniture dealers in the country make them a special feature in their stocks.

W. J. McMurtry, President

The head office and largest factory of the Gold Medal Furniture Manufacturing Company, Limited, are situated at the corner of Van Horne street and Bartlett avenue, Toronto. The company also own branch factories at Montreal and Winnipeg and have a warehouse at Vancouver. An additional factory has recently been purchased from the town of Uxbridge. This factory will be in operation early in 1913. The necessity for additional manufacturing space has been forced upon the company by their steadily increasing business, and the plant at Uxbridge is favorably situated owing chiefly to its proximity to the factory at Toronto. The Uxbridge factory will be devoted to the woodworking department which will be transferred from Toronto under the management of Mr. Robert Wright, the present superintendent of the Toronto factory.



Toronto, Montreal and Winnipeg plants of the Gold Medal Furniture Manufacturing Co.

Mr. W. J. McMurtry, President and Managing Director of the Gold Medal Furniture Manufacturing Company, Limited, founded the company in 1890 on its present site, and has been identified with it since that time. He has in fact been the moving spirit in the business and it is due to his efforts that the affairs of the company are in so satisfactory a condition. The company is a close corporation, the stock being in the hands of five or six people, of whom Mr. McMurtry, is the chief stockholder.

Output of the Company

The quantity of lumber used annually by the company is in the neighborhood of four million feet. About one and a half million feet of this is maple which is consumed, chiefly in the manufacture of spring bed frames, which are made entirely of maple. The other 2½ million feet consists of oak, birch, elm, ash and mahogany. The birch and mahogany are manufactured into parlor frames. Oak is used principally for davenports, couches, easy chairs, and mission furniture; and elm enters largely into the manufacture of mantel beds or folding beds which have the appearance of a mantel and are extensively sold in the northwest.

A trip through the Toronto factory of the Gold Medal Furniture Manufacturing Company, Limited, is an interesting experience. After visiting the various departments, seeing the working of the different machines and having the processes explained by the superintendent, Mr. Robert Wright, the visitor can understand how the high standard of quality of "Gold Medal" furniture has been attained.

To follow the lumber from its arrival at the private siding of the company until it leaves it again as a finished article of furniture is most instructive. The first process is the drying. The lumber is taken from the cars directly into the drying kilns, which have a capacity of 50,000 feet per week. It is then placed on cars and taken to the cutting-up departments, which are situated on the ground floor. In these departments the rough work is done, i.e., the lumber is cut to proper lengths and widths, moved on to the stickers, jointers and planers, and assorted

Chair in "Period" Design

Solid Cuban Mahogany Chair

approximately as to size. An elevator takes this material to the second floor where the edges are finally jointed, after which it is glued up and finished through a Berlin surface planer. The lumber is then taken to the band saws, cut to the proper suites and shapes, and passed to the shaper where it is shaped on forms to the correct size.

The next operations are trimming and boring and the furniture is now ready for the sanding department, where it is sanded and cleaned up properly before going to the assembling rooms. After assembling, the furniture is again put on the elevator and sent to the third floor to the finishing department. In this department the articles are stained and receive their first coating before being delivered to the varnishing department where they receive from three to five coats of varnish. The varnish having dried, they are rubbed and polished ready for the upholstering department. The upholstering department is near the shipping department, so that the furniture does not have to be moved more than is absolutely necessary.

Uxbridge factory of the Gold Medal Furniture Manufacturing Company

All the machinery and equipment in the factories of the Gold Medal Furniture Manufacturing Company, Limited, is of the latest pattern, and they have no hesitation in scrapping anything which is getting out of date. They also take every precaution to obviate accidents to their employees by protecting their machinery as much as possible. In addition to this, all the machinery in the factory is provided with the fan system for removing dust and shavings. A description of some of the special machinery and equipment noticed is of interest.

Special Machinery Installed

A machine for making couch feet and corner blocks for couches has been invented by the superintendent of the factory, Mr. Robert Wright. This ingenious machine not only makes the couch frames 50 per cent. stronger, but also enables the company to ship the couches in the k.d. state, thus saving half the freight to the consumer. On some of the furniture fine carving is done; for which remarkable carving machines are used. The Symonds carvers, which carve two or more pieces at the same time, do more accurate work than can be done by hand carvers and at half the cost.

A bending machine, which consists of hollow plates filled with steam, can bend and dry their chair backs in one operation in the short time of twenty minutes. This machine is also much more economically than the older types, as it handles successfully a large proportion of backs which would have been broken on the old machines.

Another machine which is giving good results is the Berlin Continuous Feed Jointer. This jointer does the work of six machines, one of its best points being that the operator is protected from risk of accident. A Berlin Finishing Surface Planer turns out fine work and does away with the old method of chipping out. It also saves half the cost of sanding. A new drying room which has been recently installed in the finishing department by Pratt & Lambert, of Buffalo, has proved a great time saver. In this room from 12 to 15 parlor suites can be dried at one time, a temperature of from 120 to 130 degrees being used. By the old method of drying, from 15 to 20 days was required.

Fire Risk Reduced to a Minimum

As a precaution against fire, the sprinkler system is installed throughout the office and factory. In addition to this, a volunteer fire brigade has been organized among the employees. A 500 gallon force pump is always ready and a plentiful supply of water is provided by a tank on the building, which has a capacity of 20,000 gallons. A surplus supply reservoir holds an additional 25,000 gallons. All the power which is required throughout the factory and office is supplied by means of three boilers and a 270 h.p. Wheelock engine. The Toronto factories occupy a floor area of 130,000 square feet.

The new factory at Uxbridge is equipped with the latest improvements. One of the newest "Morton" kilns for drying lumber, with a capacity of 25,000 ft. per week has already been installed. As at Toronto, the sprinkler and fan systems are in use throughout. The company own a private siding on the G. T. R.

In addition to the products already mentioned, the Gold Medal Furniture Manufacturing Company, Limited, are large makers of mattresses, "Hercules" bed springs and steel couches. Ingenious and up-to-date machinery is used for threading these "Hercules" springs.

The present total staff of the company is 225 and it is expected that an additional 100 men will be engaged for the new factory at Uxbridge at the beginning of the year.

Our illustration No. 601, shows a chair of solid Cuban mahogany, "Period" design. The chair and couch No. 430 are also of solid Cuban mahogany, Louis XV. style.

Enemies of the Larch Sawfly

The almost total destruction of the tamarack, or larch, which took place throughout eastern Canada almost 30 years ago was caused by an insect, the larch sawfly. It appeared again about eight years ago and in its spread westward it is repeating its former devastation on the younger tamaracks.

To all who are interested in our forests the appearance of a comprehensive account of this insect "The Large Larch Sawfly, with an account of its Parisites, other Natural Enemies and Means of Control," by the Dominion Entomologist, Dr. C. Gordon Hewitt, will be welcome. This has been published by the Dominion Department of Agriculture as Entomological Bulletin No. 5 and Bulletin No. 10 of the Second Series of the Experimental Farms Bulletins, and may be had free, on application to the Publications Branch, Department of Agriculture, Ottawa.

Dr. Hewitt, has studied the life-history, habits and means of control of this injurious sawfly, both in England and North America. In England, it was found that the natural enemies, especially parasitic insects, effectively gained control of outbreaks of the insects. Other natural enemies were mice and birds and a system of bird encouragement was started on a large scale. The devasting spread of the sawfly in North America was due to the comparative absence of the natural means of control. Several important species of parasites have been discovered and have been studied and described. To increase the number of natural enemies of the sawfly, attempts are being made to introduce and establish in Canada parasites which were discovered in England and which appeared to control the pest here. An account of these experiments and of the methods devised to encourage the birds and other means of control are described in this bulletin, which consists of forty-two pages and contains twenty-six figures, including a colored plate.

Small Fire Loss During 1912

Only 76,000,000 feet of standing timber—less than one-seventieth of one per cent. of the 500,000,000,000 patrolled—was destroyed by forest fires in the season of 1912 in territory represented at the annual forest fire conference of the Western Forestry and Conservation Association. This statement was made by Forester E. T. Allen, who manages the work of the Association which embraces California, Oregon, Idaho, Montana, Washington and British Columbia. Mr. Allen said that this record was as much the result of fortunate weather conditions as of preventive measures. The association spent $200,000 patrolling forests last summer.

Mr. Alexander MacLaurin, of the Campbell-MacLaurin Lumber Company, Montreal, has undergone an operation for appendicitis. Mr. MacLaurin, who is in the Western Hospital, Montreal, is progressing very favorably.

The Sawmill as a Colonizing Factor

Importance of the Lumbering Industry to a Newly Settled Country—Description of the New Ontario Colonization Company's Operations

Willis K. Jackson, Buffalo, N.Y.

An interesting and most unique undertaking in the way of carrying out a large colonization scheme in connection with the development of an important lumbering industry is at present being worked out in New Ontario. About 33 miles west of Cochrane, Ont., on the shore of the Mattagami river, which at that point is about 530 ft. wide, are located the headquarters of a colonization company known as New Ontario Colonization Co., Limited, with whom is associated Mr. Willis K. Jackson, the well-known lumber manufacturer of Buffalo, N. Y. The work which is being undertaken is one for which the comeral of its members have carried pany is especially fitted, as sevout similar undertakings with success in Michigan and other parts of the Northern States.

The company have established their headquarters in the city of Toronto and we are informed that they are practically a Canadian concern, as the majority of their members are citizens of Canada. Mr. Willis K. Jackson, whose portrait is published herewith, is the most prominent of the United States citizens who are interested and being a wealthy man and having had considerably practical experience in lumbering and colonization work, will be a leading spirit in this enterprise. Although a United States citizen by birth, Mr. Jackson has for many years past spent the greater portion of each year in Canada, being the owner of a splendid farm and home at Niagara-on-the-Lake, Ont.

Practically speaking, the proposition is simply one of colonization, although it involves an extremely interesting lumber manufacturing business. The Government of Ontario, realizing the importance of attracting a good class of settlers to the excellent clay lands which have been found in New Ontario, agreed with the principals of this New Ontario Colonization Company to place them in possession of two townships, in return for which they are to put in a minimum of sixteen settlers a year. They are given the right to make such disposition of the timber as they see fit and they are given possession of the lands, to sell to settlers. The attraction of the proposition from the settlers' point of view, lies in the fact that the company, in order to make its land valuable, is undertaking extensive works of improvement. This has already involved the construction of good roadways through the two townships. The company also have undertaken to buy from the settlers everything which they have to sell, logs, pulpwood, farm produce, etc., and they have agreed to carry the settlers along financially until they are able to support themselves. It will be seen therefore, that from the settlers' point of view, the proposition is an attractive one. If he were to buy land

View of Lumber Yards—Annex in Background

in some other district from the government at 50c an acre, he would, in all probability, be isolated from all companionship and far removed from a profitable market for his produce.

The land in the two townships is of an excellent quality, the equal, it is said, of anything to be found in Western Canada, and those who are acquainted with the district state that there is no possibility whatever of a settler failing to make good unless he is lazy. The company have not, as yet, placed anyone upon these lands. They only secured them during the past summer and they have considered that it would be better to wait until next spring before seeking to attract any settlers. The interval in the meantime is being devoted to the construction of roads, the erection of the houses which are necessary for the company and its employees and a few houses for prospective settlers. In this way they are making certain that they will be able to take care of settlers from the time when they commence to arrive.

Erecting a Modern Sawmill

In order to furnish the settlers with anything which they may need, the company have established a good store and already have in operation a small sawmill. Another sawmill is being erected, of a permanent type, which will be the equal of anything of its kind in Canada. The first sawmill erected by the company, which has been in operation during the last three months, is a circular mill and was furnished by the E. Long Manufacturing Co., Orillia, Ont. It is equipped with a two saw edger and a two saw trimmer, and is housed in a building 25 ft. by 75 ft. It is cutting from 10,000 to 12,000 ft. of lumber per day and from 10,000 to 20,000 lath.

The new mill which the company are now erecting will be equipped with a double cutting 8 ft. 12 in. steam tension band mill manufactured by the William Hamilton Co. of Peterboro, Ont.; a 54 inch band resaw manufactured by the Berlin Machine Works, Hamilton, Ont.; three boilers and engine manufactured by the William

Circular Mill Sawing its first Log

Circular Mill after running a month

Main Boarding House under Construction

Boarding House Annex—Accomodating 60 People

Hamilton Co., the boilers being 16 ft. by 72 inches, 150 h.p. The transmission machinery, edgers, trimmers, etc., are being supplied by the E. Long Manufacturing Co., Orillia, Ont. The mill will have a capacity of from 50,000 to 60,000 ft. per day.

A wood mill and rossing machinery for converting the small logs into pulpwood will be installed by the Waterous Engine Works Co., Brantford, Ont. This machinery consists of a steam 3-arm log loader, semi-automatic cutting-up rig, pulp conveyor, sawdust and refuse conveyors, piping, etc., for boiler room.

In connection with the mill there will be a planing mill and sash and door factory, band mill, matchers and surfacers which will be supplied by the Berlin Machine Works Co., Hamilton, Ont.

The planing mill will be erected during the coming spring and will be up-to-date in every respect. It will also be equipped for the manufacture of boxes.

When the band mill, planing mill and sash and door factory are in operation, the company will be able to supply settlers with every possible requirement in the way of lumber and general house building materials. They will, in fact, cater not only to their own settlers but to the markets of the whole north country.

As an indication of the spirit in which the company are tackling this proposition, it may be stated that the arrangement with the Ontario government was made last June, and that inside of the first week after the signatures to the contract had been completed, they had sent up several carloads of supplies and horses. Within a few weeks of that time they had 250 men at work clearing land, building houses, mills, etc., and about 12 families who had come there with a view to becoming settlers as soon as the roads could be prepared for them to get into their lands. When the first batch of workmen arrived on the scene they had to cut down trees in order to make room for the first tent that was pitched. In 90 days the company had comfortable quarters provided for their 250 employees.

An Attractive Agricultural Proposition

The two townships controlled by the company contain about 100,000 acres of very fine agricultural lands upon which there is a thick growth of spruce timber with a small amount of whitewood and balm of Gilead. Although the country is considerably farther north than the older part of Ontario and has a very cold winter, this is no drawback to it from an agricultural point of view. On account of the long days and short nights of the summer time there are more growing hours per day than in the more southern parts of Ontario and it is believed that as the country becomes settled and cleared the rigour of the winters will be considerably lessened. Letters received from members of the company which were written on November 25th, stated that at that time there was as yet no snow.

It will be seen from the above description that, primarily speaking, the proposition is one of colonization and that, as a lumbering proposition alone, it would scarcely be profitable. Nevertheless, there is plenty of timber to supply all the lumber that will be necessary for the building up of the community. The product of the small mill already in operation consists mostly of scantling, boards, etc. In order to secure large timbers for the big mill the company have had to go pretty far afield. Not a single board however, has been brought in for erection of the company's buildings, with the exception of such manufactured articles as window sash, finished flooring, etc. All the machinery and supplies which the company are taking into the country are being purchased in Canada. One of the chief policies of the company in fact, is to spend every dollar of its money in Canada.

It will be seen from the above description that the whole proposition is one of much interest of lumbermen. It will demonstrate with much force the fact that the timber resources of a country even though they be small, comparatively speaking, furnish a most important raw material for the up-building of a community and that a country which is well wooded with timber of any sort that can be turned into lumber, is far preferable to a country of equal agricultural promise which contains no timber growth. In the early days of the settlement of the prairies of western Canada, it was thought that these lands were especially attractive because no work had to be done in clearing. A more modern and businesslike view of the situation teaches settlers that a land with timber growing upon it, and which has good agricultural possibilities, is preferable to anything in the prairie line, because it affords them cheap raw material for the construction of their dwellings.

The accompanying illustrations give an excellent idea of the work which the company has carried out up to date. In one of the pictures will be seen the little sawmill which has been in operation during the past summer. This saw mill was set up upon the ground without any covering. The logs were brought to it, out of which it manufactured the lumber that was used in erecting the building to house the machinery.

Another illustration shows one of the company's boarding houses in course of erection giving an excellent idea of the substantial manner in which the buildings are constructed.

Sash and Door Men Discuss U.S. Exports

Committees Appointed to enquire into the means of Eliminating the Menace—Proposal to Adopt Grading Rules

The Ontario Sash and Door Association held an important meeting at the King Edward Hotel on December 13th, at which the principal matter under discussion was the great amount of United States doors which are being imported into Canada. Mr. W. D. Cargill, Cargill, Ont., occupied the chair, with Mr. F. W. Brennen, Hamilton, Ont., as secretary. Those present were as follows: Mr. W. D. Cargill, H. Cargill & Son, Cargill; Mr. F. W. Brennen, M. Brennen & Sons Manufacturing Company, Limited, Hamilton; Mr. G. S. Siebert, Mr. F. P. Potvin, Georgian Bay Shook Mills, Midland; Mr. W. J. MacBeth, Parry Sound Lumber Company, Toronto; Mr. O. W. Rhyness, Mickle Dyment & Son, Brantford; Mr. R. A. Rastall, R. A. Rastall & Company, Toronto; Mr. Hugh A. Rose, Toronto representative of Canadian Western Lumber Company, Fraser Mills, B.C.; Mr. R. R. Gardiner, P. W. Gardiner & Son, Galt; Mr. G. P. Davidson, Estate of James Davidson, Ottawa; Mr. H. A. Currie, Wilson Bros., Limited, Collingwood; Mr. A. E. Lloyd, C. Lloyd & Son, Wingham; Mr. G. Mustard, Lansdowne Lumber Company, Toronto; Mr. R. E. Truax, Truax & Son, Walkerton; Mr. C. M. McCabe, McCabe Bros., Tottenham; Mr. R. Stewart, Jr., R. Stewart & Company, Guelph.

Mr. Brennen opened the discussion by outlining the situation and stating that the imports of United States doors had induced some Canadian manufacturers to try to compete with the imports by reducing the prices on their own product. The purpose of the meeting, he understood, was to discuss means of meeting the competition or to adopt steps for reducing the quantity of imports.

Mr. Gardiner reported on the work of the committee appointed at the last meeting. Enquiries had been made of the Department of Customs at Ottawa and it had been found that doors were not separately classified in the customs statistics. According to other information they had received, however, he was convinced that pine doors were being delivered in Toronto at $1.80. This price was impossible without dumping; i.e., selling to Canadian markets at less than the price asked in the United States markets. There was no question that if Canadians could not produce a sufficient quantity of doors for the Canadian markets, United States doors would have to be imported. But they had a right to enquire whether the United States competition was being conducted fairly. The important thing to be done now, was to induce the government at Ottawa to classify the imports in such a manner as to make it possible to find out just how many doors were imported.

Better Organization Essential

Mr. Siebert emphasized the importance of better organization. A membership committee should be appointed to take in hand the membership of the association and get in certain other manufacturers who apparently were not represented and who ought to be fighting along with them. These men were manufacturing a lot of doors and could give a great deal of help. The organization would then be more complete and they could decide on a plan of campaign. The question of the British Columbia fir door was entirely aside. It was not Canadian competition that they were fighting. They were fighting the foreign door. If they could eliminate the United States door the trade conditions would change so that British Columbia door manufacturers would not be a factor in the east. The United States door would be kept out of Western Canada and the British Columbia manufacturers would have all they could do to handle the western trade.

Mr. Stewart was of the opinion that lumber manufacturers were supplying too low a grade of lumber at too high a price. United States lumber of a far better grade than Canadian was laid down here and a door manufactured from it could be made at thirty-five cents less than from the Canadian lumber. Mr. Rastall stated that he could buy California pine at $37.75 and the waste from this was much less than from lumber bought from Canadian manufacturers at $46. He thought that Canadian manufacturers were asking too much for their lumber and instanced a case where he had been offered lumber at $46, and, on his refusing it, the manufacturer had finally sold it to him for $35. He considered that this was hardly a fair deal.

The Importance of Standard Grading

Mr. W. J. Macbeth, of the Parry Sound Lumber Company, Toronto, stated that this has brought the matter down to the question of a standardization of grading rules. He suggested that the door manufacturers should assist lumbermen in getting this standardization. The good United States lumber which had been mentioned was all of one grade and this was surely an argument in favor of Canadian standardization.

Mr. Hugh A. Rose, Toronto representative of the Canadian Western Lumber Company, Fraser Mills, B.C., thought that the improved condition in the United States trade would soon provide good markets there for their own doors. The same thing had occurred in connection with lumber dressed on one side. The great imports of late years, had recently ceased on account of the improvement in the United States markets.

Mr. Brennen reported that from the Washington Department of Commerce he had been informed that $576,000 worth of doors had been exported to Canada during the twelve months endieng June 1st, 1912. The opinion of members present was that the imports were greater than this.

Mr. Brennen thought there was not much to fear from the United States doors. Their quality was poor. They often rattled like a skeleton in a haunted house. The Canadian manufacturers of doors would only have to get together in a more businesslike manner. There was lots of trade to be had, and so far as he knew, customers were commencing to refuse the foreign doors. He rather believed that there were as many favorable conditions as unfavorable .

Mr. Truax did not think that an appeal to the government for increased duty would meet with any favor. The only point to approach them on was the question of dumping. Owing to the fact that the Ontario and Quebec lumbermen had not any standard rules of grading and that the best grades of lumber were shipped to England, he was compelled to go to the United States for lumber. He stated that out of seventy-six cars which he had bought in the United States only one was not up to grade, whereas he could rely on the grade of only one Canadian manufacturer.

He thought that it would be better if door manufacturers could buy direct from the mill man as the middleman was often responsible for the unreliability of grades. He mentioned a case in which he had bought from a middleman and, as the lumber was not satisfactory, he had approached the mill man and been shown the invoice to the middleman. The latter had re-invoiced it to him as a higher grade.

Mr. Siebert suggested that the Ontario Sash and Door Association draw up rules of grading and buy from the manufacturers only on those rules.

Imported Doors a Menace

A resolution proposed by Mr. Siebert was then passed, stating that the importation of United States doors was a menace to Canadian door manufacturers and that steps should be taken to restrict the importation.

Mr. Gardiner said that Mr. MacBeth's statement about Canadian plants was fully justified. But, he thought it was an impossibility, considering the cost of raw material in Ontario, to make doors to compete with the United States door. It was not a question of fair competition. It was a question of dumping.

Committee Appointed to Investigate

Mr. Siebert presented another resolution, that a committee of manufacturers exclusively be appointed with full instructions to take the necessary steps on behalf of the association, to restrict the importation of United States doors. This motion was also carried.

The committee was appointed as follows: G. S. Siebert, C. Lloyd, R. R. Gardiner, G. P. Davidson, and W. D. Cargill, with Mr. Cargill as chairman.

Mr. Siebert also moved that a committee of three be appointed to draw up a set of rules for grading for use in buying lumber for sash and doors.

Mr. MacBeth presented a copy of the rules which he and others with the assistance of sash and door men had drawn up to present before the Canadian Lumbermen's Association a year ago. These rules were discussed extensively by the members present.

Mr. MacBeth suggested that rules such as these should be adopted and that if the sash and door men would do it, the situation would be improved. If the sash and door men would insist upon accepted grades, the manufacturers would have to fall into line.

Mr. Siebert suggested that a committee with Mr. MacBeth as chairman be appointed to take up the discussion of these rules with **all** members of the association, and to have copies of them submitted to door manufacturers, with a request for their views, the committee to report at the next meeting of the association.

The other members of this committee were Mr. A. Rastall and Mr. R. E. Truax. It was decided to hold the next meeting on January 24th, 1913.

The Foreign Door Problem

Interesting Letters Upon The Importation of United States Doors

An Injustice to Canadian Door Manufacturers

Burks Falls, Ont., Dec. 3rd, 1912.

Editor Canada Lumberman:

With regard to the dumping of doors from the United States into Canada, we are of the opinion there can be no question of the injustice of it. It is also certain that the Canadian manufacturer needs all the protection which can be afforded under existing conditions.

Canadian manufacturers can equal American without a doubt; we submit this has often been proved. But this could not be expected under unequal conditions. And we submit that to-day conditions between Canadian and American door manufacturers are very unequal. A few of the disabilities against the former may be seen at a glance from the following diagram.

Americans Have	Canadians Have
1. Cheaper labor.	1. Dearer labor.
2. More experienced labor.	2. Less experienced labor.
3. Longer established industries.	3. Newly established industries (comparatively).
4. Larger markets.	4. Smaller markets
5. Greater division of labor possible by larger markets.	5. Lesser division of labor compelled by smaller markets.
6. Lower freight rates.	6. Higher freight rates.
7. No inter-state restriction.	7. Trade-retarding inter-provincial laws.

To-day it is practically certain that our American cousins are prepared to do business at a loss to gain access to Canadian markets. Then again, as to dumping; it is a conceded fact that American concerns do not run continuously for years together; and any business man knows what happens when their stocks become overstocked, something disastrous to the most convenient foreign market, without a doubt.

Considering the above we submit the Canadian door manufacturer is very much in need of all the protection which can be given against the disabilities enumerated above.

Yours truly,

THE KNIGHT BROTHERS CO.,

Henry Knight.

Grading Difficulty at Root of Door Trouble

Guelph, Ont., Dec. 5, 1912

Editor Canada Lumberman:

Your favor of Dec. 2nd received, re the importation of doors from the United States. We would like to say in this connection that probably our ideas may be different from the other manufacturers, but we place the whole blame on the lumber manufacturers of Canada. Up to within a short time ago, for the last five years, we were unable to make doors at a profit, for the following reason: that the mill men and the middle men put up a grade of lumber of No. 3 cuts and better and charged us from $43 to $45 a thousand for it. Fifty per cent. of this lumber is nothing more nor less than a mill cull and a box. The door manufacturers have been up against this problem for years. Our relief came when we started to import California and western pine. We are laying this material down without any culls or box for $36 a thousand. This places us exactly in the same position as the American manufacturers, and we find no trouble in competing.

We might state that we have heard considerable discussion about the grade of No. 3 cuts and better, which they are now putting up. We tested a well known lumberman in Toronto, and he assured us that a new era had arrived and that they had got over their bad habit of shipping mill culls and box for cutting up lumber. We tested out his word and behold the new era had not arrived; the same old mill culls and the same old box, if anything a trifle worse.

We are firmly of the opinion that if the lumbermen would give the manufacturers a chance, the importation of American doors would never have taken place.

Yours truly,

Robert Stewart, Limited.

U. S. Doors Being Dumped in Canada

Cargill, Ont., Dec. 3rd, 1912.

Editor Canada Lumberman:

Re American Doors

The recent importations in large and small quantities of American doors is a matter of grave concern to the manufacturers of such in Ontario, and has been occupying the attention of the Ontario Sash and Door Association to the virtual exclusion of all other matters.

Unfortunately it has been found impossible to get figures from any source as to the exact quantity imported, but it is conceded by those most interested and who are in a position to know whereof they speak that these doors are being distributed throughout Ontario in quantities large or small as desired, and at prices much below the cost of production here, in fact will pay little more than the cost of the material.

It is expressing it mildly to say that this is a very serious condition to face for those who have invested their all in this business in good faith, as it simply means ruin for exclusive manufacturers of doors. The industry is an important one, a large employer of skilled labor, and never has been in the class productive of millionaires, from which one may deduce that the profits derived therefrom (if any) have been of a reasonable nature.

We hear at times a good deal about "Canada for the Canadians," but unless something is done to remedy this condition it will be a case of just so much more of "Canada for the Americans"; and don't you think they have already had more than they were properly entitled to? Why should it be necessary to sacrifice this particular line of industry while others are protected in their home market?

We concede the fact that doors can be made at a less cost by American manufacturers in large specialized plants using automatic machinery and cheap foreign labor, but as yet we have not a sufficiently large market to warrant such plants and have no wish to duplicate their conditions of manufacture, which savor strongly of the sweat shop.

I believe the trouble is a case of dumping their surplus product, and we have laws to protect us against such; but the difficulty lies in the matter of producing proof as I understand all sorts of schemes are devised for the purpose of evading the law.

Yours truly, W. D. CARGILL.

A Case For a Higher Duty

Editor Canada Lumberman:

To treat of any subject which involves, or implies international action, or consideration, suggests at once its importance and difficulty. We may all be agreed upon its importance, and yet be reasonably in discord as to the difficulty. The phase of this question to be dealt with here, is the "Importation of American Doors into Canada." Let us for the time being lay aside our party pride or prejudice, and consider a presentation of conditions as we find them existing now.

Our needs or wants are governed or gratified largely by our ability to buy or exchange. Where honesty and fair business dealings are recognized, there can be no good ground for jealousy or criticism. The needs of our Dominion, by reason of rapid development, have been large. At some points the supply has not been equal to the demand. This can be applied both to humans, and the material things that they make or require.

In our particular line an honest effort has been made to keep the country supplied with the products of our factories, doors, sash and columns, etc. But the ever watchful eye of our foreign competitors has been keen to observe the opportunity. In fairness, let us admit, that in a measure this has helped. But now we have the aftermath. It is not a question of need, want, or fair competition. It is simply a matter of surplus stock and dumping. Those conversant with the business need no enlightenment on this point.

We do not propose to appeal to the loyalty of anyone, expecting to do business on that alone. What we do propose is to give as good an article, at approximately the same price. In this line of business prompt shipment, and being reasonably near the seat of supply count for much. This, we have in our favor. It is not prejudice which makes thoughtful, intelligent, business people desirous of giving preference to home made goods. The progress and prosperity of our country depend altogether upon what we as a people produce. If we are to be merely retailers of what our friends across the line manufacture, then our present progress will be short lived. It is short sighted policy on the part of anyone to be caught fighting the battle of foreign competitors. This is exactly what we find existing in the door business at the present time in Canada. The dealers are being used merely as tools to dispose of the factory surplus.

Consciously or unconsciously, they have been led into an uncalled for cut-throat competition. We have no reason to believe that any one

has had the desire to make any unfair profit out of this business from the manufacturer's end. In 10 years the price of lumber has almost doubled. The price of doors is practically the same. This, in spite of the fact that wages have advanced from 25 per cent. to 50 per cent.

Modern methods of manufacture have taken care of a certain percentage of this, but the investment is necessarily greater, and competition keener.

There is no cry of distress, but we certainly propose to protect our interests. This can only be done by a realization on the part of both those who make and those who sell or use, that our individual prosperity, the welfare of our people rests largely, if not altogether, upon the support we give each other. You can not make for progress by depriving the people of a nation of work which they can perform: nor by using the goods of another country's production, when the same can be obtained at home.

Were it a case of exhorbitant price or profits, the situation would be different. When a few cents will lead one from loyalty, then may we with consistency doubt the sincerity of any professed pride in what we as a people can, or hope to, accomplish.

When foreign importation is necessary, it can fairly be termed beneficial. When it is unnecessary, it is, and will be, hurtful to the whole community. It is a blow to the very best fundamental principle of a country's real prosperity.

We hear much of the pauper pay of other countries; and much of this talk from the source of supply of these doors, which give cause for action on the part of Canadian manufacturers. We pay more for the labor involved in the manufacture of our goods than does the foreign manufacturer. This, in a measure, explains why our market is being mudded.

It is essentially unfair competition for the very good reason that because of a fight among themselves, the price of doors on the American side has got to a point where loss on the article is a recognized fact.

Then we have another enemy to contend with. He is no foreigner, presumably, but has chosen for his mission the demoralization of the trade, and the hurt of the home manufacturer.

We, as manufacturers, do not object to fair competition at home, or from abroad; but when the demoralization of the trade seems to be the object in view, there is real and just cause for united action. The impost of a higher tax will have to be considered as the true remedy for this condition.

To this end we will work, and united effort, strengthened by reason of the justice of the request, will accomplish this.

A Canadian Manufacturer.

Not Enough Canadian Plants

Toronto, December 9, 1912

Editor Canada Lumberman:

Replying to yours of the 29th ult. in reference to the importation of manufactured doors from United States into Canada; as we do not manufacture doors it is a subject that we are not vitally interested in, although personally we prefer to see these goods manufactured in our own country. We believe that probably one reason which accounts for the large number of doors that are being imported, is the fact that our Canadian manufacturers apparently are unable to fill their orders in a reasonable time. We have had occasion to purchase doors to use in our business and we have had great delay through our inability to secure them in a reasonable time. It would appear to us that until the door manufacturers inC anada are prepared to look after their orders and to supply them in a reasonable time, there is very little need to raise a cry about the importation of doors from the United States. We think that the first move that manufacturers should make is to get in the place where they can handle the business and then to take steps to, if possible, prevent further importation.

Yours truly,

The W. Booth Lumber Co., Ltd.

Duty Ought to be Higher

Barrie, Ont., Dec. 5, 1912

Editor Canada Lumberman:

We are not extensive manufacturers of sash and doors, but we find ourselves injured by the very low price at which American manufacturers are sending doors into Canada. It pays us better to buy American doors than to manufacture them, and a great many other dealers who have factories in Canada are doing the same thing now. We think that the duty on doors should be increased when entering Canada otherwise door manufacturers here will have to go out of business.

Yours very truly,

Mickle, Dyment & Son.

A Western View of Door Situation

Col. A. D. McRae Thinks Door Men Must Change Tactics—Fine Outlook for Lumber Trade

Col. A. D. McRae, vice-president and general manager of the Canadian Western Lumber Company, visited Toronto during the first week of the present month. Col. McRae and others interested in the company have been making a tour of inspection in the United States for the purpose of studying the methods of door manufacturing used by some of the largest door makers in that country. The Canadian Western Lumber Company are erecting a large fir door plant and a fir veneer plant which will be in operation early next March and will turn out one thousand doors on a ten hour run.

Col. McRae is very enthusiastic about the prospects for the fir door business and incidentally has something to say about the general door situation and the importation of doors from the United States which has been troubling the manufacturers of doors in Ontario of late. According to Col. McRae, the fir door is the coming door. Speaking to the Canada Lumberman upon the matter he said: "The fir door is the door that is coming into general use now in the Eastern States and United States fir doors are coming into Canada because there is not a good fir door made in Canada to-day. We are spending $500,000 on a plant for making fir doors at Fraser Mills and as far as I am concerned the protection on doors is all we want. If we cannot compete with American fir doors, with a duty of 25 per cent. we ought to keep out of the business.

"The fir door is coming in here because it is a better door than the others. The pine door is a light door. The fir door comes next to the hardwood door. It has the weight in it and it has the strength. It is also a cheap door.

"For our plant at Fraser Mills we bought the very best machinery. There is not a better plant in the country.

"It is true that we have to pay more for our labor in Canada and more for our lumber and machinery. Our construction costs about 50 per cent. more than in the United States. The duty of 25 per cent. on the doors, however, is quite sufficient so far as we are concerned.

"The year before last was the first time that fir doors were brought into Ontario. To-day one firm in Ontario alone has ordered twenty-five cars of fir doors for next year's trade. My idea is that the whole trade is changing over from pine to fir doors. I have come to this conclusion after visiting all the important door plants on the Pacific coast, in the Mississippi Valley and the Oshkosh plant. Many of the plants in the United States are contending with just what the door men in Ontario are contending with to-day. They are at their wits' ends to compete with the fir door. I believe that what they will have to do here to protect themselves against the United States door is to buy the cut up fir stock from British Columbia and handle the fir door."

Greater Co-operation Required

Being asked to express himself definitely for publication upon the general question of increasing the protection against doors from the United States or enforcing the customs tariff more rigidly than at present, Col. McRae said: "As I understand it, (my information may possibly not be correct), the sash and door manufacturers of Ontario are now purchasing much stock for their sash and doors from American sawmills, and if such is the case, they can hardly look to the active assistance of the Canadian lumber manufacturer for the protection they are seeking.

"I am sure that the sash and door men, if they will join the lumber manufacturer in a general movement for protection from American competition, not only in sash and doors, but in all lumber products as well, can depend upon the active assistance and co-operation of every lumber manufacturer in the Dominion.

"As you know, the western lumber manufacturers have been fighting for years to get a duty on rough lumber, so as to have some protection from American competition. There is no denying that United States rough lumber has been selling for the past two years at less than the cost of production, but notwithstanding this, we have not, as yet, been able to get any protection for our industry, and I do not believe that anything will be accomplished, either for the sash and door interest, or any other wood-working interests until such time as we all join together in a general movement for a higher tariff which will protect not only our branch of the business, but the lumber business as a whole."

Trade Conditions Exceptionally Promising

Discussing trade conditions, Cal. McRae said: "The general lumber trade is in fine condition. I have just come through the prairies and have visited all our retail yards there. I have never seen stocks as low. They have had an exceptionally good month's business in November and the business during September and October was splendid also. I believe November was the best month they ever had in the retail lumber business in Canada. There will be very little lumber

left in the yards when the time comes for spring trade. At present, stocks are less than they have been at any time in the last five years. Stocks at the mills also, I think, are less than they were a year ago, and they were low enough then. That means that practically all the mills have moved their cuts and some of them have done even better.

"Manufacturing conditions in the United States are also good, and as a result United States lumber has temporarily nearly withdrawn from the Canadian markets.

"I do not think the cut will be any greater next year than it has been this year. So far as British Columbia is concerned it will be about the same.

"I never saw so much fall ploughing and breaking ready for crops in Western Canada as I have seen this fall. I expect that next year will see an increase in the acreage in crop of one and a half million in the three provinces.

"Building permits will be very large next year. I believe we will see an increase of 25 per cent. in the quantity of building in the three prairie provinces. I look for an increase of twenty-five per cent. in the demand for lumber. That increase will be in the face of no increase in that means to the lumber trade. If the lumbermen do not make money next year they have no one but themselves to blame.

"Lumbermen in general are looking for an increase of about $2 per thousand in the price of lumber next year. I believe they will get it. In some cases they will get more. There are practically no upper grades on the coast to-day.

Yes there is a good deal of talk about this car demurrage business, but I think it is a good thing. There is no question but that a good many lumbermen have been holding cars too long. So far as I am concerned I do not want to do anything that will make it impossible for the railroads to get the necessary money to carry out the developments which we must meet. Under the conditions which we have to-day I think reciprocal demurrage would be unjustifiable. We have as much trouble with the railroads as other shippers, but one of our troubles is not demurrage."

Important Amendment to Bank Act

Bill Introduced to Permit Banks to Lend Money on Security of Threshed Grain—Would Alter Credit Business

An important bill to amend the Bank Act has been introduced in the House of Commons by Mr. J. A. M. Aikins, M.P., for Brandon, Man. The purpose of the proposed amendment is to permit banks to lend money to farmers upon security of their threshed grain. The bill was introduced on Nov. 26th, and Mr. Aikins being requested to explain it spoke as follows:

Explanation of the Proposal

"Section 88 of the Bank Act authorizes the bank to lend money to a purchaser or shipper of, or dealer in agricultural products on the security of those products, no matter what the quantity may be or where stored; but it does not authorize the bank to lend money to the farmer on his threshed grain, no matter how great the quantity or how well stored. The Act also provides that the bank may lend to a manufacturer of goods, wares and merchandise, on the security of the goods, wares and merchandise; but it does not authorize the bank to advance money to the producer of grain, although it is perhaps the best security that can be given, because so readily convertible into money. The Bill is intended to remedy this by providing that the bank may lend to a person engaged in farming upon the security of his threshed grain, an agricultural product."

Mr. W. F. MacLean—"What about live stock?"

Mr. Aikins—"A great many people desire that the bank should be authorized also to advance money on live stock. I am in entire sympathy with that, but the urgency is not so great, nor are the reasons so apparent. We all know that the farmer needs money, especially the western farmer, immediately after the threshing has taken place, for the purpose of paying liabilities incurred in respect of that threshing, and his other farming operations, and also for the payment of accounts incurred during the summer.

"In the west the period between the termination of harvesting operations and the commencement of the winter is short. For that reason the farmer ought to be permitted to devote as much time as he can to fall ploughing and to preparing for his next year's crop. At present the only way in which he can pay his liabilities which ordinarily amount to perhaps fifty per cent. of the threshed crop is by selling that crop; and, in order to do that, he must during the time I have mentioned haul his grain to market, and that takes up a large portion of his time. This Bill is intended to obviate that, and give him the opportunity of taking his grain to market when he thinks proper. It gives the further advantage that all these loans are made on the pledge receipt, which is a very simple document, and thus obviate the necessity of chattel mortgages, legal and registration fees, the cost of discharges, and such like. It will also obviate the necessity of the farmers hauling hurriedly their grain to the railway stations to be disposed of there, which, as we know, creates congestion, not only at those railway stations, but all along the line. Moreover, it gives the farmer the opportunity of disposing of his grain when he thinks proper and he is best able to judge of the time when it should be disposed of. Meanwhile he can store it without cost on his own farm."

Altering the Credit Business

The main feature of the proposed amendment is one which will commend itself to retail lumber dealers, as it will relieve them of the necessity for carrying their farmer customers until they secure money in payment for their grain. The retail lumber dealer would, in most cases, be glad to be relieved of the necessity for giving the farmer credit. Under present conditions the lumberman has to take the farmer's note and discount it at the bank. Not only does he have to pay the discount, which is a considerable burden in times when competition is keen, but he has also to assume the risk of the farmer meeting the note when it is presented at the bank. If the farmer does not meet the note the bank then comes upon the lumberman for the money. If the amendment is put through the lumberman will be able to tell the farmer to go direct to the bank for his credit.

There is however another feature of the situation which must be carefully borne in mind. Unless some further amendment is made to the Bank Act, there will be no registration of the pledges which the farmers give to the banks when securing credit on their threshed grain. A situation will at times arise when in spite of the act, a farmer will want to secure credit from a retail lumberman and the latter will have only the farmer's word for it that there is no other pledge against the grain. It will be in the power of a farmer to deceive the lumberman or other merchant by securing credit all year on the security of the grain, and at the same time to secure credit from the bank on the same security. When the merchant comes to collect he may find that the bank owns all the security. It may be thought that this is a far fetched objection, based on a situation which is not likely to develop frequently, but it is an objection which will be urged in some quarters and which ought to be studied carefully with a view to preventing the difficulty in advance if possible.

It is understood that bankers are not looking at the proposed amendment with much approval. They are in the position of preferring to have the business of crediting the farmer continued on its present basis. When giving credit it is necessary for a bank to examine the security carefully and they would find it a difficult matter in many cases to obtain reliable information upon the value of grain at some distant point.

In spite of these objections there is much in the proposal to commend it to the careful study of the Minister of Finance and the House of Commons. Its main object is to facilitate the movement of grain and to simplify the business of securing credit for the farmer. On these grounds it ought to commend itself to the House and a means ought to be found of enacting its main provisions while at the same time safeguarding the general merchant.

Jack Pine Suitable For Pulp

That jack pine pulp is entirely suitable for the manufacture of news print paper has been clearly demonstrated at the U. S. Forest Products laboratory, at Wausau, Wis., where experiments have been conducted in co-operation with the American Paper and Pulp Association. The rapid increase in the price of spruce makes the discovery of a satisfactory substitute of great importance at this time. From 1900 to 1909, the price of spruce increased from $4.83 to $9.32, or 93 per cent. In Eastern Canada are large areas of non-agricultural land where the old forest has been cut over and burned over repeatedly, until the more valuable species have been driven out and jack pine constitutes a heavy percentage of the stand. These areas have, in general, been considered as waste lands. It now appears, however, that such lands will take on a new importance and will amply justify the expenditure of money for protection from future fires, in view of the certainty that large revenues may be secured either now or later, from the utilization of the jack pine for the manufacture of pulp. The importance of this timber will necessarily increase with the exhaustion of the supplies of other species within reasonable distances of the markets.

Transmission line poles and cross-arms treated with creosote oil are less liable to destruction by fire than untreated timber of the same kind. This appears to be due to the fact that the free carbon deposited by the burning oil on the surface of the timber affords some protection from the action of the fire. A committee appointed by the National Electric Light Association of New York city conducted a series of experiments on similar specimens of treated and untreated short-leaf pine, and proved conclusively that the latter suffered considerably more damage from the effects of the fire than the specimens that had been impregnated with creosote oil.

Demurrage Charges Greatly Increased

Board of Railway Commissioners Permit Companies to Double Charge for First Day After Free Time—Second Day and all Thereafter $3 per Day

The Dominion Board of Railway Commissioners has decided in favor of granting the application of the C. P. R., the G. T. R., the Michigan Central Railroad and the C. N. R., for an increase in their demurrage charges on freight cars from $1 to $2 and $3. The increased rates will be allowed from December 15th of the present year to March 31st of next year. The railroads asked for $2, $3 and $4 for the 1st, 2nd and 3rd days respectively, after the free time allowed, but the $4 charge was not sanctioned by the Board. The charge of $2 will now be made for the first 24 hours after free time and $3 for each succeeding day. The order is not to apply to cars held in transit at stop-over points under published tariffs which have been filed with the Board.

The Vice-chairman of the Board of Railway Commissioners, Mr. D'Arcy Scott, delivered the finding of the Board, in the absence of Chairman H. L. Drayton who was on a trip to the west.

The Finding of the Board

"It cannot be denied," said Commissioner Scott, "that a car shortage equal to, if not greater than, that of last year is imminent, and unless some steps are taken to secure an adequate supply of cars, traffic will be seriously handicapped during the approaching winter and spring until the opening of navigation.

"It is urged by the railway companies that the unnecessary detention of cars by shippers and consignees not only handicaps the railway companies by depriving them of cars which would otherwise be available for traffic, but also causes congestion by blocking team tracks and private sidings and terminals. It is also contended that at least 50 per cent. of what is called railway detentions, that is, the unnecessary holding of cars in terminals by the railway companies, is due to the blocking of these terminals by the unnecessary detention of cars by shippers and consignees.

"The board is fully alive to the very unsatisfactory methods adopted by some of the railway companies for the handling of freight traffic. It has had its expert officials examine and report on the terminal and transportation facilities of the railroad companies for some time. It has had the railroad companies and representatives of the shippers before it, and has discussed with the former the necessity for increasing the facilities and rolling stock of the railways, in order to overcome the unsatisfactory conditions of affairs, and the railroad companies are, undoubtedly, making an honest effort to relieve the congested condition of freight traffic, by increasing their facilities in the way of enlarging their yards, double-tracking, providing more cars, and adding to their motive power.

"I believe there is much yet for the railroads to do to equip themselves to handle the business of the country properly, but, as I have said before, I am satisfied that they are making an honest effort to do so.

The practice of consignees holding cars and using them for storage or warehouse purposes undoubtedly exists. In many cases it is cheaper for consignees to pay $1 a day demurrage and use the car as a warehouse than to unload the car promptly and store their goods in some other place. Many merchants and traders, whose business has materially increased within the last few years, have not sufficient shed capacity to take care of their goods.

"I am of the opinion that temporarily, during the present shortage of cars, the demurrage charge should be so increased as to insure the prompt release of cars in all cases."

The judgment goes on to give examples of the beneficial results which have attended the increase of demurrage charges on the Timiskaming and Northern Ontario Railway and other lines, and continues:—

"Being of the opinion that the railway companies have made out a good case for a temporary increase of demurrage charges, I have come to the conclusion, bearing in mind the facts above stated, that the increase should not exceed a maximum of $3; I would increase the charge to $2 for the first twenty-four hours and $3 for each subsequent twenty-four hours beyond the free time as provided in our car service rules.

"The railway companies are on record as stating that, if they get this temporary increase, which I think should be granted, there will be very little congestion, and few, if any, delays in the placing of cars. It will now be incumbent upon them to carry out their undertaking. This temporary increase in demurrage charges may be taken as a substantial contribution by the shipping public towards the relief of the difficulties, and it will be for the railway companies to do the rest. Unless greater effort is made by the railroad companies, with the view of more prompt transportation and handling of traffic, I do not believe that the increase in the demurrage charges will make any substantial difference.

"There is almost a unanimity of opinion among the shipping public that they would cheerfully consent to the increase in demurrage charges if a measure of reciprocal demurrage was made effective at the same time; that is, if the railway companies would pay a per diem alllowance to the shipper or consignee for unreasonable delays in the delivery of cars on the part of railway companies. That is a matter with which we cannot deal in this application. It was brought to the attention of the board at a sitting in Winnipeg in July last, and is, I believe, now being considered by the chief commissioner and Mr. Commissioner McLean on their present Western trip, and it cannot be disposed of without a hearing in the East, where a number of shippers desire to be heard on the subject. In disposing of the question of reciprocal demurrage, the board will, of course, consider what, if any, effect this temporary increase in the demurrage charges may have upon that question.

"I therefore think an order should go granting a temporary increase in the demurrage charges as mentioned above, to become effective on the 15th December next, and continue until the 1st April next, when, unless otherwise ordered by the board, the old charge of $1 per day will be restored. I have made the effective date December 15 so as to give the shippers and consignees two weeks' notice.

"It was pointed out to us at the hearing that the charges permitted for stopover privileges at Cartier and other points throughout Canada were based upon the present demurrage charges, and that unless otherwise ordered by the board, an increase in demurrage charges might result in an increase of stopover charges. There should be no increase in stopover charges, and provision to that effect should be incorporated in the order."

The Case Presented by the Railways

The railway companies in presenting their application before the Board made the following statement:

1. That a shortage of cars exists at the present time and more serious shortage will exist and consequent congestion during the succeeding four months of the winter of 1912-1913. due to the heavy demands upon the companies' equipment and in part due to the fact that cars are retained by shippers and consignees for unreasonably long periods of time when they should be released and put back into active service.

2. That the present charges provided under the Canadian Car Service Rules are so low as not to offer any inducement to shippers and consignees in their own interest, to load and unload cars as speedily as possible and it is, in the opinion of the applicant companies, largely due to such misuse of the companies' equipment that a car shortage does and will exist.

3. That under the present scale of charges it is often much cheaper for shippers and consignees to retain cars in their possession using them as temporary warehouses and for the purpose of distributing freight therefrom in small quantities, than to provide proper warehouse facilities or utilize public warehouses for the purpose of storing freight.

4. That this abuse of the companies' facilities is more apparent and the consequent congestion more severe in large terminals.

5. That the value of the car to the company under normal conditions is much in excess of the amount which it can collect as demurrage and such value to the companies is greatly exceeded in times when the facilities and equipment of the companies are taxed to their fullest capacity as at present. Moreover, in large terminals the track space actually occupied by a car is of very great value in itself and consequently must and should be used to its maximum capacity in the interest of all shippers and consignees rather than that its use should be restricted by the improper detention of cars in the interests of one shipper or consignee.

6. That in the opinion of the applicant companies during the period from December 1, 1912, to April 1, 1913, when the severest congestion and car shortage is likely to occur it is of the utmost importance that all cars should be released as soon as possible after being placed for loading or unloading.

7. That this application is being made, not because the companies desire to collect increased demurrage charges, but solely with a view to compelling shippers and consignees to permit all available rolling stock to be in active service continuously or as nearly continuously as possible and consequently of facilitating the expeditious handling of freight generally. The applicant companies would willingly forege any demurrage charges if the result would be that cars would not be detained beyond the very reasonable free time now allowed under the rules.

Are Increased Charges Justifiable?

Railway Board Put Them Through With Unfair Haste—Reciprocal Demurrage the Logical Outcome

Montreal, December 2, 1912

Editor Canada Lumberman:

Enclosed you will find some facts in regard to the application made by the Canadian railroads to increase their demurrage charges to excessive figures, namely from one dollar per day to two dollars per day for the first demurrage day, three dollars for the second day and four dollars for each succeeding day, which of course includes both the loading and unloading of freight cars.

Mr. Duval for the railways cited that the increase of demurrage charges in the State of California worked advantageously both for the railroads and for the shippers, but he omitted to state that the California shippers enjoyed reciprocal demurrage, with the result that shippers were able to get cars when and as needed.

If there are to be any increased charges reciprocal demurrage should certainly accompany them. By reciprocal demurrage is meant:—First; freight cars have to be placed for the shipper on certain dates, the shipper of course giving the railroads notice ahead; any delay on the part of the railroads to be paid for to the shipper according to the demurrage rates. Second; the railroads to deliver the cars at destination within certain reasonable fixed time, any delay to be paid the shipper according to the demurrage rates. Third; any delay in placing the cars on the proper sidings so they can be unloaded after their arrival to be paid the shipper as stated above.

Slow Deliveries the Cause of Delay

On account of the lack of freight cars, locomotives and terminals, and in some instances poor management, freight for some time past has been delivered very slowly, with the result that shippers have lost and are still losing heavily on interest account on their goods, as payments are generally held up until goods are delivered. This interest in the aggregate will figure up into thousands of dollars.

By the enclosed newspaper clipping you will notice some arguments against any increase so I will not touch on these.

According to the Canadian Car Service Bureau's report of May 31, 1912, there was collected in demurrage by the Canadian railroads east of Fort William, caused to a great extent by the railroads bunching cars, the sum of $324,731.60. As this amount is collected on the basis of one dollar per day demurrage what would this revenue amount to at two, three and four dollars per day?

A fair average cost of a freight car is nine hundred dollars, which under the present demurrage rate of one dollar per day would yield $300 per year allowing for Sundays and holidays, which equals 33 per cent. a year gross profit. Owning freight cars to be held under demurrage at the present rate which the railroads unjustly claim is too low would be an exceedingly profitable business; one that most of us would like to invest in.

Foreign Freight Cars

Another fact that ought to be mentioned is that the Canadian railway companies are using a great many foreign cars from the United States, and for the use of these cars our railways pay 35 cents each per day (of 24 hours) to the United States roads. As these cars only cost the Canadian Railroads 35 cents per day why should they not be satisfied with this enormous profit instead of endeavoring to make the shippers pay two, three and four dollars per day?

Further, the capacity of the large freight cars which are being built to-day is so much greater than those constructed a few years ago that it is sometimes impossible to load or unload these cars within the given time, especially if the country roads are in bad condition.

I also enclose a statement showing the vast grants given the Canadian railways by the Canadian people through their Government which figure one dollar for every two dollars and thirteen cents invested by the bond and stockholders, so it is with poor grace that they should endeavor to mulct the Canadian shippers with excessive demurrage charges, whereas, our neighbors in the middle and eastern States are charged only one dollar per day demurrage.

Yours truly,

Arthur H. Campbell.

In a second letter dated Dec. 3rd Mr. Campbell says:—By this morning's paper I notice that most of the advance has been granted. I think this is a very serious matter and to my mind the commission acted very hastily, because they did not give the public any time to prepare their case. The only notice that was given out was received by the Boards of Trade of Montreal and Toronto, five days before the hearing was granted, so the shippers were not prepared with their best evidence against the request.

The statement of grants made by various governments and municipalities in Canada to the railway companies, to which Mr. Campbell refers in the above letter is as follows:—

Subsidies, Land Grants and Guarantees of Bonds

Subsidies:		
Dominion Government, cash		$148,217,071.75
Provinces, cash		35,919,360.16
Municipalities, cash		18,042,823.60
		$202,179,255.51
Land Grants:		
Dominion and Provinces, 55,256,429 acres, at average say, of $2.50 per acre, amounts to		$138,141,972.50
Guarantee of Bonds:—Dominion		
C.N.R. 3 per cent. 50 year bonds	1,923,287	
C.N.R. 3½ per cent. 50 year bonds	1,622,586-19-9d	
G.T.P.	7,200,000	
	10,745,873-19-9d or	$52,439,865
Manitoba		$ 20,899,660.00
Alberta		25,743,000.00
Saskatchewan		11,999,000.00
Ontario		7,860,000.00
Nova Scotia		5,022,000.00
British Columbia		23,196,832.00
New Brunswick		700,000.00
Quebec		476,000.00
		$148,336,357.00

Recapitulation

Cash subsidies	$202,179,255.51
Land grants	138,141,072.50
Guarantee of bonds	148,336,357.00
	$488,656,685.01
Aggregate capital liability	$1,528,689,201.00

Nearly 32 per cent. given to the railways by Canada

Or:

In other words, for every $2.13 paid by the bond and stockholders, Canada has furnished one dollar.

Protection for Timberlands

The Canadian Board of Railway Commissioners has recently prescribed regulations for the prevention of fires and for regulating the operation of locomotives in the dry season in the province of British Columbia.

This order provides that every locomotive must be fully equipped with spark arresters of a specified size, with sheet-iron dampers, over-flow pipes and division points. The company must examine, at least once a week, the nettings, dead plates, ash pans, dampers, slides and fire-protective apparatus of each locomotive and keep a record of each inspection for the Government's special inspectors who are to make an independent monthly examination. The board of railway commissioners is given power to remove from service any locomotive found defective in fire-protective apparatus. The roads are prohibited from burning lignite coal without special permission from the board, and between April and November, the burning of ties and refuse along the tracks is forbidden. Any fire starting or burning within 300 feet of the railway track shall be presumed to have started from the railway.

A measure is being discussed by those interested in the protection of Maine timberlands from fire. It will probably be introduced in the legislature of that State during the coming winter. If passed, it will give the State Board of Railway Commissioners authority similar to that held by the Canadian Board.

A Pioneer Millwright Gone

One of the oldest and best known millwrights in the Ottawa Valley, Erastus A. Bullis, died recently at his home, 486 McLeod street, Ottawa. The late Mr. Bullis built most of the first mills in Ottawa and Hull. He was 85 years of age, and before his death was enjoying very good health. Death was the result of a paralytic stroke.

The late Mr. Bullis was born in the state of Vermont, and moved to Kemptville, Ont., when quite young. A few years later he took up his residence in Hull. About the same time the late E. B. Eddy came to Hull and established a general store on Main street. Mr. Eddy intended to take up a more profitable business, and he secured the services of Mr. Bullis to build the first mill in Hull.

A few years earlier than that Mr. Bullis built the first mill on the Gatineau river, near Chelsea, on the Cantley side. He also built J. R. Booth's mill in Hull and several other small mills. Many years ago he built the Crandell mill at Hurdman's Bridge.

Importance of Uniform Lumber Grading

What Shall Be The Remedy?

Written specially for the Canada Lumberman and Woodworker by H. E. Miles

That the lumber industry is crippled, and that the Canadian branch is badly affected through not having a universal standard by which to determine the value of each grade of lumber to be marketed, is beyond question. Hence to seek a remedy would seem to be in order. What shall it be?

By a glance at the past we find that no reform has ever been proposed without meeting opposition, and no achievement was ever attained without effort on the part of its promoters. It seems to be a law of nature that the greater the object, the greater the effort required to attain it. Hence, if it appears to be a matter of great difficulty to establish a system by which a party wishing to purchase a certain quality of lumber may, by the use of technical terms, be able to make a dealer handling that kind of goods know just what he wants, this should be no discouragement or argument against the project.

No one seems to have any objection to the use of such terms in connection with the trade, but when it comes to establishing specific uniform definitions for them, it appears that there are some who would prefer to leave the public to infer, or to apply, definitions suited to their own taste. This is not logical, for what good are the terms unless all parties concerned have the same understanding of their meaning? And while definitions have been inaugurated, their meaning has been too varied to be relied upon in all places.

Present Definitions All At Variance

It will be noted that nearly all rules for the grading of lumber employ much the same terms but each define them differently, and while some definitions are practical and quite well suited to the trade, others are rather slack, indefinite and wholly unsuited to command the respect of practical dealers. For instance, one particular set of rules for the inspection of spruce allows of one inch wane on one side of all dimensions.

Those who compiled these rules evidently did so with a view to including pieces that might otherwise be very good, the wane being the only fault. However, by catering to such conditions the industry becomes demoralized and manufacturers are encouraged to retain a low standard of efficiency. And what is gained? If, for instance, lumber for dressing is allowed to pass which contains more wane than will dress off. The seller must of necessity reduce the price sufficiently to allow for the work of one man at the edger in the dressing mill when the lumber is being dressed, besides the extra freight on the same. The writer would prefer to do his own edging and save this expense and freight. When we hire a man to edge our lumber why should we not insist that he edge it instead of lowering the inspection rules to afford him a lazy job? And if it is argued that any one is liable to miss occasionally, we admit that as true, but why should we degrade the quality of our stock to provide for such errors? Besides we note that in the rules above referred to no limit is specified. Hence the average miller will employ an edgerman of the ordinary type, and, for fear of wasting lumber, will allow a large quantity of wane to pass, which, if accepted, must reduce the price as above stated.

With such rules in force, the manufacturer who has a mill well equipped, and well manned with proficient help to cut his stock properly, practically free from wane, and to even inches, rendering it ready to be dressed without further trouble, would have to meet a price co-ordinate with that offered for the rough stuff produced by the other fellow who knows little and cares less about doing things right.

An Inevitable Development

While we have presented but one illustration, the principle will apply to all classes of stock. Because such rules have failed to become popular, some people have become discouraged about trying to establish uniform grading for the trade even throughout their own province. However, that this must be accomplished and will be accomplished is beyond question. Not only for one province but for the whole of North America and possibly a part of Europe and the British Isles. We can see no reason why all such territory should not be included as well as South America as the trade between the two countries increases.

Already the dealers of the United States, which country produces by far the greatest quantity of any, have, as we have seen, the matter of inspecting pretty well organized. And since our requirements are practically the same as theirs, why cannot the same results be obtained here? Besides we are supposed to be exporters often shipping to the same markets as they. And further we find that while these countries export much the same kinds of woods, they do a lot of importing from each other. We find by looking the matter up that this country imported from the United States during the year 1911 something like 500 million feet, and we are well aware that out export trade with that country is far greater, which trade is very important. Since it is apparent that there should be universal grading for all lumber handled at least by these two countries which produces nearly fifty billion feet of lumber annually.

An Instructive Illustration

At this juncture we shall mention a matter of some importance that came under the eye of the writer and which afforded him a chance to do some business by virtue of having a definite practical guide by which the value of his stock could be determined.

It may be a surprise to some people to learn that one great cause of the importation of lumber to this country from the United States, which is becoming so obnoxious to our lumbermen, is the fact that many shippers here lack a proper method of grading, but this is the case nevertheless. Three years ago the manager of one of our largest manufacturing concerns informed the writer that his people were importing maple from the city of Boston in large quantities because they had become discouraged in trying to secure satisfactory stock in their home country despite the fact that this is the home of the maple, to say nothing of our national emblem. The writer was ashamed and began to make note. The stock imported was firsts and seconds, and the use for which such stock was purchased will further surprise the reader, for the articles to be manufactured from it required no piece of cutting to be longer than twenty-four inches, or over three inches by three inches the other way, and those people declared that after experiencing much unpleasantness they found it cheaper to buy their stock in the form of planks, firsts and seconds grade, shipping it for several hundred miles from a metropolis, than to make further attempts to secure it from those who did business in a slack unscientific manner.

It will be seen that their business should only require a grade of number one common if such could be secured near home on a low freight rate. This they recognized and stated that they would be very glad to contract for such stock with reliable people whom they could depend upon to supply the proper goods.

While this is no doubt rather an exceptional case it is beyond question that there is much more lumber imported to this country than there would be if the home trade was conducted on better methods, the greatest lack of which is the result of stock being improperly gradèd.

Many are the comments that might be made, but perhaps they are needless. Those same people were paying for beech produced in that province, prices varying widely according to the quality, which stock was all being shipped log run culls out. The writer viewed several shipments and had an opportunity of seeing the difference in the opinions of the several shippers as to what constitutes log run culls out. He was convinced that the buyers were an honorable class of people who gave fair deal, an opinion which was afterwards substantiated by dealing with them. He could not desire a better class of people with whom to do business.

Surprised An Importing Consumer

Although we would rather not refer to personal experiences, we may be excused in this instance as the above narrative seems to be quite significant.

Without asking for an order to be placed, the writer informed these people that he intended to ship them a sample car of beech stock, which he chanced to have on hand, stating a price of three dollars a thousand feet higher than he was positive they had been accustomed to pay, and that any further shipments would cost them a dollar a thousand higher than the price of the sample. This stock of course had been cut from logs most of which had been turned five times while being sawn and it was shipped number two common and better, "National" inspection, or what is sometimes termed log run culls out the same as they were supposed to have been buying. The manager laughingly remarked: "All right send it along we will be pleased to see what it is like, but your price is three dollars higher than we have ever paid, however, we will chance one car for curiosity sake. The car was shipped and, after waiting a while and hearing no complaint, two more cars were sent along; and the sequel of this narrative will be found in a letter which we have on file from

that concern which states: "The sample of beech has been received and is quite satisfactory, and while we cannot see our way clear to pay the extra dollar a thousand that you informed us you would require for further shipments, we find that the amount asked for the sample car is very satisfactory. We require about three million feet of this stock annually and if you can supply that amount we will be pleased to contract for the same and cut out all our other sources of supply."

In this instance, at least, we were persuaded that it paid to manufacture properly and to know something about how to grade the product.

Had we employed some unpopular rules unsuited to such trade, or some which the buyers would know nothing about, we doubtless would have lost the business.

The Opportunity Now at Hand

It appears to the writer that the time is ripe for the establishment of a system of rules for the grading of lumber that will ultimately be adopted universally throughout the civilized world. After a perusal of the quantity of lumber produced by other countries we find that outside of the continent of North America the figures sink into insignificance. Here is located the heart of the industry, and while such countries as South America, Australia, and Central America, contain large forests of timber the lumber industry in them is only beginning to be developed. If we turn to the Scandinavian Peninsula we find too small a population to cut much figure when compared with the amount produced on this continent, and we have no reason to believe that the trade has been established on a very high scientific basis in Russia despite their large area of timber lands. Thus, since we understand that the matter of well established rules is somewhat lacking in those places, if such is a practical proposition, which we cannot deny, it would naturally have its origin in the country that produces the most of that commodity supplying a large quantity of it to other parts of the globe.

While the European states may be in the lead in the way of systematic operations in connection with the manufacture of textile goods and other products, it is doubtful if any rules for the inspection of lumber employed by any one of them would commend themselves to so wide a sphere as those employed by a country whose product is distributed over an area of country much larger, involving many varied conditions and requirements, and whose trade reaches out to much of the civilized world. That very fact appeals to the writer very forcibly in favor of the rules employed in the United States as no doubt being better adapted than any others. However, our purpose is not to advocate the apeing of others, necessarily, but a careful consideration of such rules cannot be untimely. For, those which have already become popular have been compiled by men of extensive research and their existence is the fruit of many years of study with a view to securing a standard suited to the requirements of the trade in general. In those rules we get the benefit of such knowledge, and only need to make, perhaps, a few changes to institute a set of rules better suited to the cause than now exists.

Hardwood Rules Requiring Changes

While the writer highly appreciates the rules adopted by the National Hardwood Lumber Association, he is aware that nothing in this world is so perfect that it cannot be improved. And on examining those as above referred to, and those of the Manufacturers Association for the inspection of hardwood, he is convinced that a few changes might be made in both to their betterment. Such changes are in most instances such as would cause them to be nearer alike. As an illustration of this the writer wishes to submit one point for the practical dealers to consider. Take for instance the grade of number three common for birch as defined by the rules adopted by the National Hardwood people which rules he has been able to use to a good advantage as we have seen. To his mind, if that grade were changed to read like the grade adopted by the manufacturers which admits of no piece of cutting containing less than fifty per cent. of sound lumber, it would be better adapted to the requirements of the trade. While this grade is regarded as culls by many dealers, which perhaps it is, if the higher grades have been properly inspected it will contain a large amount of valuable lumber for a nearby market where the freight is not too high. There are bound to be pieces containing a large amount of even clear cutting having too much wane or other defects to be permissible in the better grades. Such, we believe, should not be included and thrown on the market with lumber that contains but twenty-five per cent. of sound cutting as is the case when defined by the "National" rules. We believe that a piece of birch that contains so small an amount of sound lumber, which may also contain knots, is only suitable for fuel. Hence the writer would suggest a change in this instance in favor of the rules of the "Manufacturers" which call for fifty per cent. of sound cutting. Nothing is gained by shipping fuel for lumber and paying lumber rates.

On the other hand we believe the rules as compiled by the manufacturers association could be modified a little in some other respects in a way to make them cater to the specifications of the "National" rules. This would seem logical, for is it not reasonable to suppose that each corporation have based their definitions on extensive research and much hard thought? And since the judgment of a large number of men, of perhaps equal calibre, is superior to that of a few, is it not reasonable to suppose that slight modifications in favor of each other would come much nearer the ideal? This is but one of the few changes required to unite the two associations on the matter of inspection. And if they will not unite, the people of this country can make such changes, and thus place a standard before the world which, if properly introduced, we believe will commend itself to the trade in general. Ths writer can see no reason why the Canadian Lumbermen's Association should not join hands with those who are working to the same end on the other side of the border, viz., to effect such a compromise between these two very strong associations, who at present have practically the control of the inspection of hardwood in the United States and whose influence is fast becoming felt in foreign lands.

Thus far we have dealt mainly with the matter of the grading of hardwood, but as we have seen by previous articles in this journal the softwoods are being handled on a system that appears to be very harmonious and having now been quite well established the dealers of Canada only need to fall in line and supply themselves with the rules published and supplied by the several associations having charge of the same.

The writer would further suggest that the prominent dealers in this country take the matter up by correspondence with the associations connected with the trade and get together at some future date and remedy the adverse conditions that exist. It is evident that the Wholesale Lumber Dealers Association will be found to be a very important factor and that they will be willing to co-operate as they are already working to this end. Let it be an international affair and we believe it would be represented by many of the prominent lumbermen throughout the whole of North America at the very start.

Grading Methods in New Brunswick

St. John, N. B., December 2, 1912

Editor Canada Lumberman:

Our business here is almost entirely confined to spruce, and in the grading for shipment to the United Kingdom, we class it as follows:—1sts, 2nds, 3rds, and 4ths. The 1sts, 2nds, and 3rds we pile altogether, the 4ths we pile out separately in the mill yards. The grading is done by the surveyor in the mill, but frequently he allows 4ths to go in with 1sts, 2nds, and 3rds, and in such cases we carefully cull the stuff again when shipping to the United Kingdom, and in some cases we make as large as 5 per cent. additional 4ths.

In regard to pine lumber, the stock of good pine on this river is nearly exhausted, and what we have been manufacturing in latter years is what we call 2nd growth or sapling white pine. In the grading of this wood we only find what we call "large shipper, small shipper, 4th quality, and culls." We do not get any of the better grades such as "smooth shippers, clears or planers."

In regard to hardwood lumber, we manufacture little or none of this wood here at the mouth of the river, and what little we do manufacture is shipped in the rough to the United Kingdom in thicknesses of 2, 2½, 3 and 4 inches, and we make one grade which we call "merchantable."

Yours truly,

John E. Moore.

Would Remove All Uncertainty

Toronto, December 3, 1912

Editor Canada Lumberman:

In answer to your enquiry regarding the practicability of the grading of white pine and other lumbers, I wish to say that it appeals to me as the only business-like manner of putting the stock on the market. If there were something in the way of recognized grades put up it would save an endless amount of trouble and financial loss.

As the market stands to-day there are certain names given to the product of the log and the quality of the stock shipped depends upon the individual idea of the shipper. When it reaches the consignee, his idea may be entirely different from the idea of the shipper. As the trade stands to-day his opinion is just as good as the shipper's and the trouble commences there and then if both parties are self-opinionated. As a rule the shipper gets the worst of the deal, for he cannot afford to fall out with the customer over the grading, as he feels that he can make up for the loss in the future. The practice of giving away to the consignee has a very bad effect upon business, inasmuch as it has a tendency to make him a chronic "kicker." Grading rules for lumber have been tried out in the United

States and are working satisfactorily to all parties concerned and I cannot see any reason why they should not work equally well in Canada.

Some manufacturers say it cannot be done owing to the extra room, etc., that would be required. Now such is not the case as most manufacturers put up their stocks "mill run with the culls out," and the grading rules would not, in any way interfere with this method but would simply define what is a cull and what should be laid down from the mill run as designated. Then again the mill run as put up is worth more or less according to the percentage of the different grades which it carries, in accordance with the grading that is put upon it before being used. It can be seen readily that the so-called mill run has to be subdivided before being used and the use to which the lumber is put fixes the value. I cannot see any good reason why the man who does the hard work and assumes untold hazzards should not know what his lumber carries in the different grades to which it is ultimately separated.

Lumber being a bulky commodity cannot be sold from sample but rather from lists and the different items on the list have to be described by the salesman as the different mills have different ideas of grading. The salesman has certainly a hard proposition to get orders that would be profitable to both seller and buyer, simply because the buyer does not know just what he will get and prefers to deal with the stock he is accustomed to, even at a loss.

Now all this uncertainty could be done away with by having a standardization of grades and an off-shipment could and would be adjusted by a disinterested party who would make his decision upon the stock as he found it, irrespective of the buyer or the shipper. The party at fault would pay the expense.

The grading rules presented by myself to the Canadian Lumbermen's Association last February appear to meet with the approval of a large number of both manufacturers and dealers and I think they are worthy of consideration by the trade generally.

Yours very truly,
W. J. MacBeth,
Parry Sound Lumber Company, Toronto.

Difficult to Establish Uniform Spruce Grades

Sayabec, P.Q., December 2, 1912

Editor Canada Lumberman:
Toronto, Ont,

In regard to grading spruce lumber I would state that in my opinion the spruce lumber of different sections varies so much in the character of the knot and in the character of the defects that it would be practically impossible to make a standard grade. We take the greatest of pains with our own grading and when selling same are always particular, if anything, to under-represent the particular grade in question. As a result complaints on our grades are almost unknown to us. In fact I do not suppose that we have grading claims to the extent of ½ to 1 per cent. of our shipments. Under the circumstances we are very well satisfied with things as they are.

Yours truly,
John Fenderson & Co., Inc.

Mr. Ralph Loveland in Poor Health

The firm of Loveland and Stone of Cutler, Ont., has been dissolved and a new company has been formed under the name of the Stone, Grant, Lumber Company, Limited, who will be successors to the former company. Mr. Ralph Loveland, the former member of the company, has been obliged on account of ill health, to retire from the company and reduce the extent of his active business interests. The North Channel Lumber Company, Thessalon, of which Mr. Loveland was one of the chief members is bringing its business to a close and will cease operations. Mr. Grant the member of the new company is a brother-in-law of Mr. E. P. Stone the other member of the company and like Mr. Stone comes from Saginaw. Mr. Loveland is at present in the south for the benefit of his health and expects to return in a few weeks.

J. M. Diver Making Important Change

Mr. J. M. Diver, Sarnia, Ont., has announced his resignation from the position of Vice-President and General Manager of The Cleveland-Sarnia Saw Mills Company, Limited, Sarnia. Mr. Diver has made no statement as to his future plans but is known to have been in negotiation for the exclusive control of a very large property for some time past and interesting developments are expected shortly.

Mr. Herbert T. Whaley, formerly with James Maclaren & Company, Buckingham, P.Q., has joined the forces of Messrs. Muir, Terry & Gordon, of Toronto, as a travelling representative commencing with the first of the coming year.

A Well-Merited Success

E. C. Barre, Sarnia, Ont.

Mr. E. C. Barre, the well-known assistant manager of the Cleveland-Sarnia Saw Mills Co. Ltd., has succeeded to the position of General Manager rendered vacant by the resignation of Mr. J. M. Diver, which is announced elsewhere in this issue. Mr. Barre's promotion to this important position will be recognized by the lumber trade as a well-meritted reward for the splendid service which he has given to the company.

Mr. E. C Barre is a native of Michigan, having been born in Reading on May 18, 1871. When he was five years of age his parents moved to Greenwich, Ohio, where Mr. Barre received a common school education. At the age of seventeen he commenced work in a small saw mill and lumber yard at Greenwich. In 1895 he secured a position with the Cleveland Saw Mill and Lumber Co., Cleveland, Ohio, as bookkeeper, a position which he held until 1898, when he moved to Marquette, Michigan, as Manager of the Dead River Lumber Co., a branch of the Cleveland Saw Mill and Lumber Co. He remained at Marquette until 1901 when the Dead River interest was disposed of. Then he moved to Sarnia, Ont., to take the position of assistant manager of the Cleveland-Sarnia Saw Mills Co., Ltd. From that date to the present Mr. Barre has occupied that position with eminent success. He has been a great factor in the building up of the splendid trade enjoyed by the Cleveland-Sarnia Saw Mills Co. and his promotion to the position of General Manager will ensure that the business of the company will be carried on upon progressive lines identical to those which have characterized it in the past. Mr. Barre's many friends in the trade will be greatly pleased to hear of his success and will wish him still greater honors in the future.

Ottawa Firm Opens New Office

The Elmitt Lumber Company, Limited, wholesale lumber merchants, of Ottawa, Ont., have opened an office at 18 King street, Sherbrooke, Que., where active operations will be carried on in future. For some time past a large percentage of the company's business has centred around that locality and they found that by having an office on the spot they could attend to their clients' interests more satisfactorily. While they handle lumber of all kinds, the company are specializing in hardwoods, of which they carry large stocks. The head of the Elmitt Lumber Company, Mr. T. F. Elmitt, is a native of Ottawa, and has been engaged in the lumber business for about fifteen years. Before going into business for himself he was connected with the Shepard and Morse Lumber Company, the St. Anthony Lumber Company, and the old Bronson Weston firm of Ottawa. Besides the lumber business Mr. Elmitt has always taken a keen interest in military offairs in the capital city and is a captain in the 43rd D. C. O. R. He was one of the eight men picked to represent Canada, on the Palma Trophy Team in 1908 and was also on the Bisley and Olympic teams in 1908. His many friends are sorry to see him leave the capital city.

Mr. T. F. Elmitt was in Ottawa recently after an extended trip among the different lumbering firms in the province of Quebec. Speaking of trade conditions he said: "It looks as if the cheaper grades of lumber would advance in price next year. There has been so very much building in all parts of Canada during the summer where the cheaper grades of lumber, mill culls, etc., are most used, that the supply is nearly all sold out. I have never seen so little of this class of lumber on hand in the fall after all summer's cutting as is the case just now. Of course it indicates how very active Canada is in the building line."

Death of H. C. Thompson

Hugh C. Thompson, a well-known lumberman, of Orillia, Ont., died at his home there on Dec. 7th after two days' illness of pneumonia. Mr. Thompson spent his early years in Belleville, and fourteen years ago moved to Orillia. For a number of years he was with the Grand Trunk Railway and afterward with McCormick & McLeod of Bracebridge, and Playfair & White of Midland. Mr. Thompson was sixty-four years of age, and leaves a wife and two sons.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Expecting Higher Prices for Shipping Culls

Ottawa, Dec. 9; (Special correspondence of the Canada Lumberman): Trade continues to be exceptionally good in Ottawa and the outlook for the winter was never more encouraging. One of the largest orders secured during the past week went to McAuliffe & Davis. It came from the Ontario and Manitoba Milling Company at Sudbury, where a new mill is being built. McAuliffe & Davis will supply all the necessary lumber. Their tender amounted to about $7,000.

Shipping culls will cost from ten to fifteen per cent. more next year say lumbermen here. The reason is that the supply is getting short and the demand greater so that an increase in price is the logical result.

Tenders for ties and poles are to be called for directly by the Morrisburg and Ottawa Electric Railway for use on the construction of the road, which is to commence next March. The main line will be 47 miles long and subsidiary lines will total 50 additional miles. The same company proposes to invite tenders for building several passenger and freight cars. The offices of the company are in the Canada Life building, Sparks street, and Mr. R. A. Bishop is the secretary-treasurer of the road. The engineers' report on the amount of material required for the road will be issued about the 15th of December.

The first car load of horses sent this season to the lumber camps from Ottawa left last week for the Hawkesbury Lumber Company's camps in the Temiskaming district. This season the demand for horses is not very great owing to the decreased number of camps compared with other years. It is estimated that there are fully 50 fewer camps in the Ontario district this year which means about 5,000 men less. The shortage of labor which was felt by lumbermen who required men for the camps a short time ago, has been overcome by the return of men from the harvest fields of the west.

The purchase of 81 acres of land on the Russell road, on the outskirts of Ottawa has just been closed by McAuliffe & Davis. Early next March it is proposed to commence the building of up-to-date planing mills, drying kilns and equipment for a modern lumber yard on the site. McAuliffe & Davis propose spending nearly $250,000 on this new plant, which will be touched by four railroads.

There is a movement on foot in Ottawa, which is gaining in popularity every day, to persuade the Dominion government to purchase several thousands of acres in the Gatineau district, between the Gatineau and Cologne rivers, and make a national park. The land it is proposed to acquire, now belongs to the Quebec government, but the big timber has been taken away and those who are familiar with it say it would make an ideal national park.

A representative deputation of the Canadian Forestry Association waited on Premier R. L. Borden last Friday and presented to him the resolutions passed at the recent forestry convention in Victoria, B.C. The resolutions dealt with the proper disposal of tree tops and other debris after lumbering, the prevention of settlement and squatting on lands only suitable for tree growing, the setting aside of more forest reserves and that all appointments to the forestry service be based on experience and ability. A request for an examination for all officials of the forest service was also made. The Premier promised to give the requests his serious consideration.

The deputation consisted of George Y. Chown, Kingston; Past President Hiram Robinson, Denis Murphy, George Murphy and Gordon Edwards, Ottawa, Senator Bostock, Thomas Southworth, Toronto; W. C. J. Hall, Quebec; W. Harkom, Melbourne, Que.; Ellwood Wilson, Grand Mere and Wm. Little, Montreal.

Lumbermen in Ottawa consider the increased demurrage tolls unfair. Too often they say, cars are delayed by the railroads. For example a lumberman orders ten cars of lumber daily. Instead of coming in as ordered the cars may come in in lots of 25—more or less—and the consequence is that the lumberman may not be able to unload the 25 cars in the 72 hours allowed before demurrage is charged. An appeal against the order may be made by the Canadian Manufacturers' Association. There is a very strong feeling in Ottawa amongst all classes of merchants against what they characterize as an excessive increase in demurrage tolls.

North Shore Trade Good—Weather Conditions Favorable

Thessalon, Ont. (Special correspondence of the Canada Lumberman): The mills on the north shore are now all shut down and navigation has about come to a close. The water shipments of lumber are nearly all finished for the season. A barge left here yesterday with 500,000 ft. of lumber for E. B. Foss of Bay City, Michigan. Two large barges are now completing their loads at Nesterville with a capacity of 1,000,000 ft. each. They will leave on December 5th. These will be the last boats of the season.

Mr. H. H. Bishop of the Thessalon Lumber Co. brought in two cars of very fine horses for the woods last week, for which he paid about $600 a pair.

The weather has been very unfavorable for woods operations throughout the fall. There has been so much rain that the woods are flooded. The cost of logs this season will be high. High wages and extensive supplies along with the wet weather will materially increase the cost. Lumber is selling at high prices and the demand is good. Some of the large firms have sold their next season's cut now and others are negotiating with Chicago and Cleveland parties for their entire cut of next season. The output will be very short this season, partly on account of the scarcity of labor and partly on account of the wet weather. We had about 6 inches of snow last week but it has all disappeared and the roads are impassable. Good sleighing is required from this out during the winter months.

Algoma.

Season Over at Quebec

Quebec, Dec. 8, 1912.—Business in the timber trade may now be considered at a close for the season. Shipments have ceased by water for timber and pulpwood, except some birch and a small quantity of deals which are going on the damaged Royal George as ballast. Contracts for next year's delivery will be made in February and March next.

Dry Stocks Scarce at Montreal

Montreal, December 11.—(Special correspondence of the Canada Lumberman):—Lumbermen in Montreal are greatly disappointed at the decision of the Railway Commissioners granting a temporary increase in the railway demurrage rates. This soreness is accentuated by the admittedly poor service of cars during the past season, and they feel that it is adding insult to injury to advance rates because of the action of a few men who have used cars for storage purposes. Lumbermen will be seriously affected by the decision of the Commissioners, which is regarded as illogical and altogether unwarranted. Following the hint of the Commissioners, an application for reciprocal demurrage is to be made, on behalf of the traders, who are determined to fight this question.

Considering the time of the year, business is very good, the open weather being a favorable factor, as it enables contractors to continue operations. Most lumbermen are optimists as to prospects for next year; certainly the building permits point to heavy building in 1913. For last month the permits totalled $2,550,313 in value, as compared with $878,045 in the corresponding month in 1911; while the total for the eleven months was $18,724,015, as against $13,960,280.

Generally speaking, there is a scarcity of lumber, and it is almost impossible to obtain dry stock. Prices, too, are hardening. Firms doing business with the United States report that the demand is very brisk.

Very little change in the position of newsprint is to be noted. One of the mills which started up earlier in the year, and is now turning out a large quantity of paper, is said to have made contracts for practically their entire output for a year ahead at prevailing prices; while another news mill which recently began operations has sold fifty tons a month to a daily paper in the Western States. One of the paper trade journals in the United States has expressed a fear that Canadian mills will come into that market and cut prices; but there is very little fear of this, as nearly all our mills exporting paper to the United States are manufacturing a superior quality, which commands the highest market prices, and there is no necessity for accepting unremunerative figures. Some comment has been made on a tariff case affecting newsprint before the United States Appraisers' Court. The case is as to whether Section 2 of the tariff is void in consequence of the failure of the reciprocity bill to pass the Canadian Parliament. It is pointed out that Representative Underwood's resolution at the last session of Congress cancels Section 2, otherwise the paper clause, in the reciprocity treaty, and substitutes a duty of $2 per ton on paper manufactured under that clause. It is stated that Mr. Underwood may reintroduce this clause and carry it.

Ground wood is a very unsatisfactory market. The United States mills are just now making practically all their requirements, owing to the good water powers. For the ten months to the end of October imports into the United States show a falling off of 84,000 tons. Canadian mills are running at their full capacity and will accumulate stocks until later, when there is certain to be a revival in the demand.

Sulphite is very strong, with very good buying orders. As compared with last year, prices have advanced from $5 to $7 per ton. The imports of unbleached into the United States from Europe and Canada increased, during ten months of this year, over 50,000 tons, whilst the imports of bleached remained almost stationary. In Europe there is a scarcity of sulphite, and some of the largest paper mills in Great Britain are in the market for big supplies.

New Brunswick Spruce Showing Strength

St. John, N.B., Dec. 9th. (Special correspondence of the Canada Lumberman):—The tendency for spruce in this section is still upwards, in fact good prices are being offered for goods for present delivery as well as for the season of 1913. The English deal buyers in this section are offering prices better than have been offered for some years; in fact it is said that the price is the highest that has ever been offered for deals. The stock of deals on hand at the Port of St. John does not exceed over 20 million which is a small quantity compared with previous years. The winter cut of deals will not be heavy unless conditions in the surrounding country change rapidly as the operators have not been able to yard up any heavy quantity of logs to date. The American market still continues firm and is taking anything offered at good prices. Therefore the outlook next year for a good price for English deals is very promising.

It is said that buyers for English deals are offering $15.75 for specifications of deals 50 per cent. 7 and 8 x 3 balance 9 in. up, with 3 x 4-5-6 at $14.10. Ends about $12,10 on wharves at St. John for shipment any time during next year.

The liners are only taking small parcels, and will continue to do so all winter. This will keep the stocks to a minimum on the other side, therefore keeping prices about as they are to-day. Trade conditions on the other side are extra good according to all reports from buyers who are coming over.

All stocks of deals, boards and low grade lumber have been sold up, no stocks at this port remaining unsold. Late sales of merchantable spruce boards 4 in. and up are bringing $13.00 to $13.50 per m. Low grade or refuse scantling planks and deals have been all closed out at about $9.00 per m., all prices at mills. This will leave a shortage in spruce boards and refuse, the only place buyers have to draw from will be the rotary mills cutting in the interior and the quantity will be limited and of a lower grade than city cut.

Pine boards are being firmly held at $24.00 for shipper boards 8 in. and up wide, 10 ft. and up with $16.00 for smaller boards. The higher grades such as planers are bringing about $60.00 according to quality.

Hemlock boards:—None are being offered as all stocks have been sold and shipped.

All rafting operations have ceased for the season, the river closing to-day. The St. John River Log Driving Co. rafted out of booms this year 98 million feet of spruce, pine, cedar and hemlock logs. About one million feet were left in the booms and about 1½ million feet at Government Island. This would have made about 100 millions for the season's work. The cut for next year will not be so heavy, as work has been very much hindered both by scarcity of men and the condition of the woods.

Heavy November Receipts at Tonawandas

North Tonawanda, Dec. 6; (Special correspondence of the Canada Lumberman): The customs report for North Tonawanda show that the receipts of lumber by vessel was unusually brisk during November. The total for the month amounted to 28,690,500 feet as compared with 25,794,900 feet during November 1911. 209,950 pieces of lath were also received at North Tonawanda during November.

Building has begun to slacken some in the territory supplied by local lumbermen. Salesmen report a perceptible change in the situation during the last week. While a certain amount of building will continue during the winter the summer rush is about over. It continued longer than usual on account of the mild weather during November. There is every indication, however, that next spring will see a strong revival of building in all lines using Canadian and American stocks.

The Eastern Lumber Company leads in total of lumber receipts for 1912, with upward of 40,000,000 feet to its credit. The Eastern received its last cargo a week ago. R. T. Jones & Company is second with a million or two feet less. The latter company would in all probability have reached the high mark had it been possible to bring down all the lumber contracted for. The scarcity of tonnage available during November made it necessary to leave several million feet on the docks at upper lake ports. Smith, Fassett & Company are also well toward the front in receipts. The Dock and Mill Company, M. M. Smith, proprietor, has also been a heavy buyer during the last few months. Its total for the season is in excess of 20,000,000 feet of lumber.

Mr. Levant R. Vandervoort, junior member of Smith, Fassett & Company, is able to be out again after a serious illness. Mr. Vandervoort was taken ill suddenly while visiting friends in Buffalo.

Private detectives have been engaged to solve the disappearance of H. J. Dunn, salesman for the Haines Lumber Company of this city. Dunn's home is in Chicago. He was last seen at Albany, N.Y., on the night of November 2. When he did not communicate with his employers in this city, an investigation revealed the mystery surrounding his whereabouts. The missing lumberman went from North Tonawanda to Albany. While here he acted strangely and on his departure left a trunk full of personal belongings which he said he would send for. The Empire State Association of Lumber Salesmen has taken up the unraveling of the mystery and President Jacob Rumbold is personally directing the search.

The railroad draw bridge, the only means of communication with Tonawanda Island, which contains half of the lumber yards in both Tonawandas, is in use again after being disabled when a lumber barge hit one of the abutments to the bridge. Not a car load of lumber could be moved from Tonawanda Island for seven days and the dozen lumber firms, several of which rank among the largest in the Tonawandas, were seriously handicapped in filling orders. While foot traffic was possible over the disabled structure, the bridge was closed to horses and lumber trucks as well as to railroad cars.

Bad Logging Conditions on Northern St. John

Reports from Bangor, Maine, state that unusually bad conditions in the woods and the scarcity of men for the lumber camps will have a tendency to decrease the timber cut along the St. John waters in northern Maine. Snow came early in northern Maine and at the present time there is between a foot and a foot and a half in the woods. It came before the ground had frozen, and some of the woods' roads for this reason are almost impassable. In some sections the lumbermen have been obliged to swamp new roads along the ridges to get to their operations, and in other places where plans were made to operate on low land or in the swampy country, the work has had to be abandoned altogether owing to the fact that the swamps are filled with water, and the heavy snow over a thin coating of ice will prevent them from freezing sufficiently so the men can go on them early enough to get out the timber. Men have been unusually scarce notwithstanding the fact that excellent wages are being paid. On the St. John River in Maine there are but few of the lumbering camps that have a full crew of men, and it seems to be impossible to get them. Wages are from $32 to $38 a month with board.

The Stetson, Cutler Co., of St. John, N.B., will have about 15,000,000 feet of Maine logs for their mill. W. F. Cunliffe's Sons, of Fort Kent, are operating on the Allagash to the extent of about 6,000,000 feet, which will go to St. John. Albert N. Currier, of Seven Islands, and Arthur L. Noble, of Fredericton, are cutting on the upper St. John waters for the Stetson, Cutler Co., and expect to take out five and four million feet, respectively.

It is quite possible that the St. John Lumber Co., which has the large plant at Van Buren, will not cut the 40,000,000 that it planned earlier in the season, owing to the bad conditions. Its operators are at work now and it may be that the full amount will be taken out before cutting ceases.

Charles E. Jones, of St. Francis, is cutting about 6,000,000 feet, part of which will go to the St. John Lumber Co., and part of which he will use in his shingle mill at St. Francis.

John L. Wheelock, of St. John Plantation, is cutting about 2,000,000 feet, which will go to the St. John Lumber Co.

The Intercolonial Car Shortage

There is nothing more aggravating to a keen business man than to be unable to fill orders for business, on account of a shortage of empty cars in which to make his shipments. At the present time a car shortage is prevalent in all parts of Canada. In the Maritime Provinces which are served by the Intercolonial Railway, the difficulty is if anything more pronounced than anywhere else. Mention of this shortage was made in these columns a fortnight ago, as the result of letters which have been received asking us to refer to the matter. Since then we have received further correspondence upon the subject in which the writer points out that the matter is not only one of temporary importance, but one which threatens to cause great inconvenience throughout the coming year unless the government takes active steps to provide more cars. "The shortage of cars," says one writer, "has been a very serious handicap to us here all fall, as our shipments have been tied up. Unless a very strong stand is taken by all the shippers along the road, we fear that this situation is going to be fully as bad, or worse for the coming year and we do not think that this matter can be agitated too much."

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

New Manager at Disston's Toronto Plant

Samuel Y. Dingee

Henry Disston & Sons, Philadelphia, Pa., the well known manufacturers of saws, have made a change in the management of their branch office and factory at Toronto, Ont., by appointing Mr. Samuel Y. Dingee to the position of manager of this important branch. Mr. Dingee has been in the employ of the company for 32 years, having entered in October, 1880, at the age of 15, when he was employed in a minor capacity. Since that time he has gradually advanced into more important and responsible positions. Mr. Dingee's business education has been all in the line of mill saws, used in the manufacture of lumber, such as band and circular saws and machine knives and tools. He has had exceptional opportunities for acquainting himself with the details of the manufacturing end of the business and has thus become well equipped for the management of the Toronto branch. Mr. Dingee has also had a wide experience in the use of the saws. His presence in the Toronto branch will be a distinct advantage to the business, not only because he has been trained in the great saw works at Philadelphia, but also because he has a thorough knowledge of the requirements of the business.

An Important Wire Cloth Manufacturing Company

The Capital Wire Cloth and Manufacturing Company, Limited, Ottawa, Ont., report that they are now ready for business and in a position to supply paper and pulp mills with their wire cloth requirements. The plant of the Capital Wire Cloth and Manufacturing Company is in a building consisting of two storeys and an attic, 100 feet long and 45 feet wide, situated at the corner of Armstrong and Hamilton avenues.

The company are now installing a loom to weave Fourdrinier wires 204 inches wide, which they state is the largest loom on the North American continent and they believe that it is the largest in the world.

Mr. Wm. Buchanan, managing director of the company is, they state, the oldest living Fourdrinier wire manufacturer in the country to-day, having been engaged in this business for the last 58 years, with such concerns as the DeWitt Wire Cloth Company, the Eastwood Wire Company, the Cheney Bigelow Wire Works, and for the last sixteen years having occupied the position of manager of the Appleton Wire Works of Appleton, Wis., U.S.A. With so long an experience, Mr. Buchanan has become one of the best authorities on this class of work before the paper trade to-day.

In charge of its various departments the Capital Wire Cloth and Manufacturing Company have secured the services of men who are at the top in their various lines of work. The president and manager of the sales department is Mr. J. R. Buchanan, who was manager of sales for the Appleton Wire Works for the past 16 years and is a practical wire man. Their expert machinist and loom builder is Mr. Frank F. Haefs, vice-president of the company, who has had 10 years' experience in the Fourdrinier wire business. The secretary-treasurer of the company is Mr. J. W. Perazzo, a practical wire weaver with 20 years' experience in some of the largest plants in the United States. The superintendent of the plant is Mr. M. L. Peebles, an expert electrical and steam engineer, with 12 years' experience in the Fourdrinier wire business.

The company claim to be authorities on all matters pertaining to the trade and wish us to state that they will be pleased to answer any questions pertaining to the business that will be of interest to the paper trade in the Dominion. They also wish it to be known that they are in a position to recover and repair dandy rolls and cylinder molds either at the mill or at the factory.

Readers of the Canada Lumberman who are interested in the paper business will do well to communicate with the Capital Wire Cloth and Manufacturing Company when they are in the market for anything in their line.

Simonds Saw Company Increases Its Plant

The Simonds Canada Saw Co. Ltd., 95 Rue St. Remi, Montreal, P.Q., have recently purchased the saw and machine knife department of the St. Lawrence Saw and Steel Works Co., Ltd., at Sorel, P.Q. The St. Lawrence Saw and Steel Works Co., Ltd., had been manufacturing saws and machine knives for thirty years. They established for themselves an unsurpassed reputation for the production of excellent saws and knives. The Simonds Canada Saw Co. is equally fortunate in having established for itself an enviable reputation in the production of similar articles. In taking over the saw and machine knife department of the St. Lawrence Co. they are adding greatly to their capacity and are securing a plant which will enable them to maintain and increase the splendid trade which they have worked upon in all parts of Canada. Readers of the Canada Lumberman will be much interested in learning of this important development in connection with the Simonds Canada Saw Co.

Montreal Exports Show Good Increase

Montreal, December 11th—(Special correspondence of the Canada Lumberman):—The following is a preliminary statement of the exhas just closed. This does not take into account the shipments by ports of lumber from the port of Montreal during the season which the railway companies, small shippers, and steamship companies, which will be given later. It will be seen that there is an increase of 8,412,747 feet, which is extremely good, considering the higher freight rates and the interruptions caused by strikes:

	1912	1911
	Feet, B.M.	Feet, B.M.
Watson & Todd	33,217,881	30,663,444
Robert Cox	17,316,113	13,296,102
W. & J. Sharples	12,943,460	10,222,326
J. Burstall & Company	9,149,894	9,334,797
Dobell, Beckett & Co.	4,267,930	4,930,711
Cox, Long & Company	2,211,896	2,431,104
E. H. Lemay	8,857,349	7,208,343
E. M. Nicholson	7,670,005	9,134,954
	95,634,528	87,221,781

Important Action for Commission upon Sale of Timber Limits

Arising out of the recent sale of the mill sites and timber limits of the Revelstoke and Yale-Columbia Lumber companies to the Dominion Saw Mills, there was heard recently at Vancouver one of the largest claims for commission in the annals of the B. C. courts. Mr. Edmond Picard, a Parisian broker, claims a sum of $153,000 as commission on the sale, being at the rate of 9 per cent., or in the alternative a sum of $1,105,000, being the amount of the sale price less $595,000, the figure at which he held an option on the property immediately before the sale to the Dominion Saw Mills. The action was heard in the Supreme Court before Mr. Justice Morrison, and is likely to take some days, the documentary evidence being very extensive. The defendants to the suit are the Revelstoke Saw Mill Co., the Yale-Columbia Lumber Co., Mr. Charles F. Lindmark, president of the Revelstoke Saw Mill Co., and Mr. William A. Ward. The Dominion Saw Mills Co. and the General Corporation Ltd., were originally cited as co-defendants but were dropped from the suit before the trial opened.

The defendants claimed that Mr. C. F. Lindmark had given an option to Picard without authority, and that in any event this option had expired before the sale was made. Judgment was reserved.

A new method of rafting logs is expected to be tried on the St. John river, N.B. next year. The method is what is known as "shingelling." This plan is in use on the Miramichi, and it is said to be more economical than that which has been in use on the St. John river for so many years. This new step is taken as the result of the increasing cost of rafting logs.

About a thousand laborers from Malta are to be brought to British Columbia in the spring, and fifty of these have been promised employment by the Canadian Western Lumber Company.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted

1,000 cars ordinary Sawmill Sawdust. Will accept now or later. State what you have. Box 639, Canada Lumberman, Toronto, Ont. 22-1-68

Birch Logs Wanted

Wanted about 500 logs, Prime Quebec Birch, 18 inches and up. Quote F.O.B. Box 711, c/o Goulds Advt. Offices, 54 New Oxford Street, London, England. 23-2-82

Wanted

Large quantity of Birch, Maple, Elm, Ash and Basswood, 1 inch and thicker, Log Run Dry or can place orders for spring delivery. Box 636 Canada Lumberman, Toronto, Ont. 21-24-63

Wanted

Five million feet Hemlock and Spruce, 1-in. to 2-in., for delivery next spring or summer. Can use portion now. State what you can supply. Box 640 Canada Lumberman, Toronto, Ont. 21-24-66

Wanted

One million feet 4 x 4 to 8 x 8 Maple, Beech, Birch or Elm Squares. Will accept hearts of knotty stock, for rough work. Delivery now or during 1913. Box 638, Canada Lumberman, Toronto, Ont. 22-1-67

We use yearly five hundred thousand to one million feet of Birch, Basswood and Ash in our business and are open to contract with responsible mill men for same. We would be willing to advance money on the logs and also on lumber as sawn. Write us, Manufacturer, Box 619, Canada Lumberman, Toronto, Ont. 20-37 T.F.

Logs Wanted

Reliable Canadian firm wanted to stock Western Ontario mill. Any kind of logs will be accepted on basis of sawing by the thousand. Will also buy several thousand feet of logs on cars. Good shipping facilities on Grand Trunk. Box 662, Canada Lumberman, Toronto, Ont. 24-3-9

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Wanted

Basswood, 300,000 feet, log run—200,000 No. 2 Common and a quantity of shorts. I. B. Levy, 1789 Fulton Ave., New York, N.Y. 24-6

White Pine Wanted

The Advertiser would buy Fifty Thousand or more White Pine Logs. This season's cutting. Ottawa Valley preferred. Box 664, Canada Lumberman, Toronto, Ont. 24-1

Curly Birch Veneer Logs

We buy any quantity, 16-in. quarter girth and up. State prices f.o.b. European steamer, and approximate quantity. Confirmed Bankers Credit. Box 658, Canada Lumberman, Toronto, Ont. 24-4

Lumber Wanted

Four, five and six quarter, Spruce, Hemlock and Norway, four, six, eight and ten inches wide, rough, also surfaced. White Pine Mill Culls and Lath. Box 615, Canada Lumberman & Woodworker, Toronto, Ont. 20-1-34

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Hardwood Pickets Wanted

Beech, Birch and Hard Maple.
1 x 1 x 42.
1 x 1 x 48.
1 x 1½ x 42.
1 x 1½ x 48.
1 x 1¾ x 42.
1 x 1¾ x 48.
Require Thickness, 1/16-in. Plump.
Quality—Free from all defects.
Can take delivery of green or dry stock.
Apply to The Canada Wood Specialty Co., Ltd., Orillia, for full particulars, price, etc. 24-1-TF

FOR SALE—LUMBER, ETC.

For Sale

Two cars of small cedar posts. Two cars of heading (basswood, elm and ash). We want to move this stock at once. John Carew Lumber Company, Lindsay, Ont. 24-1-7

Yellow Pine Timbers

We have on hand in London, three carloads of Yellow Pine Timbers, 8 x 14 to 12 x 14, 12 x 24 ft. long. Prompt shipment can be made. For further particulars apply to The London Lumber Co., London, Ont. 23-24-86

For Sale

500,000 ft. Maple squares, 1¼-in., 1½-in., 1¾-in., 2-in., 2¼-in. and 2½-in. Any length from 12-in. up.

Car lots and upwards.

M. Mitchell, P. O. Box 204, Lucknow, Ont. 23-2-79

Lumber For Sale

BUSINESS OPPORTUNITIES

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 115 h.p. boiler, 100 h.p. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

FOR SALE

Water Powers, Saw Mill, Farm and Timber Land, situated at Fallbrook, Lanark County, comprising:

No. 1.—Sawmill, and dam, twelve-foot head, driven by one 35-in. Samson and one 35-in. Leffel Water Wheels, and containing one Circular, Waterous 3-block Steel Carriage, Trimmer, slab saw, double edger, and complete shingle mill, planer and matcher, all in A.1. repair.

Lumber is sawn and piled in yard for less than one dollar per M. feet, deducting worth of slabs at mill. Average season's cut 500 M. feet. This season's cut over 600 M. feet, of which about 500 M. is still in yard. Large local trade and balance shipped from Perth, C. P. Ry., costing 90 cents per M. feet to deliver. No opposition on river in buying logs, which are driven to mill at a cost of one cent each, and can be bought in quantities sufficient to keep the mill going for years, at the following price, viz., $8.00 per M. feet for Ash, Bass, Elm, and $7.50 per M. feet for Spruce, Hemlock and Balsam.

No. 2.—150 acres deeded timber land, one-half to two miles off lake and can be logged very cheaply.

No. 3.—Dam and water power, at foot of Bennetts Lake, one mile from mill, 8-foot head, controlling the waters of Bennetts and Fagans lakes, with frame house and one acre of land. Also dam privilege and one acre of land foot of Sharbot Lake headwaters, of Fall River.

No. 4.—270 acre Farm, with stone dwelling, 30 x 44, 10 ft. ceilings, furnace, cistern, etc. (a lovely home) large Barn, Stables, Byres Silo, Drive Barn and Flour and Feed Store.

No. 5.—Frame house, 28 x 32, with stable and henery. All unencumbered. Wish to retire from active business. Will accept $12,000, half cash, balance arranged for all including sleighs, mill, wagons, boom chains, booms and other equipments as a going concern.

Fallbrook is 10 miles from Perth and the C. P. Ry., on the Lanark Co. Good Roads System, has daily mail, telephone, 2 stores, cheese factory, blacksmith shop, and the best rural school in the County, employing two teachers. This property is a money-maker, and everything as advertised is open for the closest inspection, including books. For further particulars, address A. B. Lees, Fallbrook, Ont. 24-1-5

For Sale

Saw Mill and fifty-three miles timber limits in County of Bonaventure, Quebec Province. For further particulars apply to J. D. Sowerby & Co., Oak Bay Mills, P.Q. 22-71tf

For Sale

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

Timber limit, containing 20,000,000 feet mixed timber. Latest improved saw mill, new; capacity 30,000 feet lumber in 10 hours, logging this winter 2,000,000 feet. Apply Geo. S. Nesbitt, Rupert, Que. 24-2-2

Quebec Timber Merchant Dies

Quebec, November 28.—The death occurred here last evening at the Chateau Frontenac of Mr. Stuart H. Dunn, one of the leading timber merchants of the city of Quebec, and well known throughout Canada and the United States.

Dam Proposed for St. Maurice River

The commission which was appointed by the Legislature of the Province of Quebec last year to study the running water powers of the Province has presented a report in which it recommends that a dam be erected on the St. Maurice River at Otter Rapids, at an estimated cost of $1,300,000 for the purpose of regulating the flow of the river. It is claimed that this would provide for a steady supply of 18,000 cubic feet per second throughout the year at Grand'Mere, Shawinigan and LaTuque, and that it would also enable the companies using the river for the driving of logs to bring down their logs in greater safety and much more regularly.

In a government report on the wood-using industries of Michigan, is stated that 50,000 board feet of apple wood is used annually for handles. "The only wood in the whole industry (handle) costing an average of $50 a thousand feet was apple, obtained in old orchards where the trees are no longer profitable for fruit. Apple wood is peculiarly fitted for saw handles and most of it is put to that use. Black cherry is employed for the same purpose, but in Michigan it costs $24 a thousand feet board measure and is much cheaper than apple wood."

Lumbering forms an important industry at Anticosti, the island in the St. Lawrence, owned by Mr. Henri Menier, the Paris financier. Four vessels are chartered for the conveyance of pulp and lumber, and next year four more are to be chartered. Some of the pulpwood has been sent to ports on the Great Lakes and also on the Atlantic coast.

Hearing of the complaint by the provinces of western Canoda that railway rates charged in the West were "an unjust discrimination" as compared with those obtaining in eastern Canada was formerly adjourned by the Board of Railway Commissioners till January 5. The reason for the abjournment was to allow the plaintiffs time to investigate the statistical evidence submitted by the defendant companies.

Review of Current Trade Conditions

Ontario

The recent decision of the Dominion Board of Railway Commissioners on the demurrage question has been the crief topic for discussion among lumber dealers lately. They report that in some cases their customers are cancelling orders and in others are asking them to be held over indefinitely. There is no doubt that the Railway Board's ruling had had quite a slackening effect, at any rate temporarily, on the lumber business. Taking this into consideration and the close proximity of the Christmas holidays, a quiet time may be expected until after the New Year. The demand for all kinds of lumber, however, was never better and the abnormal activity in the building trade gives every indication of a record year for lumber dealers in 1913. Lumber dealers generally admit that 1912 has been an exceptional year so far as volume of business is concerned and they are all optimistic as to their prospects for next year.

Owing to the wet weather in the early part of the season, particularly in June and July, there is a large quantity of stained stock in white pine on the market, more in fact than has been the case for the last five or six years. This stained stock of course means a considerable loss to manufacturers. Although the movement in the middle grades of pine has not been so brisk the last couple of weeks, the heavy demand for the low grades and the difficulty of obtaining them even at enhanced prices is bound to start a market for the higher priced lines. No. 2 Ontario spruce is particularly scarce and stocks will no doubt be at a premium in the early spring. Hemlock is now almost unobtainable and dealers can command exceptional prices for any stocks they may have to dispose of.

The hardwood market is still particularly active in all lines, prices at present remaining very firm and a considerable rise may be looked for after the holidays.

Spruce is offering from eastern Canada at a rate which bears out the reports in previous issues of the Canada Lumberman. For instance a quotation was shown to the Canada Lumberman last week which equalled $19.25 to $19.50 delivered at Toronto for an extremely nice lot of mill run, mill culls out.

Eastern Canada

The continued open weather assisted the lumber business in Quebec province during early December. The outlook for next year is good. Dry stocks of lumber in general are scarce at Montreal and prices show a tendency to advance. Building permits for November at Montreal showed a substantial increase. Exports of lumber from Montreal for the season showed an increase of nearly eight and a half million feet.

A better market is reported at Boston for eastern spruce. Buyers seem to be of the opinion that the present high price cannot last much longer but no one seems to be able to foresee the turn of events. There is no large production at present, as many of the summer mills have shut down. Random has been selling very well at steady prices. Stocks of covering boards are small and prices are firm. The market for hardwoods at Boston continues strong with buyers taking fair sized lots and paying full price. The shortage of cars is causing delay to shippers and helping to strengthen the market. Good quartered oak is selling at as high as $90. Plain oak is firm and in good demand. There is plenty of enquiry for maple. No change is reported in the market for hemlock. Firmer prices are reported for shingles at Boston. Cedar extras are going at about $4.25, although some holders are looking for a little more. Clears are bringing $3.90 to $4. There is a good demand for lath at firm prices. Dealers are asking $4.50 for 1⅝ in. and $4.10 for 1½ in.

At New York there is still an excellent demand for eastern spruce and prices are strong throughout the list. Stocks of hardwood are low and there is no difficulty in disposing of them at good prices. Plain and quartered oak are high and maple and birch continue strong. Hemlock is selling at good prices. The basic price continues at $24. Very few orders are booked at that figure the tendency being towards an increase.

Great Britain

The London spot market is quite cheerful and trade is moving along in a satisfactory manner. Prices are strong with an upward tendency. Deliveries at London docks for the week ending November 16th amounted to 6004 standards as compared with 4367 during the corresponding week of 1911.

Since the end of the importing season at Liverpool the market for all kinds of timber products has been exceptionally firm. Some hesitation however, is reported on the part of consumers and retail dealers to face the present situation. Spruce spot market values continue firm with an upward tendency. Importers raised their prices recently, to agree with c.i.f. values. Importers invariably state that their quotations are for prompt reply, as offers cannot be held over. Stocks are rapidly being depleted. Some of the largest importers are already entirely out of a few sizes. It is expected that by the end of the year consumers will have difficulty in securing stock.

Imported sawn boards are scarce, although two or three months ago they looked as though they would last for six months at least. Practically the only size in stock is 1 x 4 and these are disappearing quickly. Ocean freight rates continue high, no less than 65 shillings per standard having been paid for small parcel shipments of spruce. An upward tendency is reported in the market for birch, although the quantity of business is not heavy. There is a tendency on the part of importers to lie low and not commit themselves to current prices for March-April shipments. The spot birch market is firm with an indication of gradual advance as stocks become smaller.

The end of the season of imports from Canada has been marked by two of the leading houses issuing circulars announcing an advance in the price of third and fourth qualities by ten shillings per standard. A further advance is quite possible before the commencement of next season. It is considered certain that next year's import prices will show an advance.

At Manchester, spruce continues strong, making new high records. The scarcity is most noticeable in 3 x 9 inch deals, which have been retailed at 5d per superficial foot. Many dimensions are unobtainable.

The trade at Glasgow continues on a satisfactory basis. A serious shortage of stocks of pine deals is expected. Consignments of 11 x 3 inch third and fourth and broad fourth quality deals are being bought up on arrival at advanced prices, which shows that dealers realize that they will not be able to secure adequate supplies. It seems certain that the few shipments due to arrive will be cleared at still higher prices. Hardwoods at Glasgow are very firm.

United States

Reports from various parts in the United States indicate that the healthy expansion of trade still continues. Financial conditions on the whole are considered to be quite sound. Bank clearings show a decided increase as compared with those of a year ago and railway earnings are much higher also. The lumber business is in sympathy with the general trade and financial conditions. In the northern parts of the United States, northern pine and hemlock are in exceptionally strong demand. Stocks of these woods in fact, are insufficient to meet requirements.

Chicago:—The demand for white pine stock at Chicago is good with an exceptional urgency for immediate delivery. Indications are that this condition will continue until the opening of the next sawing season. The trade in northern pine is experiencing difficulty in securing sufficient stocks. The trouble in fact, is to secure lumber, not to get rid of it. The scarcity is particularly noticeable in the lower grades, Nos. 4 and 5 common and firsts and seconds. The hardwood market is also strong with the demand and the supply moving along on about an equal basis. Practically all orders are for immediate shipment. The stocking-up movement is not expected to commence until the beginning of the new year. The best demand is for oak, plain red oak selling at as high as $58.00. Quartered-sawed white oak is also moving readily and surplus stocks have been absorbed. There is an excellent demand for hemlock, and stocks are about sufficient to meet normal demand. The exceptional demand is causing stocks to be depleted rapidly. Stocks at mill points are shorter than usual. The demand for southern pine stock has fallen off somewhat, but shippers are still, in most cases, away behind their orders. This is accounted for to some extent by the shortage of cars. The demand for red cedar shingles is a little smaller. Clears are selling at $3.27 and start at $2.74. The prices of white cedar shingles are steady at $3.40 for extras and $2.40 for standards. There is a good demand for lath and prices are firm.

Buffalo:—There is a firm demand for most grades of white pine. An excellent inquiry is reported for pattern lumber. Stocks of box lumber are short, in fact at Buffalo and Tonawanda have none to offer. Trade in hardwoods has been good and the indications are for a continuation of the same condition. Prices are firm, particularly for oak, in which a scarcity is apparent. Hemlock has been assisted by the good building weather. Prices are stronger. The demand for yellow pine is good and prices are stronger with indications that they will continue so.

North Tonawanda:—Supplies of white pine show signs of depreciation many dealers have been forced to leave large blocks of stock at upper lake ports. The shortage applies more to the lower grades than to the uppers. The demand continues stronger and prices are

fair. Shingles are scarce and another advance of ten cents has taken place in 16 inch clears and 18 inch stock.

Barbados Lumber Trade Report

S. P. Musson, Son & Co., Barbados, report under date of November 22nd as follows: Lumberstuffs—White pine—The Schr. "Evelyn" has arrived from St. John, N.B., to our address with 175 m. ft., sold to arrive some time ago. We also note the arrival of the Schr. "A. G. Eisnor" from Gaspe with a small shipment of 83,500 ft. which has been placed at $33 for merchantable, $23.25 for second quality, and $19.25 for inferior. We understand a small cargo now about due has also been placed to arrive at $33.05 and $24.05 for merchantable and second quality, respectively. Stocks are not heavy and further receipts are wanted. Spruce—The Schr. "Evelyn" also brought 170 m. ft. of this, which we had previously sold to arrive. The market is lightly supplied, and further receipts would sell to advantage. Pitch pine—No arrivals. Shingles—A small lot of 72,400 long Gaspe cedar which came to hand per Canadian steamer from St. John, N.B., have been placed at $8.71. There is some enquiry for these at present and next arrivals should also bring full rates. Schooks—The Schr. "Augustus H. Babcock" has arrived from Portland, Me., with 24.500 bdls., part cargo for shelves. Wood hoops—We note the arrival of 2,733 bdls. French and English by London steamer.

Gordon, Grant & Co., Ltd., Port-of-Spain, Trinidad, report under date of November 11th, as follows: We have no arrivals to report but an outlet could easily be found for a well-assorted cargo or two of heart pitch pine quality. American and Canadian white pine boards are always saleable and there is also some enquiry for spruce.

Firm Lumber and Pulp Markets in Norway

Reports from Christiana, Norway, state that the wood pulp market is firm for all kinds. Chemical pulp is inclined to advance and buyers are eager to secure larger quantities. Mechanical pulp is also very firm, although there is not for this, any special enquiry. Bleached sulphite is quoted at £11 10s to £12 10s per ton c.i.f. to the east coast of England. Dry mechanical is quoted at £5 5s to £5 10s. Swedish quotations are as follows: Mechanical moist, $8.80 to $9.33; mechanical dry, white, $20 to $20.80; sulphite easy bleached, $39.20 to $40.53.; all free on board Swedish ports.

The lumber prices in Norway have during this year gone up higher than at any time previous. The rise varies somewhat for the different river districts and for the different dimensions from 5 to 10 per cent., averaging around 6 to 7 per cent. A paper in one of the leading lumber districts writes, that it is to be hoped that the sulphite and pulp mills on the international market will make it possible for the Norwegian mills, in spite of the rise in the raw material, to experience some good years, which are now very much needed. For the owners of the wood-lands and the population of these districts, it is of the utmost importance that the mills are kept running and running with some profit.

Beaver Lumber Company Opens Toronto Yard

The Beaver Lumber Company with limits and mills at Kearney, Ont., have opened an office and yard at 14 Bathurst street, Toronto. They are also building a large yard at the head of Bathurst street on the Belt Line Railway to take care of their retail trade. Mr. J. A. Bird, manager of the new company, has had many years of experience in the lumber business. The company will specialize in hemlock and hardwoods.

Canada's Exports of Wood

Canada's exports and manufactures of wood for the 6 months ending September were as follows:

Wood and mfrs. of—Total	25,621,092	26,825,549	6,800,182	18,158,986
Logs	342,207	509,796	41,709	466,415
Lumber—Deals, pine	877,256	994,481	929,234	49,723
Deals, spruce and other	3,868,419	3,216,674	2,671,031	499,714
Laths, palings & pickets	1,074,475	1,050,929	36,714	1,000,000
Planks and boards	10,320,815	11,074,317	1,051,020	8,650,347
Shingles	863,308	778,538	.....	756,195
Timber, square	411,015	903,591	883,814	5,871
Wood blocks for pulp	3,157,480	3,626,306	.....	3,626,306
Wood pulp	2,363,943	2,627,607	568,559	2,037,552

Canada's imports of wood and manufactures of wood for the six months ending September 1912 were valued at $14,332,063.

Honors for B. C. Exhibit

The Canadian Pacific Railway recently received a telegram from New York, stating that the company had carried off the cup for best exhibits of grain and display of natural resources at the 1912 American Land and Irrigation Exposition. The judges said that the Canadian Pacific Railway booth contained the finest collection of the natural resources of any country brought together in any exposition. The British Columbia fruit and timber were much commented upon and the grain display was pronounced magnificent.

After the Canal is Opened

W. C. Wickham, of the Radford-Wright Lumber Co., of Winnipeg, visited Moose Jaw recently. In an interview he spoke enthusiastically of the outlook for greatly increased business after the opening of the Panama Canal.

"When the canal is opened," he states, "it will mean an $8 rate to Europe from British Columbia ports against $16 now charged. Instead of costing some $300 to ship a carload of lumber from the Pacific to the Atlantic by rail, it will cost about $150 by the canal route. This will mean that all the surplus lumber of British Columbia will find a ready market. At present the railway freight rates prohibit the use of British Columbia lumber in the east, but with the opening of the canal this will be a thing of the past," Mr. Wickham says.

Important Legal Decision

Many of the lower mainland mills in British Columbia are operated by means of electricity and therefore much interest centered in the case of W. D. McElmon vs. the B. C. Electric Railway Company, in which the plaintiff was awarded $8,500 damages. Mr. McElmon's mill was burned last summer, the cause being lightning which ran into the mill along the power wires. He sued the company on the ground that the wires were not properly safeguarded and was awarded half the amount he sought.

The C. P. R. has lost in its appeal to the Supreme Court of Canada from the judgment which awarded the King Lumber Company damages of $200,000 because of limits being destroyed by fire. The case was tried at Nelson a year ago, when it was shown that the fire originated on the railway's right-of-way, spread across intervening land and got into the timber of the plaintiff company. The case will be taken on to the highest court.

Men are Scarce and Labor is High

Let a Cyclone blow the dust from your mill. Blows the dust in any direction and as far as desired.

Saves the price of one man and will pay for itself in one month's time.

Will not clog or choke up—Built especially for the Circular Saw Mill.

Branch at Winnipeg

EDGINGS

Ontario

Mr. A. S. Nicholson has opened a planing mill at Burlington, Ont.

John Fewings, Millbank, Ont., is advertising his lumber and coal business for sale.

The Peterboro Planing Mill Co., Peterboro, Ont., are advertising their business for sale.

The hub and spoke factory belonging to the J. S. Loughead estate at Sarnia, Ont., was recently destroyed by fire, the loss amounting to $40,000.

Fire destroyed the power house and sluice gates of the Dryden Timber & Pulp Company at Dryden, Ontario, recently, causing damage to the extent of about $1,000.

The Ontario Gazette contains notice to the effect that the Provincial Secretary has accepted the surrender of the charter of the Munn Lumber Company, Limited.

A fire which detsroyed lumber to the extent of $1,800 or $2,000, took place in the lumber yard of Mr. J. A. Letherby, Toronto Street, Midland, Ont., recently. Three large piles were totally destroyed and several smaller piles damaged so that they are practically a total loss.

The Ontario Gazette contains notice of the granting of an extra-provincial license to the greater Ottawa Sash, Door and Lumber Company, Limited, whose capital stock for use in Ontario is not to exceed $50,000. T. J. McManus, Ottawa, is attorney for the company.

The Forest Products Company, Limited, has been incorporated with a capital stock of $49,000, to manufacture logs, lumber, wood products, etc., with head office at Peterboro. The provisional directors are H. E. Robers, W. Dealer, H. G. Logan, and W. H. Hill, all of Peterboro, Ont.

Notice is given in the Ontario Gazette of the incorporation of the Acme Furniture Company, with a capital stock of $40,000. They will deal in and manufacture lumber, furniture, etc. The head office is at Berlin. The provisional directors are J. Lauffer, J. Hunt and P. L. Kroetsch, all of Berlin.

Fibre Products, Limited, have been incorporated with capital of $250,000, to carry on business as manufacturers of wood, chemical pulp, etc., and to acquire timber limits, saw mills, etc., necessary for the business. The head office is at Thorold, Ont., and the provisional directors are F. W. Manson, G. J. Manson and A. W. Marquis, all of St. Catharines.

The Russel Timber Company, Limited, has been incorporated with a capital stock of $50,000, to operate timber limits, cut and sell timber and lumber and carry on a general lumbering and contracting business. The head office is to be at Port Arthur. The provisional directors are T. A. Reed, F. F. Langworthy and A. J. McComber, all of Port Arthur.

The next year's operations of the Spanish River Pulp & Paper Company, Espanola, are expected to bring in excellent profits. The company report that there is at present an excellent demand for its paper. The entire plant is now in active operation. The output of pulp is much greater than last year and the new paper mill is turning out nearly one hundred tons of paper a day.

Reitzel Bros., contractors, Waterloo, Ont., have made a proposal to the Board of Trade of Waterloo, to erect a brick, sash and door factory and planing mill, 50 x 100 feet, at a cost of $26,000, with lumber and fixings to the value of $10,000. They are asking for a loan of $20,000 from the town, agreeing to pay interest upon it at the rate at which the debentures are issued. The Board of Trade is in favor of the proposal and the town council will be asked to submit a by-law to the ratepayers at the annual municipal elections.

Eastern Canada

Aime Trudeau, Sr., has been registered to carry on a lumber business at Sherbrooke, P. Q.

Napoleon Carriere, Leonidas Carriere and Ovila Carriere have been registered to carry on business as lumber dealers at Pine Hill, P. Q., under the style of Nap. Carriere & Fils.

Plans are being rapidly developed for the work at Grand Falls, N. B., for the erection of the large pulp and paper mills which have been projected for some time. The sum of $8,000,000 is involved in this venture.

The Danville Chair & Specialty Company, Limited, J. E. Guilmette, secretary, are preparing plans for the erection of a dry kiln in connection with their plant at Danville, Quebec. The kiln will be 60 x 16 feet, of brick construction and fitted with the latest improvements.

W. H. Montague of Hartford, Ct., is in Fredericton, N.B., preparing plans for the improvements and enlargements to the Victoria Mills for Messrs. Donald Fraser and Sons. The mills will be fitted with the most modern machinery and will be ready for operation early next spring.

The Central Railway Company of Canada are calling for tenders for 1,000,000 railway ties, to be delivered at various points in Quebec and Ontario. Tenders are being received until noon, December 20th. The chief engineer is F. Stuart Williamson, 44 Beaver Hall Hill, Montreal, P.Q.

Preliminary arrangements for the changes and improvements to be made at the Victoria Mills, Fredericton, N.B., by Messrs. D. Fraser & Sons, have been commenced in preparation for the operation of the mills during the coming season. It is understood that provision has been made for securing the necessary lumber and that the cut will probably amount to about ten million feet.

Mr. John A. Young, M.P.P., has completed a deal for the purchase of the portable mill which has been owned and operated at Upper Gagetown, N.B., by Messrs. McMulkin & Currier. Mr. Young's son, Harold, is interested with him in the proposition and they will have the mill in operation in a short time at Taymouth on Mr. Young's property. He has considerable lumber of his own to cut and the people at Taymouth will take advantage of the convenience of having a mill situated there and will have

logs cut on their properties sawed there this winter. The mill has a capacity of 20,000 feet per day. It is understood that Mr. Howard Young is disposing of his mill on the Nashwaak to the Partington Pulp & Paper Company.

It is understood that the Quebec Government is considering the framing of a measure which has for its object the encouragement of the pulp and paper industry of the province. While the exact nature of the aid to be given does not appear to have been decided upon as yet, it is expected that the example set by the Ontario Government will be followed and tenders called for the cutting of pulpwood on certain areas in the province, probably in Northern Quebec.

Acting on behalf of the St. Maurice Lumber Company, Mr. H. Hilyard, of Dalhousie, N.B., has acquired all the properties of A. W. Carpenter, of London, England, formerly carrying on business at Gaspe Basin under the title of the Gaspe Lumber and Trading Company. The purchase price is understood to be in the neighborhood of $250,000. This property was held by Mr. Carpenter as chairman of the Charing Cross Bank, which failed. It is stated that a large pulp mill is to be constructed. Included in the property acquired are the wharves of the Gaspe Lumber and Trading Company.

Western Canada

Grant & Kerr, lumber dealers, Vancouver, B.C., have dissolved.

The Home Lumber Company has been succeeded by E. J. Meiliche & Sons, Limited, Clavert, Sask.

The Goose Lake Grain and Lumber Company, Limited, Dundurn, Sask., have been succeeded by the Home Lumber Company, Limited.

The Weyburn Sash, noor and Glass Company, Weyburn, Sask., will double the size of their plant next year by the addition of a building 140x195 ft.

The West Vancouver Lumber Company, Limited, has been incorporated under the B. C. Companies Act with capital stock of $10,000 and head office at West Vancouver.

The new sawmill which is to be erected by the Canadian Puget Sound Lumber Company, at Esquimalt, B.C., will be driven by electricity. The head office of the company is at 2120 Store street, Victoria, B.C.

The Middle West Lumber Company, Limited, has been incorporated under the B. C. Companies Act, with capital stock of $100,000 and head office at Vancouver, to carry on a lumber manufacturing and timber owning business.

The Canadian Pulp and Paper Company, Limited, Winnipeg, Man., has been incorporated. The incorporators are L. E. Brownell, R. Brownell, T. R. Ferguson, C. L. Simmonds, and E. K. Williams, all of Winnipeg. The capital stock of the company is to be $1,000,000.

A proposition for the erection of a pulp mill is under way at Grand Forks, B.C. The undertaking is in the hands of a syndicate in which Mr. Alexander Robinson, Victoria, B.C., is interested. The mill will have acapacity of fifty tons per day and will cost $500,000.

The LePage Lumber Company, Limited, has been incorporated with a capital stock of $100,000, to carry on business as timber merchants, saw mill proprietors, etc., with head office at Winnipeg. The incorporators are W. B. Tomlinson, lumberman, F. A. Shaw, manager, and J. T. LePage, all of Winnipeg.

Alexander Robinson, formerly senior member of the Robinson & LeQuime Lumber Company, of Grand Forks, B.C., who disposed of their business to the Western Pine Lumber Company about two years ago, is endeavoring to interest outside capital in the establishment of a pulp mill at Grand Forks.

F. A. Barton and C. F. Schaute, Calgary, Alta., have prepared plans for the erection of a paper plant to cost $150,000. The building will consist of two storeys, 82 x 34 feet, a vat building, 48 x 14 feet, and a warehouse for the storage of lumber. The plant will manufacture heavy wrapping paper and straw board.

The Pacific Box Company, 324 Prior street, Vancouver, B.C., have purchased a site for the erection of a new plant which will cost $25,000, and have three times the capacity of their present plant. The company will be in the market for box making machinery. Mr. R. W. Sharpe is president of the company.

The Big River Lumber Company will this winter have about 1,500 men in the woods and the Prince Albert Lumber Company will have upwards of 1,000. No difficulty has so far been experienced in getting a sufficient number of lumbermen, the supply and demand being pretty well balanced. The absence of frost has delayed the work at the lumber camps considerably.

The Phoenix Lumber Company and the Jasper Forest Sawmills Company are cutting 130,000 feet of lumber a day near Edson, Alta., west of Edmonton. The manufacturing of lumber will be one of the leading industries for some years to come in that district, on account of the demand which the development of the country and the opening of the rivers north of Edmonton will inevitably create.

The Riverside Lumber Company will erect at Calgary, Alta., one of the largest box, and sash and door factories and general woodworking plants in western Canada. The main factory building will be 100 x 300 feet. There will also be four other buildings for use in the wood-working business, each 60 x 100 feet, a glazing room 60 x 100 feet, a boiler house 75 x 75 feet, and two large dry kilns. In addition to these the company will erect a large office building.

Some difficulty is being experinced by members of a company at Victoria, B.C., who have secured the foreshore rights of the B. F. Graham Lumber Company and are desirous of erecting a mill at Thetis Cove, Esquimalt Harbor. When the B. F. Graham Company secured the foreshore rights it was their intention to erect a mill nearby. The financial depression of 1907-8 interfered with this plan and the site of the mill was transferred later to a company associated with the Canadian Puget Sound Lumber Company. This company now find themselves unable to proceed with the erection of a mill because the C. P. R. have encroached upon the property by erecting a wharf for the landing of their oil fuel, the wharf overlapping the property in question. The matter has been laid before the Minister of Marine and Fisheries and it is hoped that a settlement will be reached which will permit of the mill being erected.

Cross - Cuts for Good Hard Work

The "SAW KING" Cross-Cut Saws have won exceptional favor throughout the trade by the good work they do, the hard wear they stand and their general reliability. These saws have stood the test of Camp and Mill and have proved their worth—their high quality steel and perfect tempering and grinding sets them far above the average and places them in a class by themselves.

THE "SAW KING" CROSS-CUT

The "Saw King" Cross-Cut Saws have merits possessed by no other saws. By looking at the above cut you will see that the chip spaces are wider and deeper in the centre than they are in any other part of the saw, thereby giving a capacity for the accommodation of the largest accumulation of sawdust, which is always in the centre of the saw. The chip spaces decrease in size from this point of the saw, as also does the quantity of sawdust. All users of saws know that the teeth at the centre wear much faster than they do at the ends, as the teeth are longest at the centre, it gives greater wearing capacity to the saw, and as the teeth are smaller at the ends of the saw and leaves the saw blades wider between the teeth and at the back. Where the blade is narrowest, it gives more strength and stiffness at the point where it is most required. The saws are tempered by our new improved process, giving them a keener cutting edge than any other Cross-Cut Saw made. They are thoroughly warranted. Any defective saws will be replaced by the seller.

Prompt Delivery a Specialty. **Send for Particulars and Prices.**

R. H. Smith Company Limited St. Catharines, Ontario

He's a wise man who realizes that true belt value lies in its cost per day of Service

"AMPHIBIA"

(WATERPROOF)

Leather Belting

COSTS LESS PER DAY OF SERVICE

than any other. This fact renders it the least expensive belting irrespective of any comparisons of first cost "per foot length."

Therefore—be SURE you get "AMPHIBIA"

TO INSURE SATISFACTION—STATE WHERE BELT IS TO RUN

Make Your Power Transmission an Asset—Not a Liability.

When purchasing Belting don't come to conclusions quickly—the selection of a poor cheap belt might mean considerable loss of power and efficiency in your plant.

Beardmore Belting will save you this trouble and loss—it will also wear better and last longer than any other belting on the market—it represents the maximum value obtainable in leather belting.

Made only from extra selected No. 1 Packer Steer Hides—tanned under the slow old fashioned process which positively ensures the long life of the belt.

Having everything under our supervision from the hide to the finished belt we are able to offer Leather Belting that we can fully guarantee.

SELECTION OF LOCOMOTIVES

WHAT SHOULD BE KNOWN BEFORE YOU PURCHASE LOCOMOTIVES:—

Nature of the service.
Capacity of the cars and weight of train.
Character of track—is it new or old.
Length of haul.
Is time an important factor.
Do you want a quick locomotive or a big puller.
Distance from base of supplies and quarters for the men.
Water and coal carrying capacity.
All these items and more should be considered.
A careful study of conditions may mean larger profits.
Our experience may be valuable in considering them.
A dollar saved is more than a dollar earned.

Write or wire us, or better still, come to see us.

Why Users of Berlin Matchers Never Have Bearing Troubles

Bearing troubles on Berlin Matchers ended when Berlin Engineers brought out the automatic take-up box. The cap of this perfected box adjusts automatically, with wear. It cannot get too tight, nor too loose. Consequently it won't heat, nor pound. Berlin High-Efficiency Matchers are equipped with Automatic take-up boxes for cutter head journals and side head spindles.

Compare the disadvantages and the advantages of two types of boxes for the above named parts

Screw Take-up Box

1. It is practically impossible to get both ends of the cap on a screw take-up box adjusted the same.
2. One end of the cap screwed down too tight causes heating—heating causes wear—wear not taken up immediately causes pounding of journals.
3. Stock of uneven thickness is manufactured when liners are uneven, caps screwed down too tight on one end, or when operators are careless with adjustments.
4. The operator may forget to put oil in the reservoirs during a heavy run. Journals become dry and soon heat.

An illustrated circular of the several models of this machine sent upon request

Berlin Automatic Take-up Box

1. Berlin Automatic Take-up Boxes adjust with wear without any attention whatever from the operator, except oiling.
2. There is no heating or pounding because caps are held in place by springs that keep journals rigid but never tight enough to cause heating.
3. Pressure being equal all along the cap, wear will be parallel with the cutting edge of knives, consequently stock is planed to an even thickness.
4. Whenever possible sight feed oilers are used. The operator can tell at a glance whether journals are getting the proper amount of oil.

A Good Investment

Mills in every woodworking section find Berlin Matchers a good investment. They save grades and cut producing costs at every installation.

Automatic Take-up Boxes on Berlin Matchers run for months and years without any adjustment whatever.

Write to-day for further data on our new series of Matchers.

SCANDINAVIA BELTING — FEDERAL ENGINEERING & SUPPLIES LIMITED — TORONTO

The proper kind of belting to use in order to get the best results is often a very serious problem.

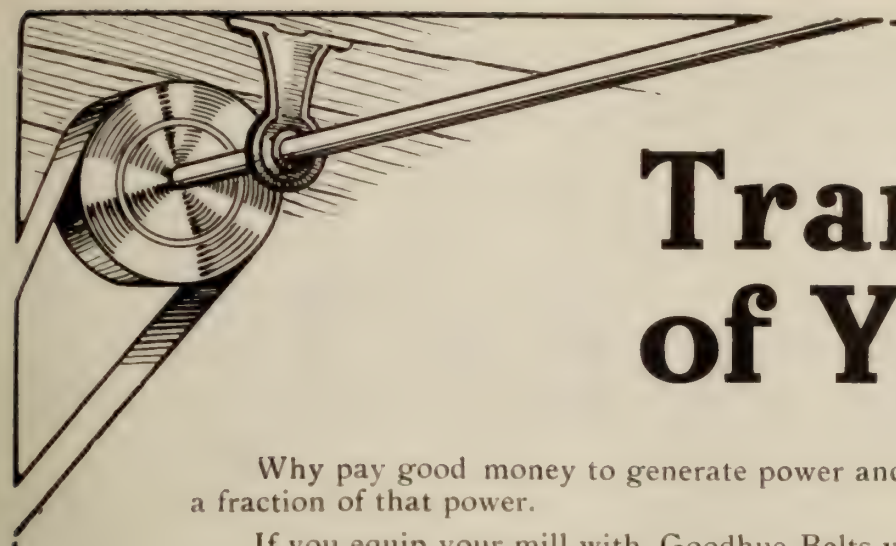
The first cost of a belt is really a minor consideration. We can furnish a belt for any kind of a drive, and solicit your enquiries.

TRADE MARK — LANCO BALATA BELTING

In writing, state size of pulleys, speed, etc.

Federal Engineering and Supplies, Limited

TORONTO - MONTREAL



Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue Belts stretch 15% to 25% less than other belts and have just the right amount of "cling" on the pulley.

Write us for particulars and prices

Schacht

—The Lumber Truck that Builds Big Business

Do you know that one Schacht Lumber Truck is worth more to you in dollars and cents than six to eight teams and wagons?

Men who have experimented say that horses can no longer compete with motor trucks in the lumber business.

Won't you let us show you where you can save money on your 1913 operating expenses?

Our booklet will be mailed free on request. Write for it.

Schacht Motor Car Co. of Canada, Ltd.

Hamilton, Ontario

The Truck with Good disposition — built for Canadians with Canadian money.

A Few Specifications—

Motor, 45-50 H.P., four cylinders.

Ignition, magneto, with double system.

Oiling, plunger pump in crank case, separate feeds to all bearings, with splash system.

Clutch, cone, thermoid faced, 15½ in. diameter.

Transmission, selective sliding gear, 3 speeds, forward and reverse.

Emergency Brakes, internal, expanding on rear wheels, 18-in. drum. Service brakes on each end of jackshaft.

Frame, rolled steel channel section, 6-inch side members.

Frame, 217¾ in. long, 38¾ in. wide.

Axles, rear, rectangular, 2¾ in. wide, 4 in. deep, drop forged. Front Timken, 1 beam with solid section through centre, 2 in. wide, 2¾ in. deep, dropped forged.

Bearings, Timken roller bearings in wheels, jackshaft and steering knuckle, annular bearings in transmission.

Tires, 36 x 4 in. single front, 36 x 5 in. dual rear.

Wheel Base, 144 in.; tread 64 in.

Speed, 10 to 18 miles per hour on direct.

Loading Space, 11 ft. 5 in. back of seat on chassis frame.

Body, to order.

One to Five Ton Capacity

Endorsement

PEOPLE are influenced, consciously or sub-consciously, by the subtle command of "endorsement."

Suppose, for example, a friend of yours, in need of a certain article, goes into the nearest hardware store. ***His*** mind, perhaps, may be free of "endorsement." The salesman shows him several makes, all equally attractive in appearance, but remarks that he understands this brand or that brand has served others well. ***That*** is "endorsement," and it very likely binds the sale of one of these makes.

Your friend tries out the tool—proves its efficiency and durability. He becomes enthusiastic and at various times tells ***you*** of his excellent find. You are not in need of any tools at this time, but one day you break one of yours and go to a hardware store as your friend did. Here the salesman endeavors to push an inferior make; you are on the point of buying this when you see the brand on another. It is the one your friend has praised. You do not know the brand the salesman is pushing, but this other one is known to you and has received the "endorsement" of your friend—an "endorsement" that establishes your confidence.

That is the tool you buy.

The new and untried, the unknown, the little used and the imitation all make way for the article that carries "endorsement" with it—"endorsement" that it has earned by years of reliable service and continual improvement.

It is to gain the aid of this greatest of all salesmen, "endorsement" that manufacturers constantly strive. Obtained, and lived up to, like an avalanche, it goes on and on, gathering tremendous force—creating an ever-increasing demand.

It is this "endorsement," bestowed on DISSTON saws and tools by millmen and mechanics the world over, that has given them their prestige. Prestige that has steadily grown and widened in its influence for nearly three quarters of a century—prestige that is born of enthusiastic ***"endorsement."***

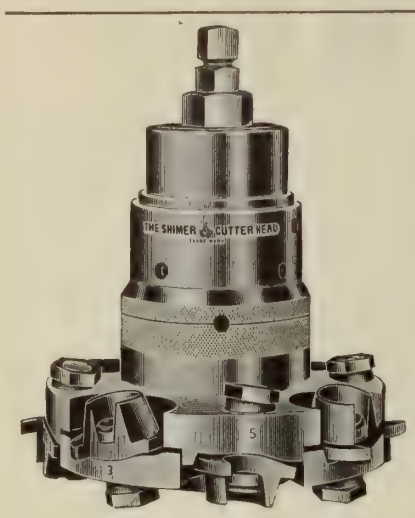
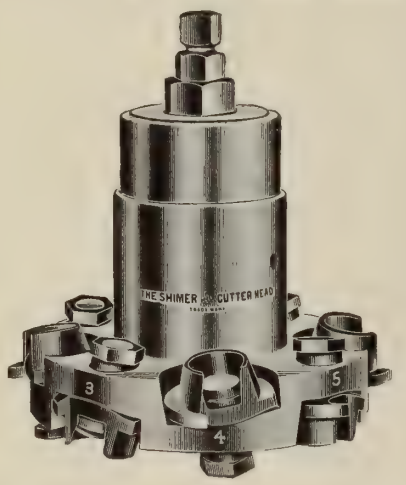
USE THE SHIMER CUTTER HEADS

For Flooring, Ceiling, Siding, Ship Lap, Jointing, Double Ceiling, Doors, Sash, Blinds, etc.

Made of steel Forgings, they represent the greatest possible strength in compact and workmanlike manner, embodying the vital principles of clearance to all leading Bit Points. The alternate and shearing effect of the cut reduces to a minimum the tearing-out tendency of cross-grained lumber. Cutters have exact shape in their exterior circles, and uniform product is maintained indefinitely without extra trouble or expense.



The Shimer Limited, with Expansion, Fig. 628. Groove Head with 8 Bits and self-centering and spindle clamping features. Price $36.23 each, complete.



The Shimer Limited in solid section, Fig. 625. Groove Head with 8 Bits and the self-centering and spindle clamping features. Price $33.50 each, complete.

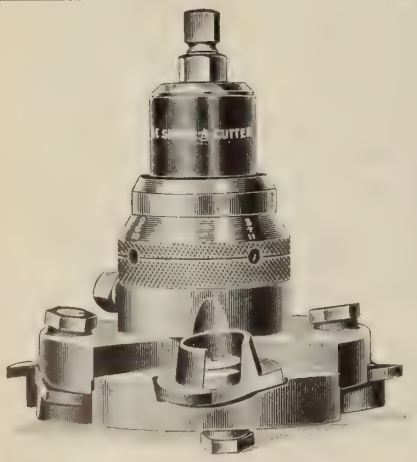


Fig. 203, Popular Expansion Groove Head with 4 bit seats, complete, net $20.48. Made also with 6 and 8 Bits to each Head.

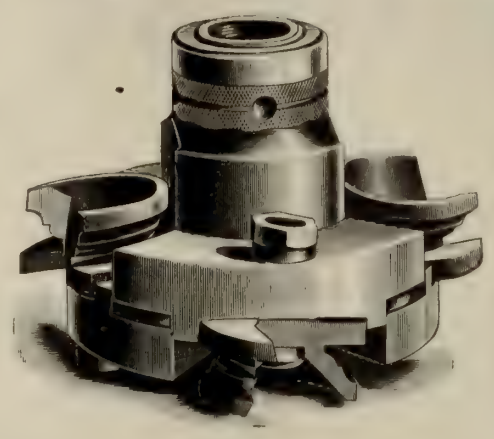
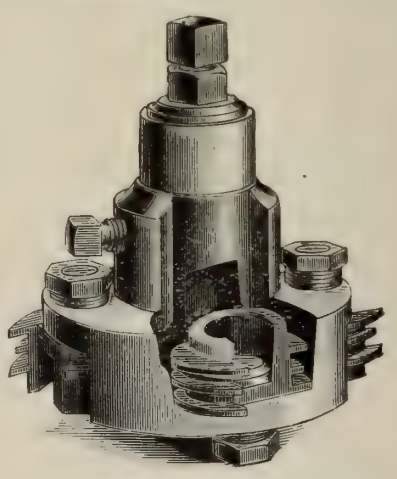
The Shimer Door and Sash Heads



Save the filing to shape at each sharpening of the cutters. They are made per order, carry in their outline the perfect counterpart of the work, thus by simply filing the Bits and setting them to the gauge the fitting of the manufactured parts is assured.

A solid Door Head with Bits to work 1 to 1¼ inch Doors costs only $18.03, and an Expansion Head only $20.63. A solid Sash Head to mould 1 to 1¼ inch Sash, complete with Bits, costs only $16.91—an Expansion Head fitted out complete only $19.51. $62.87 will give you an excellent solid section outfit, including Door Cope Heads and Sash Cope Heads. If you want the very best with Expansion the cost will be only $68.07.



Double the Capacity of Your Matcher or Moulder By the use of the Shimer Double Ceiling and Double Flooring Heads.

Run your stock with double tongue and groove and then re-saw. 100 per cent gain in output for an investment of only $40.94 and upwards.

The Bits on the Shimer Double Heads mark the saw cut line of division on the stock so that the sawyer can at once detect any variation of the saw and correct it as the board is passing through.

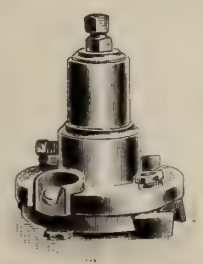
These Heads are not an experiment. We have made them for years and they are in daily use in the best mills of this and other countries. You will find them very complete and practical tools, carrying the Shimer guarantee to do as represented or no sale.

Heads for making Ship Lap

The Shimer Cutter Heads for Ship Lap are so proportioned in the Bits and their seats that a perfect draw cut is made. They work interchangeably with our matcher Heads and always produce good work.

Price, per set, complete, $33.64 to $38.48, according to thickness of cut.

Extra Bits for making Wainscoting on these Heads $1.95 each.



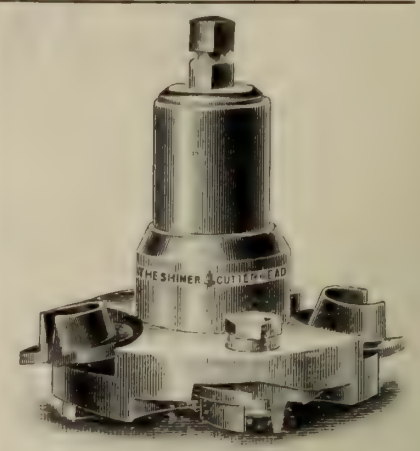


Fig. 23, a Popular Solid Groove Head with 4 bit seats, complete, $17.87. Also made with 6 or 8 Bits to each Head.

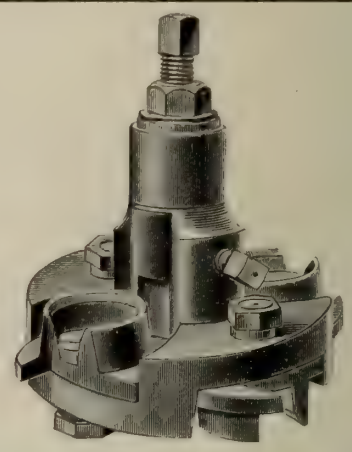
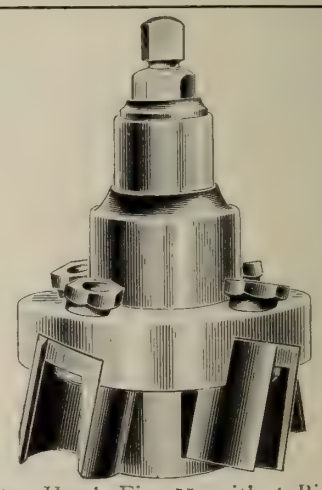


Groove Head, Fig. 2. For plain matching of tongue and groove joint, complete with Bits, $13.00.



Jointer Head, Fig. 55, with 4 Bits in line of work. Also made with 6 and 8 Bits to each Head. With 4 Bits $16.64.

Our Bedee Knives, recommended by users as the best thin steel knives on the market, can be furnished in any length or thickness on short notice. Write us about your requirements.

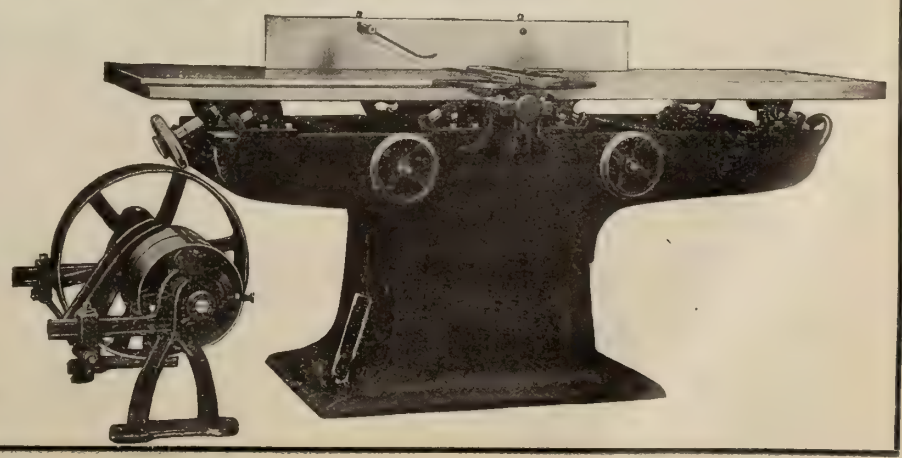
Silver's machines are designed for convenience and ease of operation and for rapid efficient service. Their moderate price recommends them to all wood workers.

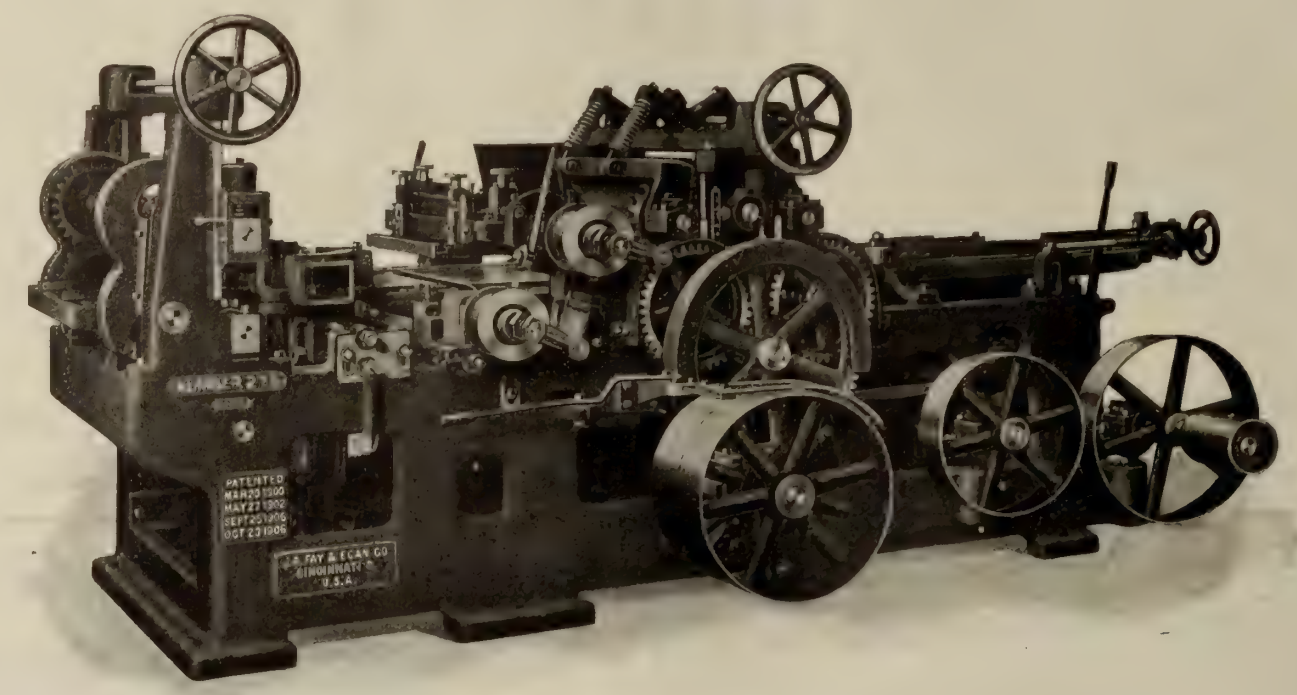
Strong, durable, high pressure machines that will save you time and labor. Made in sizes to suit any need or any purse.

Ask for 1911 Machinery Catalog and special Canadian prices.



THE SILVER MFG. CO.

375 BROADWAY **SALEM, OHIO**



By its deeds the FAY-EGAN "LIGHTNING" No. 275 has become known as the Matcher which meets all the requirements of the general planing mill:—

Some Actual Results Obtained

J. A. FAY & EGAN CO.,
Cincinnati, Ohio.

Gentlemen: We purchased one of your No. 275 Matchers, size 16 x 8, a little over a year ago, and have been running it continually ever since, working all sorts of material on it from ½-in. ceiling to sizing 16 x 8 timbers. In fact, most of the time it has been doing the work of a timber sizer and I must confess in all my 25 years of experience I have never seen its equal for the amount of work it will turn out. It has the most wonderful feed for its side, and I have run all makes of machines.

No one need be afraid of buying one of these machines for general all around work and I heartily recommend it to any wanting such a tool. We have not had a cent of repairs, and if we could not secure a duplicate of it, would not take twice the amount we paid for it.

We congratulate you on the development of such a machine and wish for you the hearty success you deserve. We are also well pleased with the other machines we purchased from you.

Yours very truly,
SHAW BROS. COMPANY,
By David Shaw, President.

Macon, Ga.

J. A. FAY & EGAN CO.,
Cincinnati, Ohio.

Gentlemen: This is to certify that I did run through one of J. A. Fay & Egan Co.'s Planers and Matchers, namely the No. 275, 24-in. 6-roll P. & M. the amount of 8,025,630 feet of roofers averaging 1-in. in thickness and 7-in. in width, during the year of 1911. The record is actual figures on our books and does not count stock sold in local market, amounting to about 75,000 feet. The machine has proven very satisfactory and we take pleasure in recommending the same.

W. B. GETTYS LUMBER CO.,
By W. B. Gettys, Mgr.

Zebulon, N. C.

J. A. FAY & EGAN CO.,
Cincinnati, Ohio.

Gentlemen: We are pleased to write you in regard to the No. 275 Planer and Matcher we purchased of you some time ago. We used this machine on a variety of work, ranging from ¼ x ½-in. soft wood to 3⅝ x 10½-in. oak and also 4¼ x 6⅝-in. hickory. We plane all this material on four sides, sometimes taking a ½-in. cut with the side heads on oak 3⅝-in. thick. A large percentage of the work done on this machine is planing and matching semi-circular tank staves, 1¼-in. x 4-in. wide. We find we can feed all the various kinds of material as fast as a man can keep the machine full, and machine appears to have a capacity greater than this on nearly all kinds of stock, including the tank staves. We are entirely satisfied with this machine.

M. RUMELY CO. ADVANCE THRESHER PLANT.

Battle Creek, Mich.

—the actual results, both in quantity and variety, obtained by users in all parts of the country, are the strongest proofs of the value of this machine.

—note in letters herewith; the first, shows a variety of work from ¼" ceiling of 16" x 8" timbers; the second large output on one kind of work; and third, some of the hardest work ever done on a Matcher.

—equally satisfactory results are obtained on other classes of work, everywhere, in fact, we have never put out a No. 275 that has not more than met all expectations of the purchaser.

—if you use or need a general purpose matcher, let us tell you more about the No. 275, a Matcher, Double Surfacer, Floorer and Inside Molder combined.

—write today for descriptive folder and price.

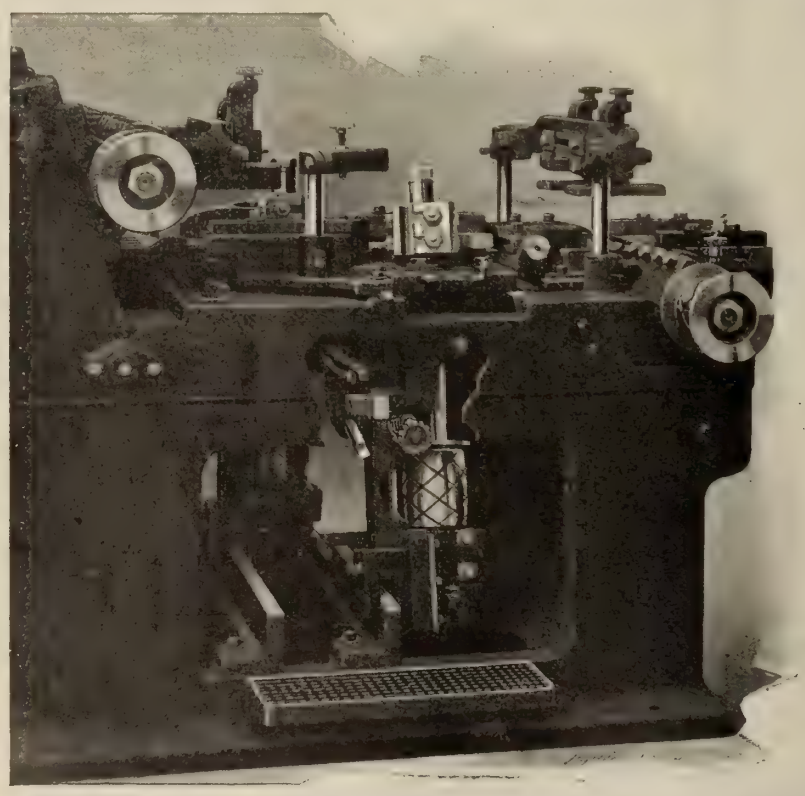
American *No. 34* Inside Moulder

This is a brand new machine. The general design and form of construction of the frame; the direct and simple system of gearing; the massive bed plate supporting the matcher legs; the side clamping boxes for both cutter heads and side head journals; the accurately fitted and easy adjustments throughout, are all features that make this the most up-to-date ***Inside Moulder*** on the market today.



The sectional view shows the angle adjustment of Matcher Legs, and the vertical adjustment of side spindles.

We have a handsome book which describes this machine fully. Let us send you one.

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

The Proof of the Wheel is in the Trial

If you are not using Aloxite Wheels in your mill just let us send you a wheel for trial.

Give it a good fair chance to prove its worth—let your filer learn for himself that the Aloxite Wheel will cut fast and clean, without burning or case hardening the saw—let him test the wheel for durability and for its ability to hold its shape.

These are just the qualities that have recommended Aloxite Wheels to hundreds of filers—the qualities that will prove to **your** filers that Aloxite Wheels will give better gummed saws in less time—at less wheel cost.

May we have your Trial Order?

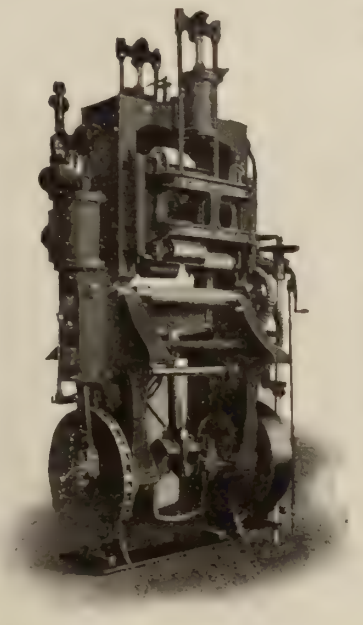
WICKES GANGS

"As Staple in a Saw Mill as Sugar in a Grocery."

FLAT GANGS Unexcelled in the manufacture of

Flooring Strips **Cedar Siding** **Shiplap**
Silo Stock **Door Stock** **Box Lumber**
Boards

from cants and flitches, from either hard or soft woods.



ROUND LOG GANGS

JUST WHAT THE NAME IMPLIES—taking all your small logs just as they come from the pond and cutting them up into boards or dimensions, getting every board there is in the log, never over-slabbing (wish we could say this of all head sawyers.) Built to handle either one or two logs at once, up to 14 in. diameter.

KEEP THE SMALL LOGS AWAY FROM THE HEAD SAW and CARRIAGE entirely, raise your cutting capacity, and install ecomony by the same stroke.

Not an EXPERIMENT, but an ECONOMIC NECESSITY.

Think it Over Carefully, then Write us for Details.

"The Gang cannot Overslab."

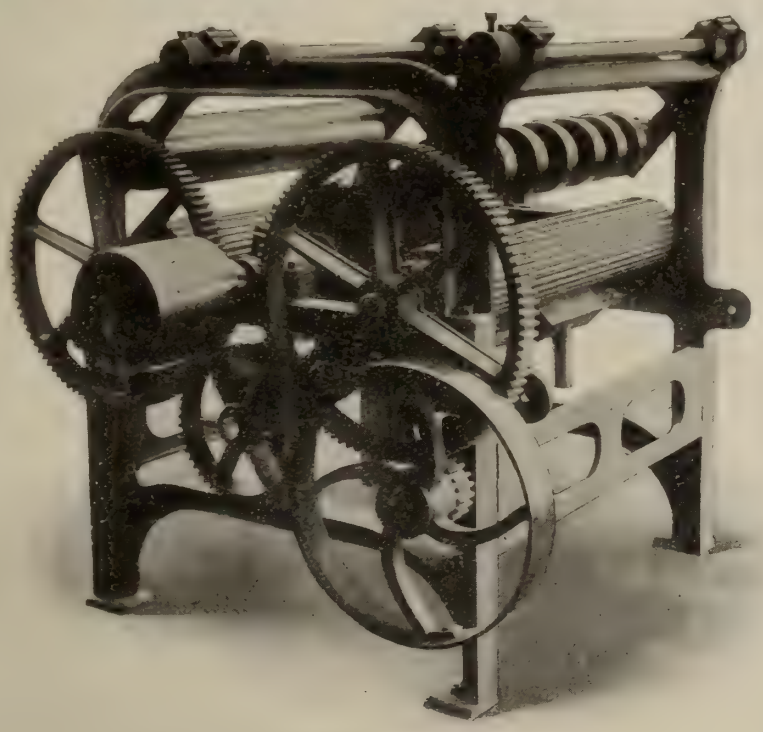
"Everything for the Saw Mill From the Motive Power to the Trimmer"



Our Two Saw Edger

We can supply a complete saw mill equipment and all Mowry made. Every machine is complete, simple, and a model of good workmanship.

If you are contemplating the installation of new machinery for winter and spring operations it will cost you nothing to enquire into the merits of our equipment.

Repairing saw mill machinery is also in our line.

May we send you our literature?

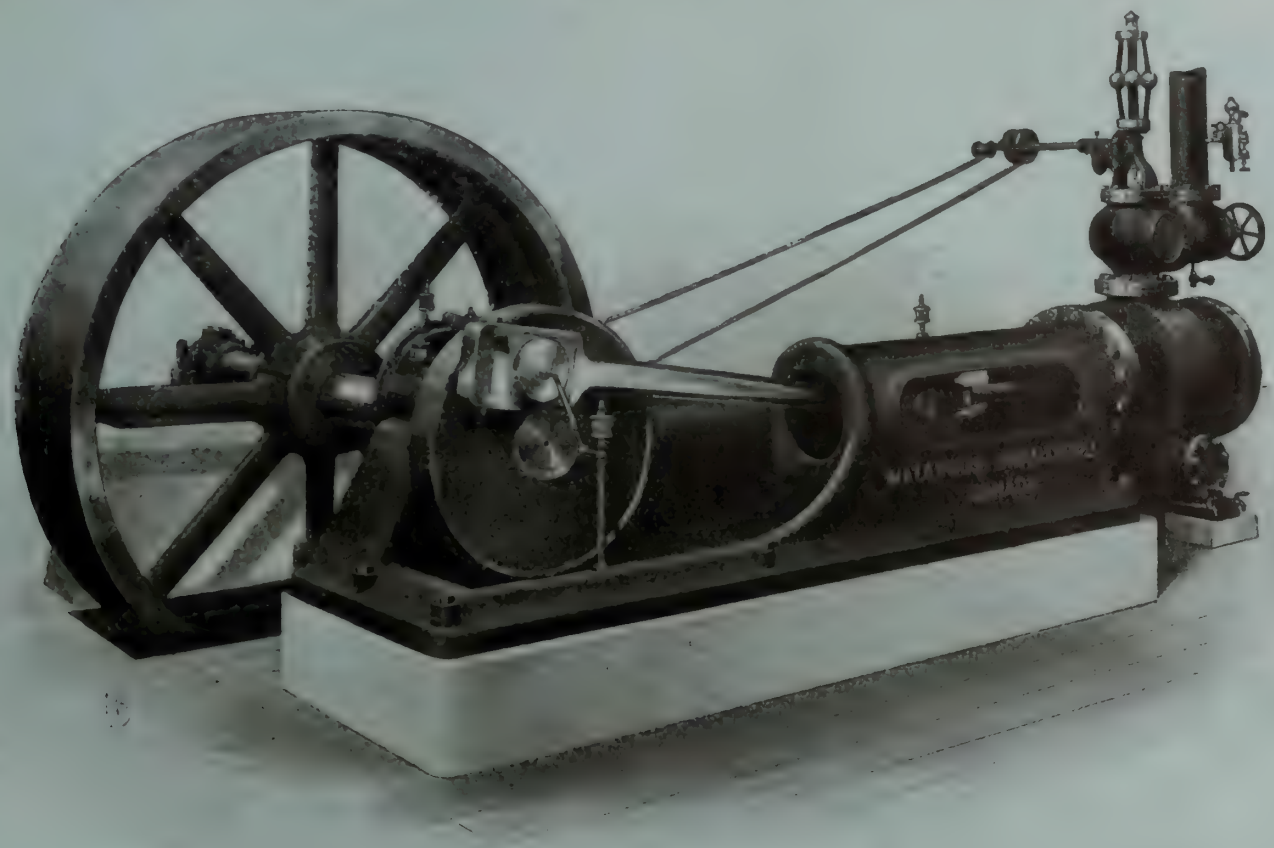
A "Heavy" Duty Engine for Sawmill Work



The Waterous Side Crank

THIS Engine is especially built for Sawmill work. It combines strength and simplicity with the ability to be on the job all the time.

There is nothing to get out of order. Parts are few, are sturdily built, and are easily gotten at for oiling and overhauling.

With an occasional wipe-down and a dose of oil on the wearing surfaces, the engine will run from whistle to whistle without a hitch.

For an absolutely reliable engine that will stand up to severe service under all sorts of conditions, we can honestly recommend the "Heavy Duty Side Crank."

Built in sizes from 60 H.P. to 600 H.P.

Full particulars, prices and specifications on request

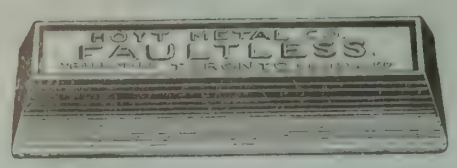
BRANTFORD, CANADA



$5,000,000.00

worth of mixed metals is what we market every year

PEERLESS metal is compounded specially for sawmills and is the best on the market for that purpose.

FAULTLESS metal is a high grade copper hardened alloy made for heavy duty work, sawmills and engines.

Our policy is large tonnage, perfect alloys, and absolutely fair and honest treatment of the trade.
